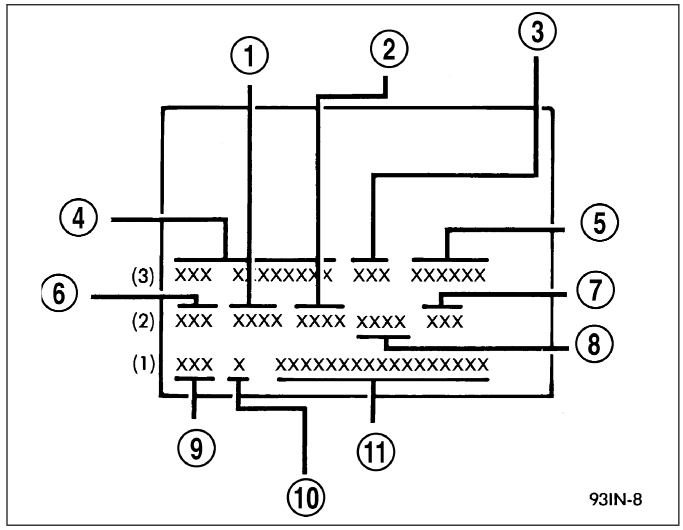
GROUP TAB LOCATOR



INTRODUCTION

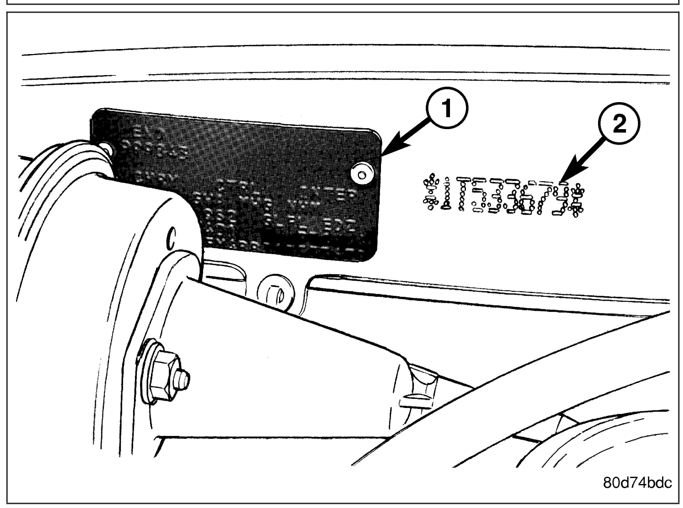


TABLE OF CONTENTS

BODY CODE PLATE

DESCRIPTION

The Body Code Plate is located in the engine compartment on the plenum behind the right side strut tower. There are seven lines of information on the body code plate. Lines 4, 5, 6, and 7 are not used to define service information. Information reads from left to right, starting with line 3 in the center of the plate to line 1 at the bottom of the plate.

DIGITS 7 THROUGH 23

Vehicle Identification Number

- (Refer to VEHICLE DATA/VEHICLE INFORMATION/VEHICLE IDENTIFICATION NUMBER - DESCRIPTION) for proper breakdown of VIN code.

IF TWO BODY CODE PLATES ARE REQUIRED

The last code shown on either plate will be followed by END. When two plates are required, the last code space on the first plate will indicate (CTD)

When a second plate is required, the first four spaces of each line will not be used due to overlap of the plates.

FASTENER IDENTIFICATION

DESCRIPTION

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 8.9 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts.

HOW TO DETERMINE BOLT STRENGTH

	Mark	Class
Hexagon head bolt	 Bolt head No. 4 — 5 — 6 — 7 — 8 — 9 — 10 — 11 —	4T 5T 6T 7T 8T 9T 10T 11T
	 No mark	4T
Hexagon flange bolt w/washer hexagon bolt	 No mark	4T
Hexagon head bolt	 Two protruding lines	5T
Hexagon flange bolt w/washer hexagon bolt	 Two protruding lines	6T
Hexagon head bolt	 Three protruding lines	7T
Hexagon head bolt	 Four protruding lines	8T

	Mark	Class
Stud bolt	 No mark	4T
	 Grooved	6T
Welded bolt		4T

95IN-4

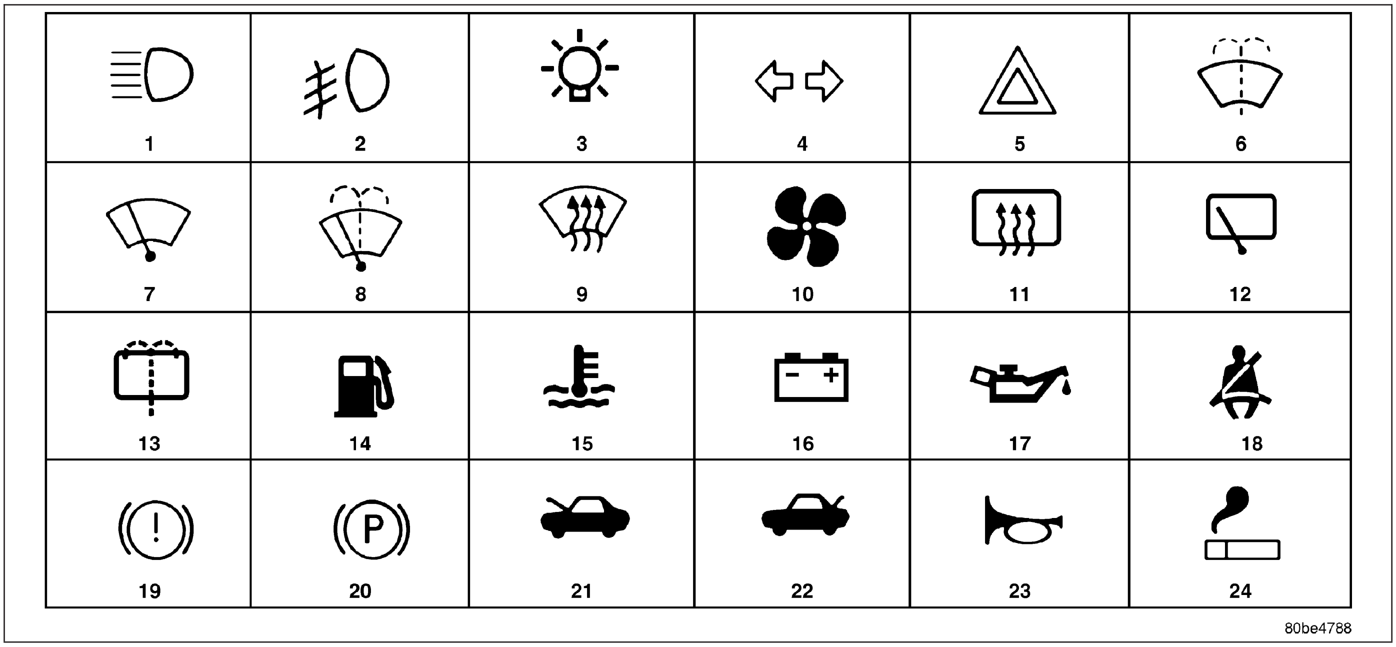
FASTENER USAGE

DESCRIPTION

FASTENER USAGE

WARNING: Use of an incorrect fastener may result in component damage or personal injury.

Fasteners and torque specifications references in this Service Manual are identified in metric and SAE format.



During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

THREADED HOLE REPAIR

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

INTERNATIONAL SYMBOLS

DESCRIPTION

The graphic symbols illustrated in the following International Control and Display Symbols Chart are used to identify various instrument controls. The symbols correspond to the controls and displays that are located on the instrument panel.

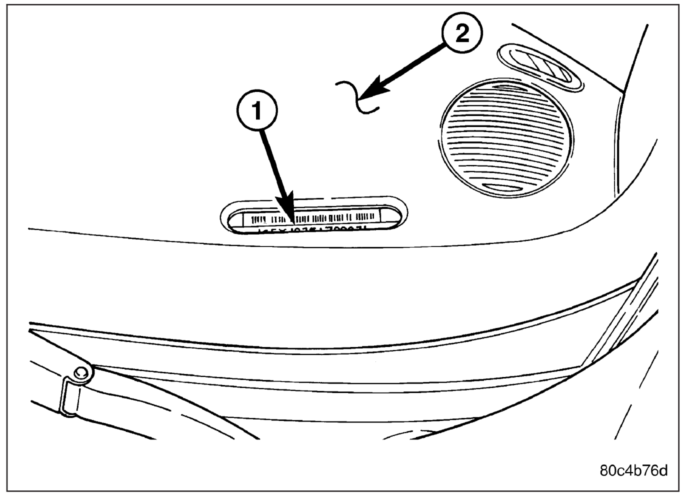
Individual Torque Charts appear within many or the Groups. Refer to the Standard Torque Specifications Chart for torque references not listed in the individual torque charts.



VEHICLE IDENTIFICATION NUMBER

DESCRIPTION - VEHICLE IDENTIFICATION NUMBER

The Vehicle Identification Number (VIN) is located on the upper left corner of the instrument panel, near the left A-Pillar. The VIN consists of 17 characters in a combination of letters and numbers that provide specific information about the vehicle. Refer to VIN Code Decoding Chart.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

VIN CODE DECODING

POSITION	INTERPRETATION	CODE = DESCRIPTION
1	Country of Origin	1 = Manufactured by DiamlerChrysler Corporation
2	Make	B = Dodge
3	Vehicle Type	3 = Passenger Car
4	Restraint System	D = Restraint System With Out Air Bags Sales Code (CGJ) (Mexico) H = Restraint System Air Bags Front Next Generation Multi Stage Sales Code (CG1) With Side Air Bags Sales Code (CGS) J = Restraint System Air Bags Front Next Generation Multi Stage Sales Code (CG1) Without Side Air Bags Sales Code (CGS)

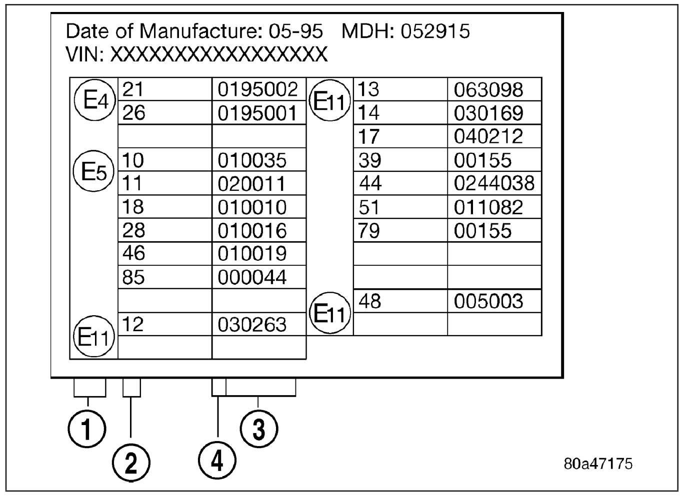
VEHICLE CERTIFICATION LABEL

DESCRIPTION

A vehicle certification label is attached to the rear shutface of the driver's door. This label indicates date of manufacture (month and year), Gross Vehicle Weight Rating (GVWR), Gross Axle Weight Rating (GAWR) front, Gross Axle Weight Rating (GAWR) rear and the Vehicle Identification Number (VIN). The Month, Day and Hour of manufacture is also included.

All communications or inquiries regarding the vehicle should include the Month-Day-Hour and Vehicle Identification Number.



8086df7b

E-MARK LABEL

DESCRIPTION

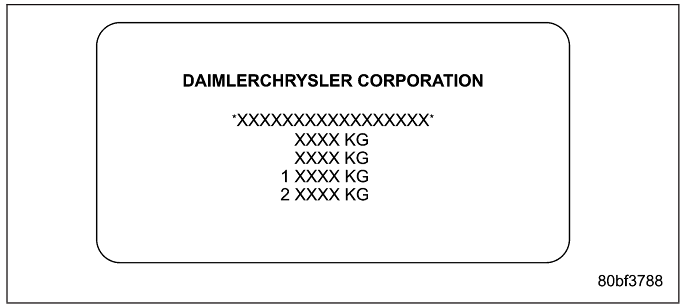
An E-mark Label is located on the rear shut face of the driver's door. The label contains the following information:

- Date of Manufacture
- Month-Day-Hour (MDH)
- Vehicle Identification Number (VIN)
- Country Codes
- Regulation Number
- Regulation Amendment Number
- Approval Number

VECI LABEL

DESCRIPTION

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.



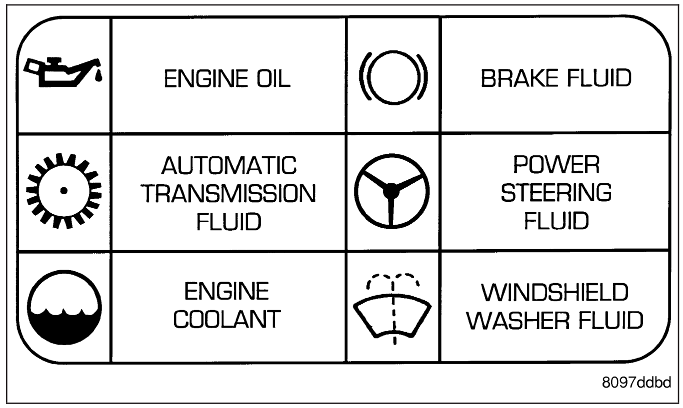
The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

MANUFACTURER PLATE

DESCRIPTION

The Manufacturer Plate is located in the engine compartment on the passenger side rear corner of the hood. The plate contains five lines of information:

1. Vehicle Identification Number (VIN)
2. Gross Vehicle Mass (GVM)
3. Gross Train Mass (GTM)
4. Gross Front Axle Rating (GFAR)
5. Gross Rear Axle Rating (GRAR)



LUBRICATION & MAINTENANCE

TABLE OF CONTENTS

INTERNATIONAL SYMBOLS

DESCRIPTION

DaimlerChrysler Corporation uses international symbols to identify engine compartment lubricant and fluid inspection and fill locations.

FLUID TYPES

DESCRIPTION

ENGINE OIL

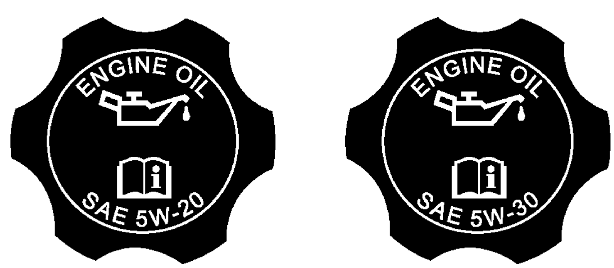
WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Européens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API CERTIFICATION AND LICENSE SYMBOL



Use an engine oil that is API Certified and Licensed to display the certification mark. MOPAR® provides engine oils that meet or exceed, Material Standard MS-6395 requirement.

9400-9

SAE VISCOSITY

SAE 5W-20 and SAE 5W-30 engine oils are recommended for all operating temperatures. These engine oils are designed to improve low temperature starting and vehicle fuel economy. Refer to the engine oil filler cap for the preferred engine oil viscosity grade for each vehicle. SAE viscosity grades are used to specify the correct viscosity oil for an engine. Use only Multi-Viscosity oils such as SAE 5W-20 or 5W-30. These are specified with a dual SAE viscosity grade which indicates the cold (5W) to hot (20, 30) temperature performance range of the oil.

81364ec7

ACEA CATEGORIES

For countries that use the ACEA European Oil Categories for service fill oils, use engine oils that meet the requirements of ACEA A1/B1, A2/B2, or A3/B3.

CONTAINER IDENTIFICATION

The Engine Oil Certification Mark was developed and trademarked by the API to refer customers to those engine oils preferred by the automobile manufacturers. This symbol means that the oil has been certified and licensed by the American Petroleum Institute (API). This certification mark will only be found on the front of the oil containers. Those oils that do not display the "Mark" on the front of the container should not be used.

9400-9

DaimlerChrysler only recommends API Certified engine oils that meet the requirements of Material Standard MS-6395. Use Mopar or an equivalent oil meeting the specification MS-6395.

SYNTHETIC ENGINE OILS

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that are certified by the American Petroleum Institute (API) to display the "Certification Mark" and show SAE viscosity grade recommended for each vehicle. Follow the service schedule that describes your driving type.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines and emission systems by:

- Increasing the level of Phosphorus and Sulfur in the engine oil. The API Certified Engine Oils control the Phosphorus and Sulfur contents of the oil to levels that reduce the contamination effect on the vehicles emission control system.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. The engine oils contain a performance additive system carefully developed to optimize the oils performance in the engine. The addition of supplements may cause the oil to thicken prematurely, cause excessive deposit build-up and potentially shorten engine life.

ENGINE COOLANT

WARNING: Antifreeze is an ethylene glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant

with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

TRANSMISSION FLUID

NOTE: Refer to the maintenance schedules in the Owner's Manual for the recommended maintenance (fluid/ filter change) intervals for this transaxle.

NOTE: All transaxles have a common transmission and differential sump. Filling the transaxle accommodates the differential as well.

TRANSMISSION FLUID

Mopar® CVT+4 is required in the CVT automatic transaxles.

Mopar® CVT+4 when new is green in color. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** A dark brown/black fluid accompanied with a burnt odor and/or deterioration in shift quality may indicate fluid deterioration or transmission component failure.

G288 and T350 Manual transaxles require the use of Mopar® ATF+4 (Automatic Transmission Fluid)

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded gasoline having an octane rating of 87. The use of premium gasoline is not recommended. The use of premium gasoline will provide no benefit over high quality regular gasoline, and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as “reformulated” gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly support the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasoline free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle’s catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle’s performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.

- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of DaimlerChrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

POWER STEERING FLUID

The recommended fluid for the power steering system is Mopar® Power Steering fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid. Both Fluids have the same material standard specifications (MS-9602).

Mopar® ATF+4 (and Mopar® Power Steering fluid + 4), when new, is red in color. ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL**. ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

The power steering system is filled-for-life at the factory and requires no regular maintenance. Although not required at specific intervals, the fluid level may be checked periodically. Check the fluid level anytime there is a system noise or fluid leak suspected. (Refer to 19 - STEERING/PUMP/FLUID - STANDARD PROCEDURE)

FLUID CAPACITIES

SPECIFICATIONS - FLUID CAPACITIES

DESCRIPTION	SPECIFICATION
Fuel Tank	57L (15 gal.)

**(Includes heater and coolant recovery bottle filled to MAX level.)	

FLUID FILL/CHECK LOCATIONS

DESCRIPTION

The fluid check/fill point locations are located in each applicable service manual section.

LUBRICATION POINTS

DESCRIPTION

Lubrication point locations are located in each applicable Sections.

MAINTENANCE SCHEDULES

DESCRIPTION

MAINTENANCE SCHEDULE

There are three maintenance schedules that show **required** service for your vehicle.

First is Schedule **“B”- ALL ENGINES**. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.
- Heavy Loading

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 102,000 miles (170 000 km) or 60 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: Most vehicles are operated under the conditions listed for Schedule ″B″ - ALL ENGINES.

Second is Schedule **“A”**. It is for vehicles that are not operated under any of the conditions listed under Schedule ″B″.

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

Under no circumstances should oil change intervals exceed 6000 miles (10 000 km) or 6 months whichever comes first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add, if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.

- Inspect the brake hoses.
- Inspect the CV joints (if equipped) and front suspension components.
- Check the manual transmission fluid level (if equipped).
- Check the coolant level, hoses, and clamps.

CAUTION: Do not check the automatic transaxle fluid. It must be check by a trained service technician every 15,000 miles and if required only the recommended fluid be added. Refer to the section “Fluids, Lubricants And Genuine Parts” for the proper fluid.

SCHEDULE B

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.
- Heavy Loading

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 102,000 miles (170 000 km) or 60 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

Miles (Kilometers)	**3,000 (5 000)**	**6,000 (10 000)**	**9,000 (15 000)**	**12,000 (20 000)**	**15,000 (25 000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X

** This maintenance is recommended by the manufacturer to the owner, but not required to maintain the emissions warranty.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

WARNING:
You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

MAINTENANCE SCHEDULES - GASOLINE ENGINES - EXPORT

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **"A"**. It lists all the scheduled maintenance to be performed under "normal" (if none of the conditions in Schedule **"B"** apply to you) operating conditions.

Second is Schedule **"B."** It is a schedule for vehicles that are operated under the conditions listed below.

Follow Schedule **"B"**if you usually operated you vehicle under one or more of the following conditions.

- Day or night temperatures are below 0° C (32° F).

- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32° C (90° F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

NOTE: If ANY of these apply to you then change your engine oil every 5 000 km (3,000 miles) or 3 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 163 000 km (102,000 miles) or 60 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: Most vehicles are operated under the conditions listed for Schedule ″B″.

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect the brake hoses.
- Inspect the CV joints (if equipped) and front suspension components.
- Check the automatic transmission fluid level.
- Check the coolant level, hoses, and clamps.

SCHEDULE A

Kilometers **(Miles)** **[Months]**	**12 000** **(7,500)** **[6]**	**24 000** **(15,000)** **[12]**	**36 000** **(22,500)** **[18]**	**48 000** **(30,000)** **[24]**	**60 000** **(37,500)** **[30]**
Change engine oil and engine oil filter.	X	X	X	X	X
Rotate tires.	X	X	X	X	X
Check spare tire for proper pressure and correct stowage.	X	X	X	X	X
Inspect brake linings.			X		

Kilometers (Miles) [Months]	12 000 (7,500) [6]	24 000 (15,000) [12]	36 000 (22,500) [18]	48 000 (30,000) [24]	60 000 (37,500) [30]
Replace engine air cleaner filter.				X	
Replace make-up air filter.				X	
Replace spark plugs.				X	

Kilometers (Miles) [Months]	72 000 (45,000) [36]	84 000 (52,500) [42]	96 000 (60,000) [48]	108 000 (67,500) [54]	120 000 (75,000) [60]	132 000 (82,500) [66]
Change engine oil and engine oil filter.	X	X	X	X	X	X
Rotate tires.	X	X	X	X	X	X
Check spare tire for proper pressure and correct stowage.	X	X	X	X	X	X
Flush and replace engine coolant at 60 months, regardless of mileage.					X	
Inspect brake linings.	X			X		
Replace engine air cleaner filter.			X			
Replace make-up air filter.			X			
Replace spark plugs.			X			
Inspect PCV valve, replace as necessary.			X			
Inspect auto tension drive belt and replace if required.			X			

Kilometers (Miles) [Months]	144 000 (90,000) [72]	156 000 (97,500) [78]	160 000 (100,000)	168 000 (105,000) [84]	181 000 (112,500) [90]	192 000 (120,000) [96]
Change engine oil and engine oil filter.	X	X		X	X	X
Rotate tires.	X	X	X	X	X	X
Check spare tire for proper pressure and correct stowage.	X	X		X	X	X
Flush and replace engine coolant, if not done at 60 mos.			X			
Inspect brake linings.	X				X	
Replace engine air cleaner filter.	X					X
Replace make-up air filter.	X					X
Replace spark plugs.	X					X
Inspect PCV valve, replace as necessary.	X					X
Inspect auto tension drive belt and replace if required.	X					

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

SCHEDULE B

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0° C (32° F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32° C (90° F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 102,000 miles (163 000 km) or 60 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

Kilometers (Miles)	**5 000 (3,000)**	**10 000 (6,000)**	**14 000 (9,000)**	**19 000 (12,000)**	**24 000 (15,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Rotate tires.		X		X	
Check spare tire for proper pressure and correct stowage.		X		X	
Inspect engine air cleaner filter, replace if necessary.					X
Inspect and replace make-up air filter, if required.					X

Kilometers (Miles)	**29 000 (18,000)**	**34 000 (21,000)**	**38 000 (24,000)**	**43 000 (27,000)**	**48 000 (30,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Rotate tires.	X		X		X
Check spare tire for proper pressure and correct stowage.	X		X		X
Inspect brake linings.	X				
Replace engine air cleaner filter.					X
Replace make-up air filter.					X
Replace spark plugs.					X
Inspect PCV valve, replace as necessary.					X

Kilometers (Miles)	**53 000 (33,000)**	**58 000 (36,000)**	**62 000 (39, 000)**	**67 000 (42,000)**	**72 000 (45,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Rotate tires.		X		X	

Kilometers **(Miles)**	**53 000** **(33,000)**	**58 000** **(36,000)**	**62 000** **(39, 000)**	**67 000** **(42,000)**	**72 000** **(45,000)**
Check spare tire for proper pressure and correct stowage.		X		X	
Inspect brake linings.		X			
Inspect engine air cleaner filter, replace if necessary.					X
Inspect and replace make-up air filter, if required.					X

Kilometers **(Miles)**	**77 000** **(48,000)**	**82 000** **(51,000)**	**86 000** **(54,000)**	**91 000** **(57,000)**	**96 000** **(60,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Change Automatic Transaxle (CVT) Fluid and Filter.					X
Rotate tires.	X		X		X
Check spare tire for proper pressure and correct stowage.	X		X		X
Inspect brake linings.			X		
Replace engine air cleaner filter, replace if necessary.					X
Replace make-up air filter.					X
Replace spark plugs.					X
Inspect PCV valve, replace as necessary.					X
Inspect auto tension drive belt and replace if required.					X
Flush and replace engine coolant at 60 months, or 102,000 miles (163, 000 km) whichever comes first.					

Kilometers **(Miles)**	**101 000** **(63,000)**	**106 000** **(66,000)**	**110 000** **(69,000)**	**115 000** **(72,000)**	**120 000** **(75,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Rotate tires.		X		X	
Check spare tire for proper pressure and correct stowage.		X		X	
Inspect brake linings.				X	
Inspect engine air cleaner filter, replace if necessary.					X
Inspect and replace make-up air filter, if required.					X
Inspect auto tension drive belt and replace if required.					X

Kilometers **(Miles)**	**125 000** **(78,000)**	**130 000** **(81,000)**	**134 000** **(84,000)**	**139 000** **(87,000)**	**144 000** **(90,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Change Rear Drive Assembly (RDA) fluid.		X			
Change Power Transfer Unit (PTU)		X			
Rotate tires.	X		X		X

Kilometers (Miles)	125 000 (78,000)	130 000 (81,000)	134 000 (84,000)	139 000 (87,000)	144 000 (90,000)
Check spare tire for proper pressure and correct stowage.	X		X		X
Inspect brake linings.					X
Replace engine air cleaner filter.					X
Replace make-up air filter.					X
Replace spark plugs.					X
Inspect PCV valve, replace as necessary.					X
Inspect auto tension drive belt and replace if required.					X

Kilometers (Miles)	149 000 (93,000)	154 000 (96,000)	158 000 (99,000)	160 000 (100,000)	163 000 (102,000)
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X		X
Rotate tires.		X			X
Check spare tire for proper pressure and correct stowage.		X			X
Flush and replace engine coolant, if not done at 60 months.					X

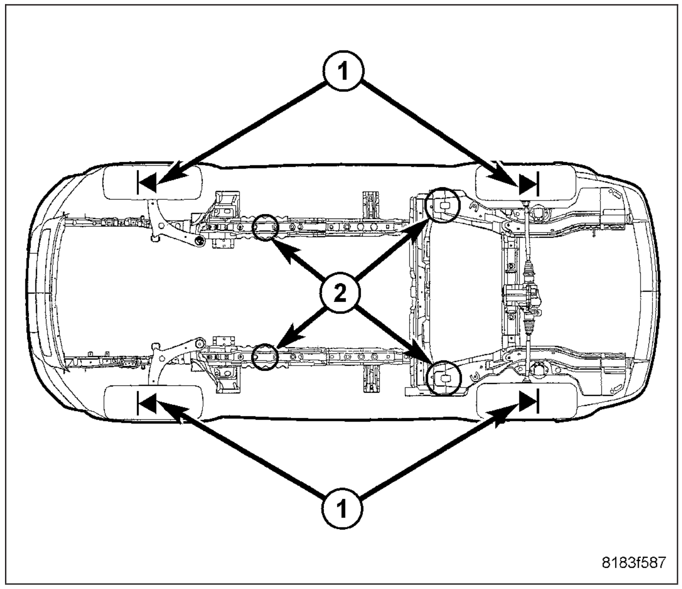
Kilometers (Miles)	168 000 (105,000)	173 000 (108,000)	178 000 (111,000)	182 000 (114,000)	187 000 (117,000)	192 000 (120,000)
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X	X
Change Automatic Transaxle (CVT) fluid and filter.						X
Rotate tires.		X		X		X
Check spare tire for proper pressure and correct stowage.		X		X		X
Inspect brake linings.		X				
Replace engine air cleaner filter.	X					X
Inspect and replace make-up air filter, if required.	X					
Replace make-up air filter.						X
Replace spark plugs.						X
Inspect PCV valve, replace as necessary.						X
Inspect auto tension drive belt and replace if required.	X					X

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

WARNING:
You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

HOISTING

STANDARD PROCEDURE - HOISTING



Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

WARNING: The hoisting and jack lifting points provided are for a complete vehicle. When the engine or rear suspension is removed from a vehicle, the center of gravity is altered making some hoisting conditions unstable. Properly support or secure vehicle to hoisting device when these conditions exist.

CAUTION: Do not position hoisting device on suspension components, damage to vehicle can result. Do not attempt to raise one entire side of the vehicle by placing a floor jack midway between the front and rear wheels. This practice may result in permanent damage to the body.

When properly positioned, a floor jack can be used to lift the vehicle and support the raised vehicle with jack stands.

A floor jack or any lifting device, must never be used on any part of the underbody other then the described areas.

1 - DRIVE ON LIFT
2 - FRAME CONTACT LIFT (SINGLE POST)
2 - CHASSIS LIFT (DUAL POST)
2 - OUTBOARD LIFT (DUAL LIFT)
2 - FLOOR JACK

JUMP STARTING

STANDARD PROCEDURE - JUMP STARTING

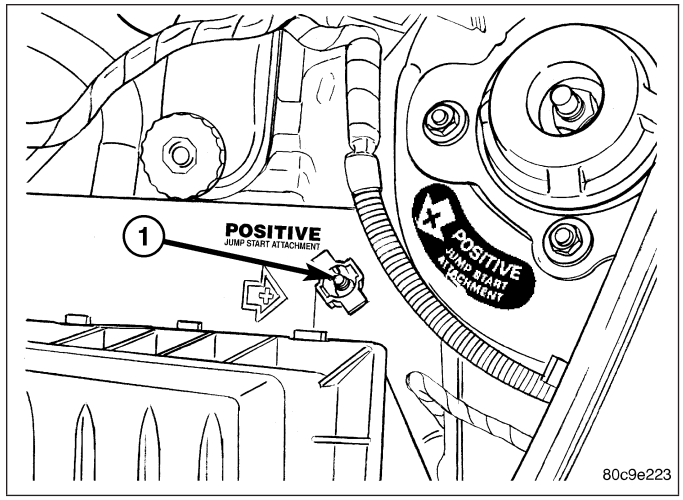
WARNING: Review all safety precautions and warnings in battery/starting/charging sections. Do not jump start a frozen battery, personal injury can result. Do not jump start when maintenance free battery indicator dot is yellow or bright color. Do not jump start a vehicle when the battery fluid is below the top of lead plates. Do not allow jumper cable clamps to touch each other when connected to a booster source. Do not use open flame near battery. Remove metallic jewelry worn on hands or wrists to avoid injury by accidental arcing of battery current. When using a high output boosting device, do not allow battery voltage to exceed 16 volts. Refer to instructions provided with device being used.

CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

TO JUMP START A DISABLED VEHICLE:

1. Raise hood on disabled vehicle and visually inspect engine compartment for:
   - Battery cable clamp condition, clean if necessary.
   - Frozen battery.
   - Yellow or white color test indicator, if equipped.
   - Generator drive belt condition and tension.
   - Fuel fumes or leakage, correct if necessary.

CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.



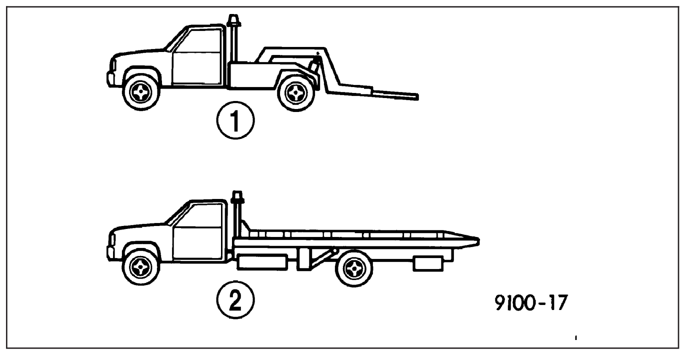
2. When using another vehicle as a booster source, park the booster vehicle within cable reach. Turn off all accessories, set the parking brake, place the automatic transmission in PARK or the manual transmission in NEUTRAL and turn the ignition OFF.
3. On disabled vehicle, place gear selector in park or neutral and set park brake. Turn off all accessories.
4. Connect jumper cables to booster battery. RED clamp to positive terminal (+) or remote terminal. BLACK clamp to negative terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result. Review all warnings in this procedure.
5. On disabled vehicle connect RED jumper cable clamp to positive (+) remote terminal. Connect BLACK jumper cable clamp to engine ground.
   a. Pull the protective sleeve from the remote positive terminal labeled Position Jump Post Attachment.
   b. Connect RED jumper cable clamp to positive (+) remote terminal.
   c. Connect BLACK jumper cable clamp to Negative Jump Post Attachment or engine ground as close to the ground cable attaching point as possible
6. Start the engine in the vehicle which has the booster battery, let the engine idle a few minutes, then start the engine in the vehicle with the discharged battery.

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will overheat and could fail.

7. Allow battery in disabled vehicle to charge to at least 12.4 volts (75% charge) before attempting to start engine. If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 minutes), before cranking again.

DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp from engine ground on disabled vehicle.
- Disconnect RED cable clamp from battery positive remote terminal.



TOWING

STANDARD PROCEDURE - TOWING

WARNING: Do not allow towing attachment devices to contact the fuel tank or lines, fuel leak can result. Do not lift or tow vehicle by front or rear bumper, or bumper energy absorber units. Do not venture under a lifted vehicle if not supported properly on safety stands. Do not allow passengers to ride in a towed vehicle. Use a safety chain that is independent from the towing attachment device.

CAUTION: Do not damage brake lines, exhaust system, shock absorbers, sway bars, or any other under vehicle components when attaching towing device to vehicle. Do not attach towing device to front or rear suspension components. Do not secure vehicle to towing device by the use of front or rear suspension or steering components. Remove or secure loose or protruding objects from a damaged vehicle before towing. Refer to state and local rules and regulations before towing a vehicle. Do not allow weight of towed vehicle to bear on lower fascia, air dams, or spoilers.

To avoid damage to bumper fascia and air dams use of a wheel lift or flat bed towing device is recommended. When using a wheel lift towing device, be sure the unlifted end of disabled vehicle has at least 100 mm (4 in.) ground clearance. If minimum ground clearance cannot be reached, use a towing dolly. If a flat bed device is used, the approach angle should not exceed 15 degrees.

SUSPENSION

TABLE OF CONTENTS

FRONT SUSPENSION

TABLE OF CONTENTS

FRONT SUSPENSION

DESCRIPTION

This vehicle has a gas pressurized MacPherson strut type front suspension design.

Each side of the front suspension consists of these major components:

- Hub (pressed into Bearing)
- Bearing (pressed into Knuckle)
- Knuckle
- Lower Control Arm
- Stabilizer Bar
- Strut Assembly

The front suspension also includes a crossmember to support the lower half of the suspension. Service procedures for the front suspension crossmember can be found in the Frame & Bumpers Group.

WARNING

WARNINGS AND CAUTIONS

WARNING: Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from production or aftermarket linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not sand, or grind brake lining unless equipment used is designed to contain the dust residue. Do not clean brake parts with compressed air or by dry brushing. Cleaning should be done by dampening the brake components with a fine mist of water, then wiping the brake components clean with a dampened cloth. Dispose of cloth and all residue containing asbestos fibers in an impermeable container with the appropriate label. Follow practices prescribed by the Occupational Safety And Health Administration (OSHA) and the Environmental Protection Agency (EPA) for the handling, processing, and disposition of dust or debris that may contain asbestos fibers.

WARNING: Do not remove the strut shaft nut while strut assembly is installed in vehicle, or before the coil spring is compressed with a compression tool. The spring is held under high pressure.

CAUTION: Only frame contact hoisting equipment can be used on this vehicle. It cannot be hoisted using equipment designed to lift a vehicle by the rear axle. If this type of hoisting equipment is used, damage to rear suspension components will occur.

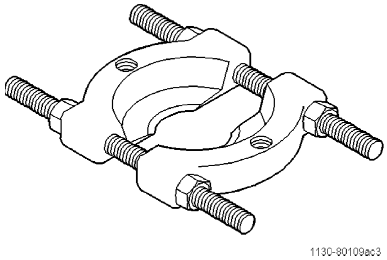
CAUTION: At no time when servicing a vehicle can a sheet metal screw, bolt, or other metal fastener be installed in the shock tower to take the place of an original plastic clip. It may come into contact with the strut or coil spring.

CAUTION: Wheel bearing damage will result if after loosening the hub nut, the vehicle is rolled on the ground or the weight of the vehicle is allowed to be supported by the tires for a length of time.

STANDARD PROCEDURE

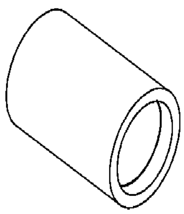
LUBRICATION

There are no serviceable lubrication points on the front suspension. The ball joints and tie rod ends are sealed for life and require no maintenance.



SPECIFICATIONS

FRONT SUSPENSION FASTENER TORQUE



DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Hub Nut	245	181	—
Lower Ball Joint Stud Pinch Bolt	82	60	—
Lower Control Arm Front Pivot Bolt	183	135	—

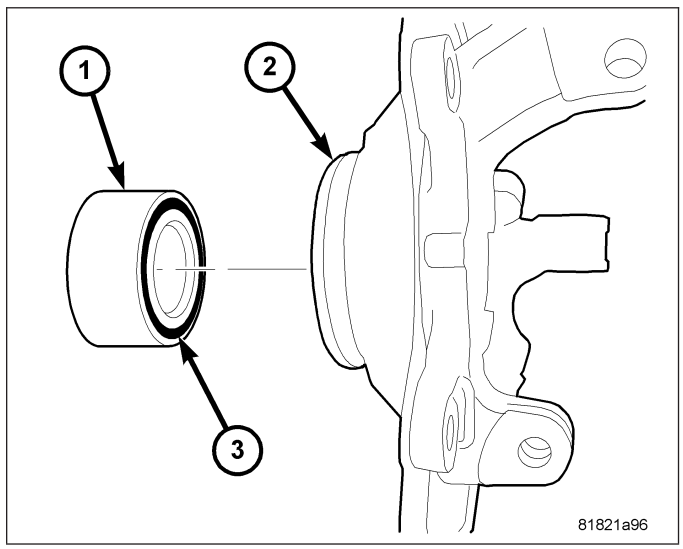
HUB / BEARING



DESCRIPTION

The wheel bearing (5) and hub (3) are pressed into the knuckle (1). The wheel bearing is secured in place using a snap ring.

One side of the wheel bearing has an integrated magnetic encoder ring for wheel speed sensor usage as equipped. It is important that the wheel speed sensor magnetic encoder ring (dark band) (3) be positioned to the inside of the knuckle or the wheel speed sensor will not operate correctly.

The wheel bearing is a Unit 1 type cartridge bearing that requires no maintenance. The wheel bearing can be serviced separately from the hub.

The hub supports the driveline halfshaft outer constant velocity (C/V) joint. Each is splined and meshes in the center of the hub. The outer C/V joint is retained to the hub using a nut. The nut is locked to the outer C/V stub shaft using a cotter pin.

The hub has five studs pressed into its flange.

DIAGNOSIS AND TESTING

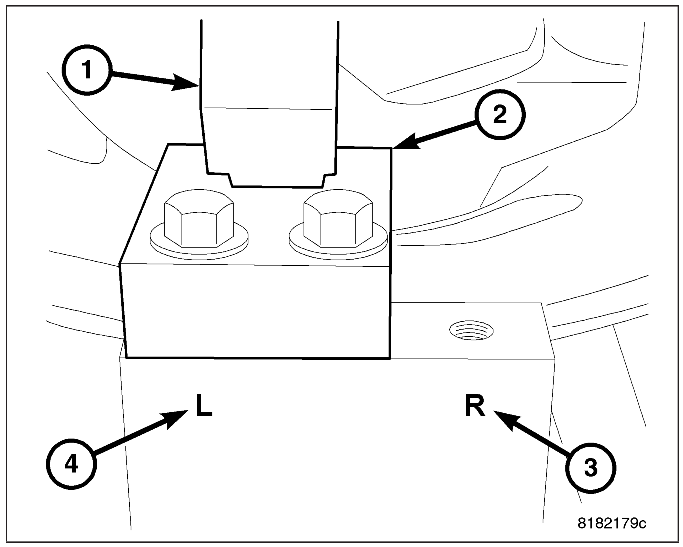
WHEEL BEARING AND HUB

NOTE: The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.

The following procedure may be used for diagnosing the condition of the wheel bearing and hub.

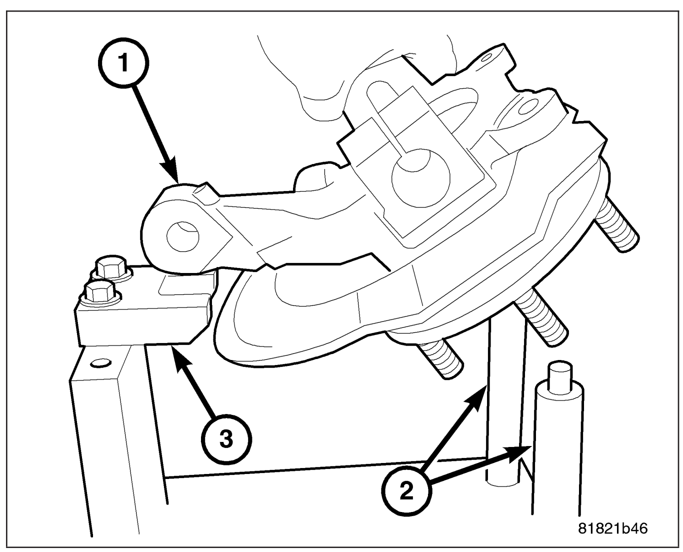
1. Remove the wheel and tire assembly, disc brake caliper and brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL)
2. Rotate the wheel hub checking for resistance or roughness.

Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub bearing will require replacement. Do not attempt to disassemble the bearing for repair. If the wheel bearing is disassembled for any reason, it must be replaced.



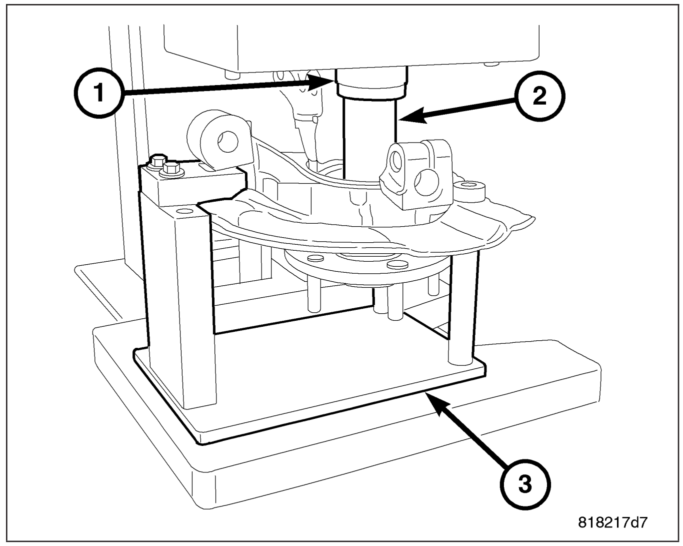
Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease weeping from the bearing is considered normal and should not require replacement of the wheel bearing.

To diagnose a bent hub, measure hub runout. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING)

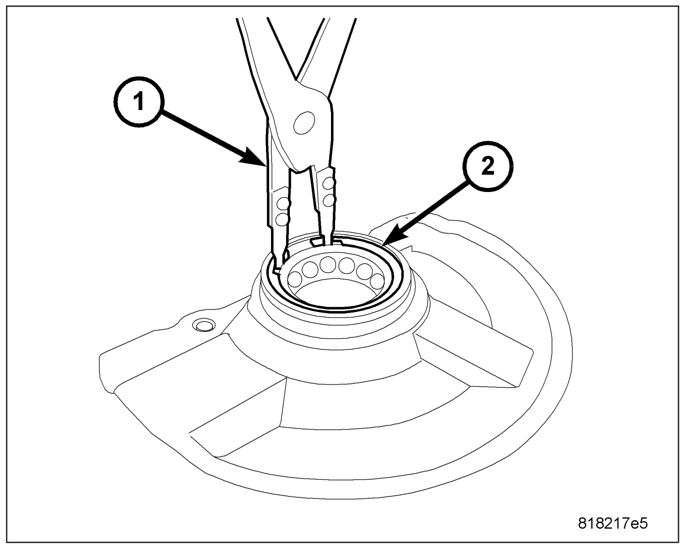


REMOVAL

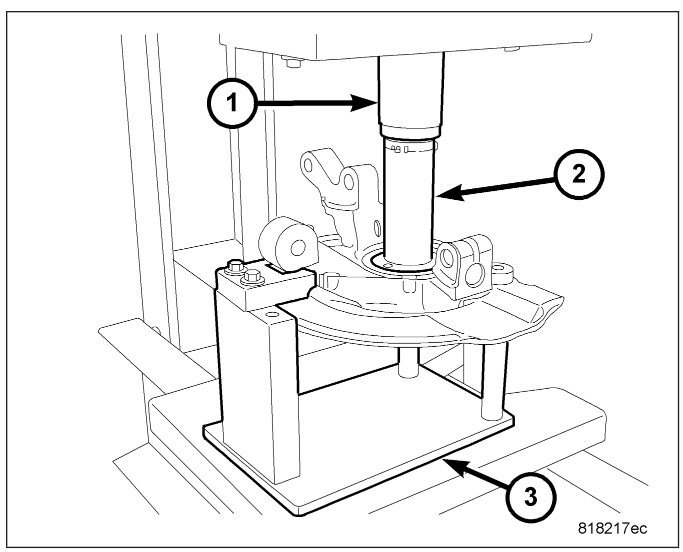
NOTE: The removal and installation of the wheel bearing and hub from the knuckle is only to be done with the knuckle removed from the vehicle.



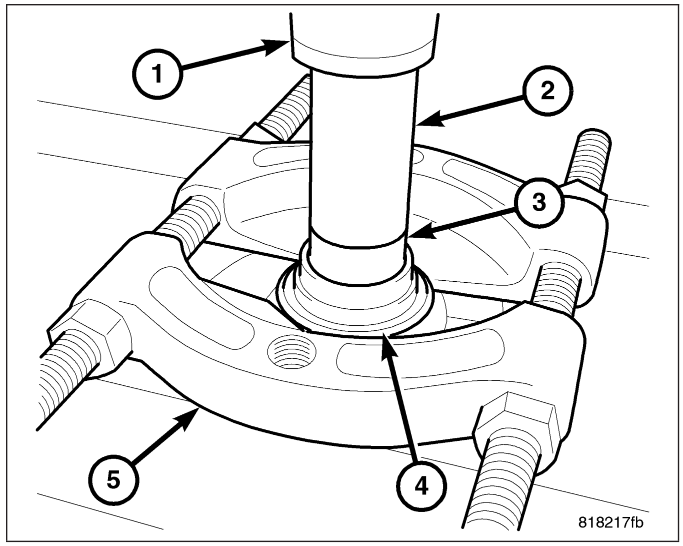
1. Remove the steering knuckle from the vehicle. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL)
2. Position the locator block (2) for Fixture, Special Tool 9712, as follows:
   a. For left side knuckles, place the locator block (2) to the left side (4) on the Fixture. The side of the locator block with the angle cut goes downward, toward the Fixture. Install the mounting screws and tighten them to approximately 54 N·m (40 ft. lbs.).
   b. For right side knuckles, place the locator block (2) to the right side (3) on the Fixture. The side of the locator block with the angle cut goes downward, toward the Fixture. Install the mounting screws and tighten them to approximately 54 N·m (40 ft. lbs.).



3. Install the knuckle in the Fixture as shown, guiding the steering arm (1) to rest on the locator block (3) and the brake caliper mounting bosses on the two Fixture pins (2).

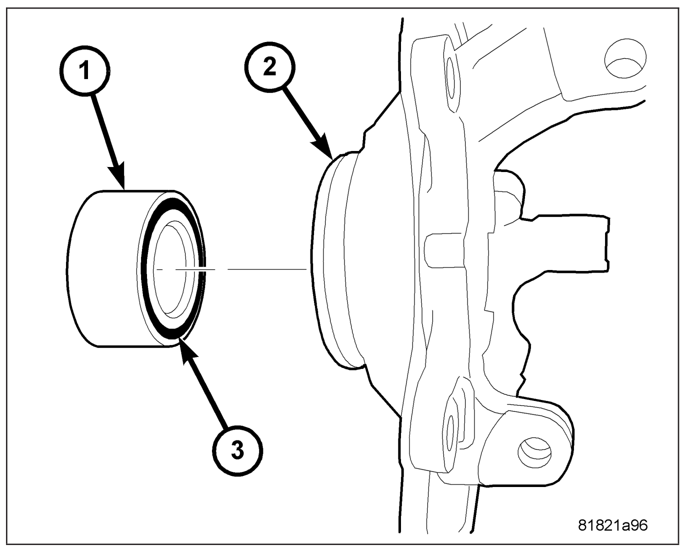


4. Place the Fixture (3) with knuckle in an arbor press.
5. Position Remover/Installer, Special Tool 9712-2 (2), in the small end of the hub. Lower the arbor press ram (1) and remove the hub from the wheel bearing and knuckle. The bearing race will normally come out of the wheel bearing with the hub as it is pressed out of the bearing.



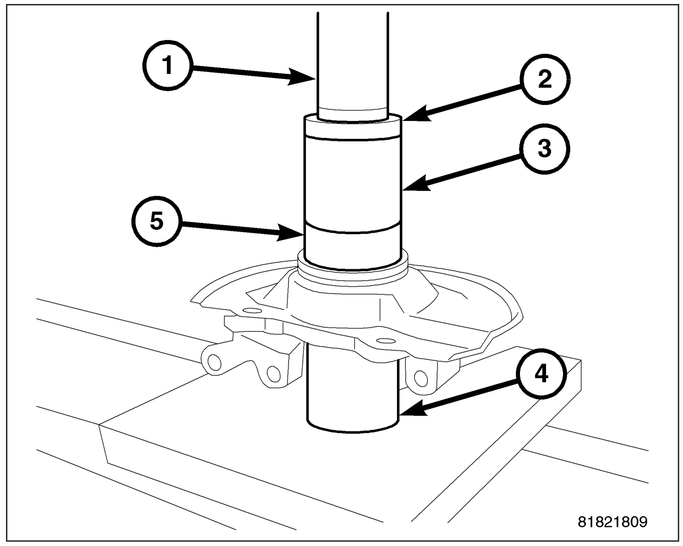
6. Remove the knuckle from the Fixture and turn it over.
7. Remove the snap ring (2) from the knuckle using an appropriate pair of snap ring pliers (1).

8. Place the knuckle back in the Fixture (3) in the arbor press ram.
9. Place Installer (2), Special Tool MD-998334, on the outer race of the wheel bearing. Lower the arbor press ram (1) and remove the wheel bearing from the knuckle.
10. Remove the knuckle and tools from arbor press.



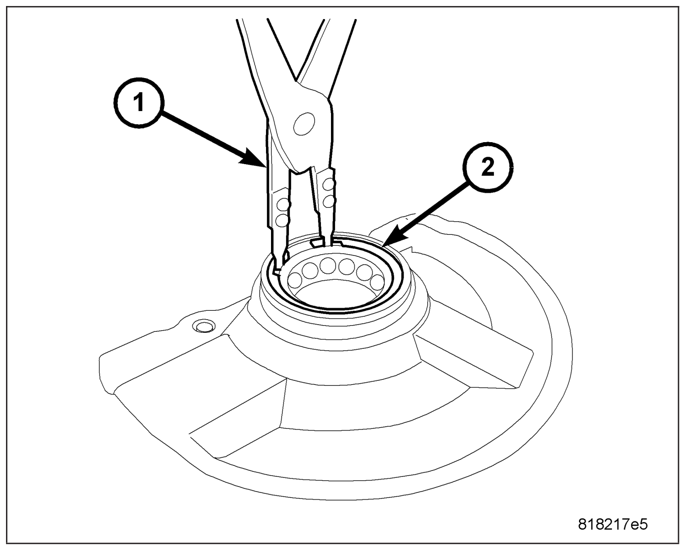
11. If the bearing race is still pressed onto the hub, install the Bearing Splitter (5), Special Tool 1130, between the hub flange and the bearing inner race (4).
12. Place the hub, bearing race and Bearing Splitter in an arbor press. The press support blocks must not obstruct the wheel hub while it is being pressed out of the bearing race.
13. Place Remover/Installer (2), Special Tool 9712-2, in the end of the hub (3). Lower the arbor press ram (1) and remove the hub from the bearing race.

NOTE: For installation, (Refer to 2 - SUSPENSION/FRONT/HUB / BEARING - INSTALLATION).

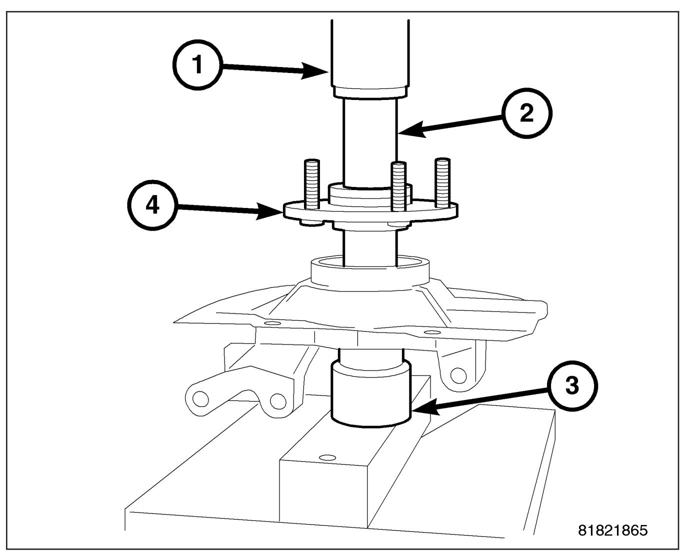


INSTALLATION

CAUTION: When installing the wheel bearing (1) in the knuckle (2) it is important to place the side of bearing with the wheel speed sensor magnetic encoder ring (dark band) (3) in the knuckle first. Otherwise, the wheel speed sensor will not operate correctly.



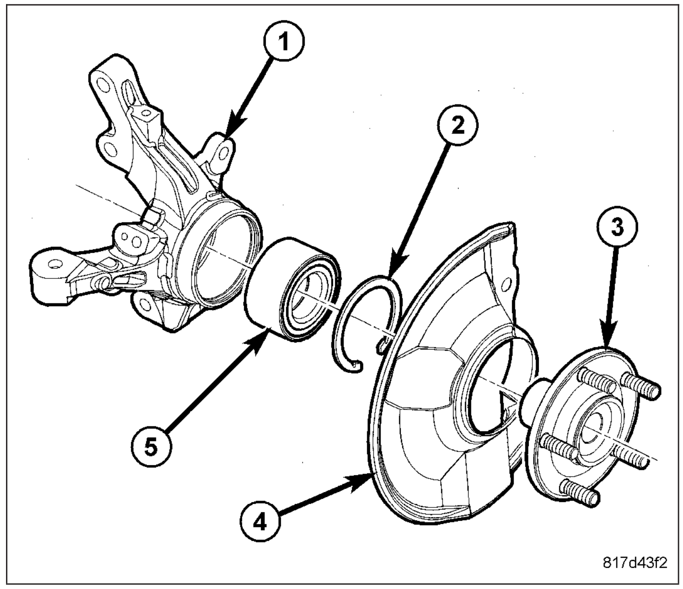
1. Wipe the bearing bore of the knuckle clean of any grease or dirt with a clean, dry shop towel.



2. Place the knuckle in an arbor press supporting the knuckle from underneath using Cup (4), Special Tool 6310-1.
3. Place the NEW wheel bearing (5) magnetic encoder ring side down (see above Caution) into the bore of the knuckle. Be sure the wheel bearing is placed squarely into the bore.
4. Place Receiver (3), Special Tool 8498, larger inside diameter end down over the outer race of the wheel bearing.
5. Place Disc (2), Special Tool 6310-2, into top of Receiver 8498. Lower the arbor press ram (1) and press the wheel bearing into the knuckle until it is bottomed in the bore of the knuckle.
6. Remove the knuckle and tools from the arbor press.

7. Install a NEW snap ring (2) in the knuckle using an appropriate pair of snap ring pliers (1). Make sure the snap ring is fully seated.

8. Place the knuckle in an arbor press. Support the knuckle from underneath using Remover/Installer (3), Special Tool MB-990799, smaller end up against the wheel bearing inner race.
9. Place the hub (4) in the wheel bearing making sure it is square with the bearing inner race.
10. Position Remover/Installer, Special Tool 9712-2 (2), in the end of the hub. Lower the arbor press ram (1) and press the hub into the wheel bearing until it bottoms.
11. Remove the knuckle and tools from the press.



12. Verify the hub turns smoothly without rubbing or binding.
13. Install the knuckle on the vehicle. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - INSTALLATION)

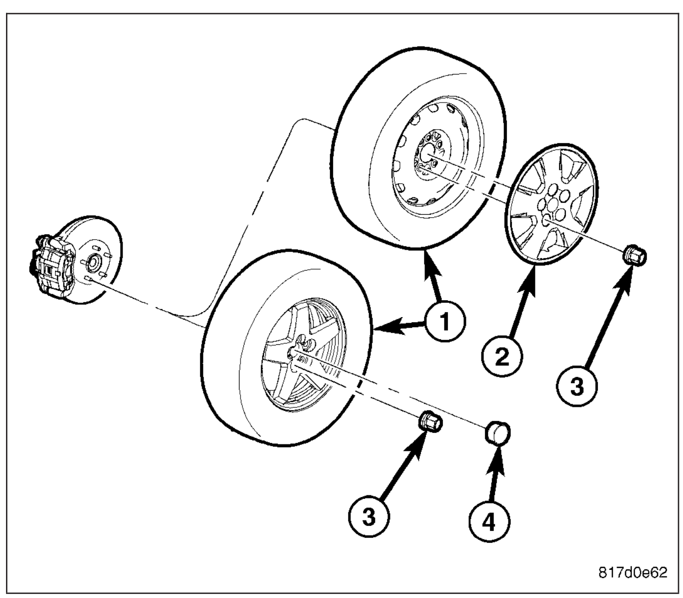
KNUCKLE

DESCRIPTION

The knuckle (1) is a single casting with legs machined for attachment to the front strut assembly on the top, lower control arm ball joint on the bottom, and steering linkage on the trailing end. The knuckle also has two machined, drilled and tapped legs on the leading end casting to support and align the front disc brake caliper adapter.

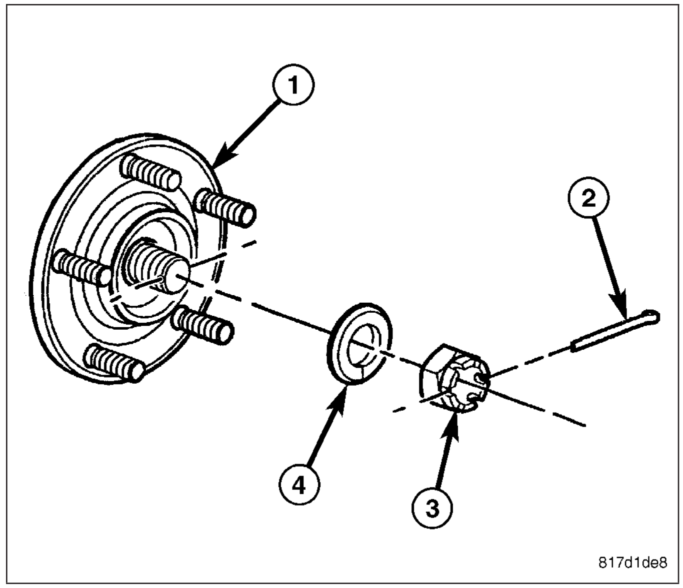
The knuckle supports the wheel bearing (5) and hub (3). The hub is pressed into a sealed-for-life wheel bearing that is pressed into the knuckle. A snap ring also holds the bearing in place. A shield is pressed onto the knuckle behind the hub.

DIAGNOSIS AND TESTING



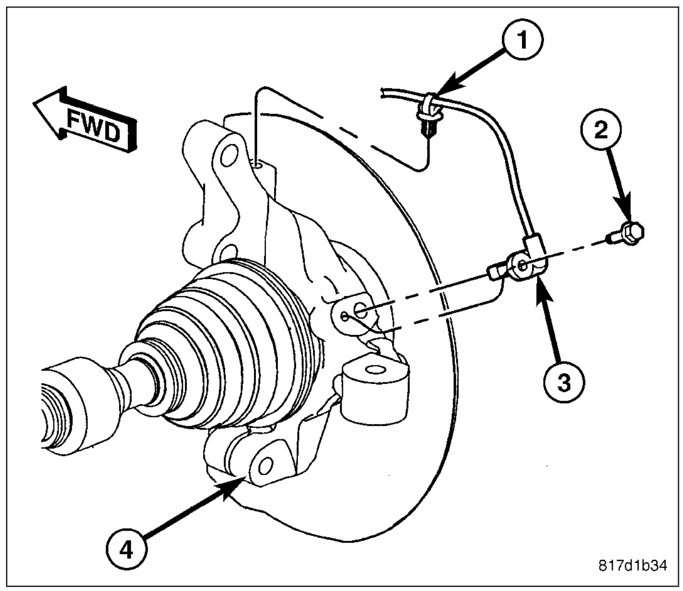
KNUCKLE

The front suspension knuckle is not a repairable component of the front suspension. It must be replaced if found to be damaged in any way. If it is determined that the knuckle is bent when servicing the vehicle, no attempt is to be made to straighten the knuckle.

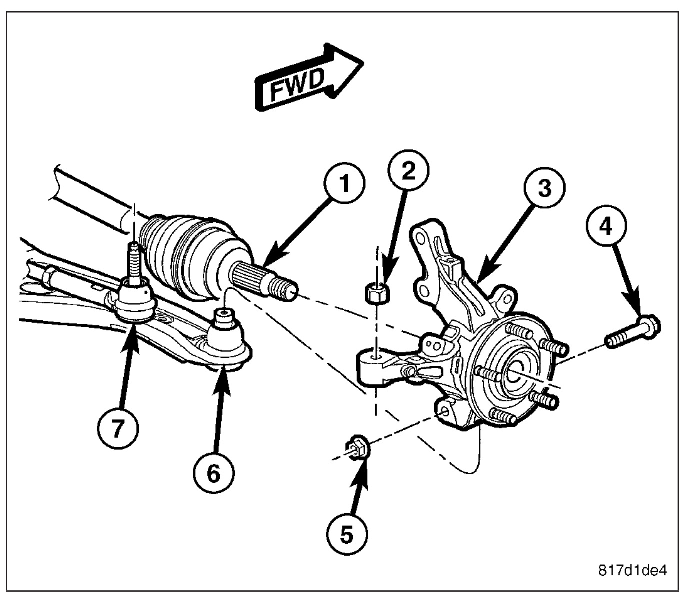


REMOVAL

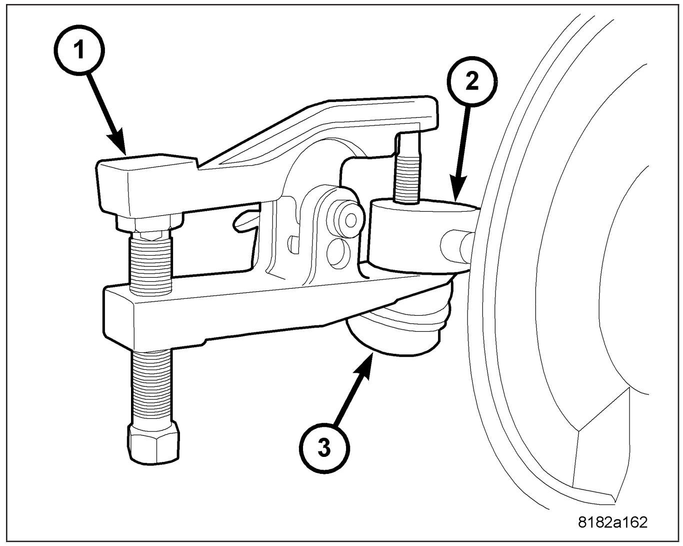
NOTE: Before proceeding, review all Warnings and Cautions. (Refer to 2 - SUSPENSION/FRONT - WARNING)



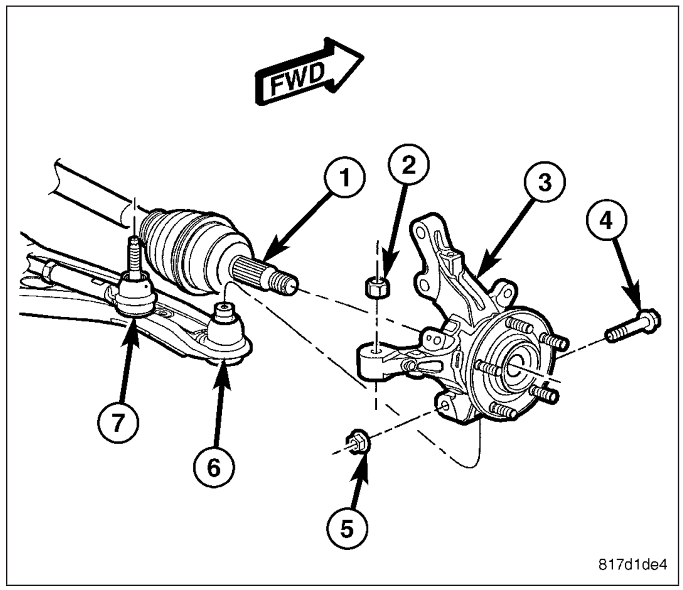
1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).



3. Remove the cotter pin (2) from the hub nut (3).
4. While a helper applies the brakes to keep the hub (1) from rotating, remove the hub nut (3) and washer (4) from the axle half shaft.
5. Access and remove the front brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - REMOVAL)

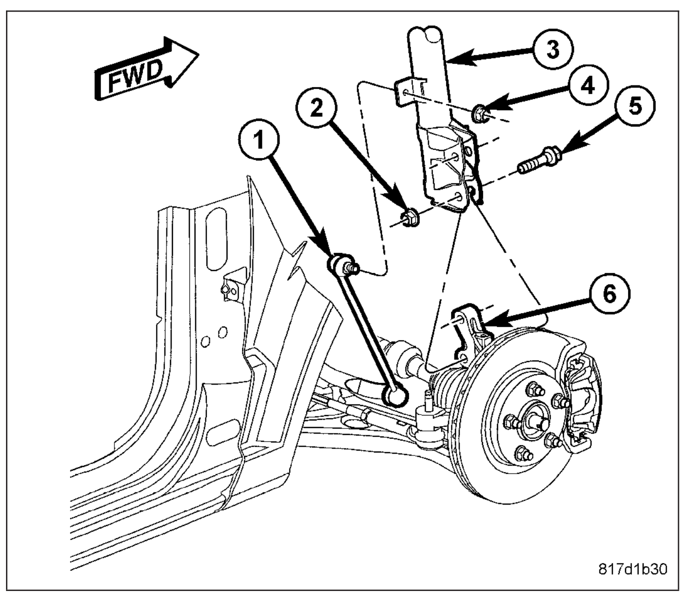


6. Remove the routing clip (1) securing wheel speed sensor cable to the knuckle (4).
7. Remove the screw (2) fastening the wheel speed sensor head (3) to the knuckle (4). Pull the sensor head out of the knuckle.

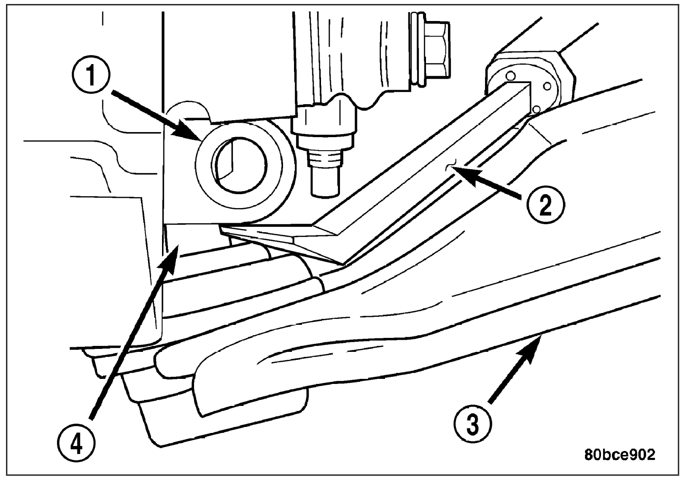


8. Remove the nut (2) attaching the outer tie rod (7) to the knuckle (3). To do this, hold the tie rod end stud with a wrench while loosening and removing the nut with a standard wrench or crowfoot wrench.

9. Release the outer tie rod end (3) from the knuckle (2) using Remover (1), Special Tool 9360.
10. Remove the outer tie rod from the knuckle.

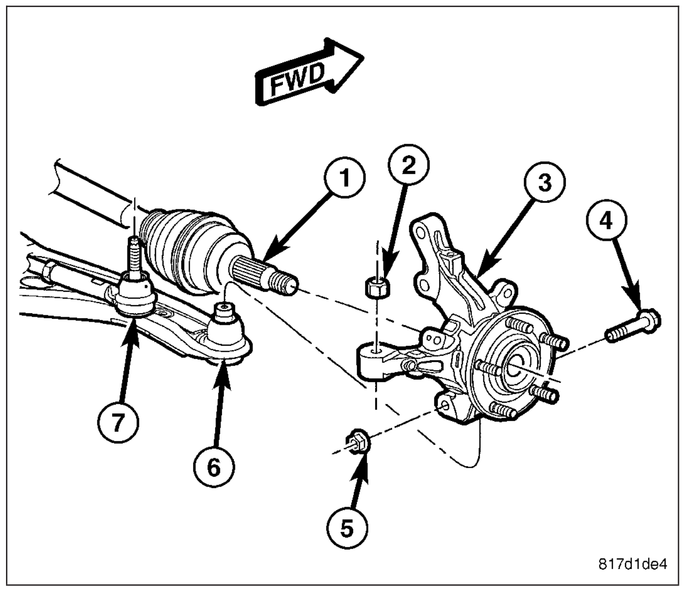


11. Remove the nut (5) and pinch bolt (4) clamping the ball joint stud (6) to the knuckle (3).



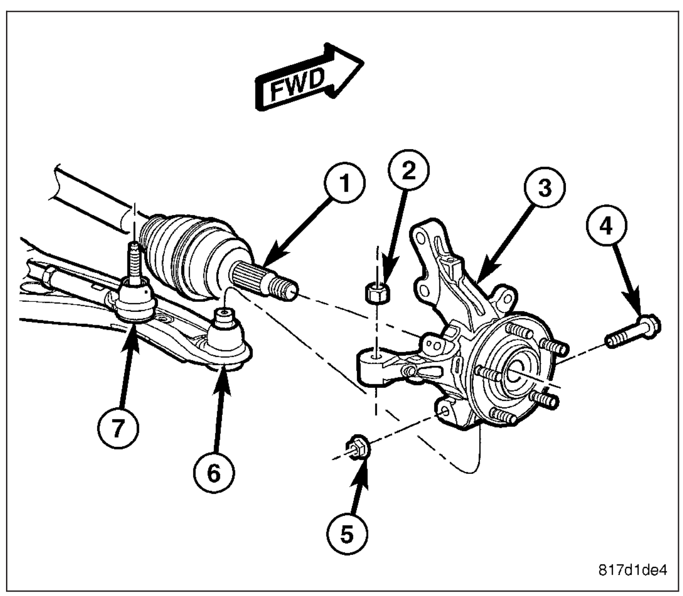
CAUTION: The strut assembly-to-knuckle attaching bolts (5) are serrated and must not be turned during removal. Proper removal is required. Refer to the following steps for the correct method.

12. While holding the bolt heads stationary, remove the two nuts (2) from the bolts (5) attaching the strut (3) to the knuckle (6).
13. Remove the two bolts (5) attaching the strut (3) to the knuckle (6) using a pin punch.



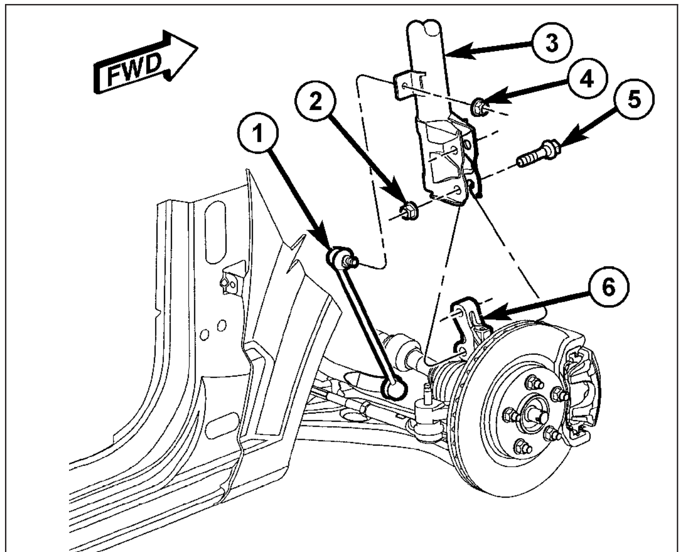
CAUTION: Use care when separating the ball joint stud (4) from the knuckle (1), so the ball joint seal does not get cut.

14. Using an appropriate prying tool (2), separate the ball joint stud (4) from the knuckle (1) by prying down on lower control arm (3) and up against the ball joint boss on the knuckle.



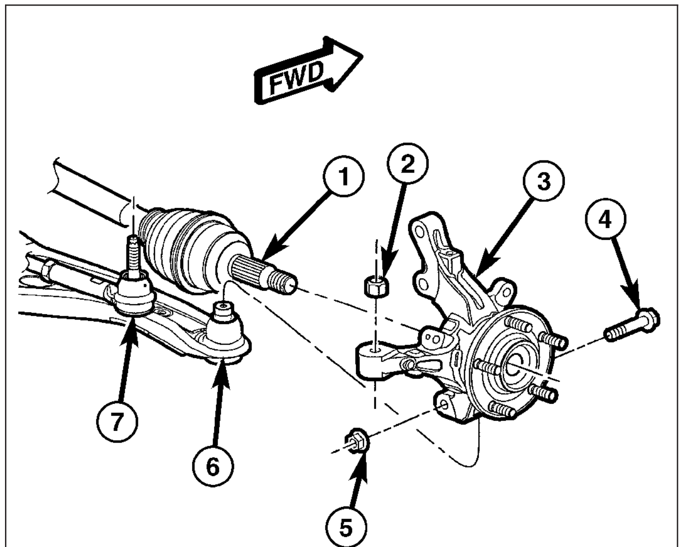
NOTE: Do not allow the half shaft (1) to hang by the inner C/V joint; it must be supported to keep the joint from separating during this operation.

15. Pull the knuckle (3) off the half shaft (1) outer C/V joint splines and remove the knuckle from the vehicle.

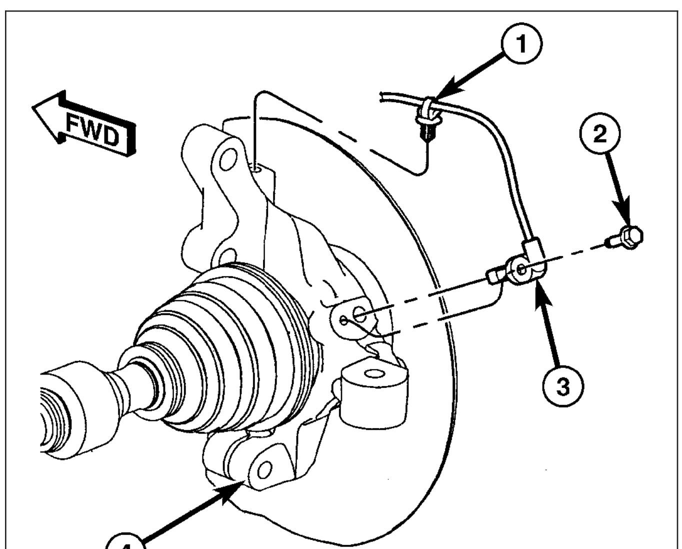


INSTALLATION

1. Slide the hub of the knuckle (3) onto the splines of the halfshaft outer C/V joint (1).
2. Install the knuckle (3) onto the ball joint (6) stud aligning the bolt hole in the knuckle boss with the groove formed into the side of the ball joint stud.
3. Install a NEW ball joint stud pinch bolt (4) and nut (5). Tighten the nut to 82 N·m (60 ft. lbs.).



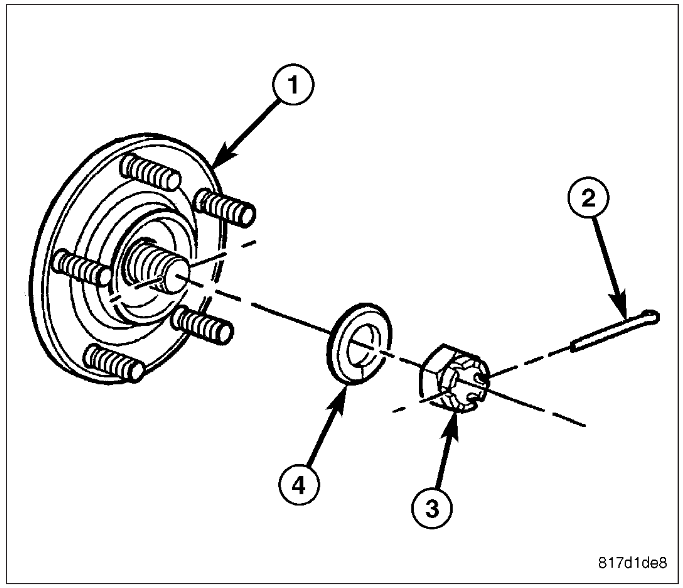
CAUTION: The strut assembly-to-knuckle attaching bolts (2) are serrated and must not be turned during installation. Install the nuts while holding the bolts stationary in the steering knuckle. Refer to the following step.



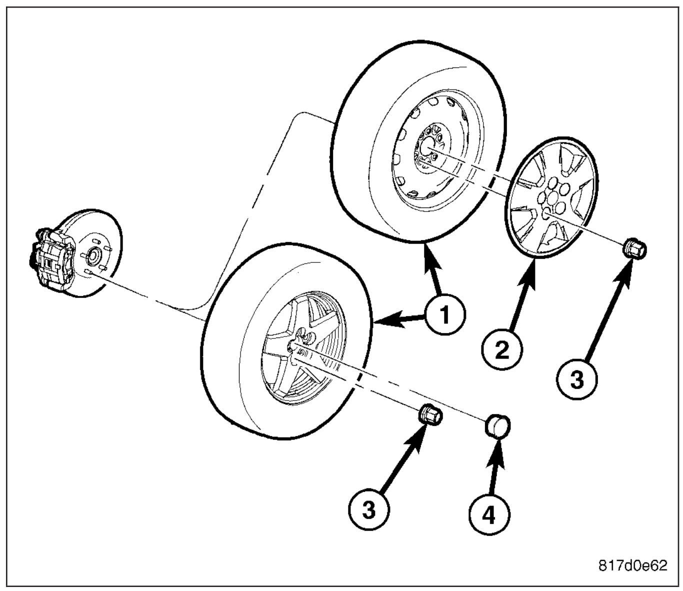
817d1b30

4. Position the lower end of the strut assembly (3) in line with the upper end of the knuckle (6), aligning the mounting holes. Install the two mounting bolts (5).
5. Install the nuts (2) on the two bolts (5). While holding the bolts in place, tighten the nuts to 84 N·m (62 ft. lbs.).

817d1de4



6. Install the outer tie rod (7) ball stud into the hole in the knuckle (3) arm. Start the tie rod mounting nut (2) onto the stud. While holding the tie rod end stud with a wrench, tighten the nut with a wrench or crowfoot wrench to 102 N·m (75 ft. lbs.).

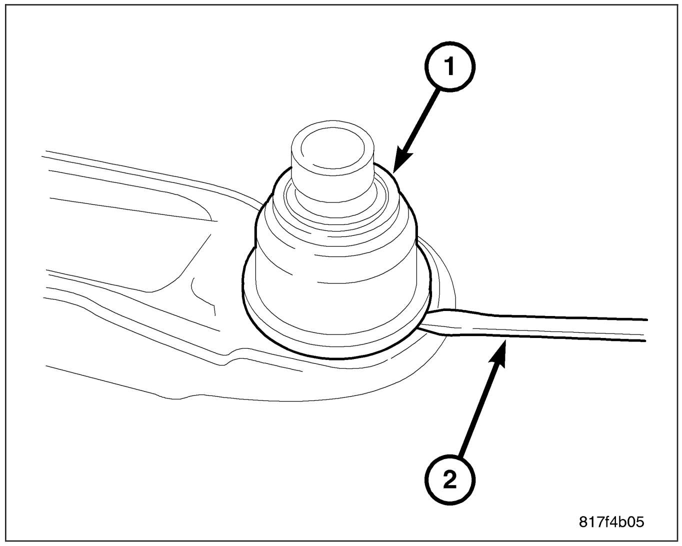


817d1b34

7. Install the wheel speed sensor head (3) into the knuckle (4). Install the mounting screw (2) and tighten it to 12 N·m (106 in. lbs.).
8. Install the routing clip (1) securing the wheel speed sensor cable to the knuckle (4).
9. Install the brake rotor, disc brake caliper and adapter. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - INSTALLATION)

10. Clean all foreign matter from the threads of the halfshaft outer C/V joint.
11. Install the washer (4) and hub nut (3) on the end of the halfshaft and snug it.
12. While a helper applies the brakes to keep the hub (1) from rotating, tighten the hub nut (3) to 245 N·m (181 ft. lbs.).
13. Insert the cotter pin (2) through the notches in the nut and the hole in halfshaft. If the notches in the nut do not line up with the hole in the halfshaft, continue to tighten the nut until they do. **Do not loosen the nut.**
14. Wrap the cotter pin (2) ends tightly around the lock nut.

15. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
16. Lower the vehicle.
17. Perform wheel alignment as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

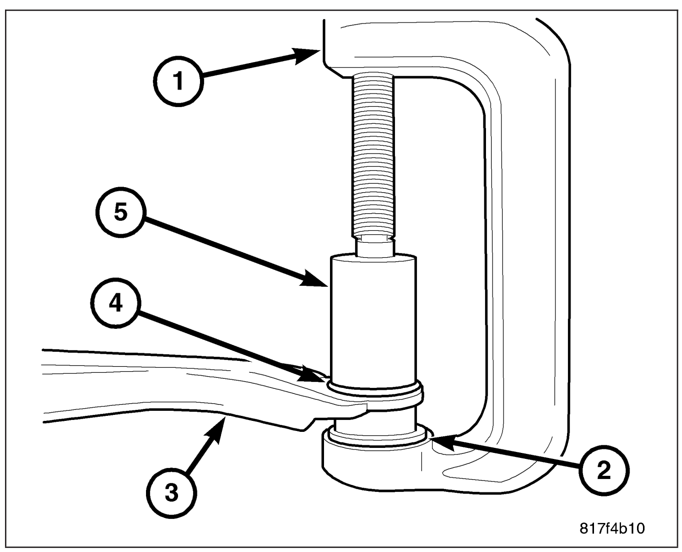


SEAL-LOWER BALL JOINT

REMOVAL

CAUTION: This procedure is designed to be used only if a seal boot is damaged during related service procedures. It is not to be used as a repair procedure for a cut seal boot on a vehicle that has been driven and exposed to road and weather conditions.

1. Remove the lower control arm from the vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL)
2. Using a screwdriver or other suitable tool (2), pry the seal boot (1) off of the ball joint.



INSTALLATION

CAUTION: This procedure is designed to be used only if a seal boot is damaged during related service procedures. It is not to be used as a repair procedure for a cut seal boot on a vehicle that has been driven and exposed to road and weather conditions.

1. Place a liberal dab of Mopar® Multi-Mileage Lube (No more than 10g) or equivalent around the base of the ball joint stud at the socket.
2. Position the ball joint stud straight up.
3. Place the NEW ball joint seal boot over the ball joint stud.
4. By hand, start the seal boot over the sides of the ball joint.

CAUTION: Prior to installing the sealing boot using Remover/Installer, Special Tool 6289-4, make sure there are no burrs on the inside of the tool. Remove any burrs and lubricate with a small amount of Mopar® Multi-Mileage Lube or equivalent.

5. Place Remover/Installer, Special Tool 6289-4, onto the screw-drive of Ball Joint Press, Special Tool C-4212F.
6. Place Remover/Installer, Special Tool 6289-6, angle-cut end up into the cup of Ball Joint Press, Special Tool C-4212F. Before tightening the set, turn the Remover/Installer so that the tallest point of the angle-cut is away from the body of the control arm when installing the seal boot.
7. Place the control arm ball joint into Remover/Installer 6289-6. Rotate the arm left or right until the tallest point of the angle cut on the Remover/Installer is away from the body of the control arm.

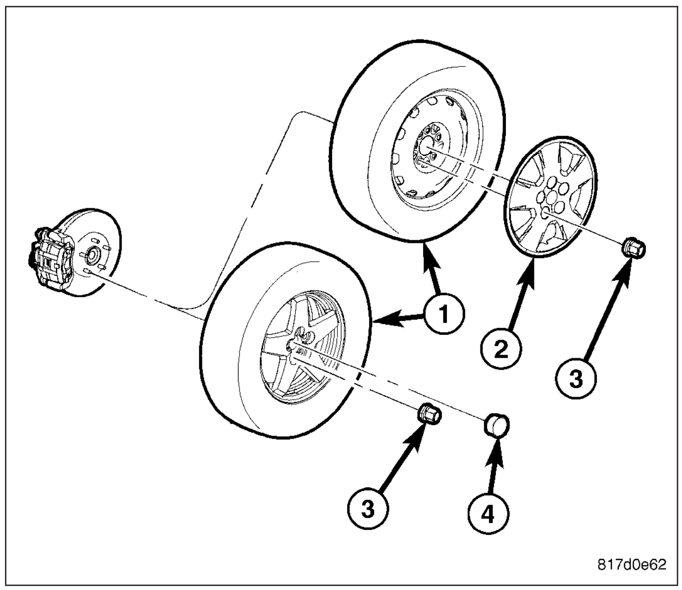
8. Lower Remover/Installer 6289-4 onto outer lip of ball joint seal.
9. By hand, tighten the Ball Joint Press screw-drive installing the seal boot. Tighten the screw-drive until the seal boot is seated squarely down against the top surface of the lower control arm (3). It may be necessary to use a wrench to seat the seal boot, but do not overtighten.
10. Remove the tools and wipe any grease off the ball joint stud using a clean shop towel with Mopar® Brake Parts Cleaner applied to it.
11. Install the lower control arm. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION)

ARM-LOWER CONTROL

DIAGNOSIS AND TESTING

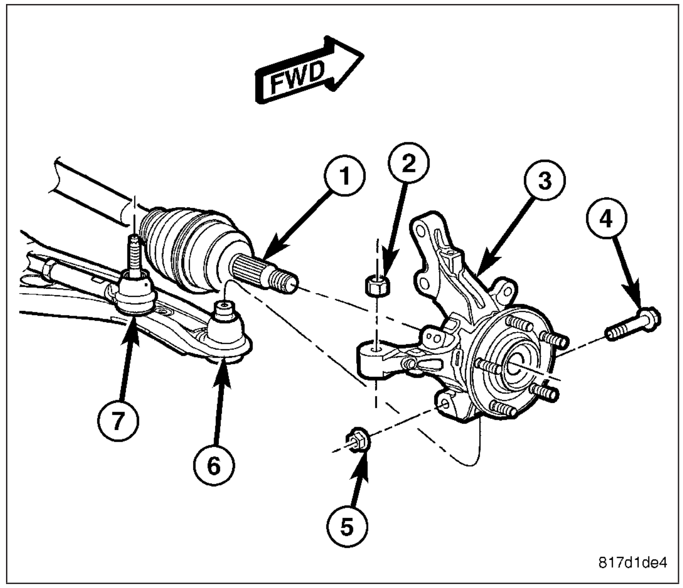
LOWER CONTROL ARM

Inspect the lower control arm for signs of damage from contact with the ground or road debris. If the lower control arm shows any sign of damage, look for distortion. Do not attempt to repair or straighten a broken or bent lower control arm. If damaged, the lower control arm stamping is serviced only as a complete component.



Inspect both lower control arm isolator bushings for severe deterioration and replace the lower control arm as required. Inspect the ball joint per the inspection procedure in this section of the service manual and replace the lower control arm required.

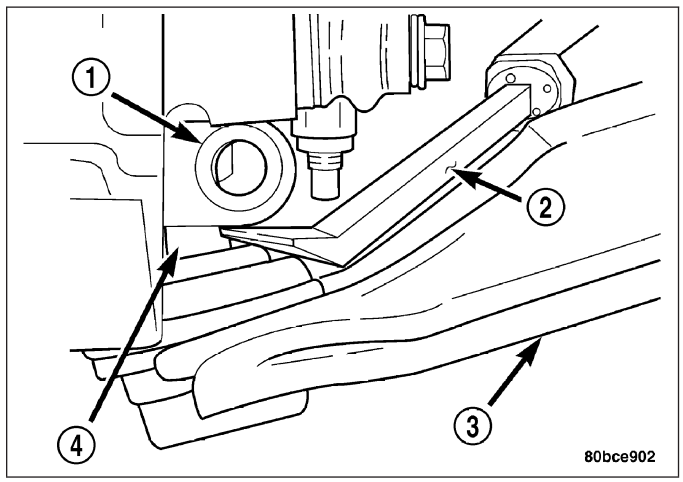
The only serviceable component of the lower control arm is the ball joint seal boot. It should only be replaced if damaged during service of a chassis component. Otherwise, replace the entire control arm.



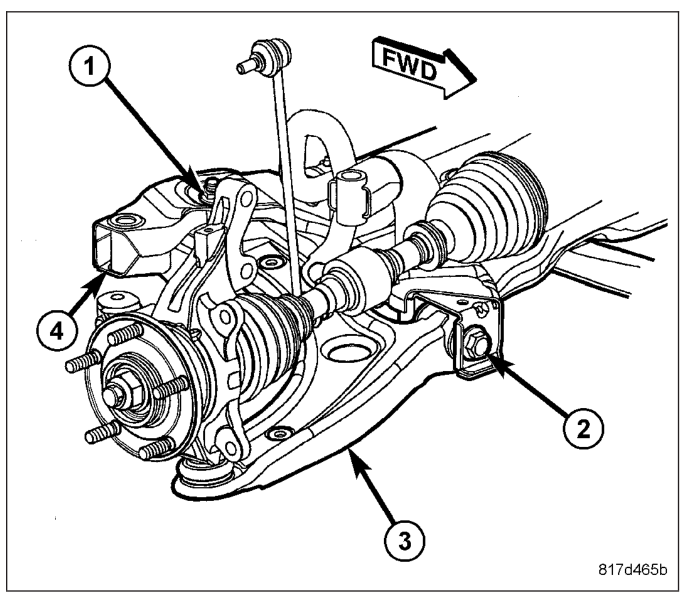
REMOVAL

NOTE: Before proceeding, (Refer to 2 - SUSPENSION/FRONT - WARNING).

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).



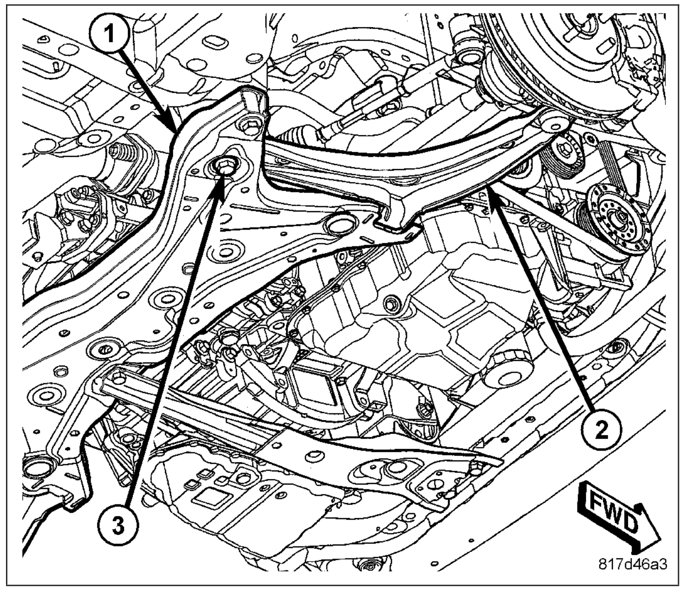
3. Remove the nut (5) and pinch bolt (4) clamping the ball joint (6) stud to the knuckle (3).



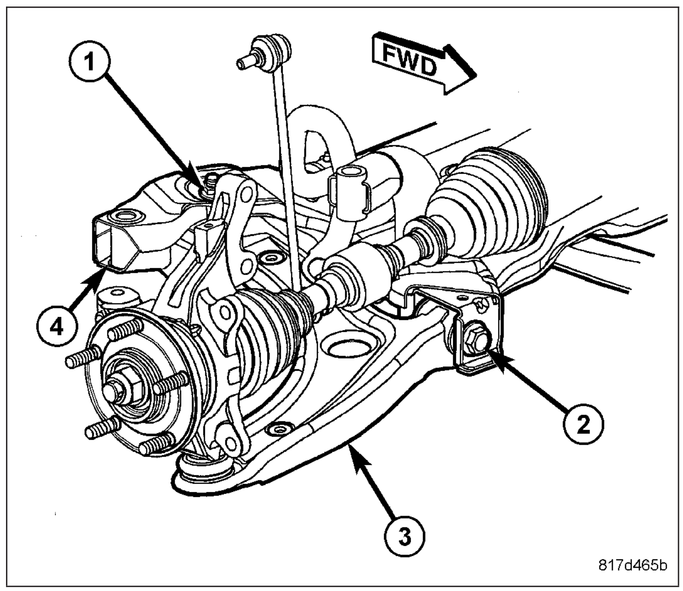
CAUTION: Upon removing the knuckle from the ball joint stud, do not pull outward on the knuckle. Pulling the knuckle outward at this point can separate the inner C/V joint on the halfshaft thus damaging it.

CAUTION: Use care when separating the ball joint stud (4) from the knuckle (1), so the ball joint seal does not get cut.

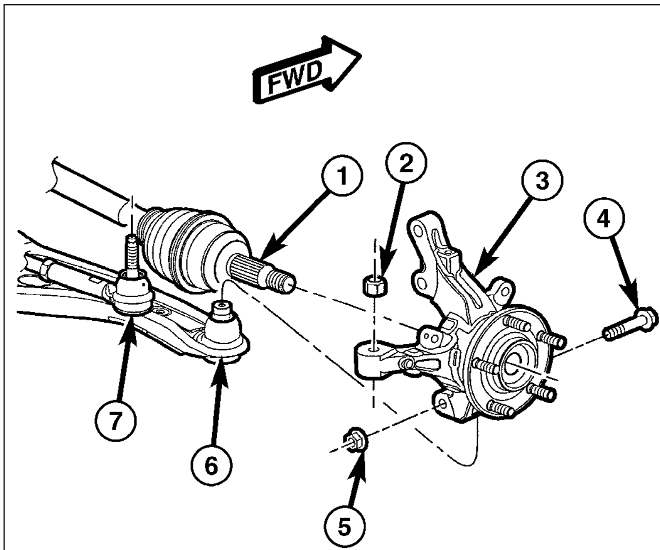
4. Using an appropriate prying tool (2), separate the ball joint stud (4) from the knuckle (1) by prying down on lower control arm (3) and up against the ball joint boss on the knuckle.



5. Remove the front bolt (2) attaching the lower control arm (3) to the front suspension crossmember (4).
6. Remove the nut (1) on the rear bolt attaching the lower control arm (3) to the front suspension crossmember (4). Remove the bolt.
7. Remove the lower control arm (3) from the crossmember (4).

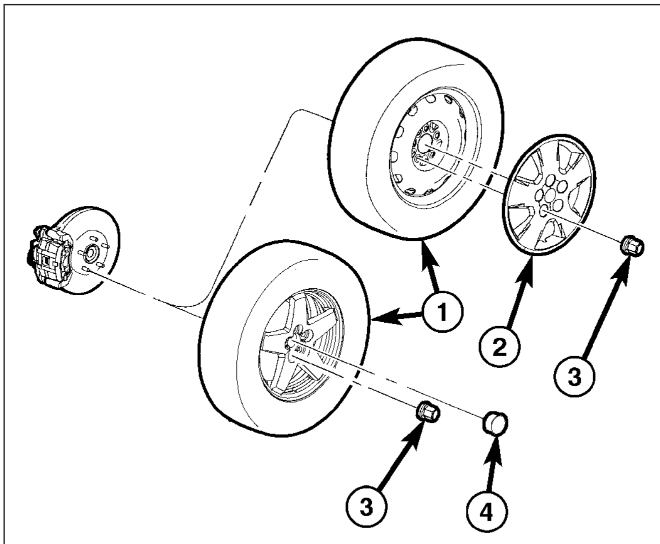


INSTALLATION



1. Place the lower control arm (2) into the front suspension crossmember (1).
2. Insert the rear bolt (3) up through the crossmember (1) and lower control arm (2).

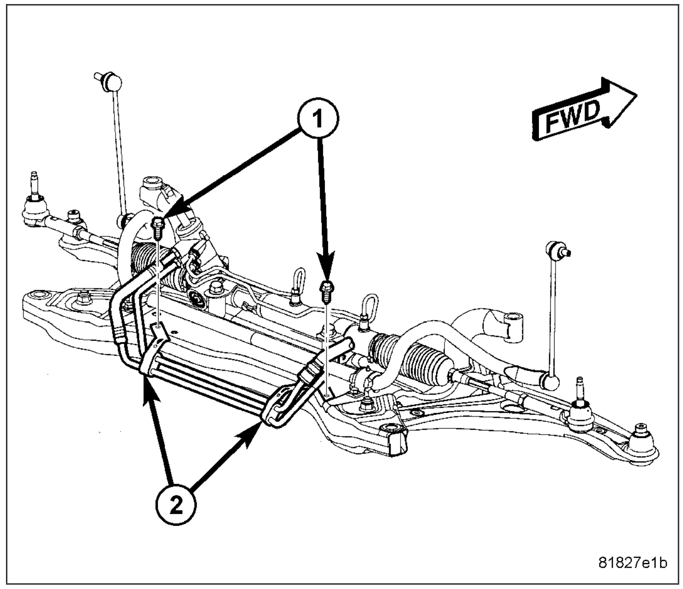
3. Install, but do not fully tighten, the nut (1) on the rear bolt attaching the lower control arm (3) to the crossmember (4).
4. Install, but do not fully tighten, the front bolt (2) attaching the lower control arm to the crossmember.
5. With no weight or obstruction on the lower control arm, tighten the lower control arm rear mounting bolt nut (1) to 183 N·m (135 ft. lbs.).
6. With no weight or obstruction on the lower control arm, tighten the lower control arm front pivot bolt (2) to 183 N·m (135 ft. lbs.).



7. Install the ball joint (6) stud into the knuckle (3), aligning the bolt hole in the knuckle boss with the groove formed in the side of the ball joint stud.
8. Install a NEW ball joint stud pinch bolt (4) and nut (5). Tighten the nut to 82 N·m (60 ft. lbs.).

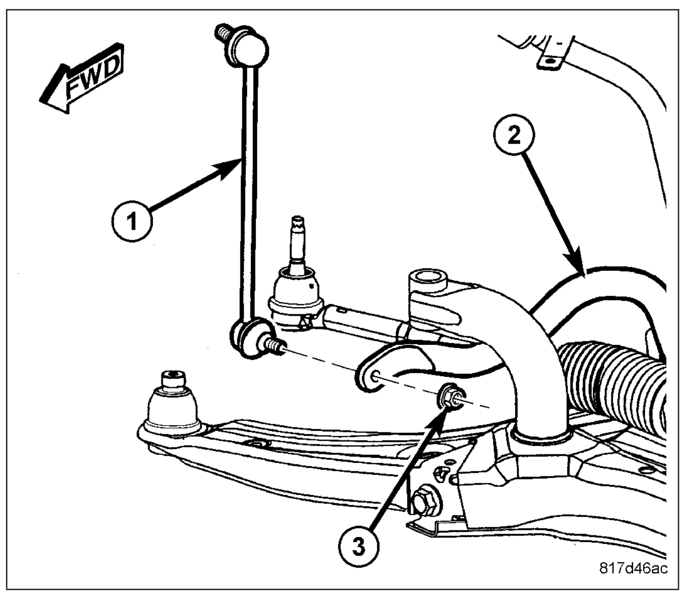
817d1de4

9. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
10. Lower the vehicle.
11. Perform wheel alignment as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)



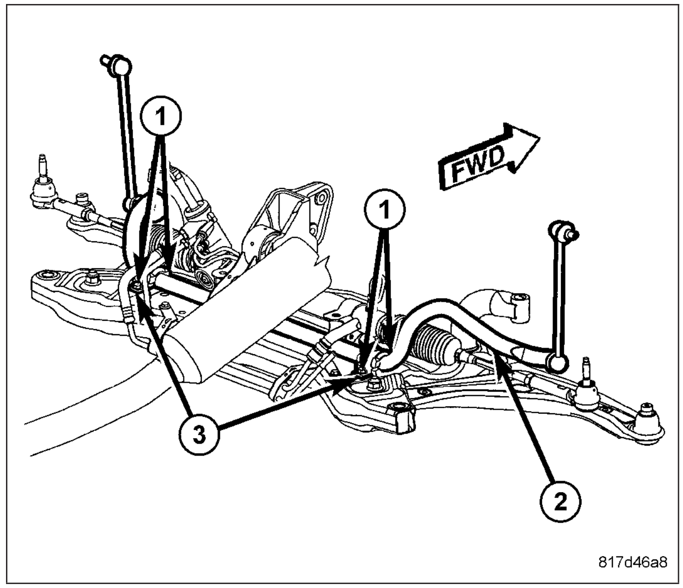
817d0e62

BAR-STABILIZER

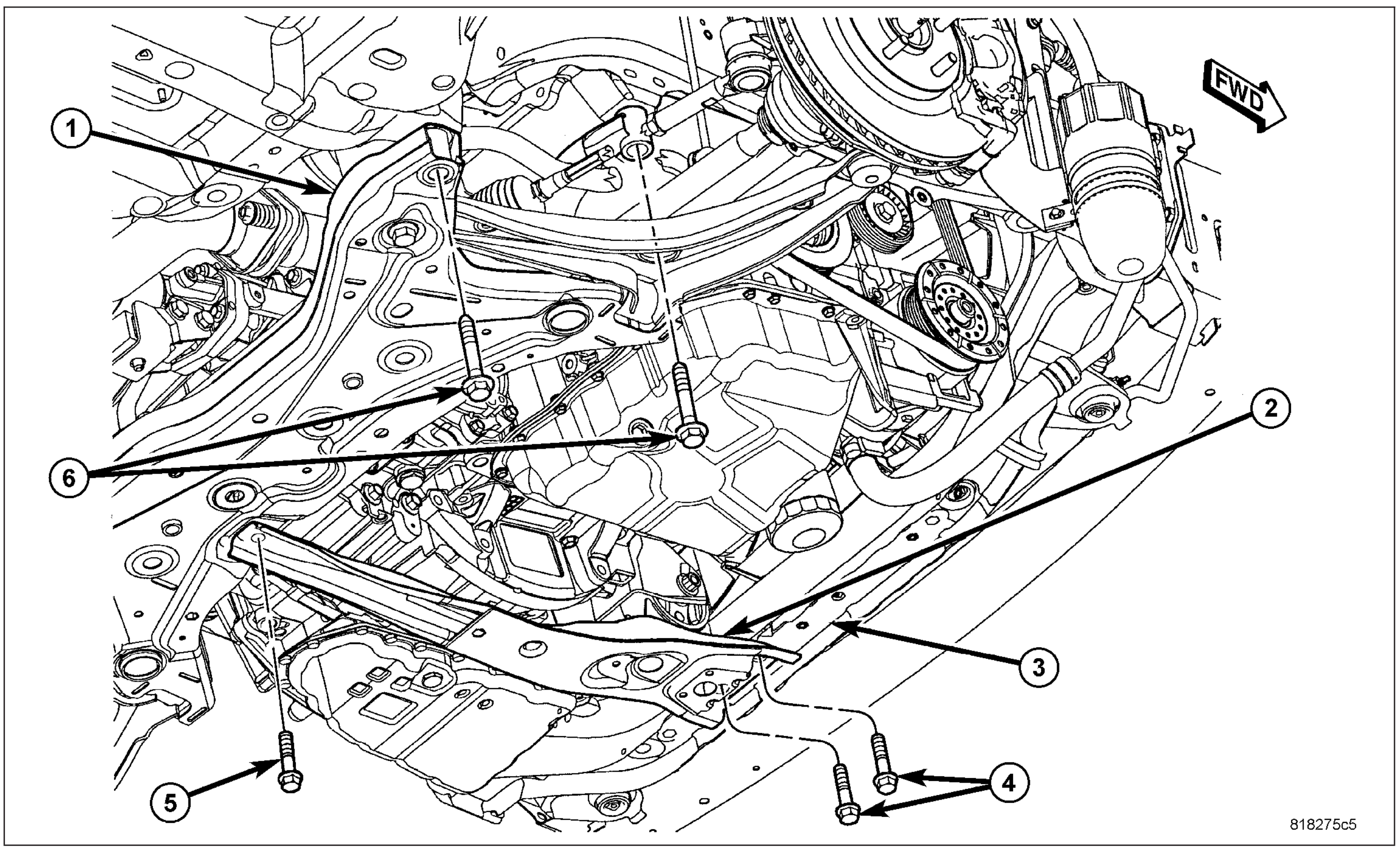


REMOVAL

NOTE: Before proceeding, (Refer to 2 - SUSPENSION/FRONT - WARNING).

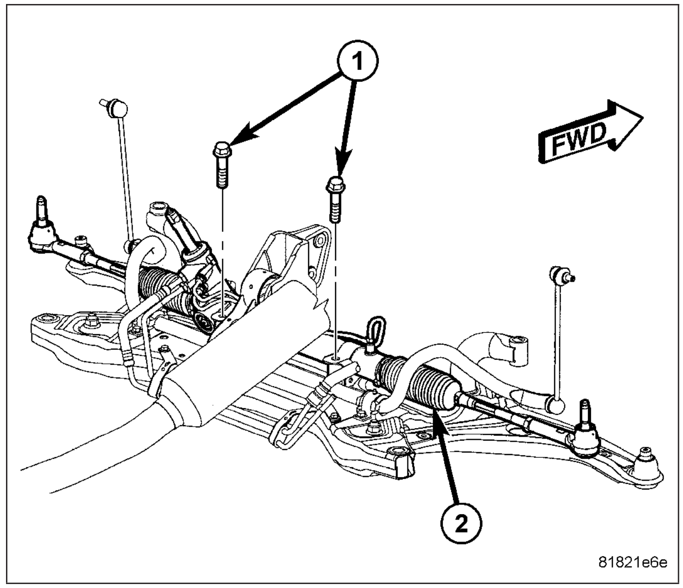


1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. If equipped, remove the engine belly pan. (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL)
3. Remove the rear engine mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/REAR MOUNT - REMOVAL)
4. Remove the front engine mount through-bolt.
5. Remove the bolts (1) securing the power steering hose routing clamps (2) to the crossmember.



6. At each end of the stabilizer bar, while holding the stabilizer bar link (1) lower stud stationary, remove the nut (3) securing the link to the stabilizer bar (2).

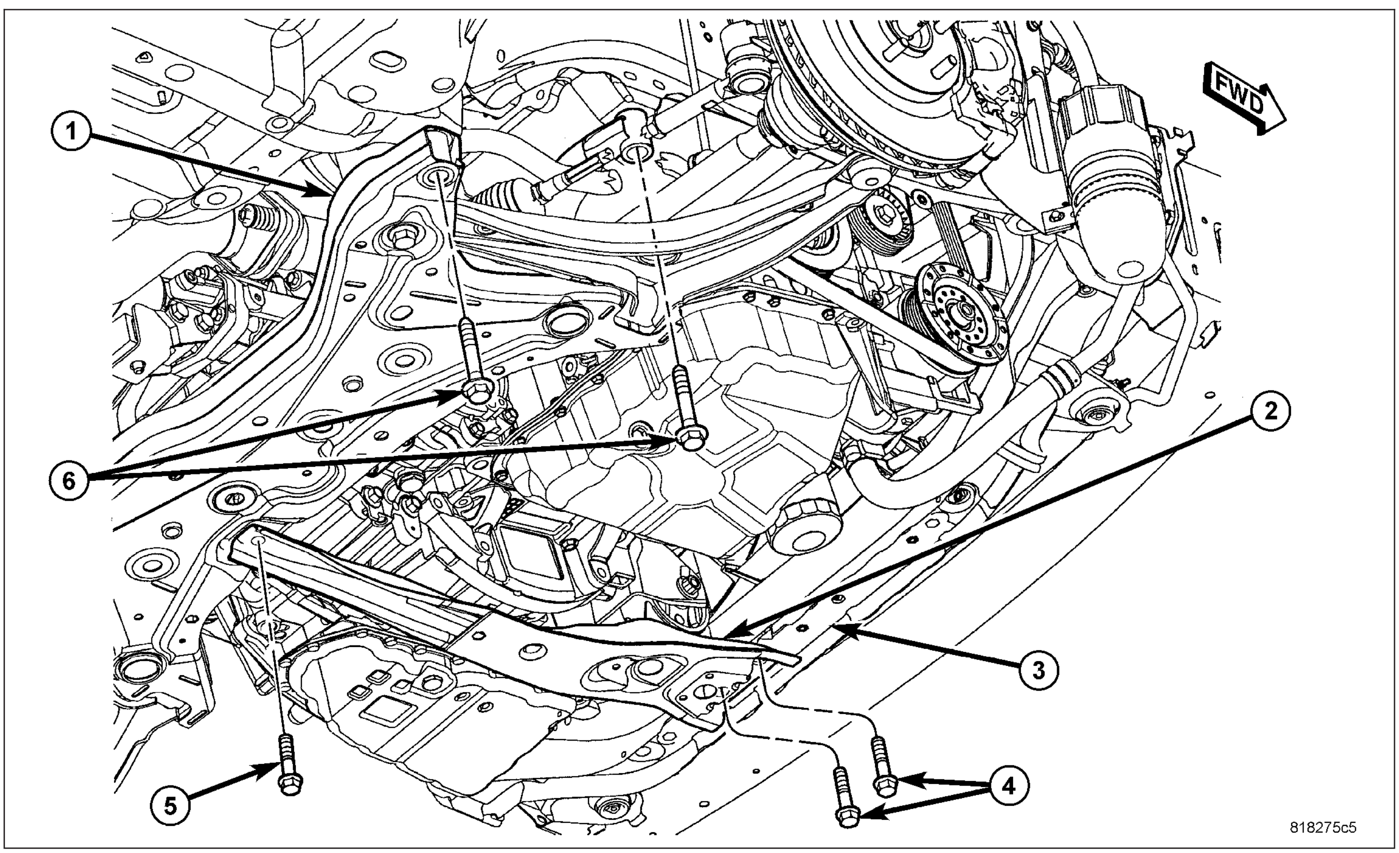
7. Remove the screws (1) securing the stabilizer bushing retainers (3) to the crossmember.
8. Remove the two stabilizer bushing retainers.
9. Utilizing the slit cut into the cushions (bushings), remove the two cushions from the stabilizer bar.



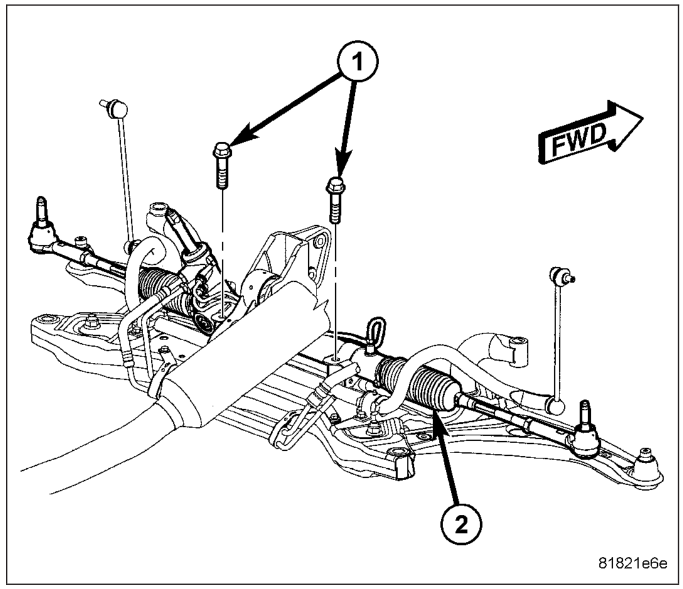
NOTE: Before removing the front suspension crossmember from the vehicle, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) may be lost.

10. Mark the location of the front crossmember on the body near each mounting bolt.
11. Support the crossmember with a transmission jack.
12. Remove the four mounting bolts (6) securing the front crossmember (1) to the body.

13. Remove the two bolts (1) securing the steering gear (2) to the crossmember.
14. Support the steering gear using a bungee cord or other to keep the steering gear from lowering when the crossmember is lowered.
15. Slowly lower the crossmember until there is enough space present to remove the stabilizer bar between the rear of the crossmember and the body. Due to the fact that the fore-and-aft crossmember is still attached, do not lower crossmember any more than necessary to remove the stabilizer bar.
16. Remove the stabilizer bar out over rear of crossmember.

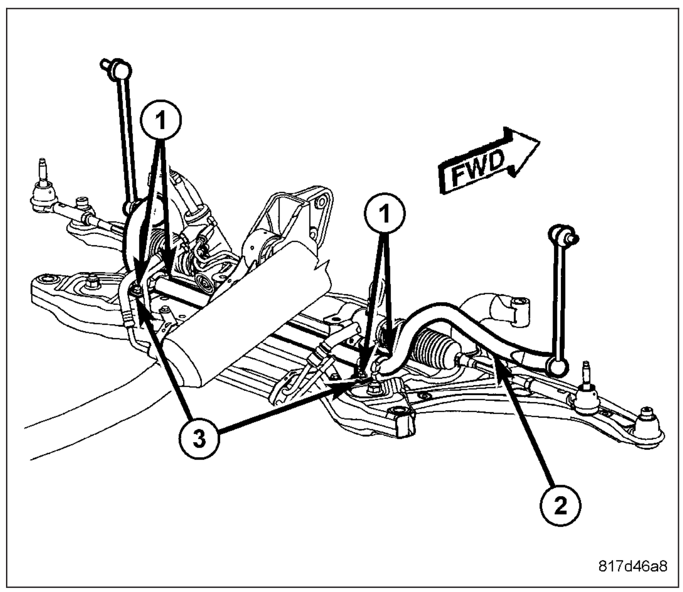


INSTALLATION

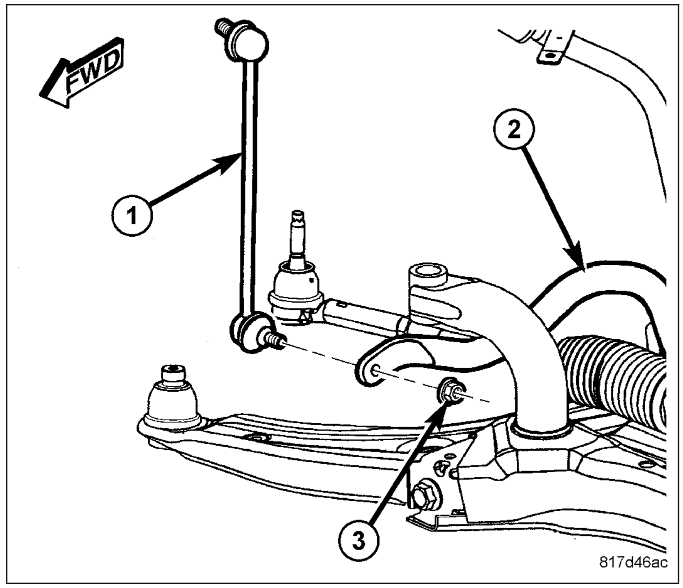


NOTE: Before stabilizer bar installation, inspect the cushions and links for excessive wear, cracks, damage and distortion. Replace any pieces failing inspection.

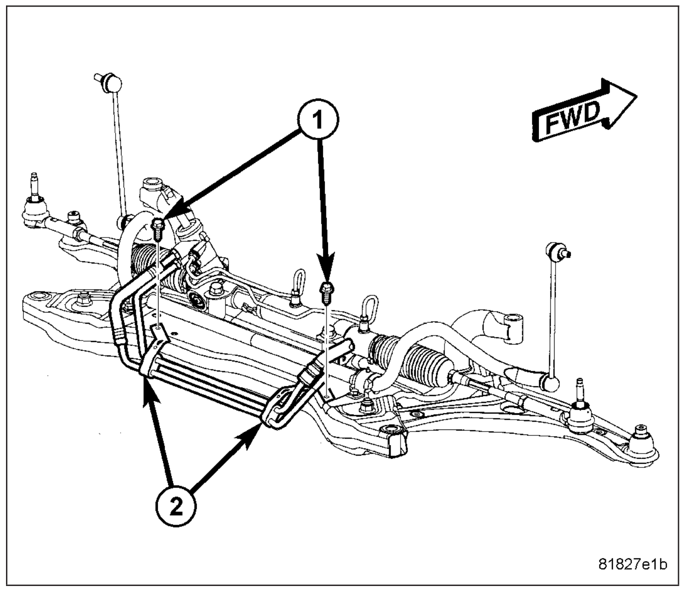
NOTE: Before installing the stabilizer bar, make sure the bar is not upsidedown. The stabilizer bar (1) must be installed so that when in mounted position, the ends of the bar curve over the top of the steering gear before attaching to the links.



1. Install the stabilizer bar, link ends first, from the rear over top of the crossmember. Curve the ends of the bar over the steering gear.



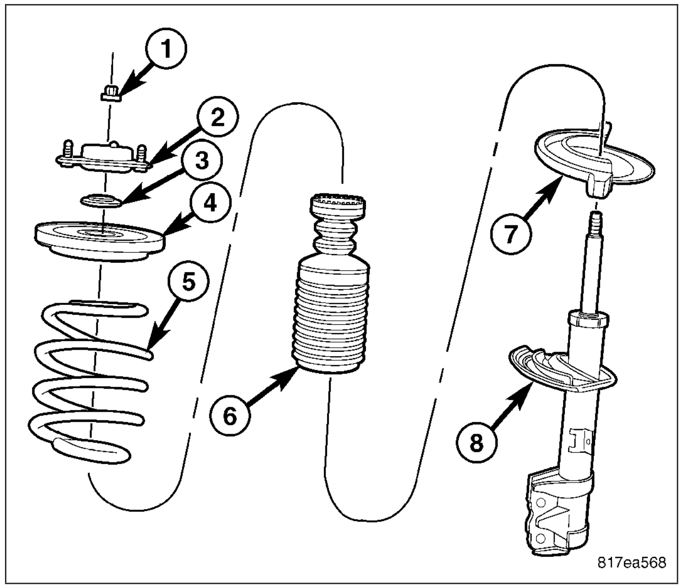
2. Slowly raise the crossmember (1) into mounted position using the transmission jack matching the crossmember to the marked locations on the body made during removal.
3. Install the four mounting bolts (6) securing the front crossmember (1) to the body. Tighten the crossmember mounting bolts to 190 N·m (140 ft. lbs.).
4. Remove the transmission jack.
5. Remove the bungee cord or other supporting the steering gear (2).
6. Install the two bolts (1) securing the steering gear (2) to the crossmember. Tighten the steering gear mounting bolts to 70 N·m (52 ft. lbs.).



7. Install the two cushions (bushings) on the stabilizer bar utilizing the slit cut into the cushion sides.
8. Install the two stabilizer bushing retainers (3) over the cushions.
9. Install the screws (1) securing the stabilizer bushing retainers (3) to the crossmember. Tighten all four stabilizer bar cushion retainer screws to 30 N·m (22 ft. lbs.).

10. Attach the stabilizer bar link (1) at each end of the stabilizer bar (2). At each link, install and tighten the nut (3) while holding the stabilizer bar link lower stud stationary. Tighten the nuts to 58 N·m (43 ft. lbs.).

11. Position the power steering hose routing clamps (2) on the crossmember. Install the screws and tighten each to 8 N·m (71 in. lbs.).
12. Install the rear engine mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/REAR MOUNT - REMOVAL)
13. If equipped, install the engine belly pan. (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL)
14. Lower the vehicle.



STRUT ASSEMBLY

DESCRIPTION

A Macpherson type design strut assembly is used in place of the front suspension upper control arm and upper ball joint. The bottom of the strut mounts directly to the steering knuckle using two attaching bolts and nuts going through the strut clevis bracket and knuckle. The top of the strut mounts directly to the strut tower of the vehicle using the three threaded studs on the strut assemblies upper mount.

The strut assembly includes the following components:

- Upper mount (rubber isolated) (2)
- Bearing (3)
- Upper spring seat and isolator (4)
- Coil spring (5)
- Dust shield and jounce bumper (6)
- Lower spring isolator (7)
- Strut (damper) (8)

Each component is serviced by removing the strut assembly from the vehicle and disassembling it.

Coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. If a coil spring requires replacement, be sure that it is replaced with a spring meeting the correct load rating for the vehicle and its specific options.

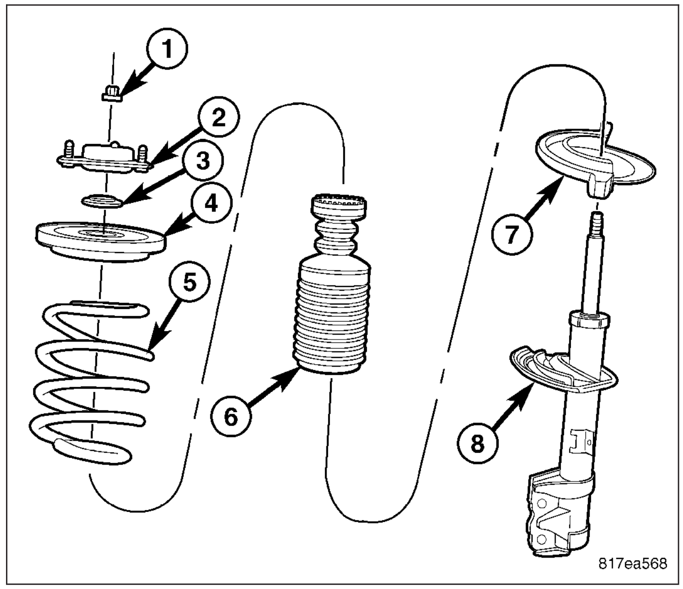
OPERATION

The strut assembly cushions the ride of the vehicle, controlling vibration, jounce and rebound of the suspension.

The coil spring controls ride quality and maintains proper ride height.

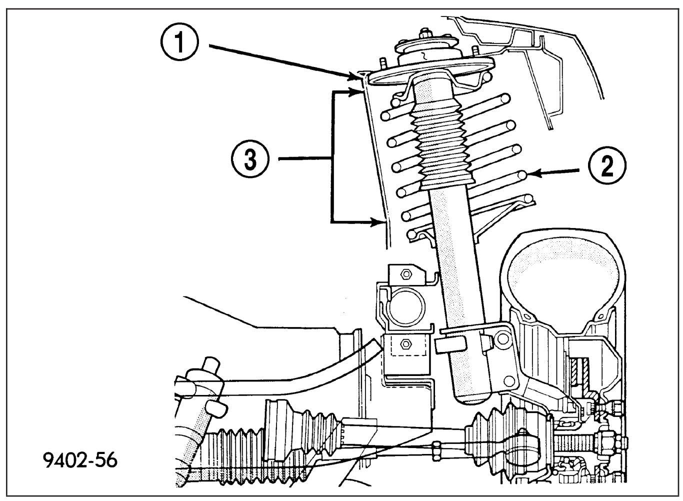
The spring isolators isolate the coil spring at the top and bottom from coming into metal-to-metal contact with the upper mounting seat and the strut.

The jounce bumper limits suspension travel and metal-to-metal contact under full jounce condition.



The strut dampens jounce and rebound motions of the coil spring and suspension.

DIAGNOSIS AND TESTING

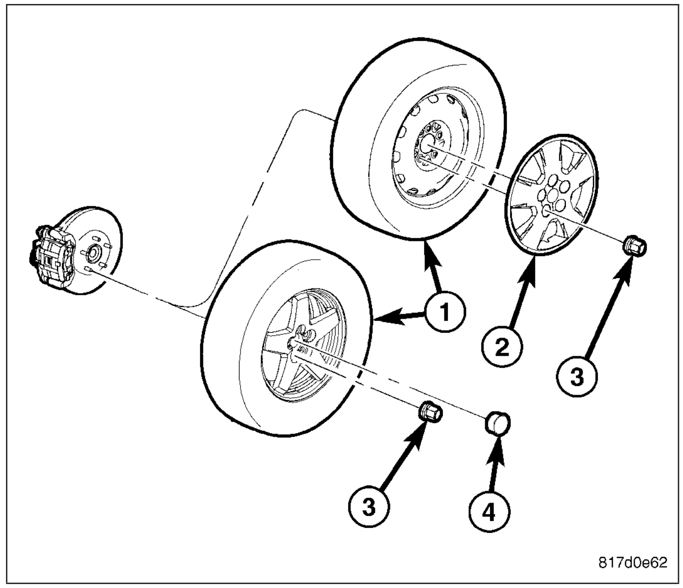


STRUT ASSEMBLY

Inspect the strut assembly for the following conditions:

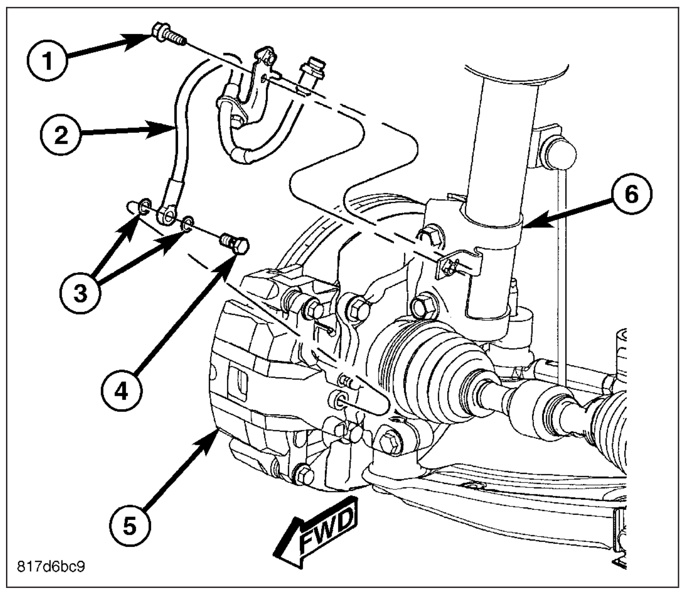
- Inspect for a damaged or broken coil spring (5).
- Inspect for a torn or damaged dust shield (6).
- Lift the dust shield and inspect the strut assembly for evidence of fluid running from the upper end of the strut fluid reservoir. (Actual leakage will be a stream of fluid running down the side and dripping off lower end of unit). A slight amount of seepage between the strut shaft and strut shaft seal is not unusual and does not affect performance of the strut assembly.
- Inspect the jounce bumper for signs of damage or deterioration.
- Inspect the clearance between the shock tower and the coil spring. Make sure no fasteners are protruding through the shock tower possibly contacting the coil spring and strut. Because of the minimum clearance in this area, installation of metal fasteners could damage the coil spring coating and lead to a corrosion failure of the spring.

CAUTION: At no time when servicing a vehicle can a sheet metal screw, bolt or other metal fastener be installed into the strut tower (1) to take the place of an original plastic clip. Also, do not drill holes into the front strut tower for the installation of any metal fasteners into the shock tower area indicated (3).



REMOVAL

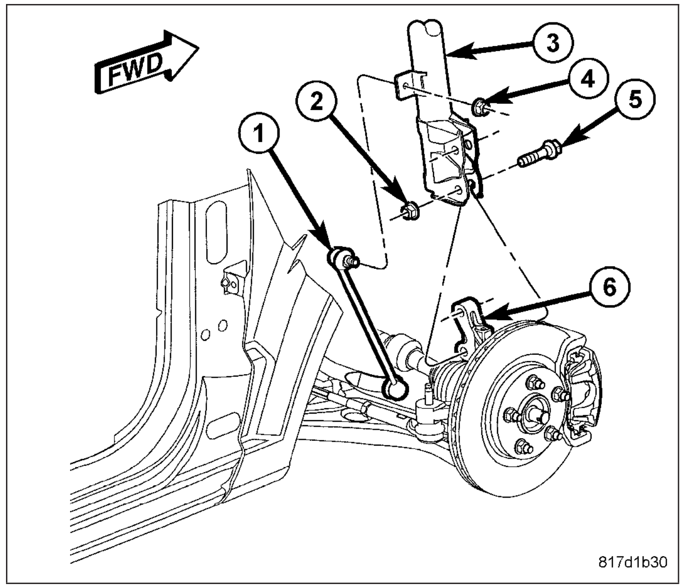
NOTE: Before proceeding, (Refer to 2 - SUSPENSION/FRONT - WARNING).



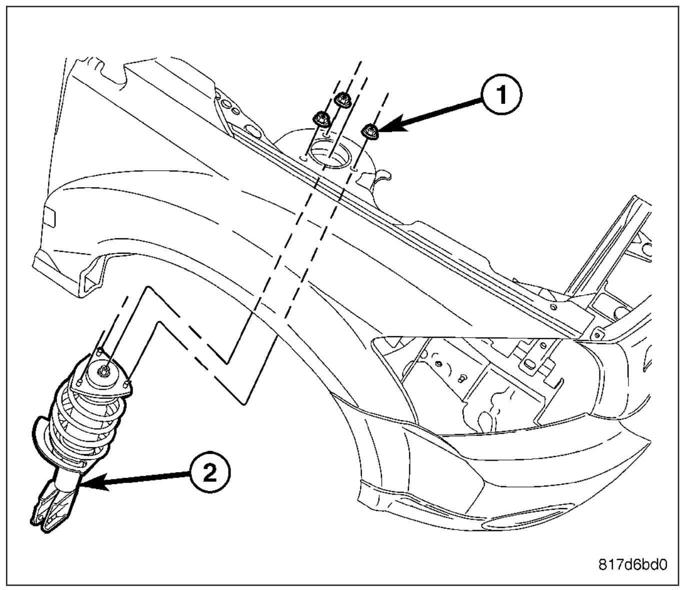
1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).

NOTE: If both strut assemblies are to be removed, mark the strut assemblies right or left and keep the parts separated to avoid mix-up. Not all parts of the strut assembly are interchangeable side-to-side.



3. Remove the screw (1) securing the flex hose (2) routing bracket to the strut (6).



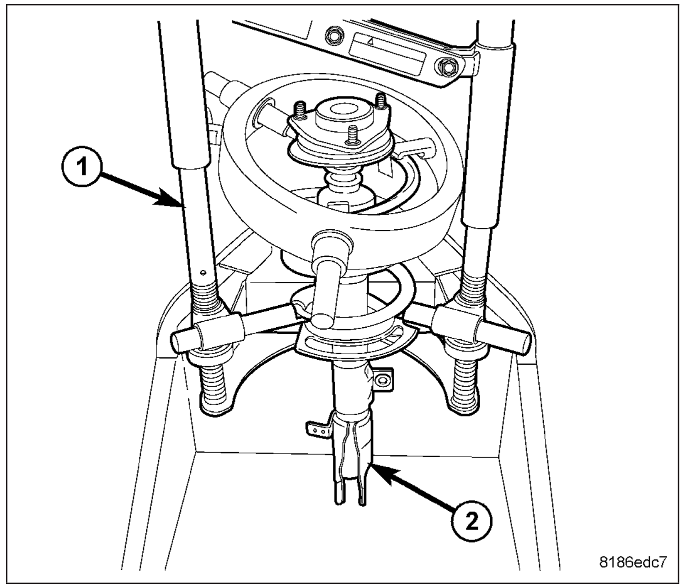
4. While holding the stabilizer bar link (1) stud stationary, remove the nut (4) securing the link to the strut (3).

CAUTION: The strut assembly-to-knuckle attaching bolts (5) are serrated and must not be turned during removal. Hold the bolts stationary in the knuckle while removing the nuts, then tap the bolts out using a pin punch.

5. While holding the bolt heads stationary, remove the two nuts (2) from the bolts (5) attaching the strut (3) to the knuckle (6).
6. Remove the two bolts (5) attaching the strut (3) to the knuckle (6) using a pin punch.

7. Lower the vehicle just enough to open the hood without allowing the tires to touch the floor.
8. Remove the three nuts (1) attaching the strut assembly (2) upper mount to the strut tower.
9. Remove the strut assembly (2) from the vehicle.
10. For disassembly, (Refer to 2 - SUSPENSION/FRONT/STRUT - DISASSEMBLY).

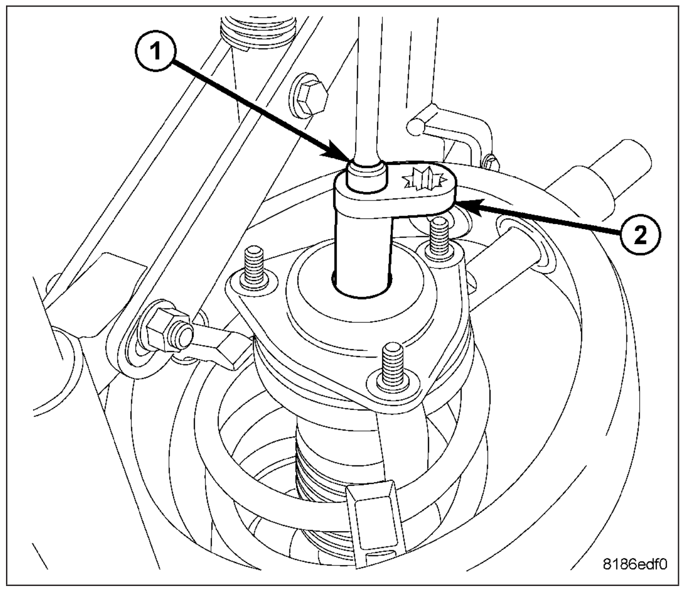
DISASSEMBLY



NOTE: The strut assembly must be removed from the vehicle for it to be disassembled and assembled. (Refer to 2 - SUSPENSION/FRONT/STRUT - REMOVAL)

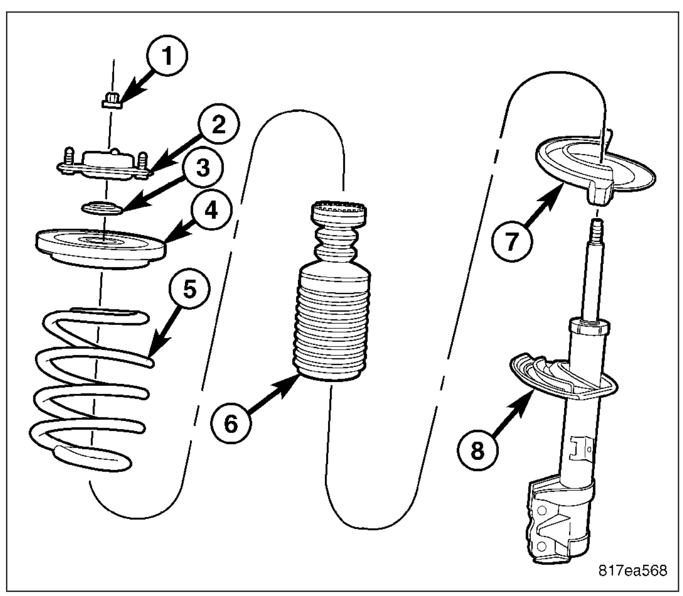
For the disassembly and assembly of the strut assembly, use strut spring compressor, Pentastar Service Equipment (PSE) tool W-7200, or equivalent, to compress the coil spring. Follow the manufacturer’s instructions closely.

WARNING: Do not remove the strut rod nut before the coil spring is properly compressed. The coil spring is held under pressure. The coil spring must be compressed, removing spring tension from the upper mount and bearing, before the strut rod nut is removed.



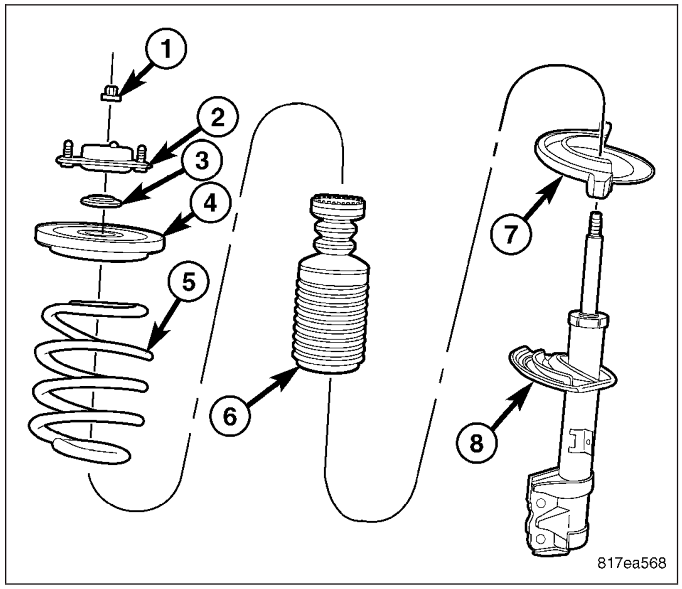
1. If both struts are being serviced at the same time, mark both the coil spring and strut assembly according to which side of the vehicle the strut is being removed from.

2. Position the strut assembly (2) in the strut coil spring compressor (1) following the manufacturers instructions and set the lower and upper hooks of the compressor on the coil spring. Position the strut clevis bracket (4) straight outward, away from the compressor.
3. Compress the coil spring until all coil spring tension is removed from the upper mount and bearing.



CAUTION: Never use impact or high speed tools to remove the strut rod nut. Damage to the strut internal bearings can occur.

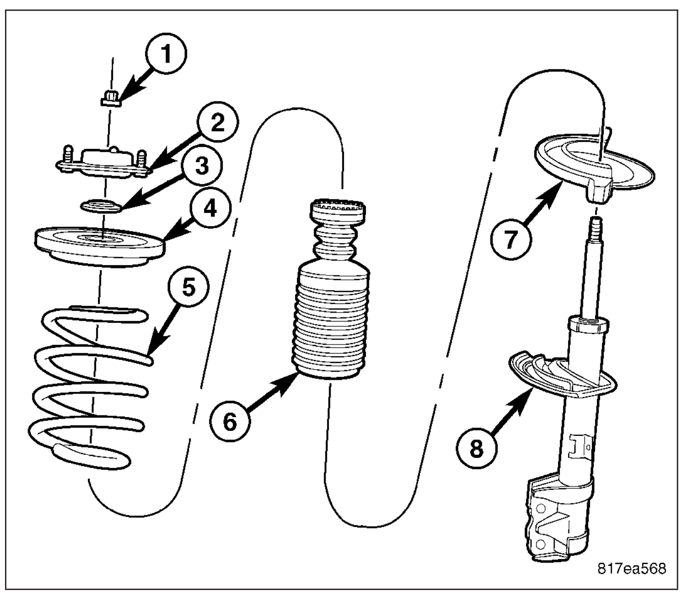
4. Once the spring is sufficiently compressed, install Strut Nut Wrench (2), Special Tool 9362, on the strut rod nut. Next, install Strut Shaft Socket (1), Special Tool 9894, on the end of the strut rod. While holding the strut rod from turning, remove the nut using the strut nut wrench.



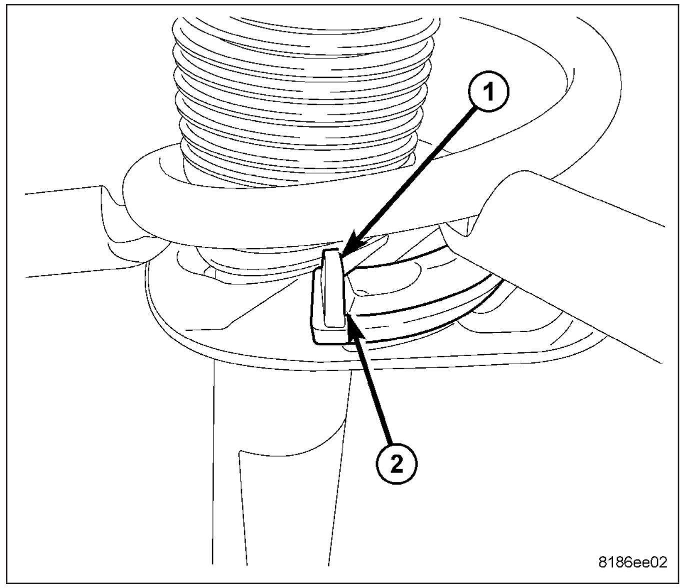
5. Remove the clamp (if installed) from the bottom of the coil spring and remove the strut (damper) (8) out through the bottom of the coil spring. the dust shield and jounce bumper will come out with the strut.
6. Remove the lower isolator (7) from the strut seat.
7. Slide the dust shield and jounce bumper (6) from the strut rod.
8. Remove the upper mount (2) and bearing (3) from the top of the upper spring seat and isolator (4).
9. Remove the upper spring seat and isolator (4) from the top of the coil spring (5).
10. Remove the lower spring isolator (2) from the lower spring seat on the strut (1).

NOTE: If the coil spring needs to be serviced, proceed with the next step, otherwise, proceed with step Step 12.

11. Release the tension from the coil spring by backing off the compressor drive completely. Push back the compressor hooks and remove the coil spring.
12. Inspect the strut assembly components for the following and replace as necessary:
    - Inspect the strut (damper) (8) for shaft binding over the full stroke of the shaft.
    - Inspect the jounce bumper (with dust shield) (6) for cracks and signs of deterioration.
    - Check the upper mount (2) for cracks and distortion and its retaining studs for any sign of damage.
    - Check the bearing (3) for any binding.
    - Check the upper spring seat and isolator (4) for cracks and distortion.
    - Inspect the upper and lower spring isolators (7) for material deterioration and distortion.
    - Inspect the coil spring (5) for any sign of damage to the coating.

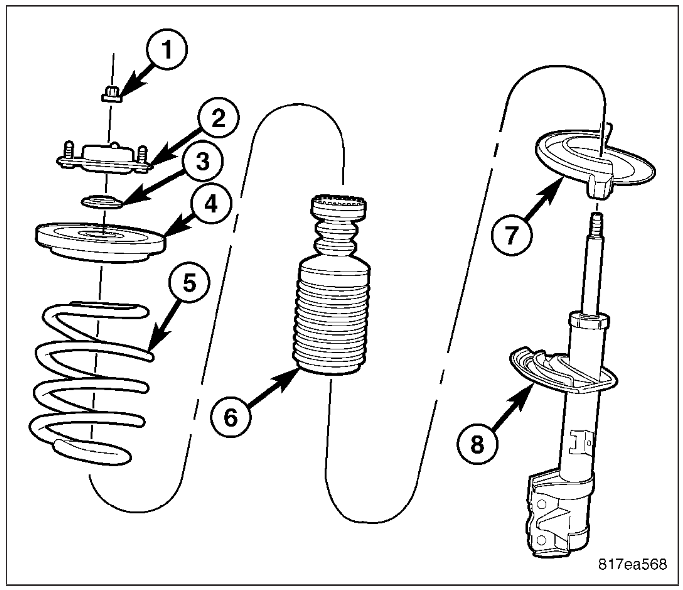


NOTE: For reassembly, (Refer to 2 - SUSPENSION/FRONT/STRUT - ASSEMBLY).



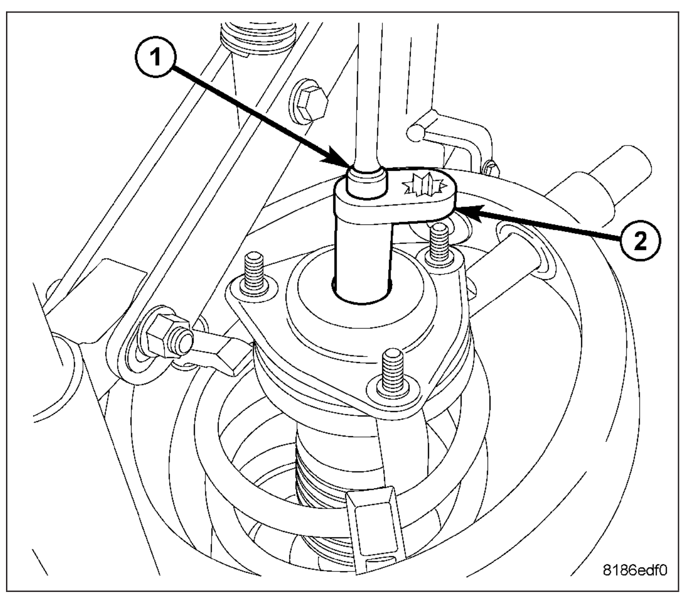
ASSEMBLY

NOTE: If the coil spring has been removed from the spring compressor, proceed with the next step, otherwise, proceed with step Step 3.

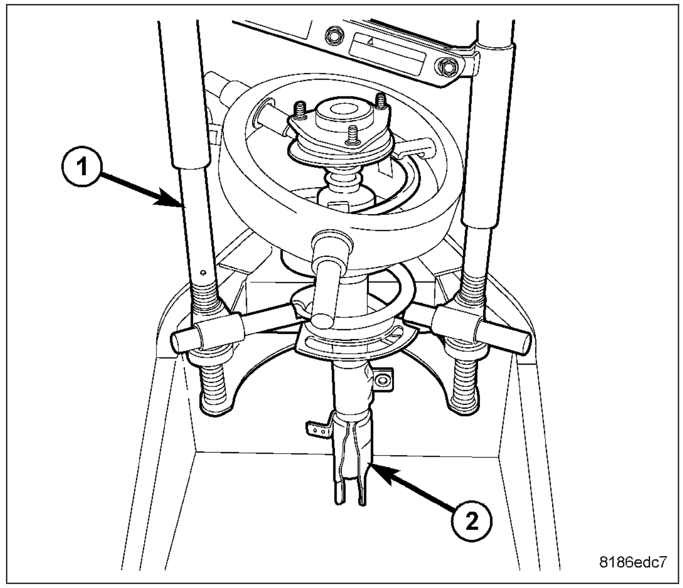


1. Place the coil spring in the spring compressor following the manufacturers instructions. Before compressing the spring, rotate the spring so the end of the bottom coil is at approximately the 9 o'clock position as viewed above (or to where the spring was when removed from the compressor). This action will allow the strut (damper) clevis bracket to be positioned outward, away from the compressor once installed.
2. Slowly compress the coil spring until enough room is available for strut assembly reassembly.
3. Install the upper spring seat and isolator (4) on top of the coil spring (5).
4. Install the bearing (3) and upper mount (2) on top of the upper spring seat and isolator (4).
5. Install the lower spring isolator (7) on the spring seat on the strut (8).
6. Slide the dust shield and jounce bumper (6) onto the strut rod.

7. Install the strut (3) up through the bottom of the coil spring and upper spring seat, mount, and bearing until the lower spring seat contacts the lower end of the coil spring. Rotate the strut as necessary until the end of the bottom coil (2) comes in contact with the stop (1) built into the lower spring isolator

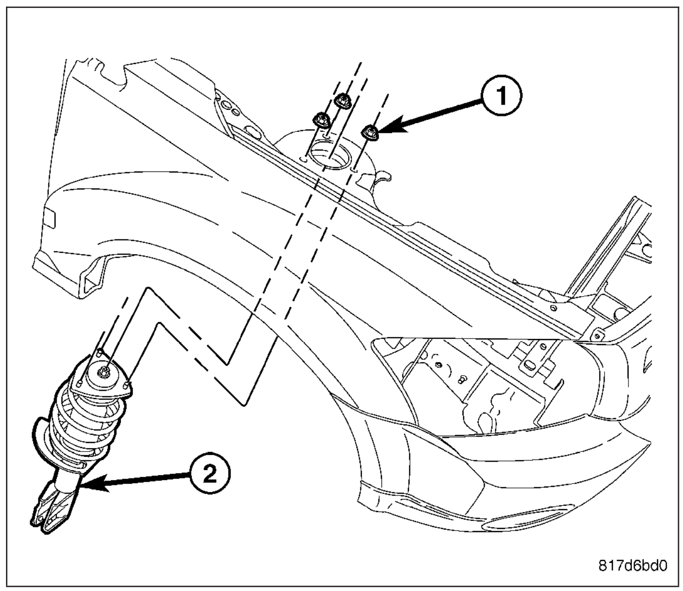


8. While holding the strut in position, install the nut (1) on the end of the strut rod.

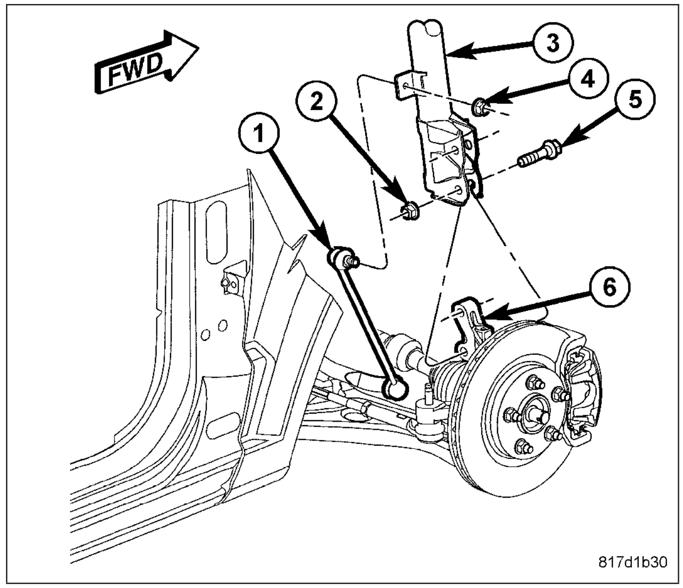


CAUTION: Never use impact or high speed tools to remove the strut rod nut. Damage to the strut internal bearings can occur.

9. Install Strut Nut Wrench (2), Special Tool 9362, on the strut rod nut. Next, install Strut Shaft Socket (1), Special Tool 9894, on the end of the strut rod. While holding the strut rod from turning, tighten the strut rod nut to 60 N·m (44 ft. lbs.) using a torque wrench on the end of Special Tool 9362.

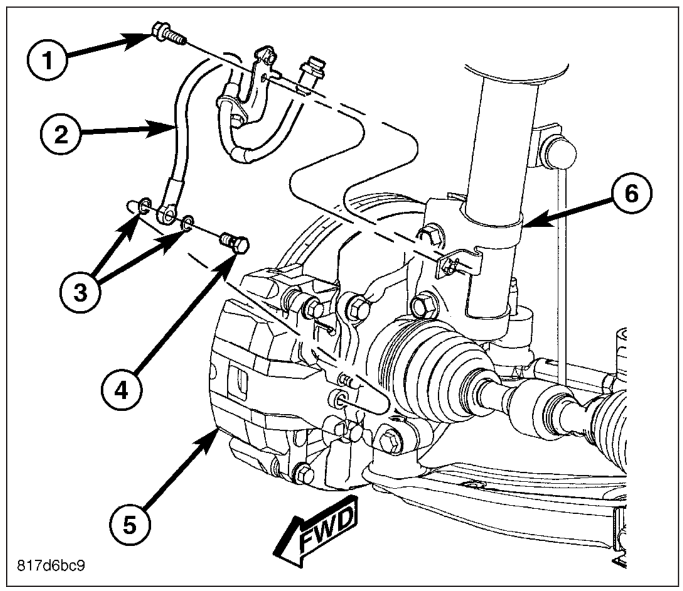


10. Slowly release the tension from the coil spring by backing off the compressor (1) drive completely. As the tension is relieved, make sure the upper mount and bearing align properly. Verify the upper mount does not bind when rotated.
11. Remove the strut assembly from the spring compressor.
12. Install the strut assembly on the vehicle. (Refer to 2 - SUSPENSION/FRONT/STRUT - INSTALLATION)

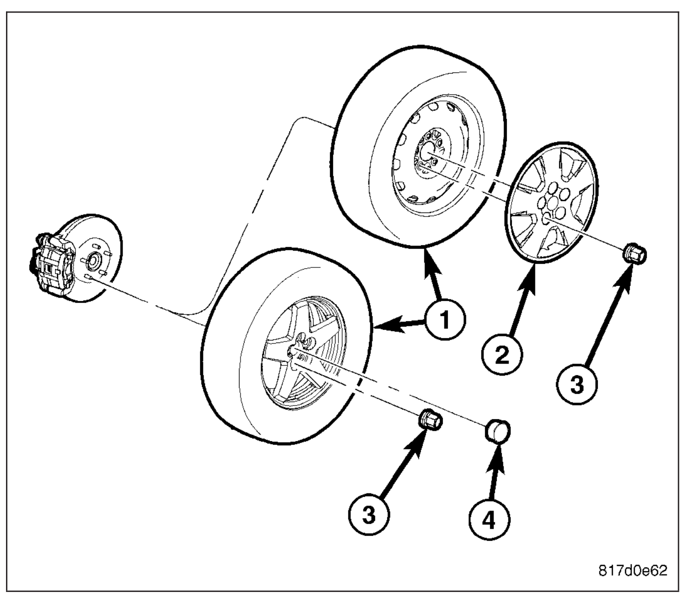


INSTALLATION

1. Raise the strut assembly (2) into the strut tower, aligning the three studs on the strut assembly upper mount with the holes in strut tower. Install the three mounting nuts (1) on the studs. Tighten the three nuts to 48 N·m (35 ft. lbs.).



CAUTION: The strut assembly-to-knuckle attaching bolts (5) are serrated and must not be turned during installation. Install the nuts while holding the bolts stationary in the knuckle.



2. Position the lower end of the strut assembly (3) in line with the upper end of the knuckle (6), aligning the mounting holes. Install the two attaching bolts (5). Install the nuts (2). While holding the bolts in place, tighten the nuts to 84 N·m (62 ft. lbs.).
3. Attach the stabilizer bar link (1) to the strut (3). Install and tighten the nut (4) while holding the stabilizer bar link stud stationary. Tighten the nut to 58 N·m (43 ft. lbs.).

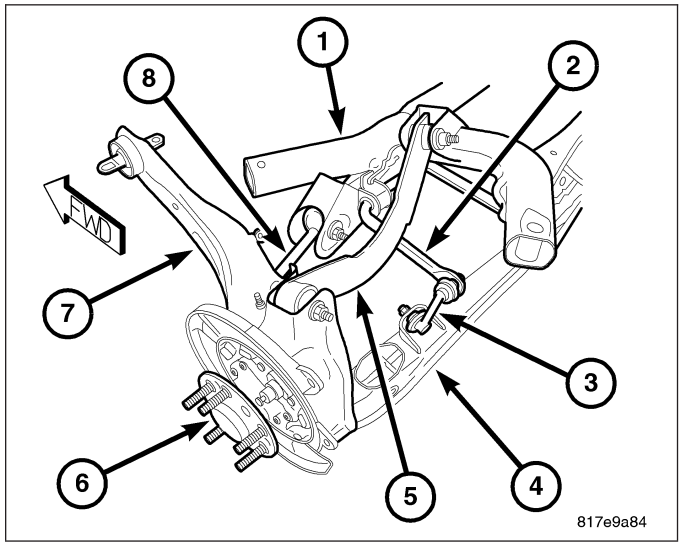
4. Secure the flex hose (2) routing bracket to the strut (6) with the mounting screw (1). Tighten the mounting screw to 13 N·m (120 in. lbs.).

5. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
6. Lower the vehicle.

REAR SUSPENSION

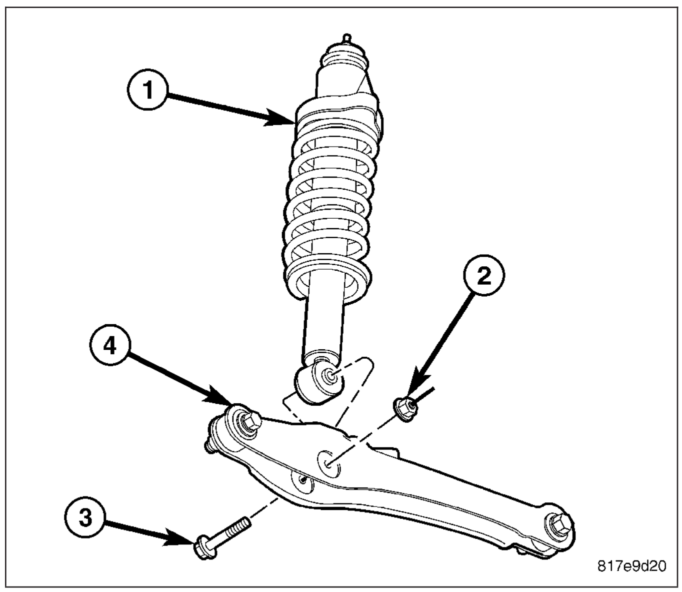
TABLE OF CONTENTS

REAR SUSPENSION



DESCRIPTION

This vehicle uses a multi-link rear suspension design.



The rear suspension consists of these major components:

- (1) Rear Crossmember
- (2) Stabilizer Bar
- (3) Stabilizer Link
- (4) Lower Control Arm
- (5) Upper Control Arm
- (6) Hub And Bearing
- (7) Trailing Arm
- (8) Control Link

Information on the rear crossmember can be found in The Frame And Bumpers Group. Information on all other components can be found in this Group.

Also included in the rear suspension is a rear shock assembly (1). It fastens to the lower control arm (4) and body.

WARNING

WARNINGS AND CAUTIONS

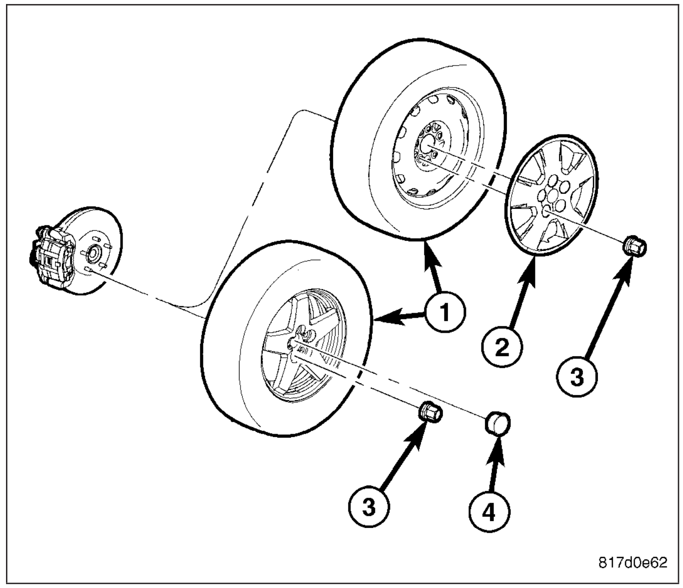
WARNING: Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from production or aftermarket linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not sand, or grind brake lining unless equipment used is designed to contain the dust residue. Do not clean brake parts with compressed air or by dry brushing. Cleaning should be done by dampening the brake components with a fine mist of water, then wiping the brake components clean with a dampened cloth. Dispose of cloth and all residue containing asbestos fibers in an impermeable container with the appropriate label. Follow practices prescribed by the Occupational Safety And Health Administration (OSHA) and the Environmental Protection Agency (EPA) for the handling, processing, and disposition of dust or debris that may contain asbestos fibers.

CAUTION: Only frame contact or wheel lift hoisting equipment can be used on this vehicle. It cannot be hoisted using equipment designed to lift a vehicle by the rear axle. If this type of hoisting equipment is used, damage to rear suspension components will occur.

CAUTION: All-Wheel-Drive only - Wheel bearing damage will result if after loosening the hub nut, the vehicle is rolled on the ground or the weight of the vehicle is allowed to be supported by the tires for a length of time.

NOTE: If a rear suspension component becomes bent, damaged or fails, no attempt should be made to straighten or repair it. Always replace it with a new component.

SPECIFICATIONS



REAR SUSPENSION FASTENER TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Brake Flex Hose Trailing Link Mounting Nut	15	11	—
Brake Flex Hose Trailing Link Mounting Screw	23	17	—
Crossmember Stay Brace Mounting screws	25	18	221
Hub And Bearing Mounting Bolts	105	77	—
Hub Nut	245	181	—
Lower Control Arm Trailing Link Bolt Nut	95	70	—
Lower Control Arm Crossmember Mounting Bolt Nut	95	70	—
Shock Assembly Lower Mounting Bolt Nut	99	73	—
Shock Assembly Upper Mounting Nuts	48	35	—

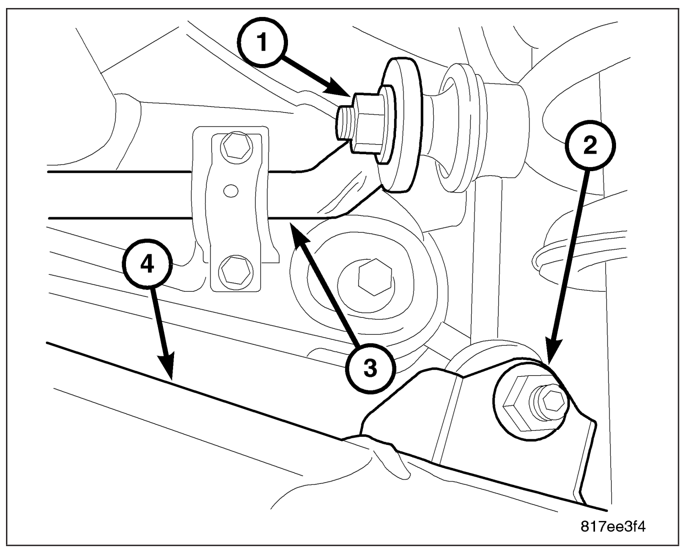
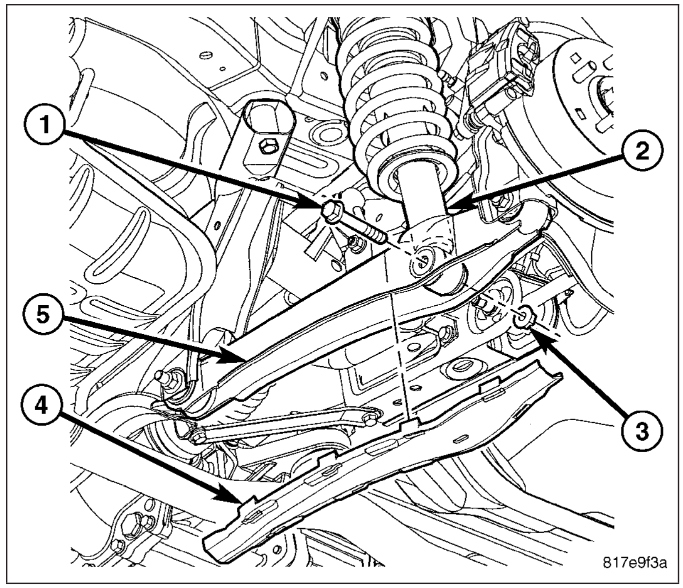
Wheel Mounting (Lug) Nuts	135	100	—

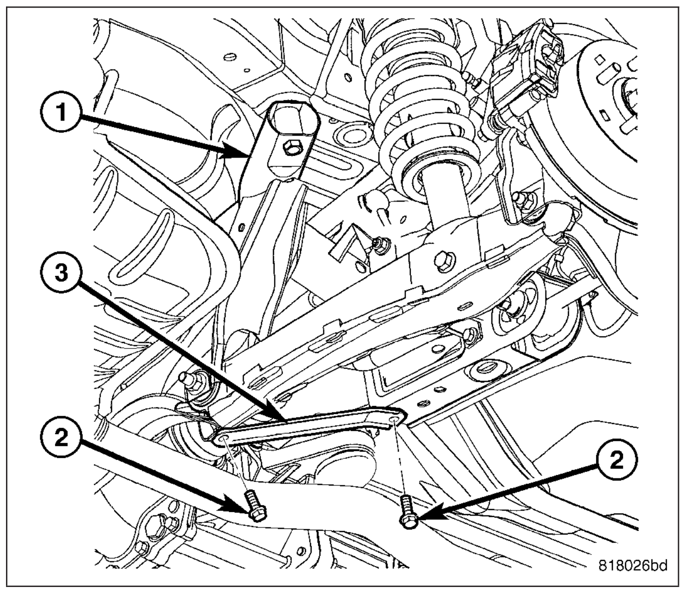


ARM-LOWER CONTROL

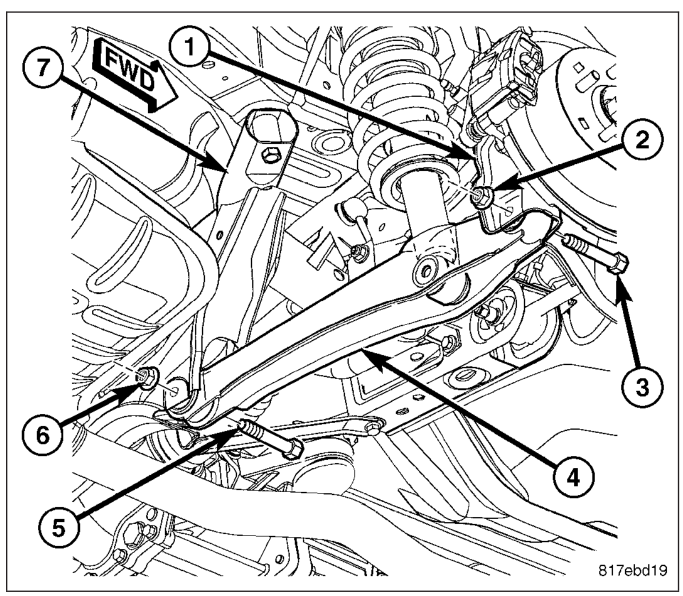
REMOVAL



1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).

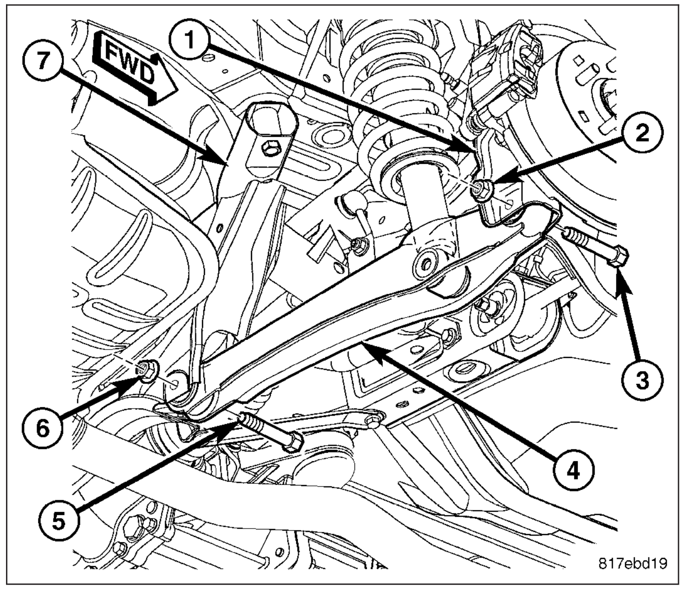


3. If equipped, while holding the stabilizer bar link lower stud stationary, remove the nut (2) securing the link to the lower control arm (4).

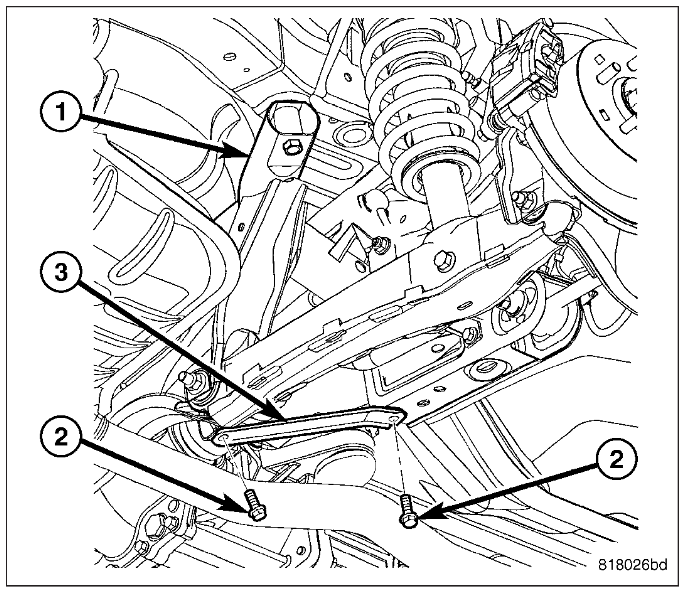


4. Remove the cover (4) on the bottom of the lower control arm (5).
5. Remove the lower shock (2) mounting nut (3) and bolt (1).

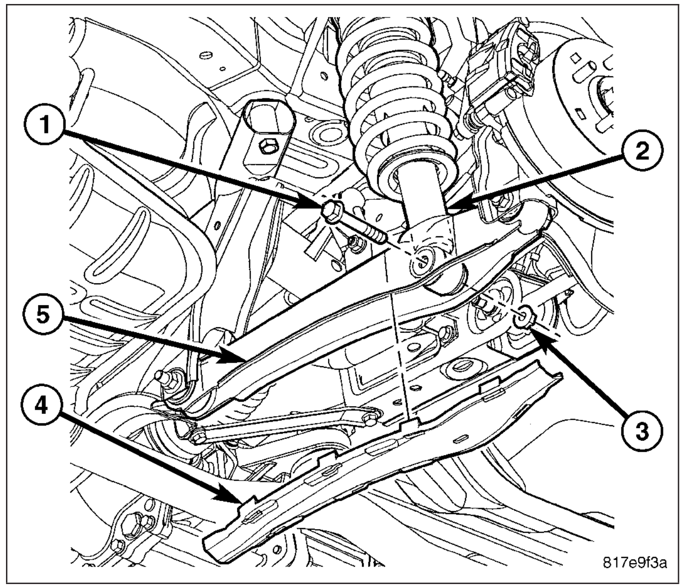
6. Remove the stay brace (3) mounting screws (2). Remove the stay brace.



7. Remove the nut (2) and bolt (3) securing the lower control arm (4) to the trailing link (1).
8. Remove the nut (6) and bolt (5) securing the lower control arm (4) to the crossmember (7).
9. Remove the lower control arm (4).

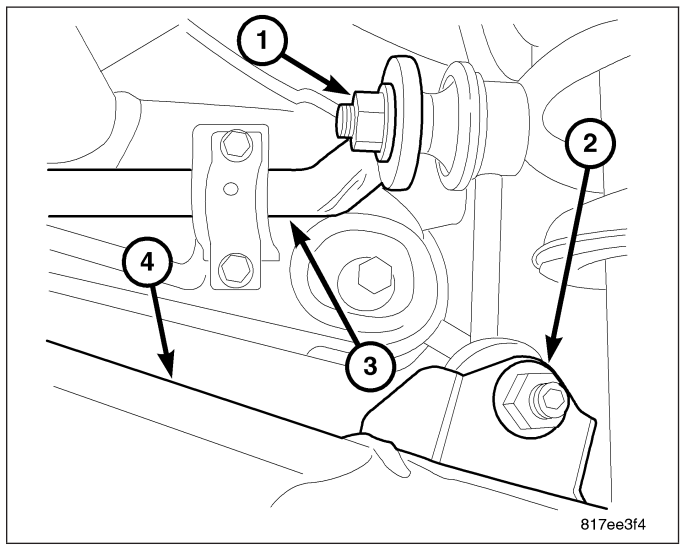


INSTALLATION

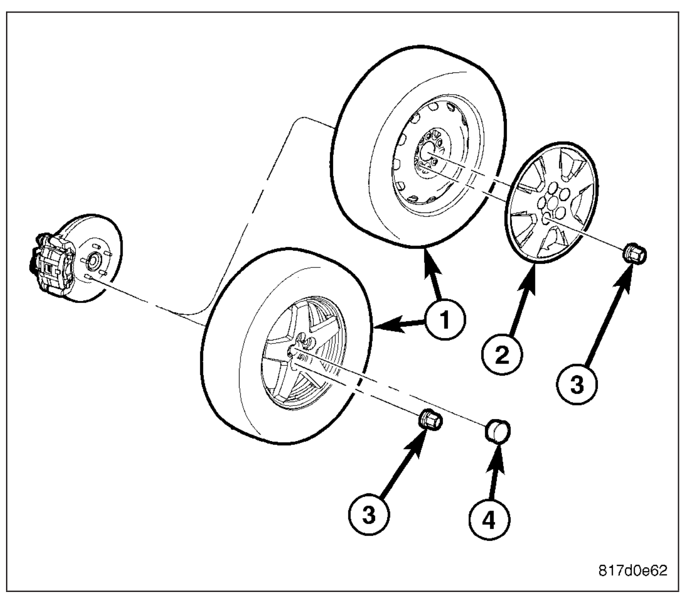


1. Position the lower control arm and install the bolt (5) and nut (6) securing the lower control arm (4) to the crossmember (7). Do not tighten at this time.
2. Install the bolt (3) and nut (2) securing the lower control arm (4) to the trailing link (1). Do not tighten at this time.

3. Install the stay brace (3) on the crossmember (1). Install and tighten the mounting screws (2) to 25 N·m (18 ft. lbs.).

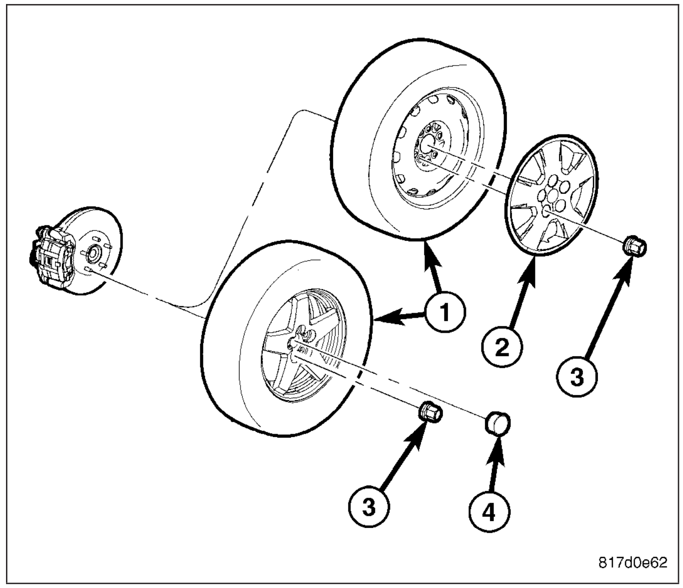


4. Install the mounting bolt (1) and nut (3) fastening the shock assembly (2) to the lower control arm (5). Do not tighten at this time.
5. Install the cover (4) on the bottom of the lower control arm (5).

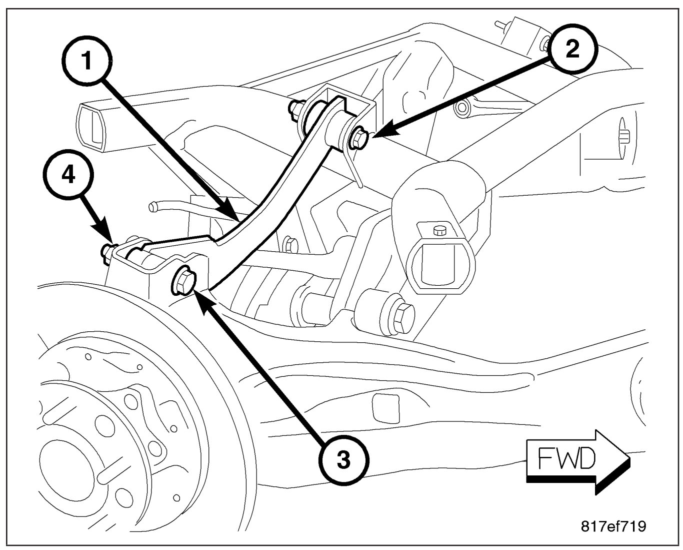


NOTE: When attaching a stabilizer bar link to the lower control arm it is important that the lower mounting stud be positioned properly. The lower mounting stud on the right side link needs to point toward the rear of the vehicle when inserted through the lower control arm mounting flange. The left side link lower stud needs to point toward the front of the vehicle. Otherwise the suspension geometry will not function properly.

6. If equipped, attach the stabilizer bar link to the lower control arm (4). Install the nut (2) and while holding the stabilizer bar link lower stud stationary, tighten the nut (2) to 58 N·m (43 ft. lbs.).



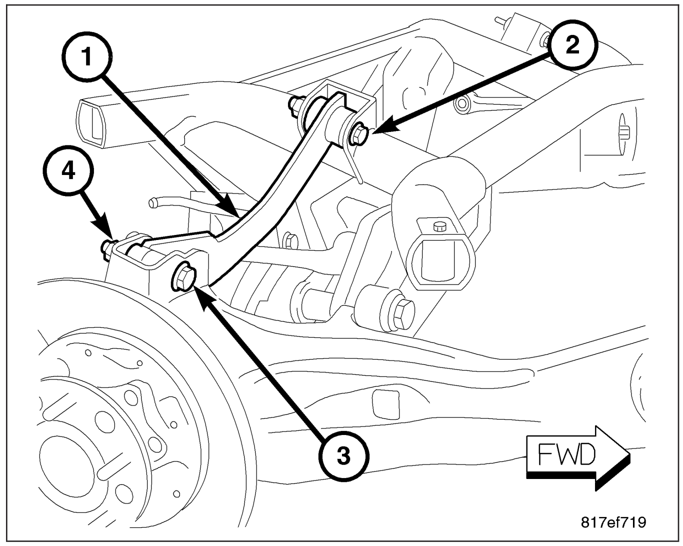
7. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
8. Lower the vehicle.
9. Position the vehicle on an alignment rack/drive-on lift. Raise the vehicle as necessary to access mounting bolts and nuts.
10. Tighten the lower control arm mounting bolt nut at the crossmember to 95 N·m (70 ft. lbs.).
11. Tighten the lower control arm mounting bolt nut at the trailing link to 95 N·m (70 ft. lbs.).
12. Tighten the shock assembly lower mounting bolt nut to 99 N·m (73 ft. lbs.).
13. Perform wheel alignment as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)



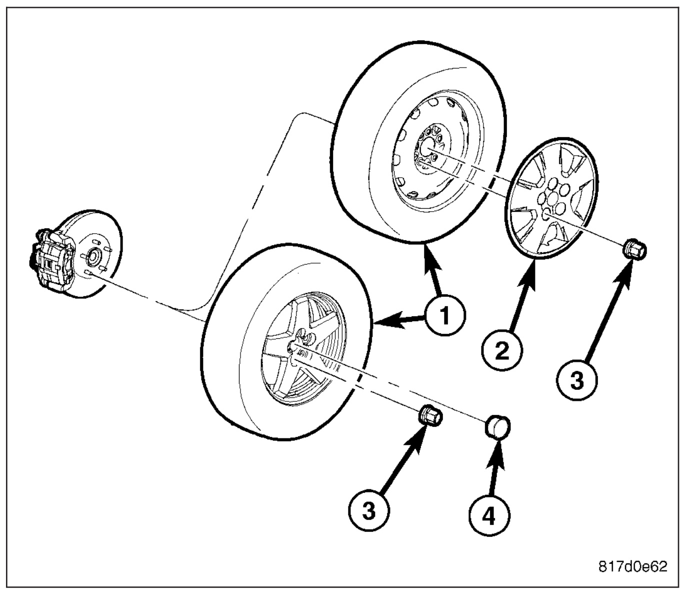
ARM-UPPER CONTROL

REMOVAL

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).

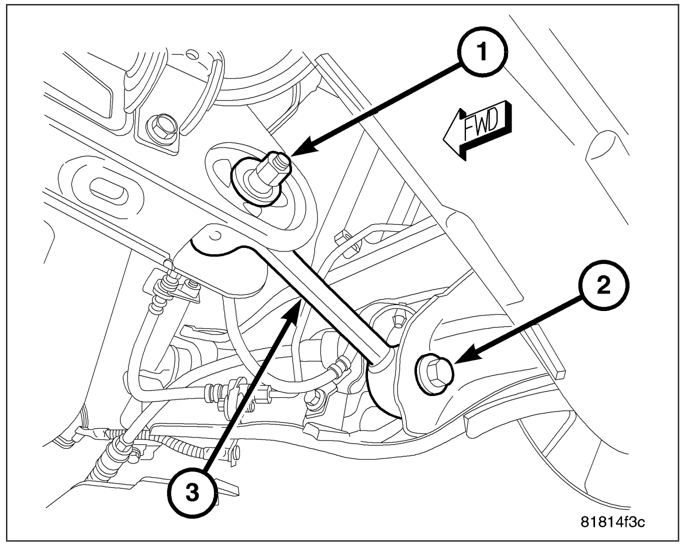


3. Remove the nut (4) and bolt (3) securing the upper control arm (1) to the trailing link.
4. Remove the bolt (2) securing the upper control arm (1) to the crossmember.
5. Remove the upper control arm (1).

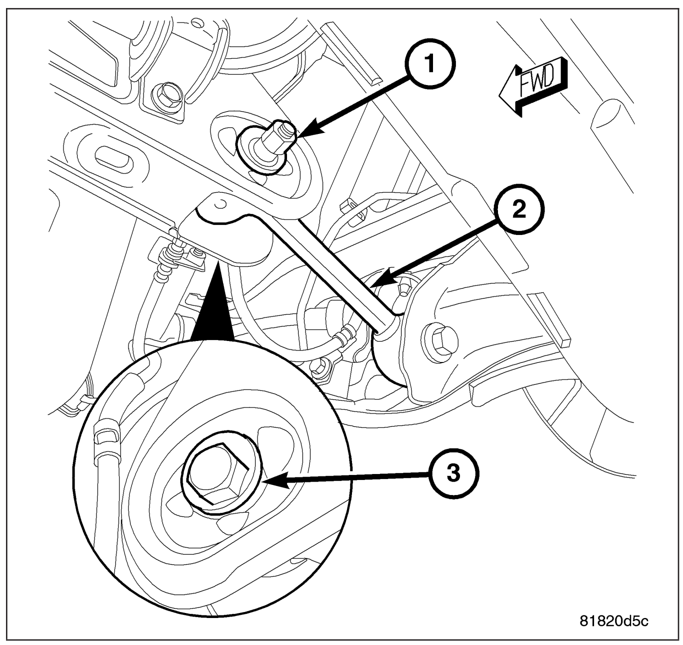


INSTALLATION

1. Position the upper control arm (1) and install the bolt (2) securing the arm to the crossmember. Do not tighten at this time.
2. Install the bolt (3) and nut (4) securing the upper control arm (1) to the trailing link. Do not tighten at this time.



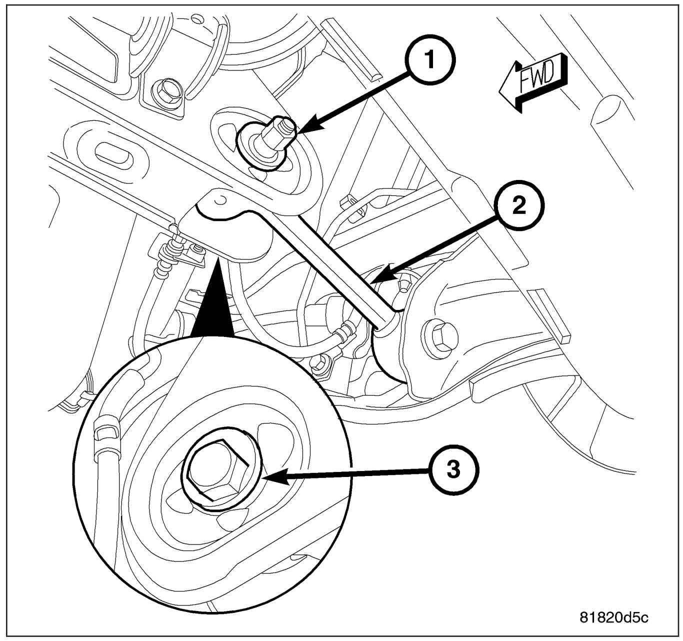
3. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
4. Lower the vehicle.
5. Position the vehicle on an alignment rack/drive-on lift. Raise the vehicle as necessary to access mounting bolts and nuts.
6. Tighten the upper control arm mounting bolt at the crossmember to 95 N·m (70 ft. lbs.).
7. Tighten the upper control arm mounting bolt nut at the trailing link to 95 N·m (70 ft. lbs.).
8. Perform wheel alignment as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)



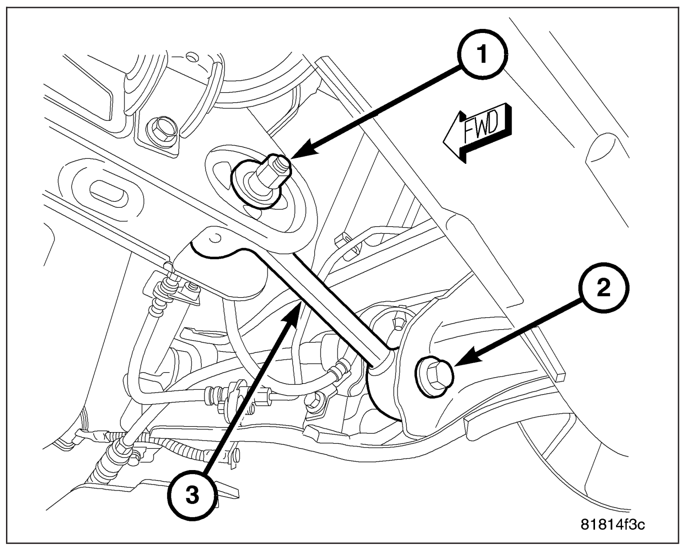
LINK-TOE

REMOVAL

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the bolt (2) securing the toe link (3) to the trailing link.

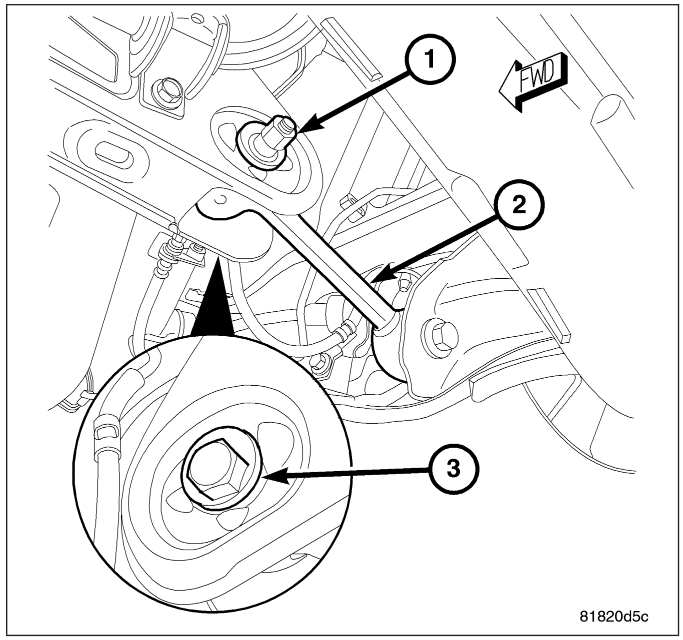


3. Mark the position of the cam bolt cam on the crossmember using a paint marker or crayon. Do not use any type marker that will scratch or damage the surface of the crossmember.
4. While holding the cam bolt head (3) stationary, loosen and remove the toe link mounting cam bolt nut (1) and washer. Remove the cam bolt.
5. Remove the toe link (2).



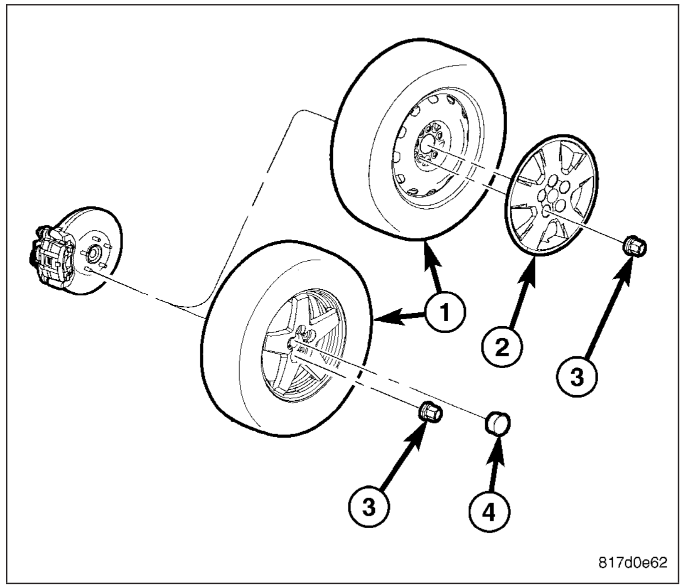
INSTALLATION

CAUTION: When installing the cam bolt (3) and washer make sure the cams stay inside the abutments built into the crossmember. Failure to do so can damage the abutments and make toe adjustment difficult.

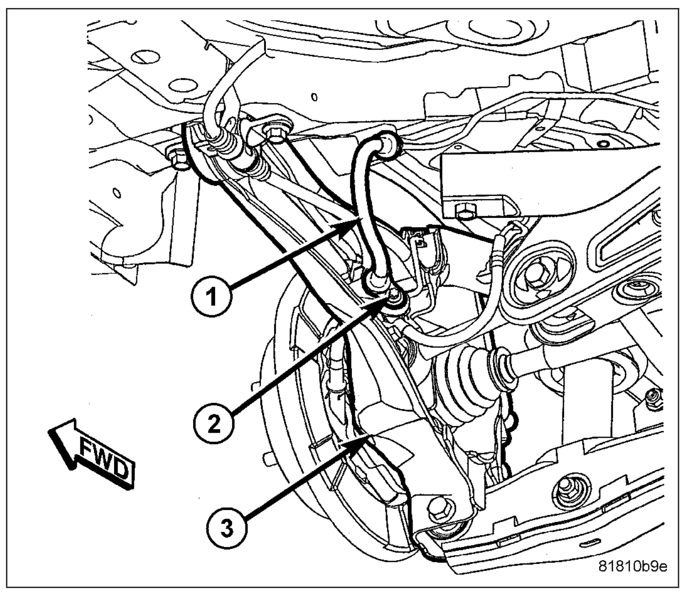


1. Position the toe link (2) and install the cam bolt (3) from the front through the crossmember and link. Match the cam on the bolt to the marks made during removal or position the top of the cam to the 12 O'clock position.
2. Install the cam washer and nut (1) securing the toe link (2) to the trailing link. Do not tighten at this time.

3. Install the bolt (2) securing the link to the crossmember. To install the bolt it may be necessary to flex the trailing link body mount bushing inward or outward using an appropriate prying tool. Do not tighten at this time.
4. Lower the vehicle.
5. Position the vehicle on an alignment rack/drive-on lift. Raise the vehicle as necessary to access mounting bolts and nuts.
6. Tighten the toe link mounting bolt at the trailing link to 95 N·m (70 ft. lbs.).
7. Perform wheel alignment as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

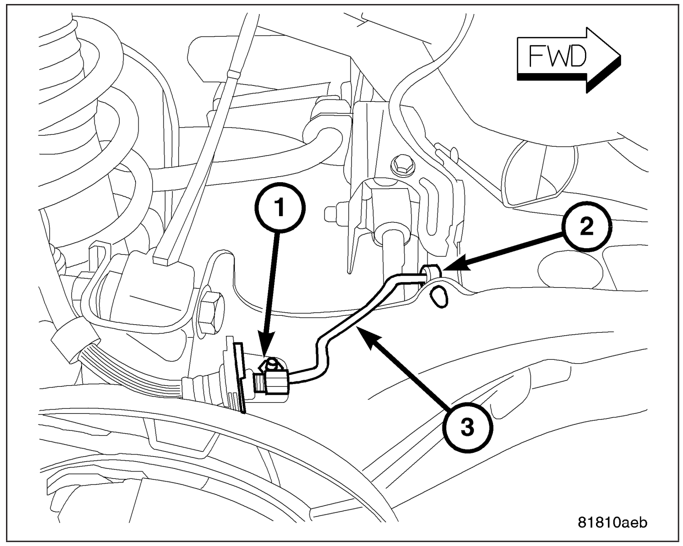


8. Once rear toe is set, while holding the cam bolt head (3) stationary, tighten the toe link mounting cam bolt nut (1) to 25 N·m (18 ft. lbs.).

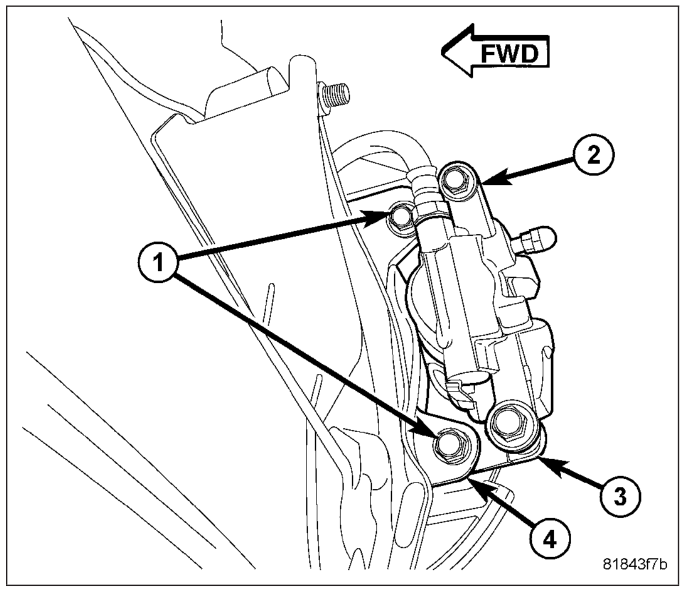


LINK-TRAILING

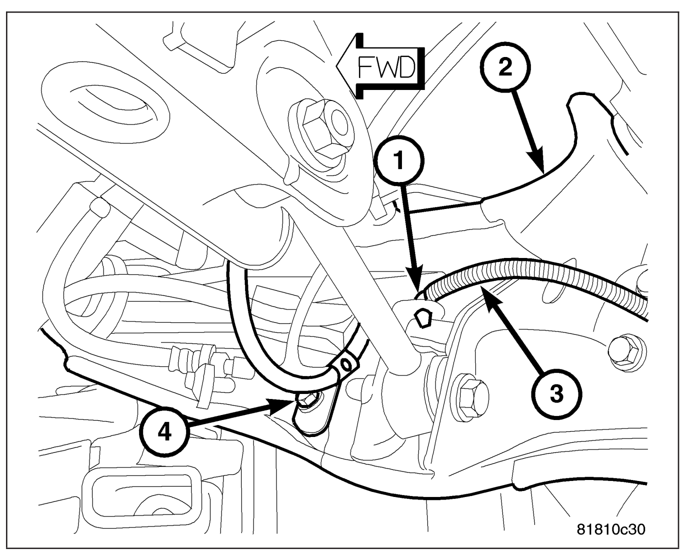
REMOVAL



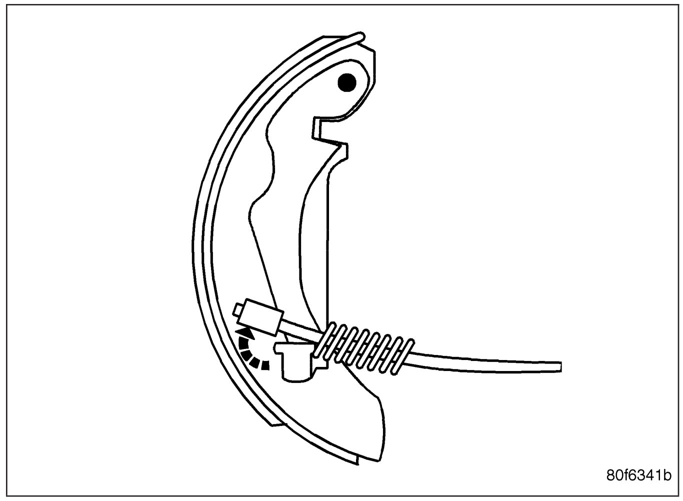
1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).



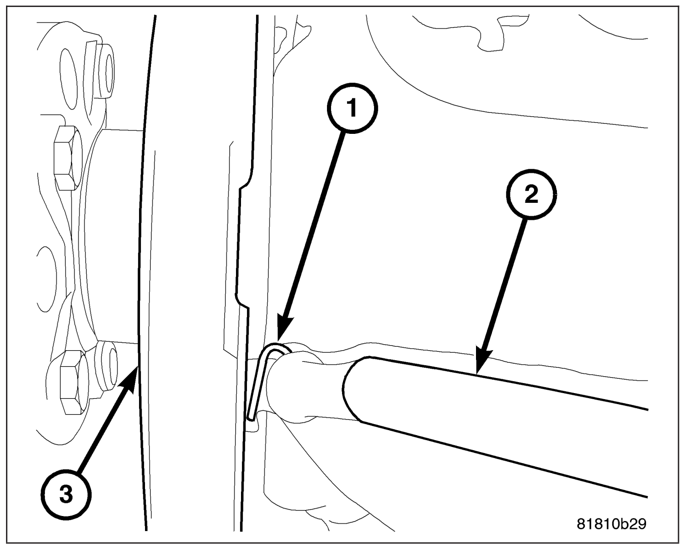
3. Remove the screw (2) securing the brake flex hose (1) to the trailing link (3).



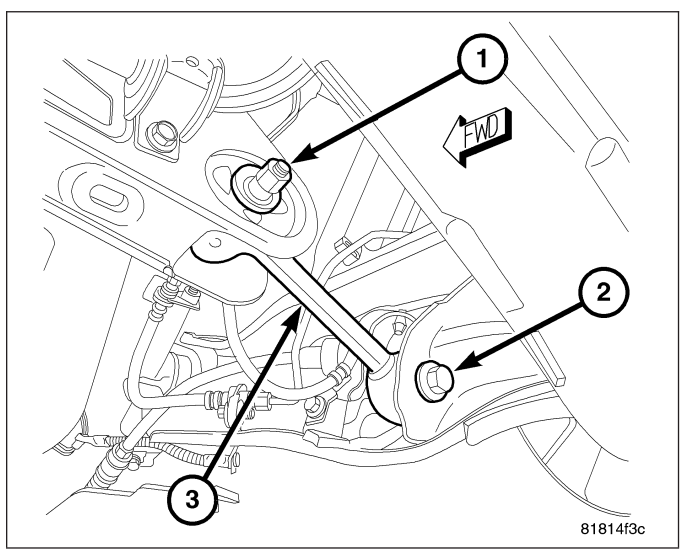
4. Remove the nut (1) securing the brake tube routing bracket to the trailing link.
5. Remove the brake tube (3) from the routing clip (2) on the trailing link.



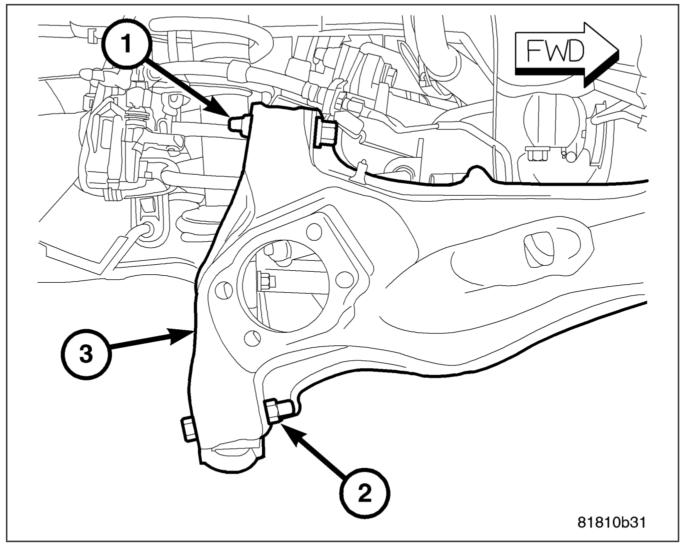
6. Remove the two bolts (1) securing disc brake caliper adapter (3) to the brake support plate (4).
7. Remove the disc brake caliper (2) and adapter (3) as an assembly. Hang the assembly out of the way using wire or a bungee cord. Use care not to overextend the brake hose and tubing when doing this.



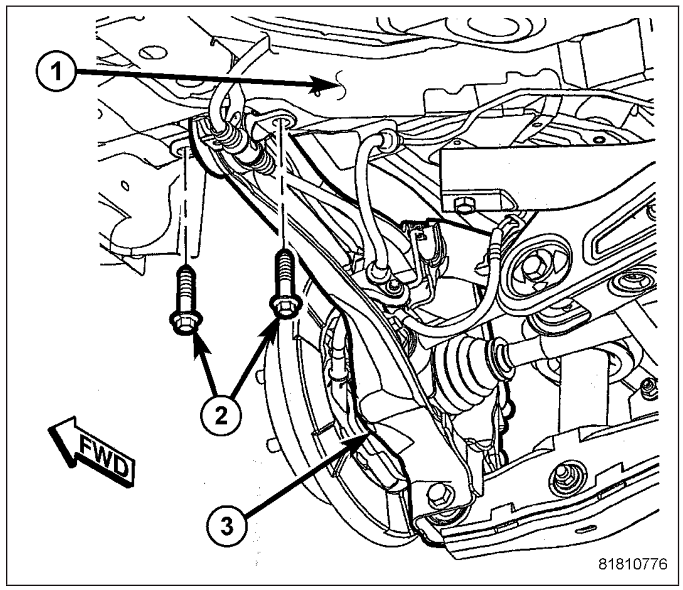
8. If equipped, remove the screw (4) fastening the wheel speed sensor (3) to the trailing link (2).
9. If equipped, remove the routing clip (1) fastening the wheel speed sensor (3) to the trailing link (2).
10. Remove the brake rotor, then hub and bearing. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)



11. Remove the parking brake cable from the lever on the parking brake shoe.

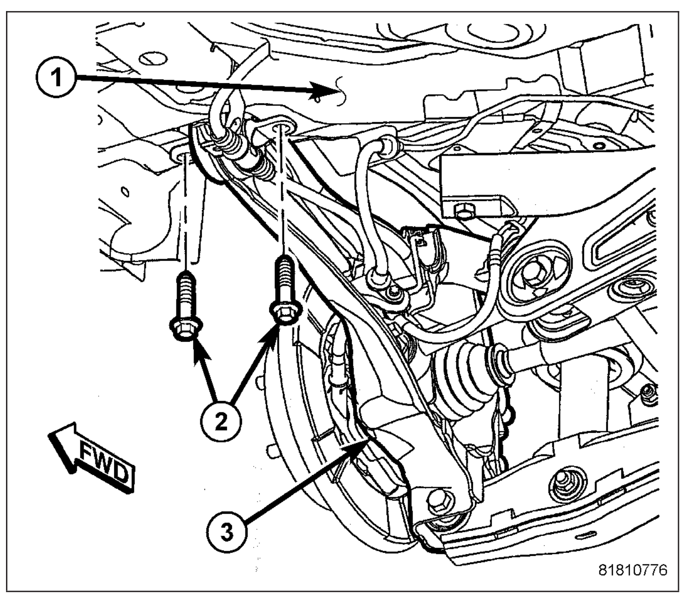


12. Remove the hair pin (1) securing the parking brake cable (2) to the brake support plate (3).
13. Slide the brake support plate (3) with parking brake shoes off the end of the parking brake cable (2) and remove.
14. Pull the parking brake cable from the trailing link.

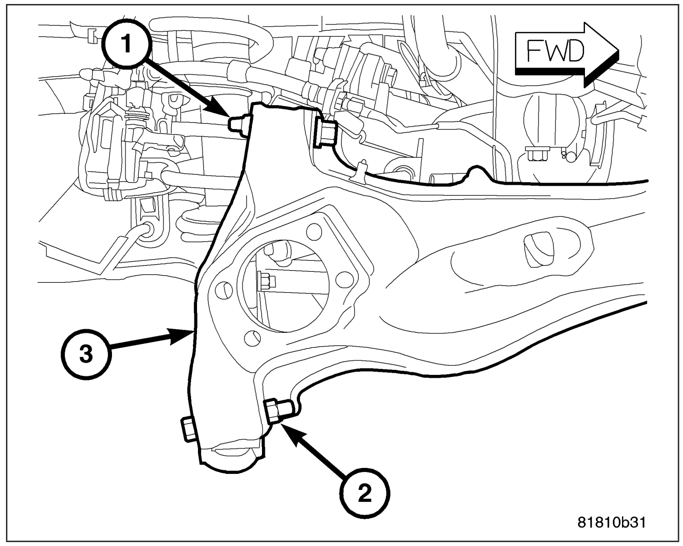


15. Remove the bolt (2) securing the toe link (3) to the trailing link.

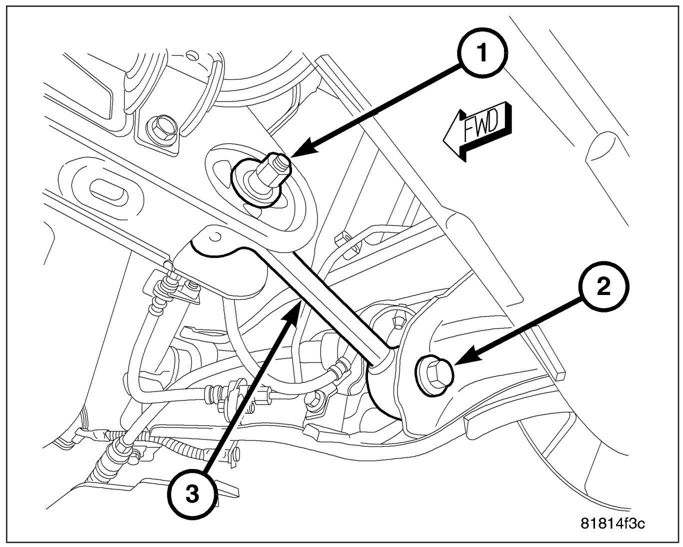
16. Remove the nut (2) and bolt securing the lower control arm to the trailing link (3).
17. Remove the nut (1) and bolt securing the upper control arm to the trailing link (3).



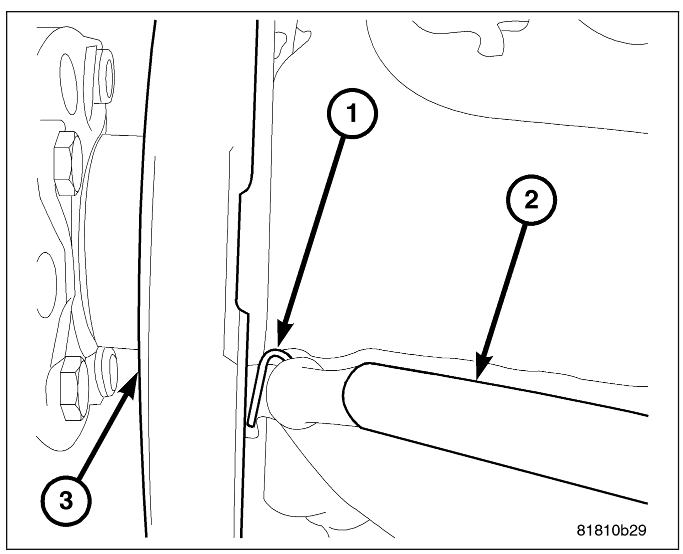
18. Remove the two bolts (2) fastening the leading end of the trailing link (3) to the body (1).
19. Remove the trailing link.



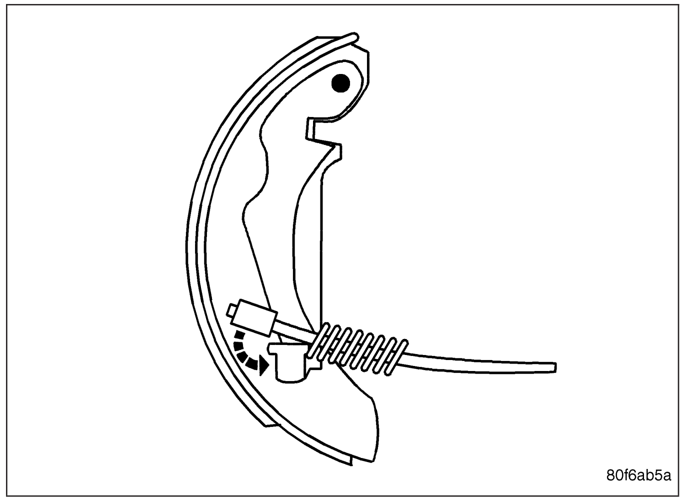
INSTALLATION



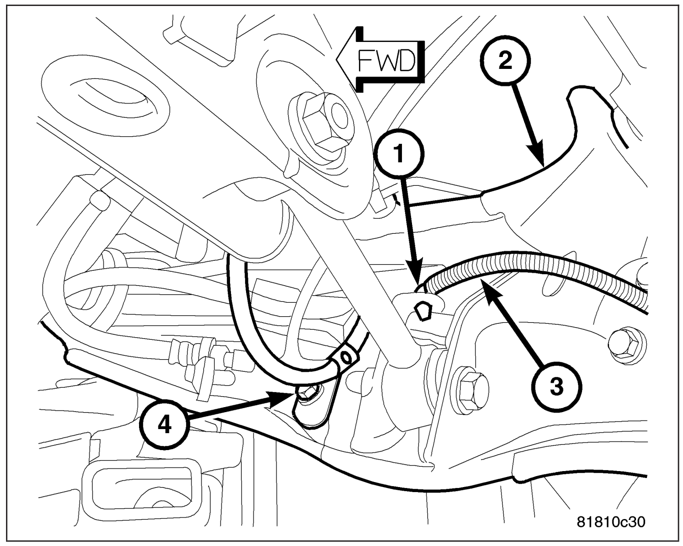
1. Position the trailing link and install the two bolts (2) fastening the leading end of the trailing link (3) to the body (1). Tighten the two mounting bolts to 60 N·m (44 ft. lbs.).



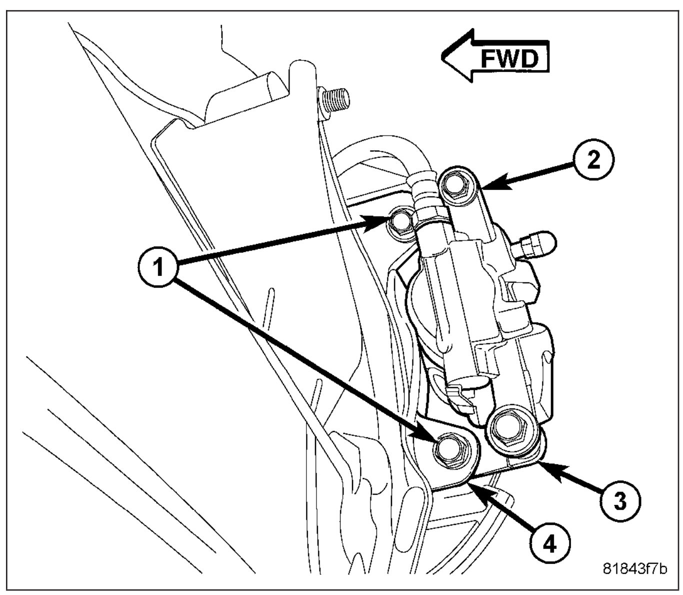
2. Position the upper control arm on the trailing link (3) and install the bolt and nut (1) securing the arm to the link. Tighten the mounting bolt nut to 95 N·m (70 ft. lbs.).
3. Position the lower control arm on the trailing link (3) and install the bolt and nut (2) securing the arm to the link. Tighten the mounting bolt nut to 95 N·m (70 ft. lbs.).



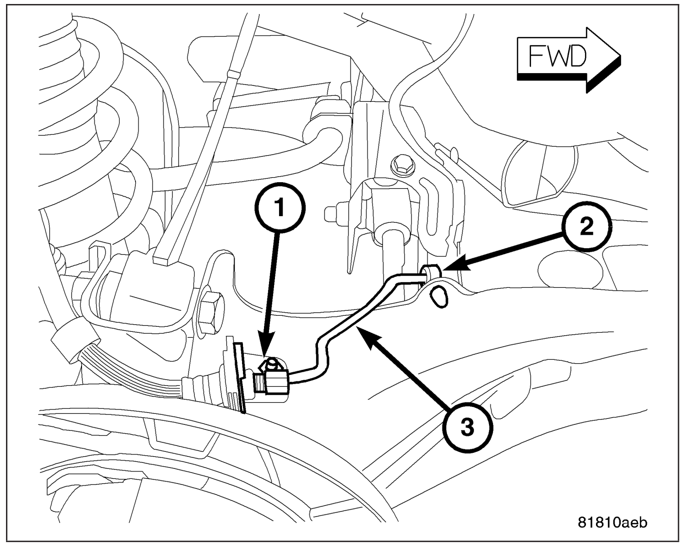
4. Install the bolt (2) securing the toe link to the trailing link. To install the bolt it may be necessary to flex the trailing link body mount bushing inward or outward using an appropriate prying tool. Tighten the mounting bolt to 95 N·m (70 ft. lbs.).



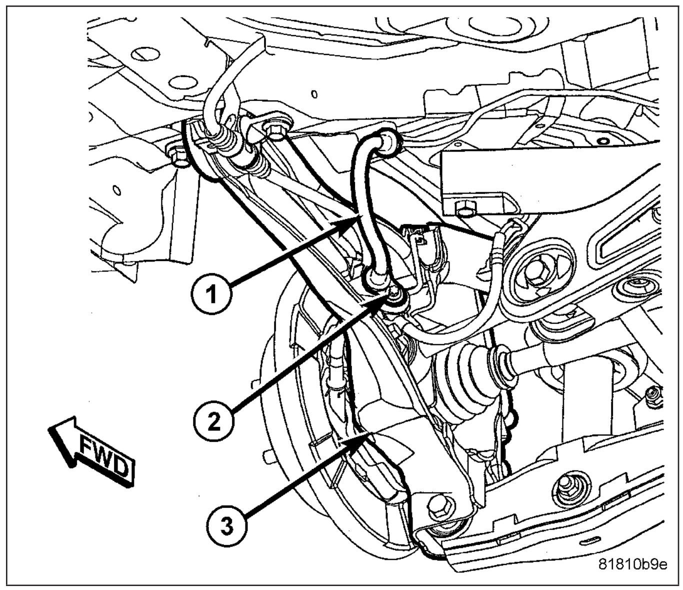
5. Insert the parking brake cable through the trailing link from the inboard side.
6. Slide the parking brake cable (2) into the brake support plate (3) with parking brake shoes.
7. Install the hair pin (1) securing the parking brake cable (2) to the brake support plate (3).



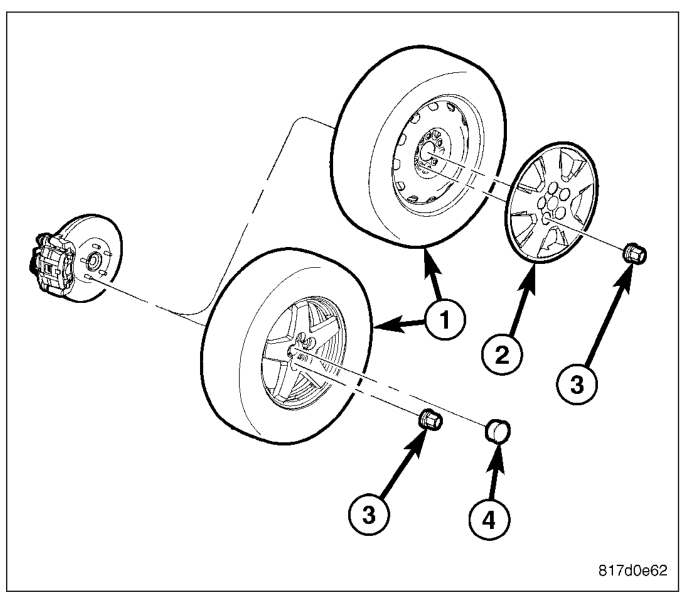
8. Install the parking brake cable onto the lever on the parking brake shoe.



9. If equipped, position the wheel speed sensor (3) and install the screw (4) fastening the sensor to the trailing link (2). Tighten the mounting screw to 18 N·m (13 ft. lbs.).
10. If equipped, position the wheel speed sensor (3) and install the routing clip (1) fastening the sensor to the trailing link (2).
11. Install the hub and bearing, then install the brake rotor onto the wheel studs. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - INSTALLATION)



12. Slide the disc brake caliper (2) and adapter (3) assembly over brake rotor and brake support plate.
13. Install the two bolts (1) securing disc brake caliper adapter (3) to the brake support plate (4). Tighten the mounting bolts to 105 N·m (77 ft. lbs.).

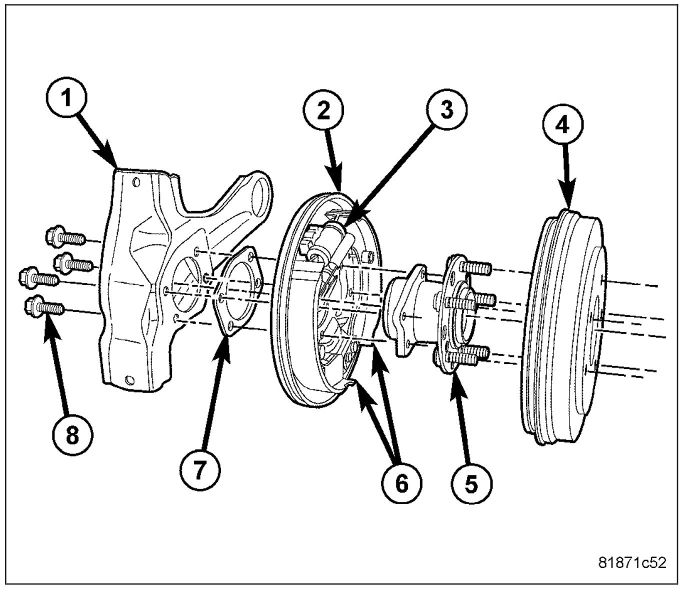


14. Position the brake tube on the trailing link inserting the tube into the routing clip (2) and routing bracket over the welded stud.
15. Install the nut (1) on the welded stud. Tighten the nut to 15 N·m (11 ft. lbs.).

16. Position the brake flex hose (1) at the trailing link (3) bracket and install the mounting screw (2). Tighten the screw to 23 N·m (17 ft. lbs.).

17. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
18. Lower the vehicle.
19. Perform wheel alignment as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

HUB / BEARING



DESCRIPTION

The rear wheel bearing and wheel mounting hub used on this vehicle are a one-piece sealed unit or hub and bearing assembly. It is permanently lubricated when assembled and is sealed for life. There is no periodic lubrication or maintenance recommended for these units.

The hub and bearing (5) is mounted to the trailing link (1).

All vehicles have a magnetic encoder integrated into the right rear hub and bearing for speed sense. Vehicles equipped with antilock brakes have a magnetic encoder integrated into both rear hub and bearings. The encoder works with the rear wheel speed sensors to provide wheel speed signal. The sensor mounts by screw to the rear of the front-wheel-drive hub and bearing while the sensor clips to the rear of the all-wheel-drive hub and bearing.

The only serviceable components of the hub and bearing are the wheel mounting studs pressed into the hub.

DIAGNOSIS AND TESTING

HUB AND BEARING

NOTE: The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.

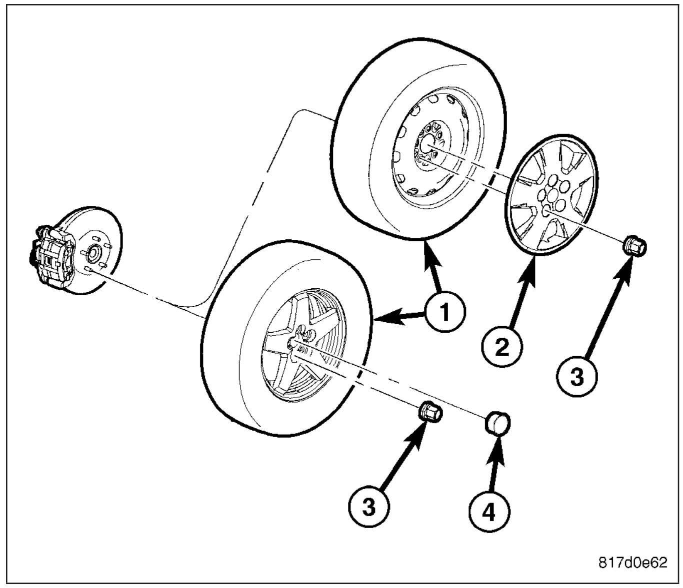
The following procedure may be used for diagnosing the condition of the wheel bearing and hub.

1. Remove the wheel and tire assembly, disc brake caliper and brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL)
2. Rotate the wheel hub checking for resistance or roughness.

Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub and bearing will require replacement. Do not attempt to disassemble the bearing for repair. If the wheel bearing is disassembled for any reason, it must be replaced.

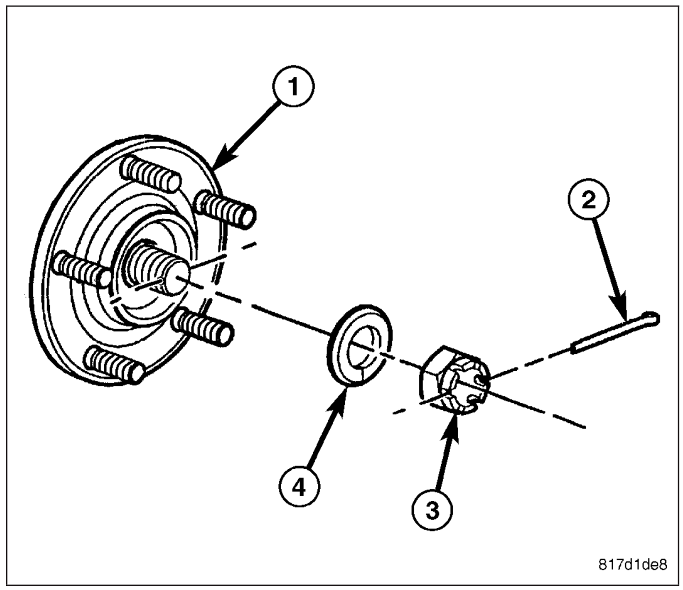
Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease weapage from the bearing is considered normal and should not require replacement of the wheel bearing.

To diagnose a bent hub, measure hub runout. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING)



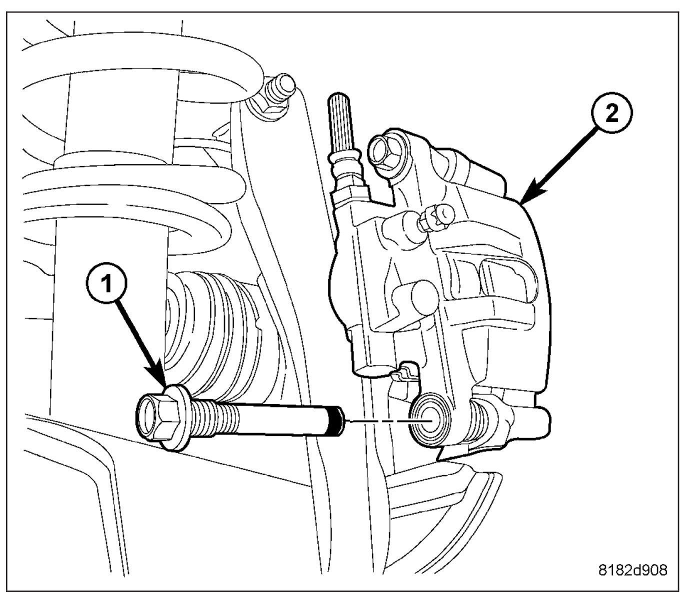
REMOVAL

ALL-WHEEL-DRIVE



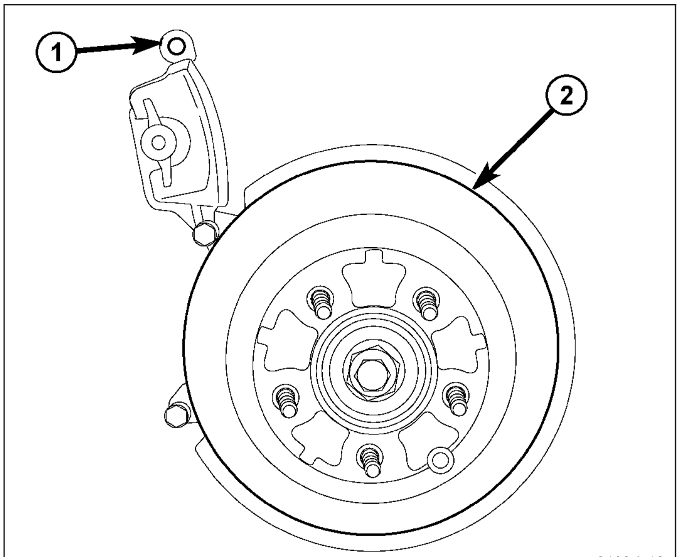
NOTE: Before proceeding, (Refer to 2 - SUSPENSION/REAR - WARNING).

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

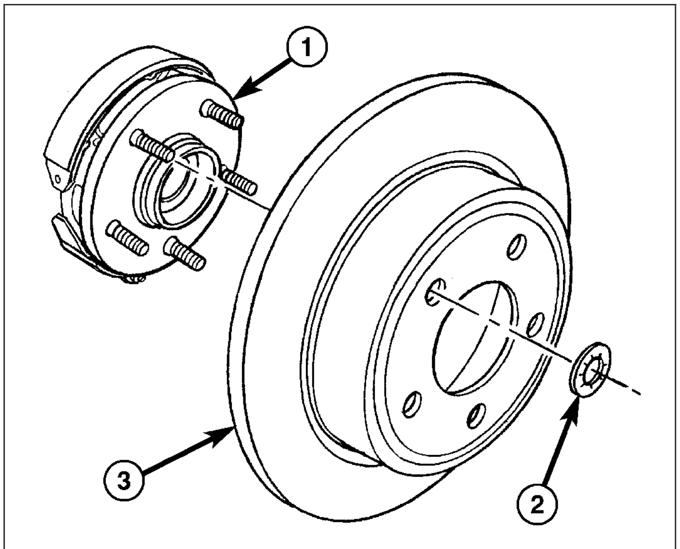


2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).

3. Remove the cotter pin (2) from the hub nut (3) on the end of the axle half shaft.
4. While a helper applies the brakes to keep the hub (1) from rotating, remove the hub nut (3) and washer (4) from the axle half shaft.
5. Tap the end of the half shaft inward, loosening it from the hub and bearing.

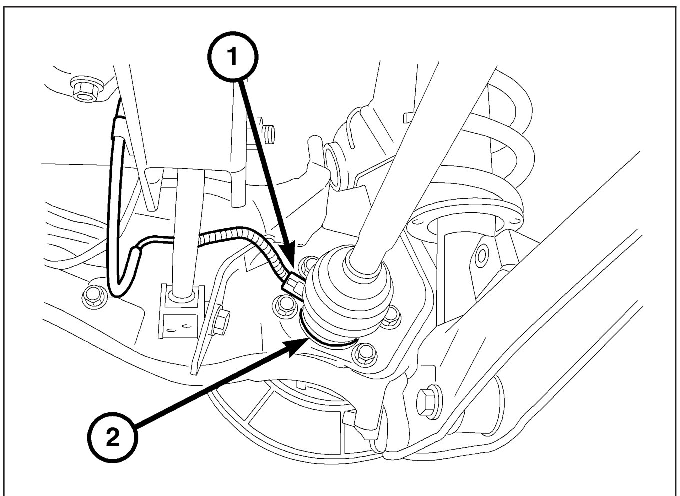


6. Remove the disc brake caliper (2) lower guide pin bolt (1).



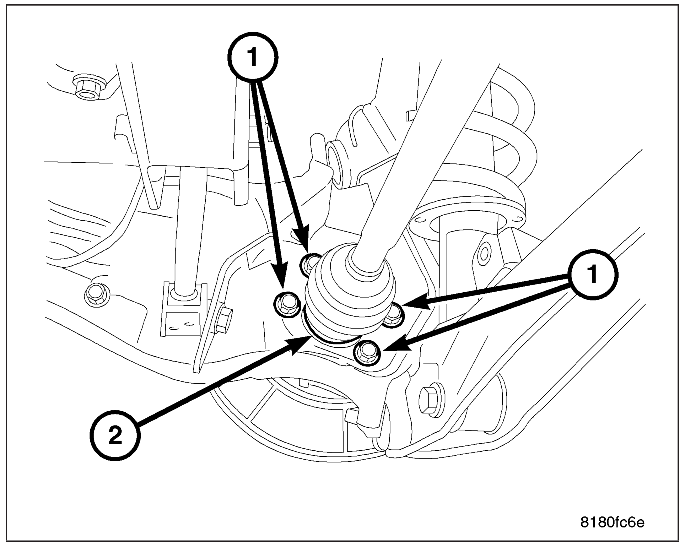
CAUTION: When moving rear brake caliper upward, use extreme care not to damage or over-extend the flex hose. Damage may occur.

7. Rotate the caliper upward hinging off the upper guide pin bolt. Rotate the caliper upward just enough to allow brake rotor removal. Hang the caliper assembly in this position using wire or a bungee cord.



8182dc10

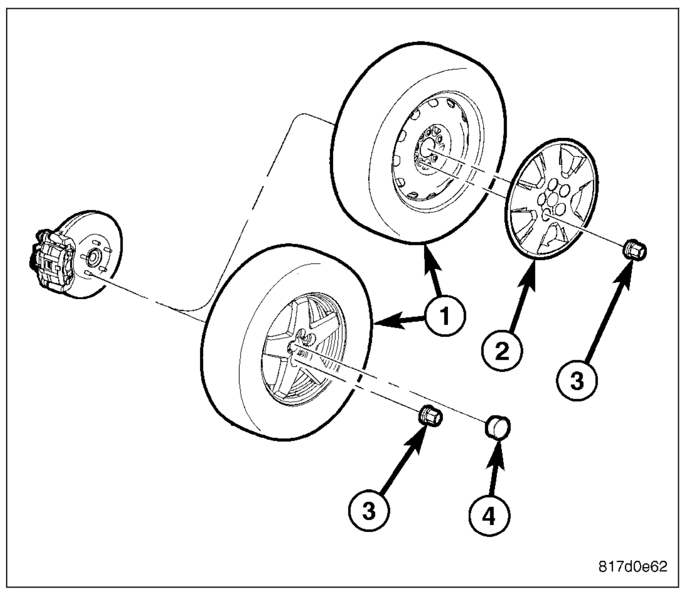
8. Remove any clips (2) retaining the brake rotor (3) to the wheel mounting studs.
9. Slide the brake rotor (3) off the hub and bearing (1).



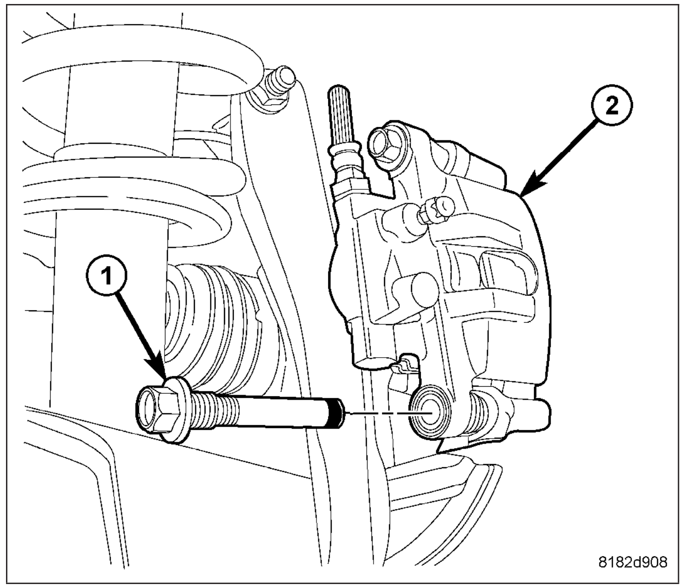
8138a4b2

10. Unclip the wheel speed sensor head (1) from the retainer on the rear of the hub and bearing (2).

8180fc67



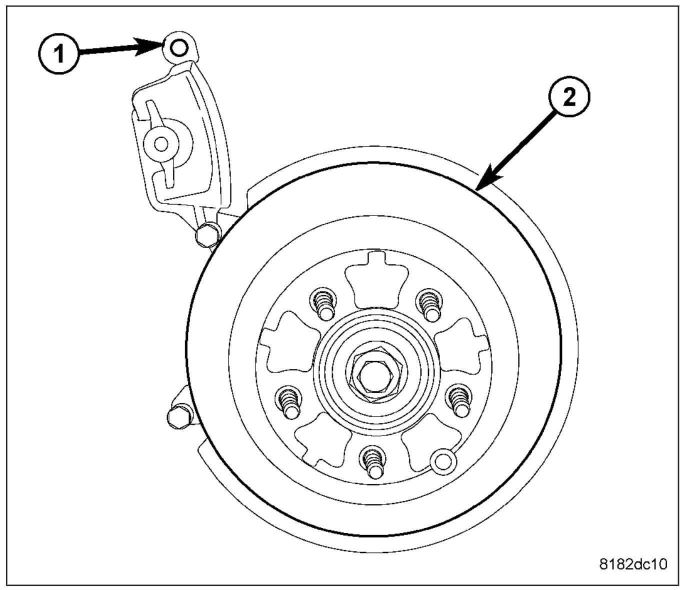
11. Remove the four bolts (1) securing the hub and bearing (2) to the trailing link.
12. Remove the hub and bearing.



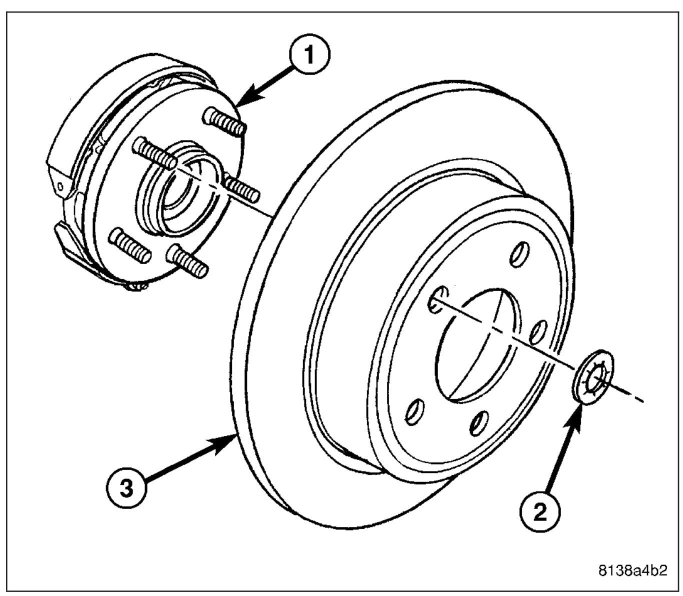
FRONT-WHEEL-DRIVE

NOTE: Before proceeding, (Refer to 2 - SUSPENSION/REAR - WARNING).

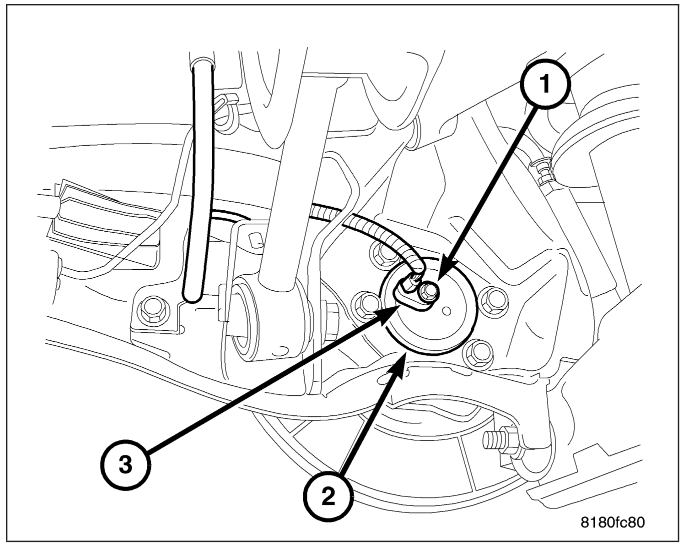
1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel mounting nuts (3), then the rear tire and wheel assembly.



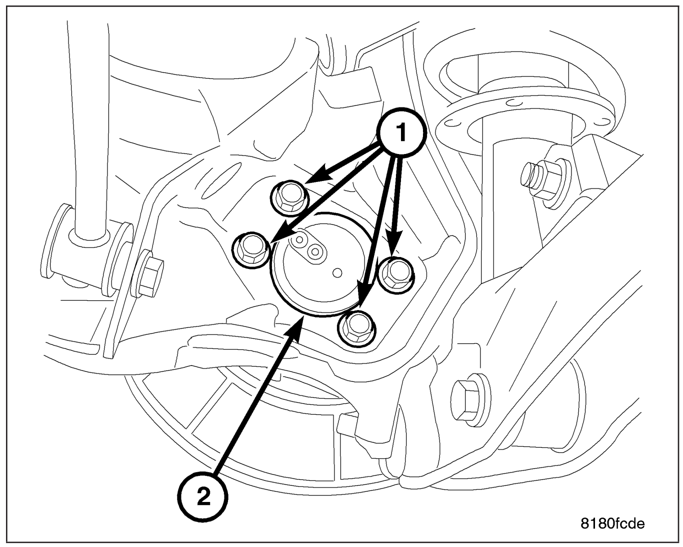
3. Remove the disc brake caliper (2) lower guide pin bolt (1).



CAUTION: When moving rear brake caliper upward, use extreme care not to damage or over-extend the flex hose. Damage may occur.

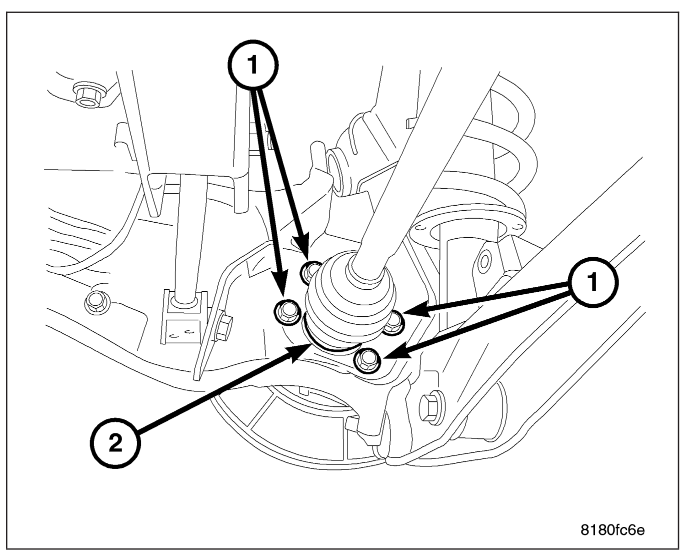


4. Rotate the caliper upward hinging off the upper guide pin bolt. Rotate the caliper upward just enough to allow brake rotor removal. Hang the caliper assembly in this position using wire or a bungee cord.

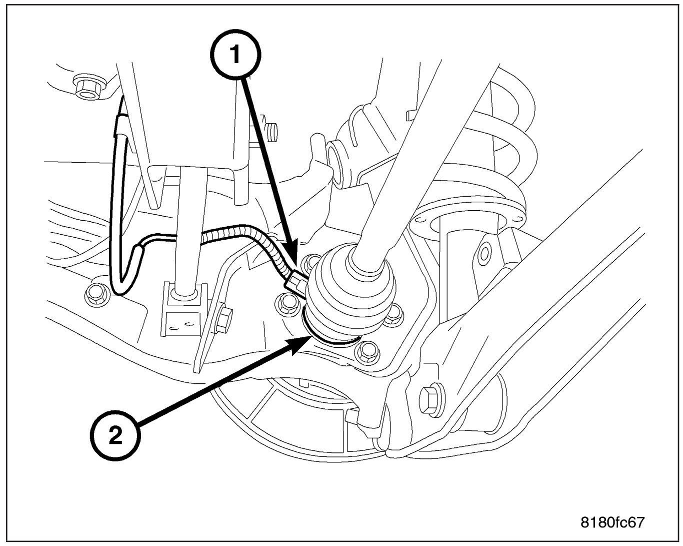


5. Remove any clips (2) retaining the brake rotor (3) to the wheel mounting studs.
6. Slide the brake rotor (3) off the hub and bearing (1).

7. Remove the screw (1) fastening the wheel speed sensor head (3) in the rear of the hub and bearing (2).

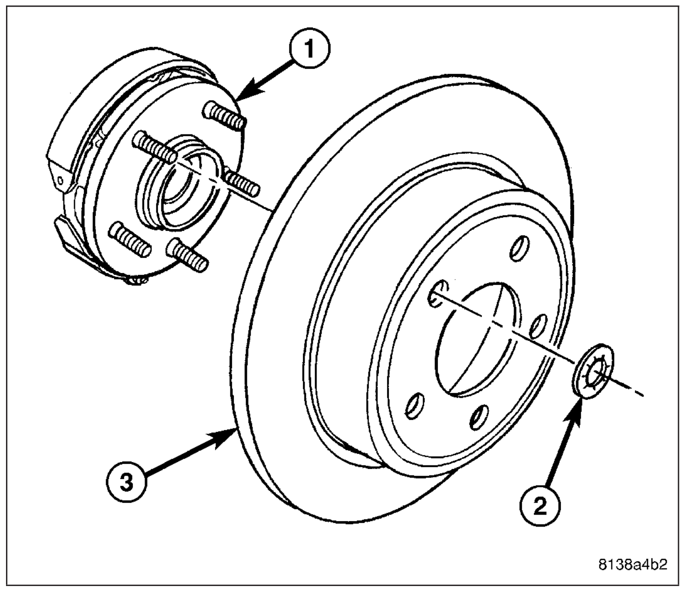


8. Remove the four bolts (1) securing the hub and bearing (2) to the trailing link.
9. Remove the hub and bearing.

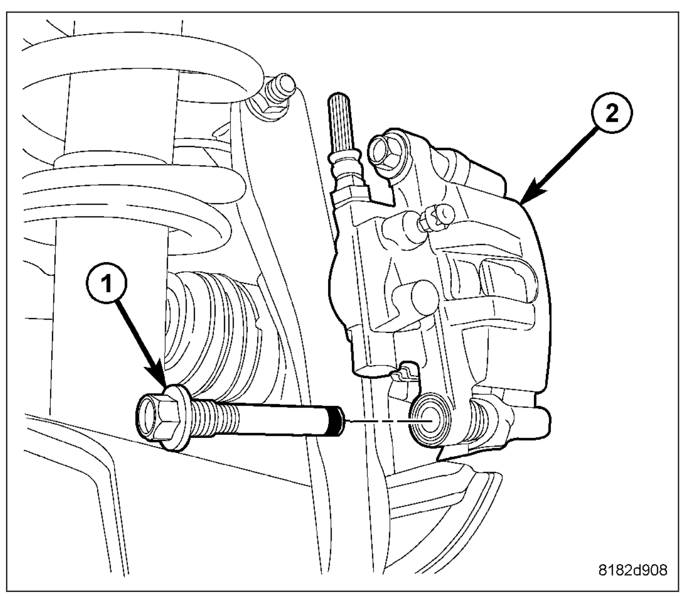


INSTALLATION

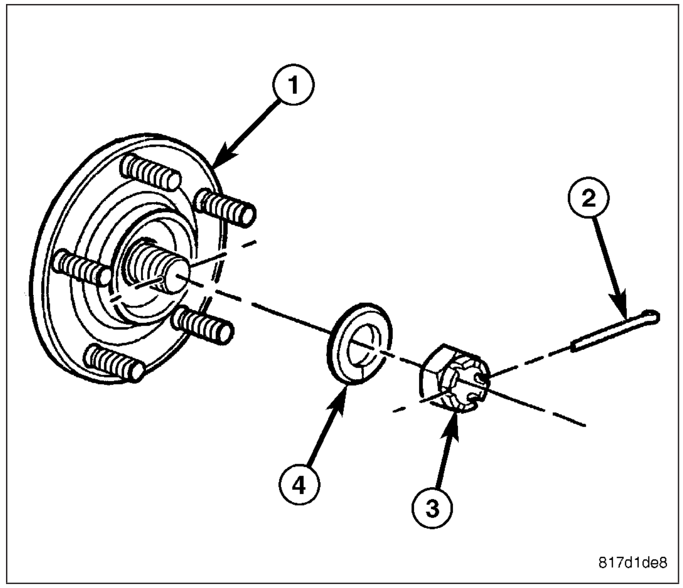
ALL-WHEEL-DRIVE



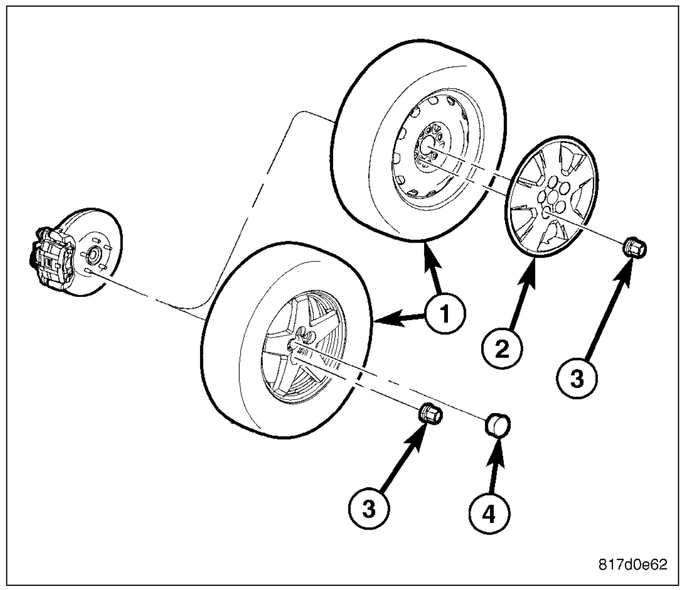
1. Slide the hub and bearing over the axle half shaft and position it on the brake support plate and trailing link.
2. Install the four bolts (1) securing the hub and bearing (2) to the trailing link. Tighten the bolts to 105 N·m (77 ft. lbs.).



3. Clip the wheel speed sensor head (1) (flat side to bearing rear) into the retainer on the rear of the hub and bearing (2).

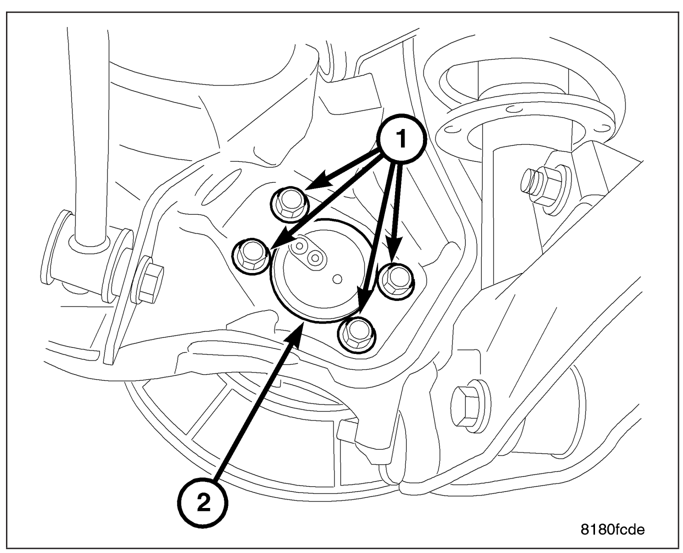


4. Slide the brake rotor (3) over the parking brake shoes and onto the hub and bearing (1).

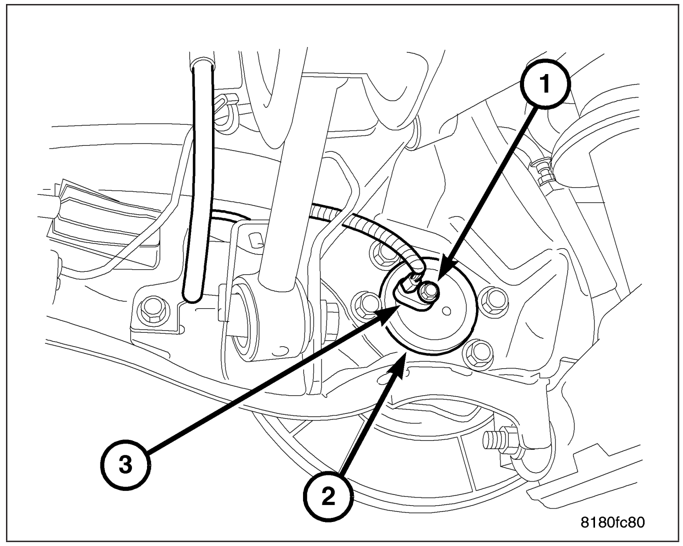


5. Rotate the disc brake caliper downward over the brake rotor and lower part of caliper adapter.
6. Install the disc brake caliper (2) lower guide pin bolt (1). Tighten the guide pin bolt to 60 N·m (44 ft. lbs.).

7. Clean all foreign matter from the threads of the half shaft outer C/V joint.
8. Install the washer (4) and hub nut (3) on the end of the half shaft and snug it.
9. While a helper applies the brakes to keep the hub (1) from rotating, tighten the hub nut (3) to 245 N·m (181 ft. lbs.).
10. Insert the cotter pin (2) through the notches in the nut and the hole in half shaft. If the notches in the nut do not line up with the hole in the half shaft, continue to tighten the nut until they do. **Do not loosen the nut.**
11. Wrap the cotter pin (2) ends tightly around the lock nut.

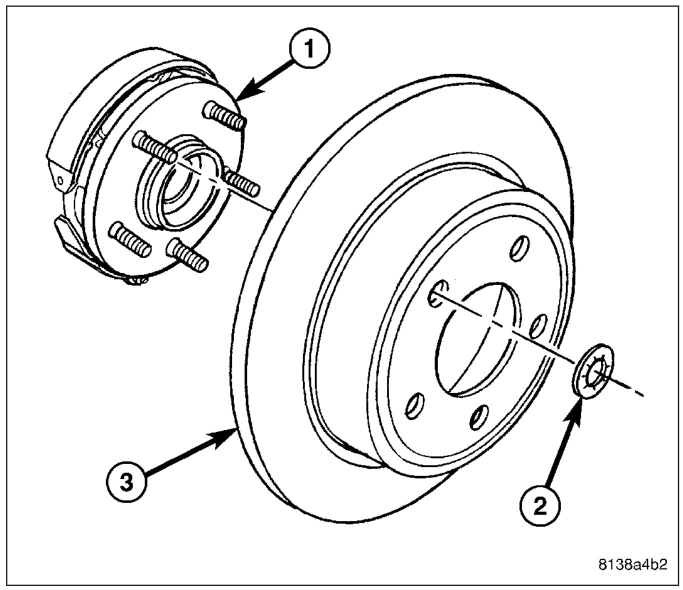


12. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
13. Lower the vehicle.
14. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving it.

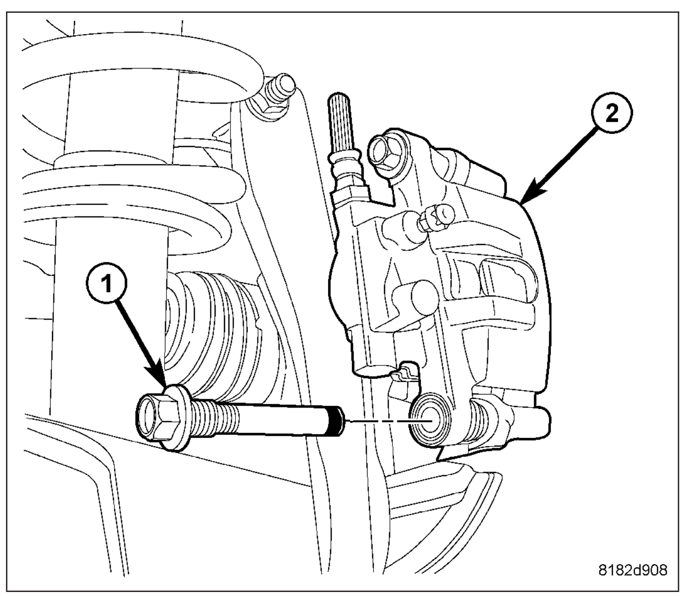


FRONT-WHEEL-DRIVE

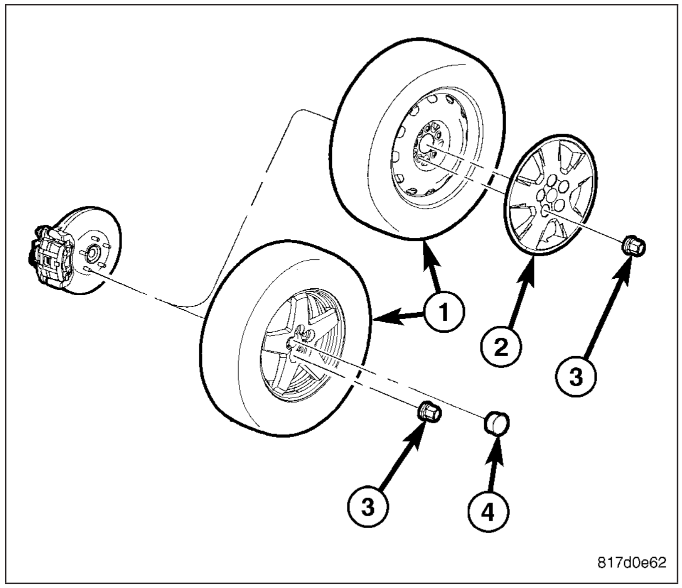
NOTE: If equipped, make sure the wheel speed sensor mount on the rear of the hub and bearing is directed toward the front of the vehicle.



1. Position the hub and bearing on the brake support plate and trailing link.
2. Install the four bolts (1) securing the hub and bearing (2) to the trailing link. Tighten the bolts to 105 N·m (77 ft. lbs.).



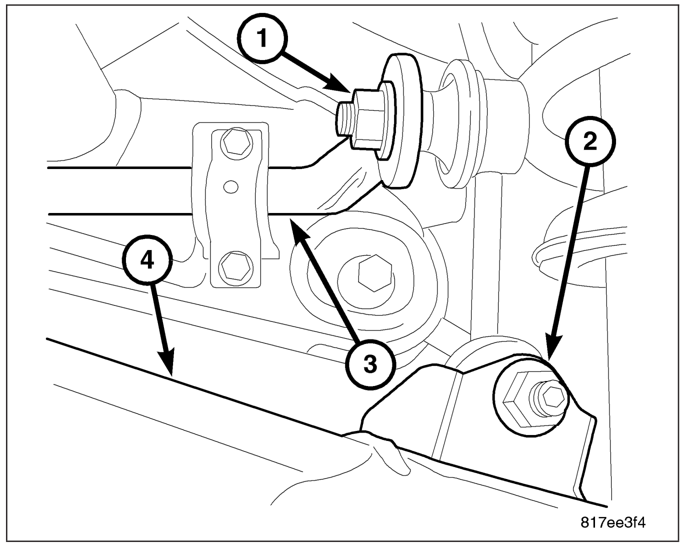
3. If equipped, install the wheel speed sensor head (3) into the rear of the hub and bearing (2).
4. Install the wheel speed sensor head mounting screw (1). Tighten the screw to 10 N·m (89 in. lbs.).



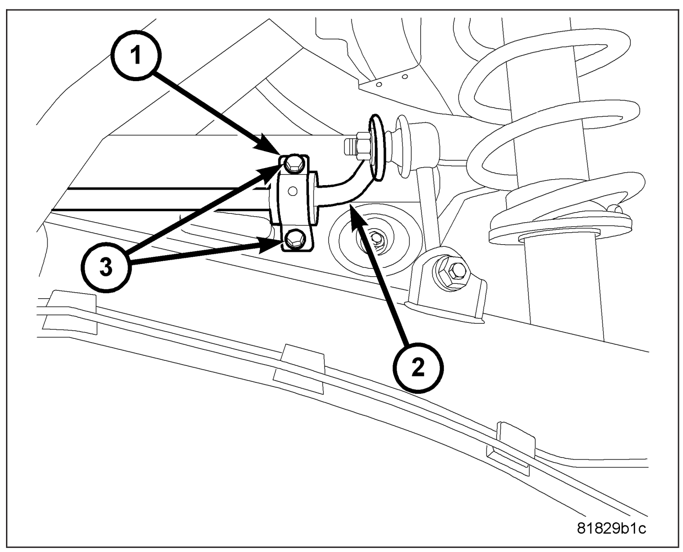
5. Slide the brake rotor (3) over the parking brake shoes and onto the hub and bearing (1).

6. Rotate the disc brake caliper downward over the brake rotor and lower part of caliper adapter.
7. Install the disc brake caliper (2) lower guide pin bolt (1). Tighten the guide pin bolt to 60 N·m (44 ft. lbs.).

8. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
9. Lower the vehicle.
10. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving it.



BAR-STABILIZER

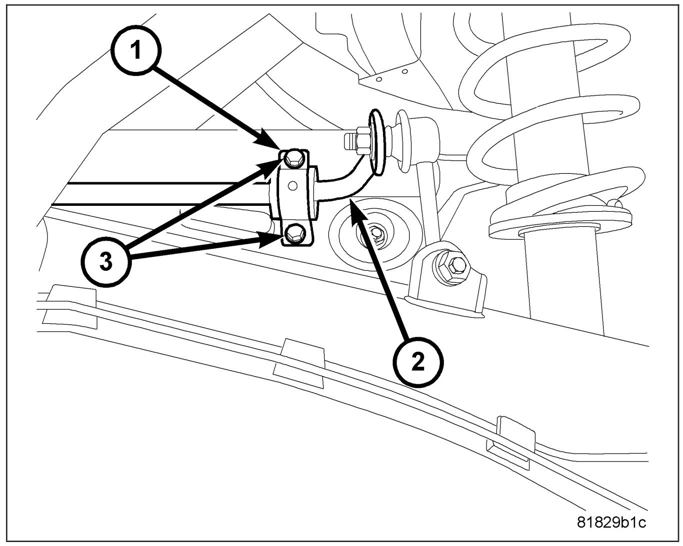


REMOVAL

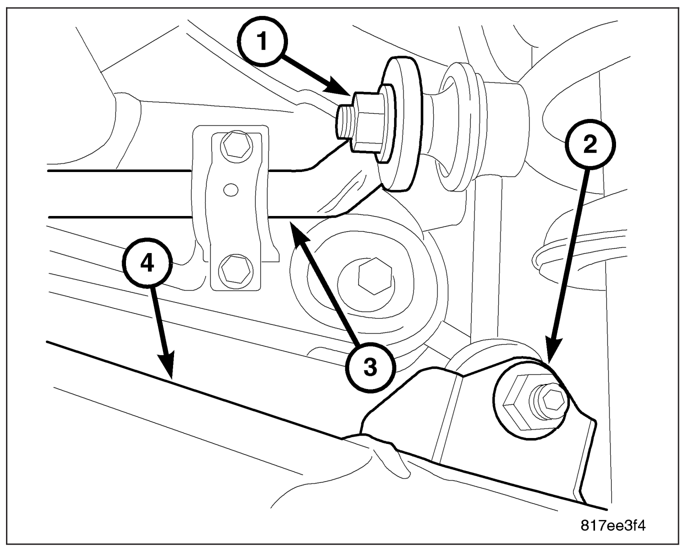
NOTE: Before proceeding, (Refer to 2 - SUSPENSION/REAR - WARNING).

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. On both sides of the vehicle, while holding the stabilizer bar link upper stud stationary, remove the nut (1) securing the link to the stabilizer bar (3).

3. If equipped with all-wheel-drive, remove the rear driveline module. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR DRIVELINE MODULE - REMOVAL)
4. On both sides of the vehicle, remove the screws (3) securing the stabilizer bushing retainers (1) to the crossmember.
5. Remove the two stabilizer bushing retainers.
6. Remove the stabilizer bar (2) from the vehicle.
7. If required, remove the two cushions from the stabilizer bar utilizing the slit cut into the cushions (bushings).

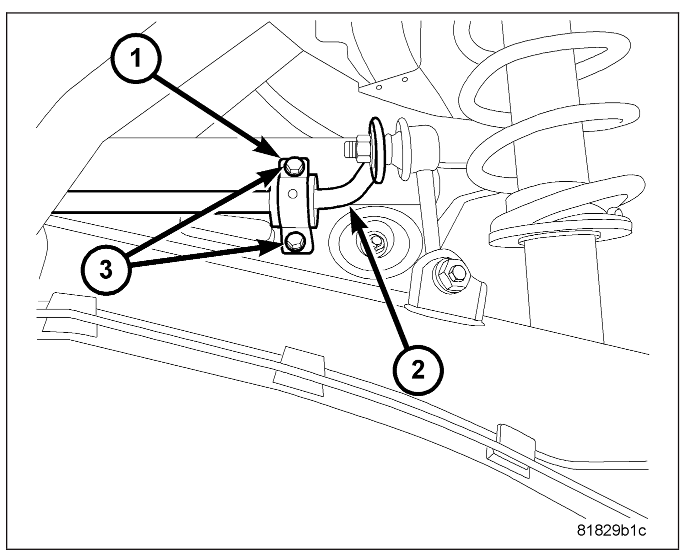


INSTALLATION



1. If required, install the two cushions on the stabilizer bar (one on each side) utilizing the slit cut into the cushions (bushings).

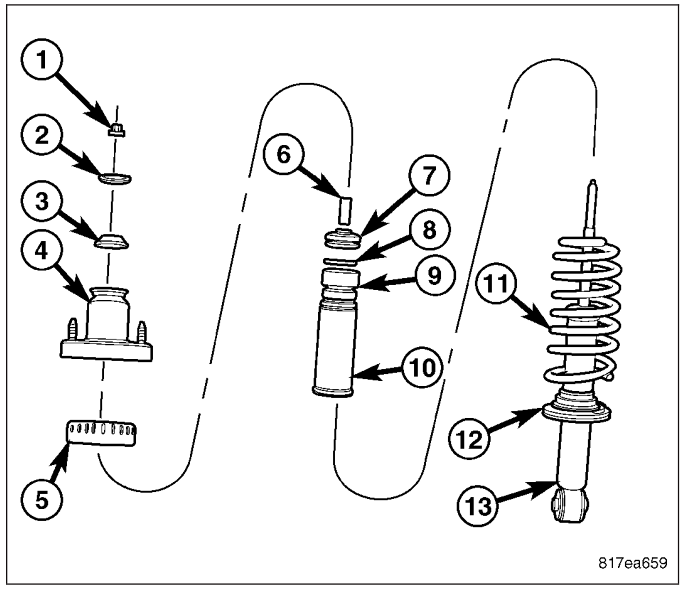
NOTE: When installing the stabilizer bar on a vehicle with all-wheel-drive, position the bar so that the bar loops under the axle half shafts once installed, not over the axle half shafts.



2. Position the stabilizer bar (2) on the rear crossmember.
3. Install the two retainers (1) over the cushions at the mounting holes and install the retainer screws (3). Do not tighten the screws at this time.

4. If equipped with all-wheel-drive, install the rear driveline module. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ REAR DRIVELINE MODULE - INSTALLATION)
5. On each side of the vehicle, install the stabilizer link upper stud in the end of the stabilizer bar (3). Install the nut (1) on each upper stud and while holding the stabilizer link stud stationary, tighten the nut (2) to 58 N·m (43 ft. lbs.).

6. Tighten the cushion retainer screws to 34 N·m (25 ft. lbs.).
7. Lower the vehicle.



SHOCK ASSEMBLY

DESCRIPTION

A coil-over shock absorber assembly supports each side of the vehicle. The bottom of the shock assembly mounts to the lower control arm. The top of the shock assembly mounts to the body.

The shock assembly includes the following major components:

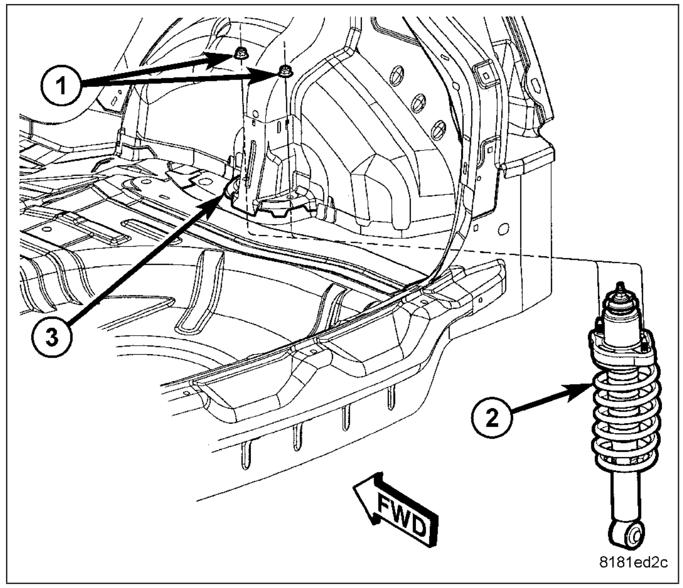
- Upper bushing (3)
- Upper mounting bracket (4)
- Upper spring isolator (5)
- Sleeve (6)
- Lower bushing (7)
- Jounce bumper (9)
- Dust shield (10)
- Coil spring (11)
- Lower spring isolator (12)
- Shock absorber (13)

Each component is serviced by removing the shock assembly from the vehicle and disassembling it.

Coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. If a coil spring requires replacement, be sure that it is replaced with a spring meeting the correct load rating for the vehicle and its specific options.

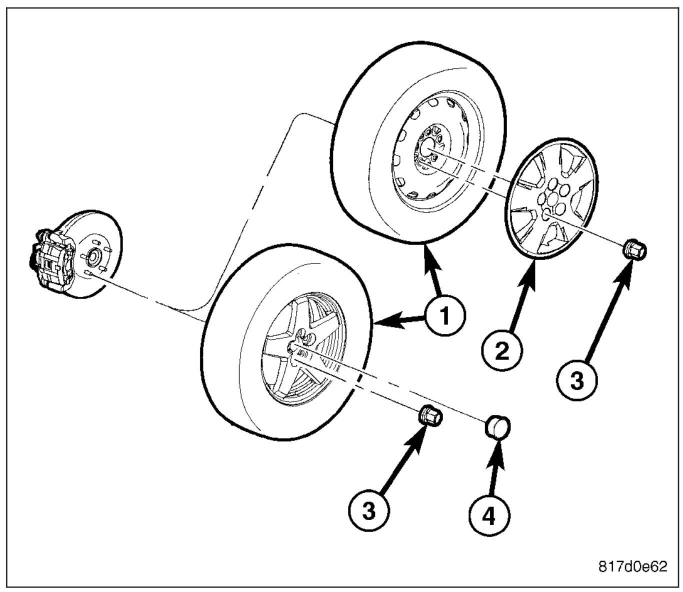
DIAGNOSIS AND TESTING

SHOCK ABSORBER



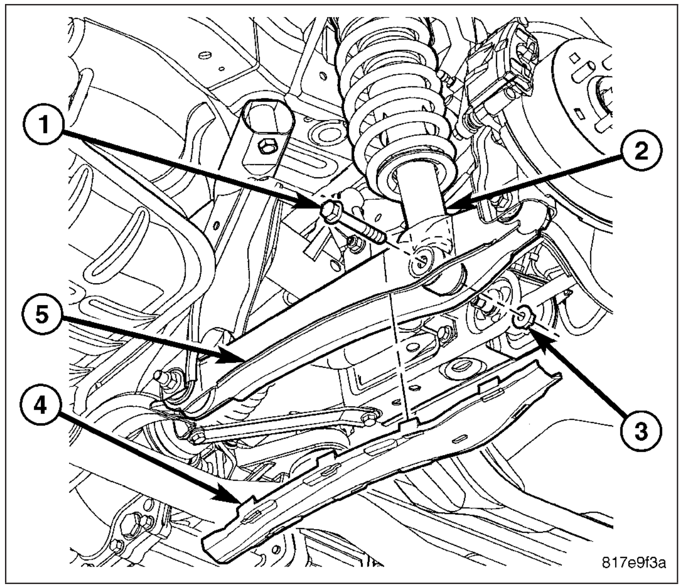
Inspect the shock absorber for damage and evidence of fluid running from the upper end of the fluid reservoir. (Actual leakage will be a stream of fluid running down the side of the reservoir tube and dripping off lower end of unit). A slight amount of seepage between the shaft and shaft seal is not unusual and does not affect performance of the shock absorber.

REMOVAL

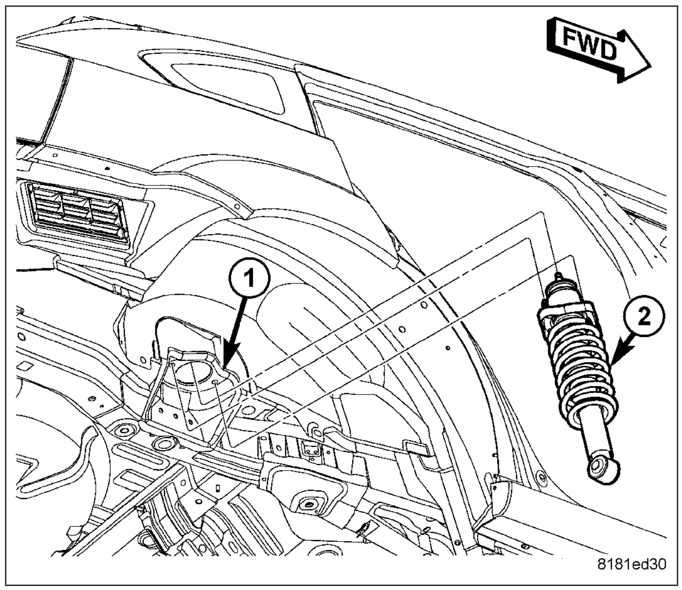


NOTE: Before proceeding, (Refer to 2 - SUSPENSION/REAR - WARNING).

1. Remove the interior rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL)



2. Remove the two nuts (1) securing the shock assembly (2) to the body bracket (3).

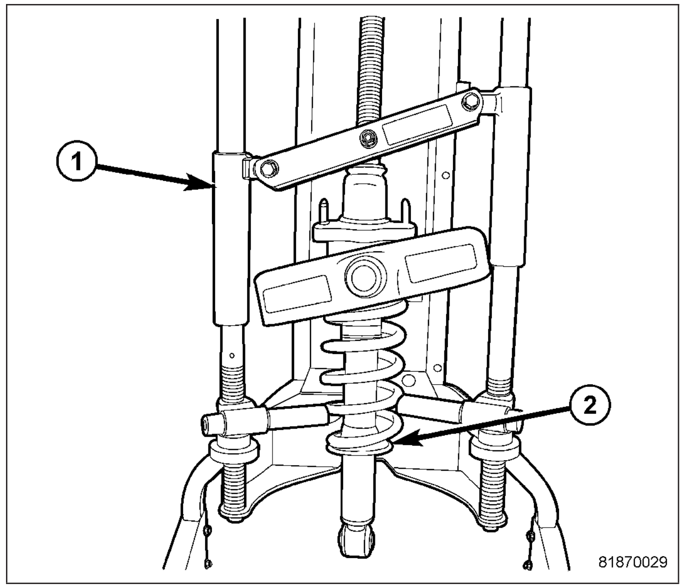


3. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
4. Remove the wheel mounting nuts (3), then the rear tire and wheel assembly.

5. Remove the cover (4) on the bottom of the lower control arm (5).
6. Remove the shock (2) lower mounting nut (3) and bolt (1).

7. Lower the shock assembly (2) out of the body bracket (1) and lift out over rear suspension.

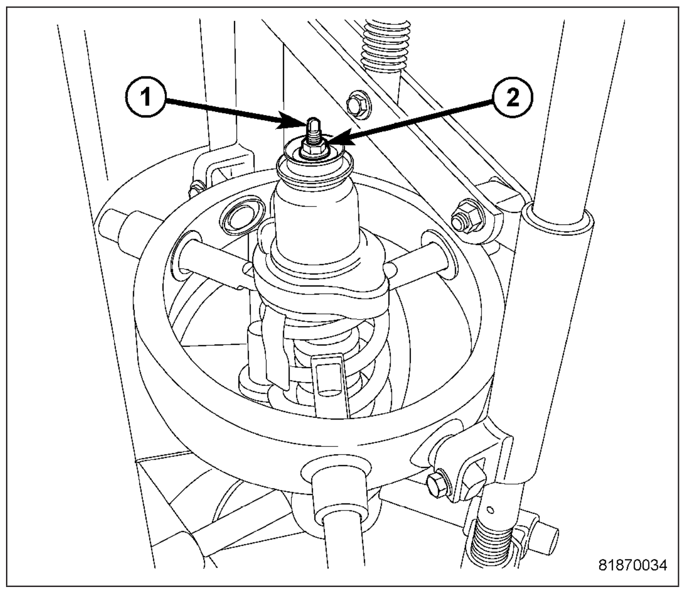
DISASSEMBLY



NOTE: The shock assembly must be removed from the vehicle for it to be disassembled and assembled. (Refer to 2 - SUSPENSION/REAR/SHOCK - REMOVAL)

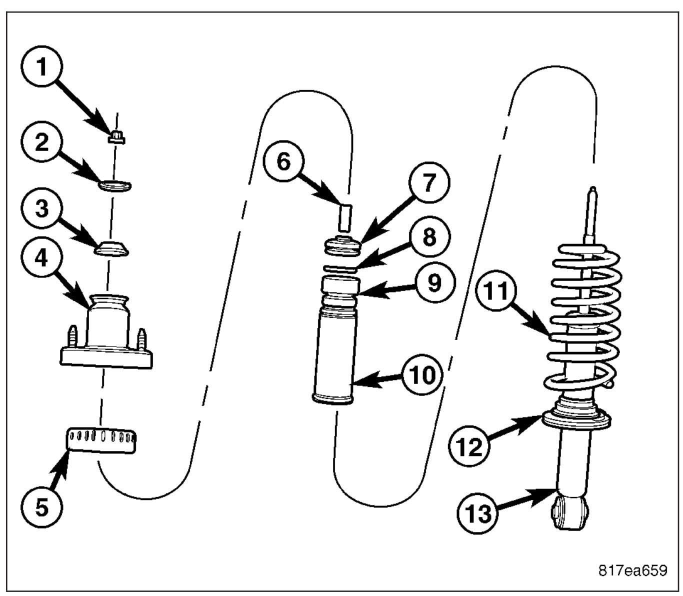
For the disassembly and assembly of the shock assembly, use Strut Spring Compressor, Pentastar Service Equipment (PSE) tool W-7200, or the equivalent, to compress the coil spring. Follow the manufacturer's instructions closely.

WARNING: Do not remove the shock rod nut before the coil spring is properly compressed. The coil spring is held under pressure. The coil spring must be compressed, removing spring tension from the upper mounting bracket, before the shock rod nut is removed.



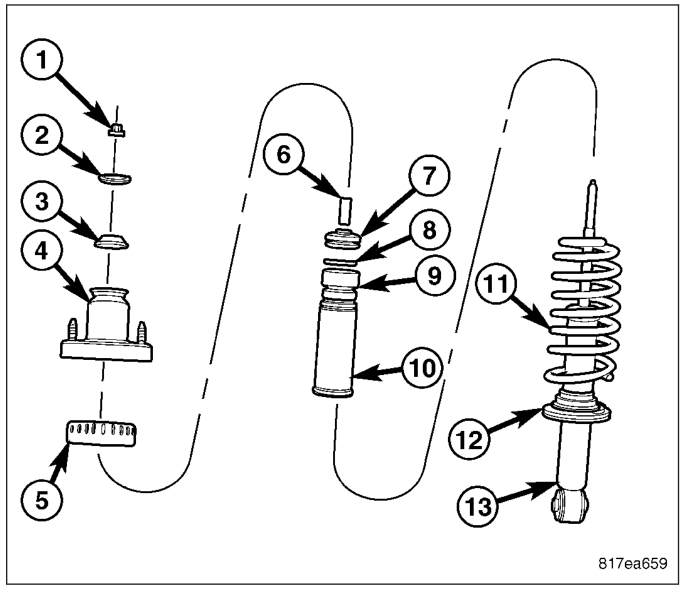
1. If both shocks are being serviced at the same time, mark both the coil spring and shock assembly according to which side of the vehicle the shock is being removed from.

2. Position the shock assembly (2) in the strut spring compressor (1) following the manufacturers instructions and set the lower and upper hooks of the compressor on the coil spring.
3. Compress the coil spring until all spring tension is removed from the upper mounting bracket and bushings.



CAUTION: Never use impact or high speed tools to remove the shock rod nut. Damage to the shock internal bearings can occur.

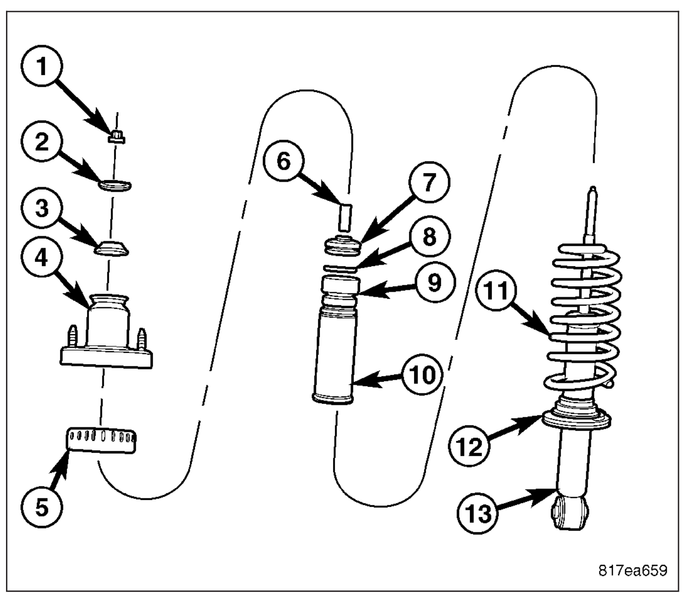
4. Once the spring is sufficiently compressed, install Snap-On® Shock Absorber Socket A139, or equivalent, on the end of the shock rod (1). While holding the shock rod from turning, remove the nut (2) using a wrench. Remove the washer below the nut.



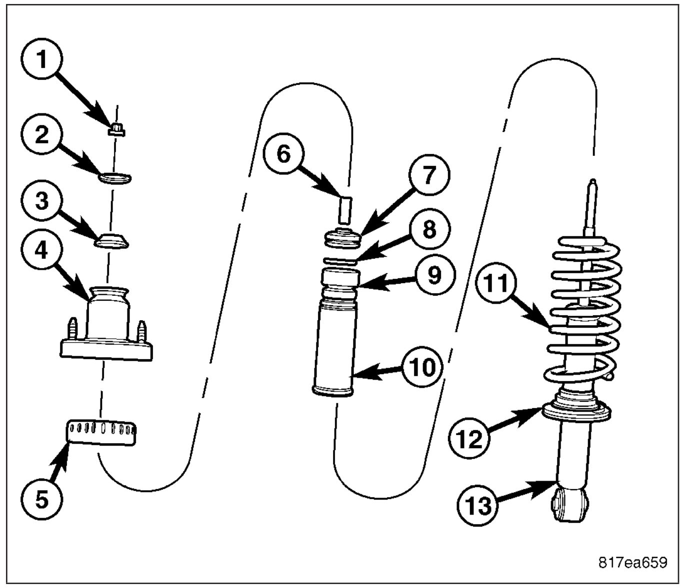
5. Remove the shock absorber (13) out through the bottom of the coil spring (11). The washer (8), jounce bumper (9), dust shield (10) and lower spring isolator will come out with the shock.
6. Slide the washer (8), jounce bumper (9), dust shield (10) from the shock rod.
7. Remove the lower isolator (12) from the shock spring seat.
8. Remove the upper mounting bracket (4), bushings (3, 7), sleeve (6) and upper spring isolator (5) from the top of the spring.
9. Remove the bushings (3, 7), sleeve (6) and upper spring isolator (5) from the upper mounting bracket (4).

NOTE: If the coil spring needs to be serviced, proceed with the next step, otherwise, proceed with step Step 12.

10. Release the tension from the coil spring by backing off the compressor drive completely. Push back the compressor hooks and remove the coil spring.
11. Inspect the shock assembly components for the following and replace as necessary:
    - Inspect the shock (13) for shaft binding over the full stroke of the shaft.
    - Inspect the jounce bumper (9) for cracks and signs of deterioration.
    - Inspect the dust shield (10) for cracks and tears.
    - Check the upper mounting bracket (4) for cracks and distortion and its retaining studs for any sign of damage.
    - Inspect the upper (3) and lower (7) bushings, for material deterioration and signs of deterioration. Inspect the sleeve (6) for wear and distortion.
    - Inspect the upper (5) and lower (12) spring isolators for material deterioration and distortion.
    - Inspect the coil spring (11) for any sign of damage to the coating.



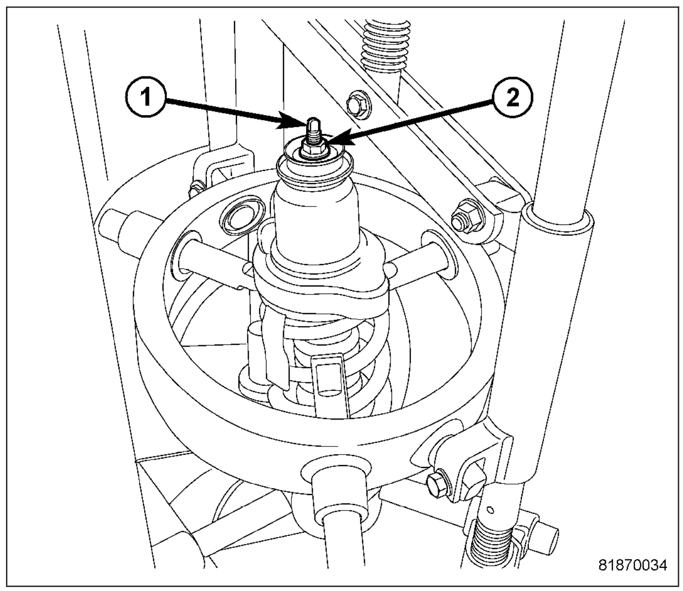
NOTE: For reassembly, (Refer to 2 - SUSPENSION/REAR/SHOCK - ASSEMBLY)



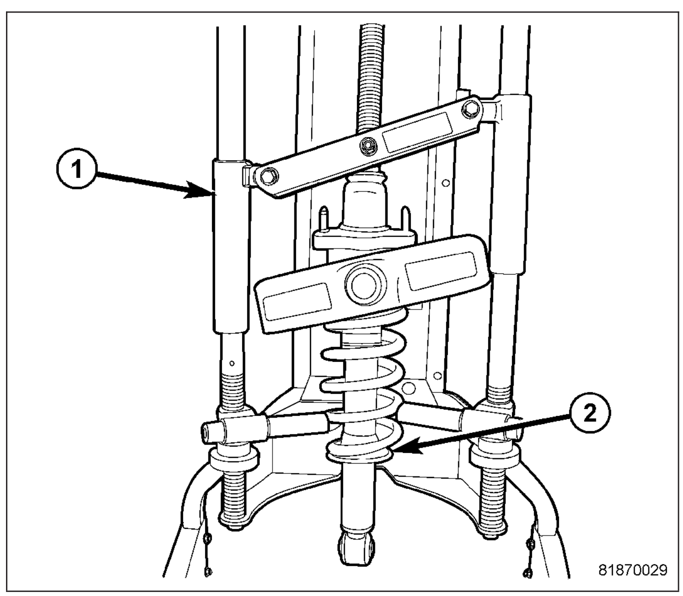
ASSEMBLY

NOTE: If the coil spring has been removed from the spring compressor, proceed with the next step, otherwise, proceed with step Step 3.

1. Place the coil spring in the spring compressor following the manufacturers instructions.
2. Slowly compress the coil spring until enough room is available for shock assembly reassembly.
3. Assemble the bushings (3, 7) and sleeve (6) through the upper mounting bracket (4).
4. Install the upper spring isolator (5) on the upper mounting bracket (4).
5. Install the upper mounting bracket (4) on top of the coil spring.

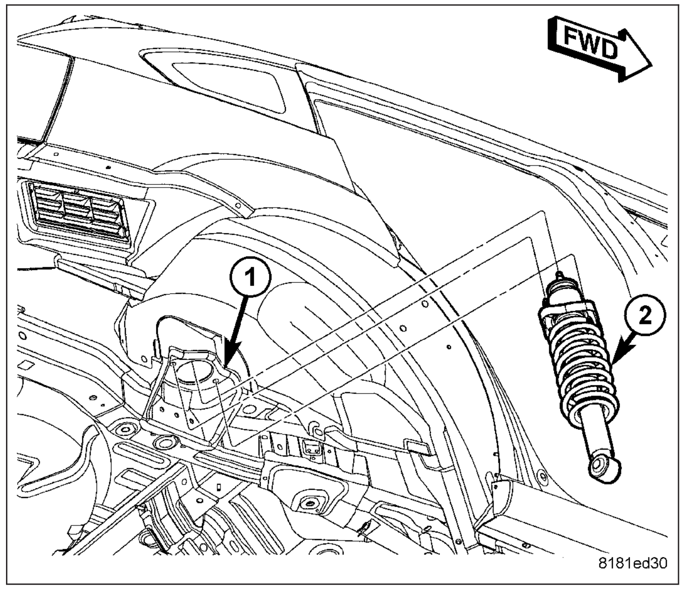


6. Install the lower spring isolator (12) on the spring seat of the shock absorber (13).
7. Slide the dust shield (10), jounce bumper (9) and washer (8) onto the shock rod.
8. Install the shock absorber (13) up through the bottom of the coil spring and upper mounting bracket until the lower spring seat contacts the lower end of the coil spring.
9. While holding the shock absorber in position, install the washer (2) and nut (1) on the end of the shock rod.

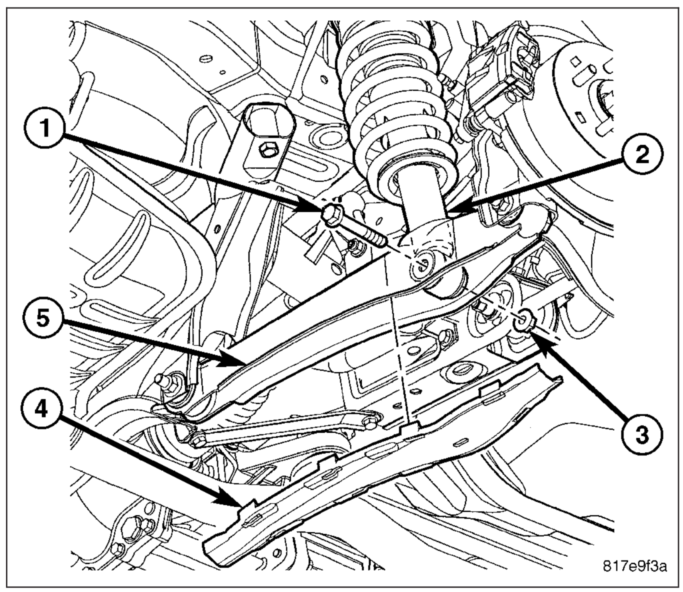


CAUTION: Never use impact or high speed tools to remove the shock rod nut. Damage to the shock internal bearings can occur.

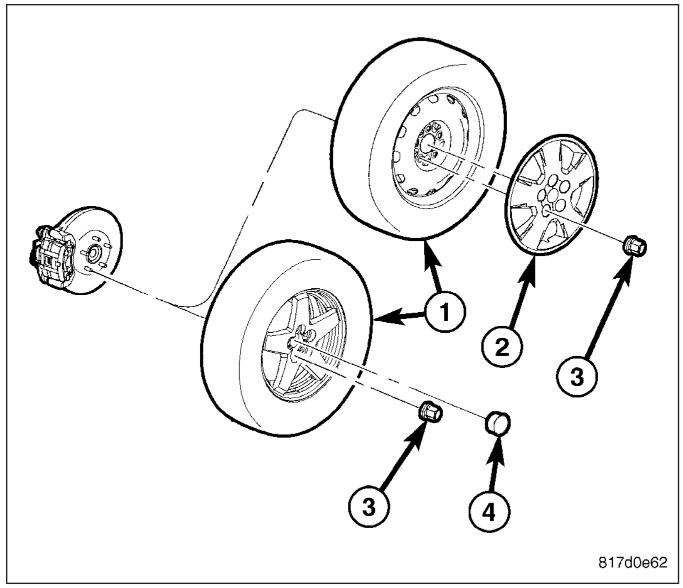
10. Install Snap-On® Shock Absorber Socket A139, or equivalent, on the end of the shock rod (1). While holding the shock rod from turning, tighten the nut (2) using a crows foot wrench and a torque wrench. Tighten the shock rod nut to 24 N·m (18 ft. lbs.).



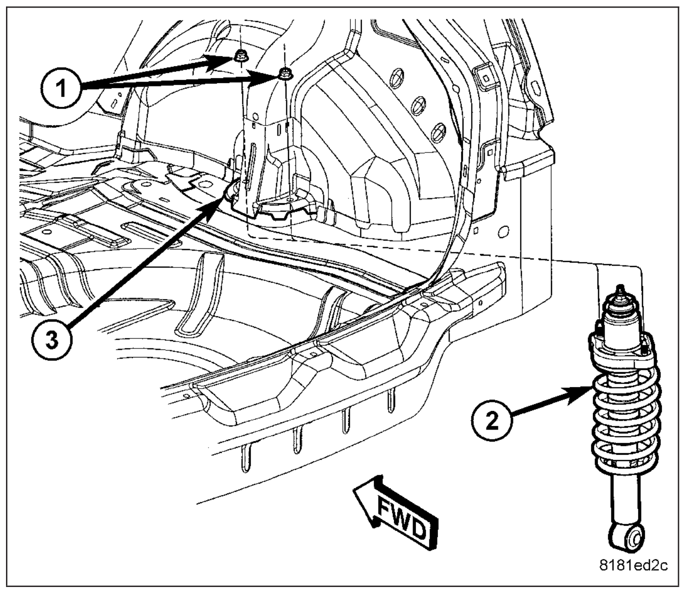
11. Turn the upper mounting bracket or shock absorber as necessary until the mounting studs on the mounting bracket line up with the lower mounting bolt eyelet at the bottom of the shock absorber.
12. Slowly release the tension from the coil spring by backing off the compressor (1) drive completely.
13. Remove the shock assembly from the spring compressor.
14. Install the shock assembly on the vehicle. (Refer to 2 - SUSPENSION/REAR/SHOCK - INSTALLATION)



INSTALLATION

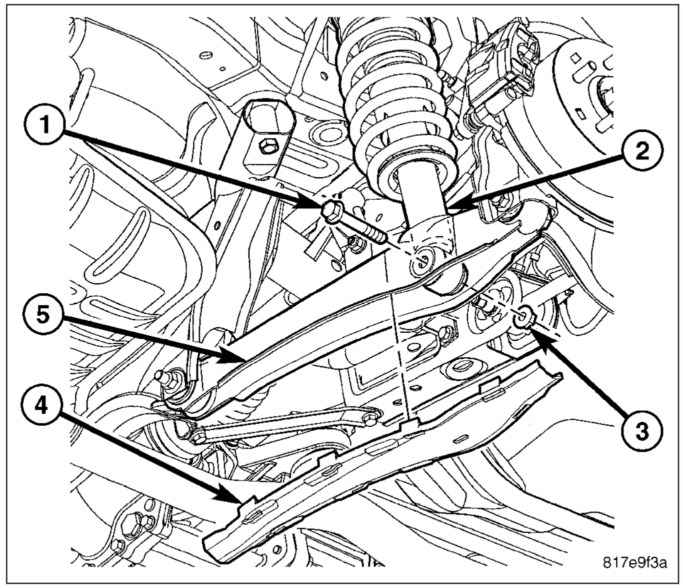


1. Insert the lower end of the shock assembly (2) down though the lower control arm from above just enough to clear the body, then lift it up into the body bracket (1).



2. Install the mounting bolt (1) and nut (3) fastening the shock assembly (2) to the lower control arm (5). Do not tighten at this time.
3. Install the cover (4) on the bottom of the lower control arm (5).

4. Install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
5. Lower the vehicle.



6. install the two nuts (1) securing the shock assembly (2) to the body bracket (3). Tighten the mounting nuts to 48 N·m (35 ft. lbs.).

7. Install the interior rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION)

8. Position the vehicle on an alignment rack/drive-on lift. Raise the lift as necessary to access the shock mounting bolt (1) and nut (3).
9. Tighten the shock assembly lower mounting bolt nut (3) to 99 N·m (73 ft. lbs.).

WHEEL ALIGNMENT

TABLE OF CONTENTS

WHEEL ALIGNMENT

DESCRIPTION

Vehicle wheel alignment is the positioning of all interrelated front and rear suspension angles. These angles affect the handling and steering of the vehicle when it is in motion. Proper wheel alignment is essential for efficient steering, good directional stability, and proper tire wear.

The method of checking a vehicle's front and rear wheel alignment varies depending on the manufacturer and type of equipment used. The manufacturer's instructions should always be followed to ensure accuracy of the alignment, except when DaimlerChrysler Corporation's wheel alignment specifications differ.

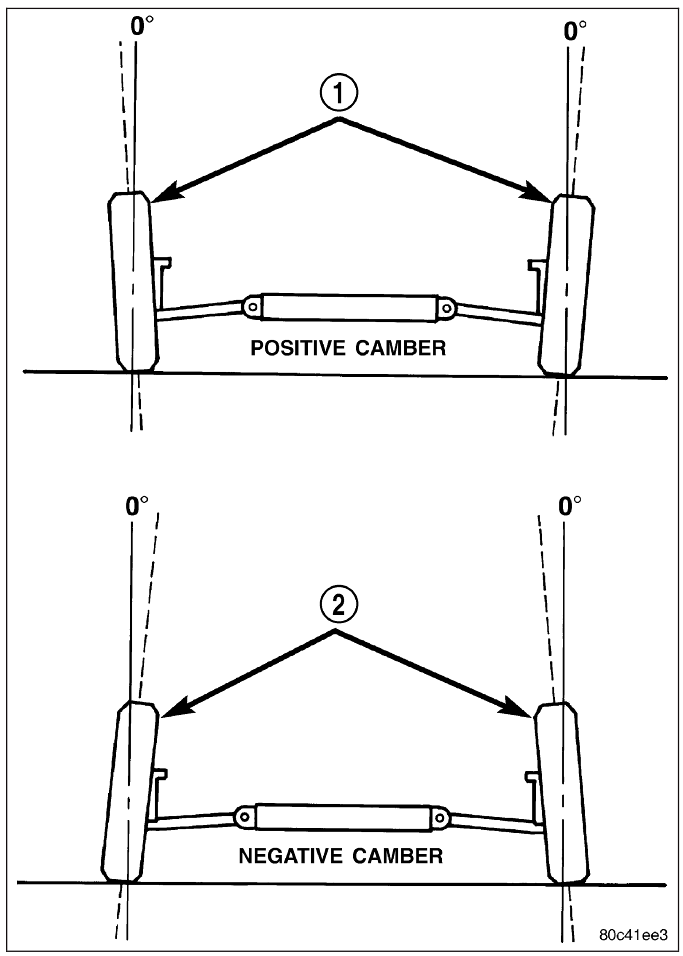
On this vehicle, the suspension angles that can be adjusted are as follows:

Front

- Camber
- Toe

Rear

- Camber
- Toe



Check the wheel alignment and make all wheel alignment adjustments with the vehicle standing at its proper curb height specification. Curb height is the normal riding height of the vehicle. It is measured from a certain point on the vehicle to the ground or a designated area while the vehicle is sitting on a flat, level surface. Refer to Curb Height Measurement in this section for additional information.

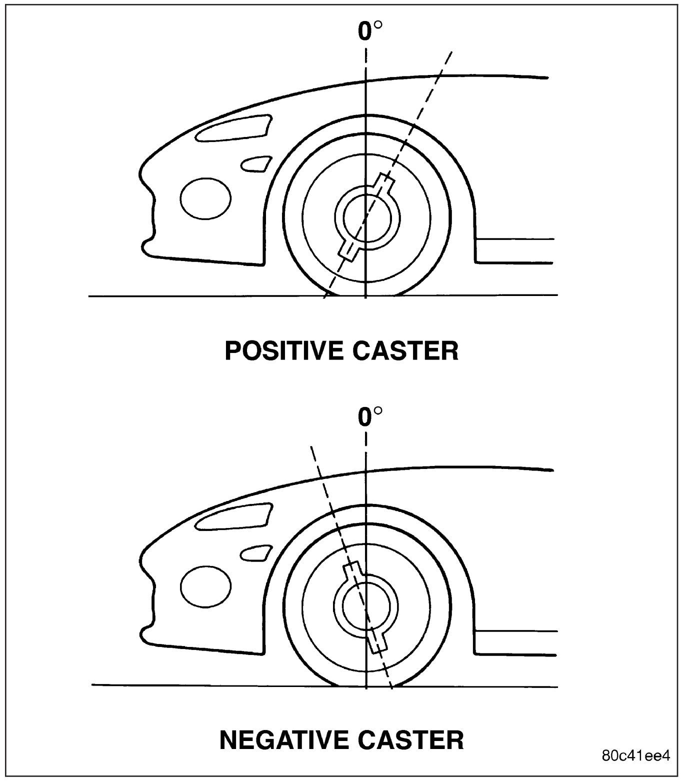
Typical wheel alignment angles and measurements are described in the following paragraphs.

CAMBER

Camber is the inward or outward tilt of the top of the tire and wheel assembly. Inward tilt (2) is known as negative camber. Outward tilt (1) is known as positive camber. Camber is measured in degrees of angle relative to a true vertical line. Camber is a tire wearing angle.

- Excessive negative camber will cause tread wear at the inside of the tire.
- Excessive positive camber will cause tread wear on the outside of the tire.

CROSS CAMBER



Cross camber is the difference between left and right camber. To achieve the cross camber reading, subtract the right side camber reading from the left. For example, if the left camber is +0.3° and the right camber is 0.0°, the cross camber would be +0.3°.

CASTER

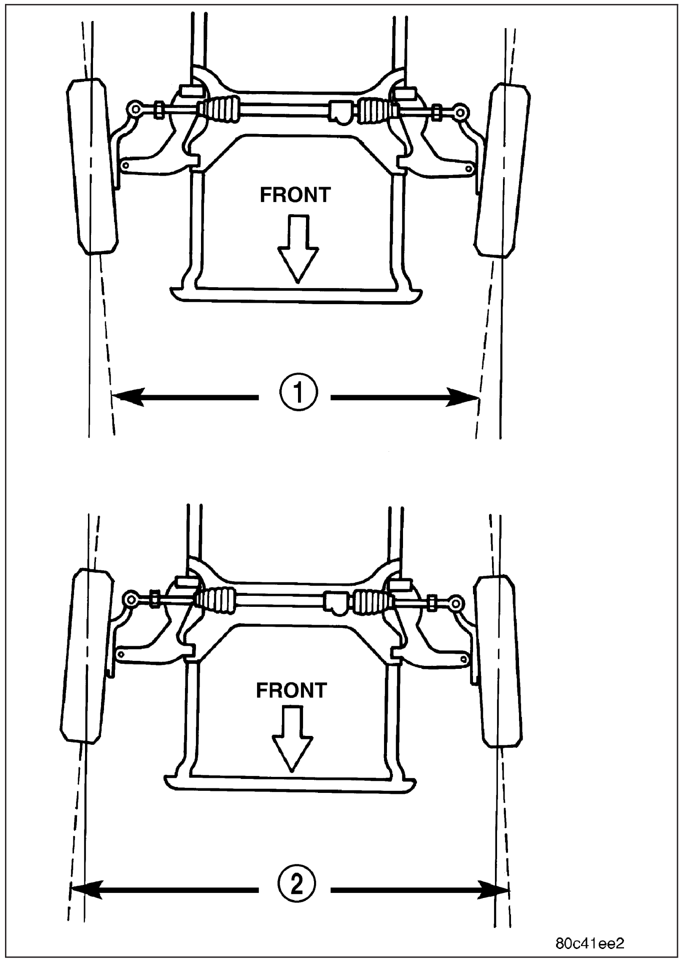
Caster is the forward or rearward tilt of the steering knuckle in reference to the position of the upper and lower ball joints. Caster is measured in degrees of angle relative to a true vertical center line. This line is viewed from the side of the tire and wheel assembly.

- Forward tilt (upper ball joint ahead of lower) results in a negative caster angle.
- Rearward tilt (upper ball joint trailing lower) results in a positive caster angle.

Although caster does not affect tire wear, a caster imbalance between the two front wheels may cause the vehicle to lead to the side with the least positive caster.

CROSS CASTER

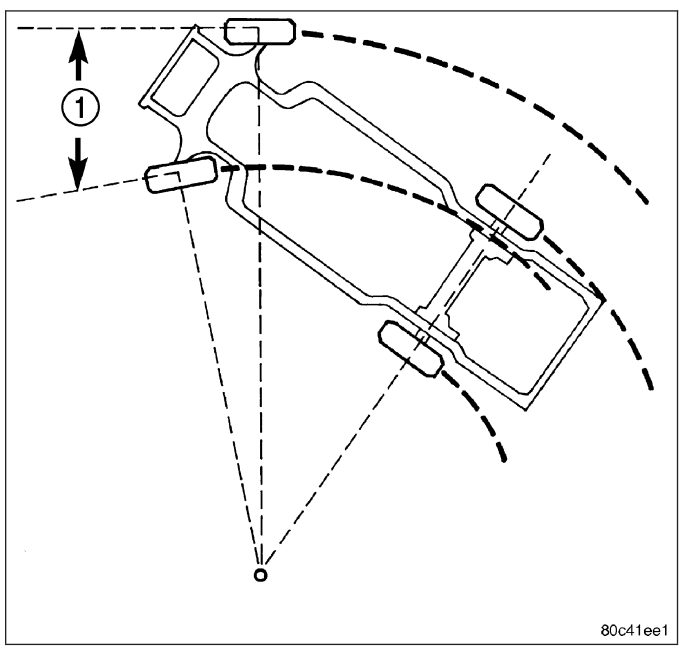
Cross caster is the difference between left and right caster.



TOE

Toe is the inward or outward angle of the wheels as viewed from above the vehicle.

- Toe-in (1) is produced when the front edges of the wheels on the same axle are closer together than the rear edges.
- Toe-out (2) is produced when the front edges of the wheels on the same axle are farther apart than the rear edges.

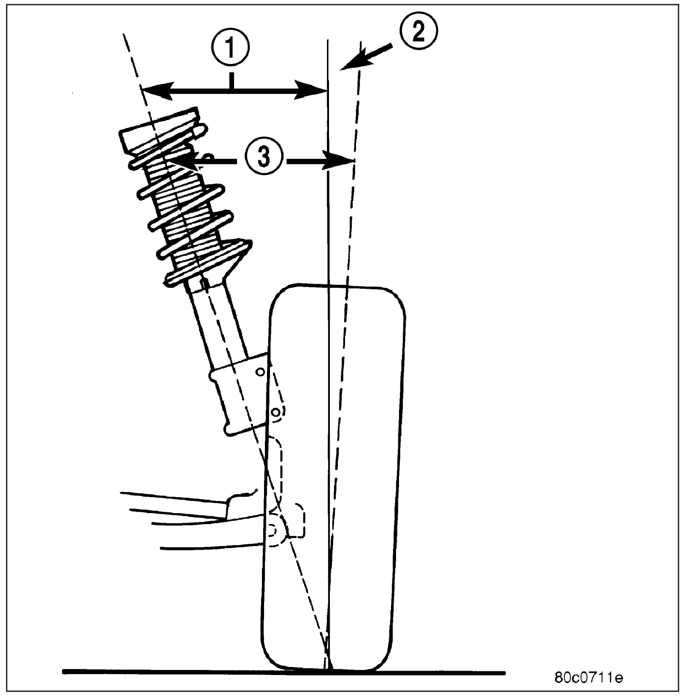


Toe-in and toe-out can occur at the front wheels and the rear wheels.

Toe is measured in degrees or inches. The measurement identifies the amount that the front of the wheels point inward (toe-in) or outward (toe-out). Toe is measured at the spindle height. Zero toe means the front and rear edges of the wheels on the same axle are equal distant.

TOE-OUT ON TURNS

Toe-out on turns (1) is the relative positioning of the front wheels while steering through a turn. This compensates for each front wheel's turning radius. As the vehicle encounters a turn, the outboard wheel must travel in a larger radius circle than the inboard wheel. The steering system is designed to make each wheel follow its particular radius circle. To accomplish this, the front wheels must progressively toe outward as the steering is turned from center. This eliminates tire scrubbing and undue tire wear when steering a vehicle through a turn.



DYNAMIC TOE PATTERN

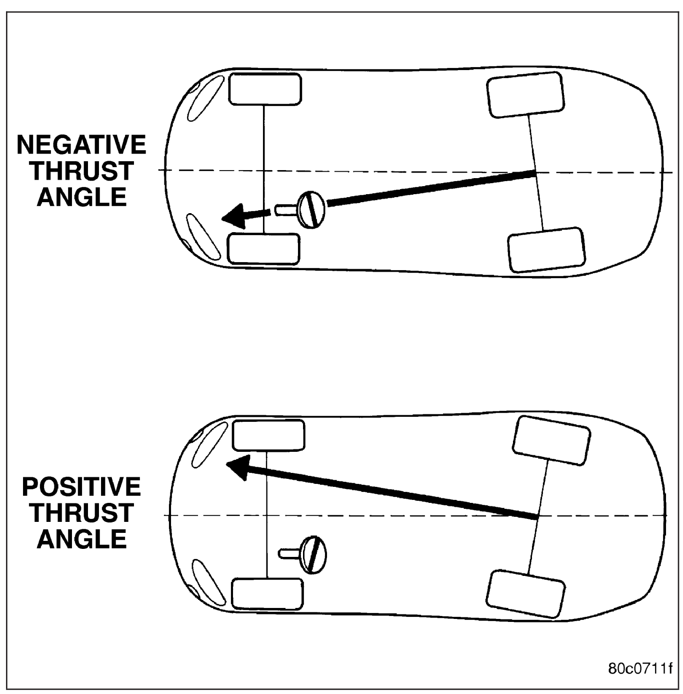
Dynamic toe pattern is the inward and outward toe movement of the front and rear tires through the suspension's jounce and rebound travel. As the vehicle's suspension moves up and down, the toe pattern varies. Toe pattern is critical in controlling the directional stability of the vehicle while in motion. Front and rear dynamic toe pattern is preset by the factory at the time the vehicle is assembled.

It is not necessary to check or adjust front or rear dynamic toe pattern when doing a normal wheel alignment. The only time dynamic toe pattern needs to be checked or adjusted is if the frame of the vehicle has been damaged.

STEERING AXIS INCLINATION (S.A.I.)

Steering axis inclination (1) is the angle between a true vertical line starting at the center of the tire at the road contact point and a line drawn through the center of the upper ball joint (or strut) and the lower ball joint. S.A.I. is built into the vehicle and is not an adjustable angle. If S.A.I. is not within specifications, a bent or damaged suspension component may be the cause.

INCLUDED ANGLE (I.A.)



Included angle (3) is the sum of the S.A.I. angle (1) plus or minus the camber angle (2), depending on whether or not the wheel has positive or negative camber. If camber is positive, add the camber angle to the S.A.I angle. If camber is negative, subtract the camber angle from the S.A.I. angle. Included angle is not adjustable, but can be used to diagnose a frame misalignment or bent suspension component (spindle, strut).

THRUST ANGLE

Thrust angle is the averaged direction the rear wheels are pointing in relation to the vehicle's center line. The presence of negative or positive thrust angle causes the rear tires to track improperly to the left or right of the front tires (dog tracking).

- Negative thrust angle means the rear tires are tracking to the left of the front tires.
- Positive thrust angle means the rear tires are tracking to the right of the front tires.

Improper tracking can cause undue tire wear, a lead or pull and a crooked steering wheel. Excessive thrust angle can usually be corrected by adjusting the rear wheel toe so that each wheel has one-half of the total toe measurement.

DIAGNOSIS AND TESTING

SUSPENSION AND STEERING

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
Front End Whine On Turns	1. Defective Wheel Bearing 2. Incorrect Wheel Alignment 3. Worn Tires	1. Replace Wheel Bearing 2. Check And Reset Wheel Alignment 3. Replace Tires
Front End Growl Or Grinding On Turns	1. Defective Wheel Bearing 2. Engine Mount Grounding Against Frame Or Body Of Vehicle. 3. Worn Or Broken C/V Joint 4. Loose Wheel Lug Nuts 5. Incorrect Wheel Alignment 6. Worn Tires	1. Replace Wheel Bearing 2. Check For Motor Mount Hitting Frame Rail And Reposition Engine As Required 3. Replace C/V Joint 4. Verify Wheel Lug Nut Torque 5. Check And Reset Wheel Alignment 6. Replace Tires
Front End Clunk Or Snap On Turns	1. Loose Wheel Lug Nuts 2. Worn Or Broken C/V Joint 3. Worn Or Loose Tie Rod Or Ball Joint 4. Worn Control Arm Bushing 5. Loose Sway Bar Or Upper Strut Attachment	1. Verify Wheel Lug Nut Torque 2. Replace C/V Joint 3. Tighten Or Replace Tie Rod End Or Ball Joint 4. Replace Control Arm Bushing 5. Tighten Sway Bar Or Upper Strut Attachment To Specified Torque
Front End Popping/Clicking/ Snapping During Acceleration After Drive-To-Reverse Shift, Reverse-To-Drive Shift Or While Turning	1. Insufficient grease on mating surface of axle half shaft outer C/V joint mating surface to wheel hub/bearing.	1. Separate half shaft from hub and bearing and wipe mating surfaces clean. Apply light coating of wheel bearing grease to C/V joint mating surface and reassemble. Tighten hub nut to specified torque.
Front End Whine With Vehicle Going Straight At A Constant Speed	1. Defective Wheel Bearing 2. Incorrect Wheel Alignment 3. Worn Tires	1. Replace Wheel Bearing 2. Check And Reset Wheel Alignment 3. Replace Tires
Front End Growl Or Grinding With Vehicle Going Straight At A Constant Speed	1. Engine Mount Grounding 2. Worn Or Broken C/V Joint	1. Reposition Engine As Required 2. Replace C/V Joint
Front End Whine When Accelerating Or Decelerating	1. Worn Or Defective Transaxle Gears Or Bearings	1. Replace Transaxle Gears Or Bearings
Front End Clunk When Accelerating Or Decelerating	1. Loose Wheel Lug Nuts 2. Worn Or Broken Engine Mount	1. Verify Wheel Lug Nut Torque 2. Replace Engine Mounts

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
	3. Worn Or Defective Transaxle Gears Or Bearings	3. Replace Transaxle Gears Or Bearing
	4. Worn Or Broken C/V Joint	4. Replace C/V Joint
	5. Worn Or Loose Ball Joint	5. Tighten Or Replace Ball Joint
	6. Worn Or Loose Control Arm Bushing	6. Tighten To Specified Torque Or Replace Control Arm Bushing
	7. Loose Crossmember Bolts	7. Tighten Crossmember Bolts To Specified Torque
Road Wander	1. Incorrect Tire Pressure	1. Inflate Tires To Recommended Pressure
	2. Incorrect Front Or Rear Wheel Toe	2. Check And Reset Front Wheel Toe
	3. Worn Wheel Bearings	3. Replace Wheel Bearing
	4. Worn Control Arm Bushings	4. Replace Control Arm Bushing
	5. Excessive Friction In Steering Gear	5. Replace Steering Gear
	6. Excessive Friction In Steering Shaft Coupling	6. Replace Steering Coupler
	7. Excessive Friction In Strut Upper Bearing	7. Replace Strut Bearing
Lateral Pull	1. Unequal Tire Pressure	1. Inflate All Tires To Recommended Pressure
	2. Radial Tire Lead	2. Perform Vehicle Lead Diagnosis And Correction Procedure - Refer To Tires And Wheels
	3. Incorrect Front Wheel Camber	3. Check And Reset Front Wheel Camber
	4. Power Steering Gear Imbalance	4. Replace Power Steering Gear
	5. Wheel Braking	5. Correct Braking Condition Causing Lateral Pull
Excessive Steering Free Play	1. Incorrect Steering Gear Adjustment	1. Adjust Or Replace Steering Gear
	2. Worn Or Loose Tie Rod Ends	2. Replace Or Tighten Tie Rod Ends
	3. Loose Steering Gear Mounting Bolts	3. Tighten Steering Gear Bolts To The Specified Torque
	4. Loose Or Worn Steering Shaft Coupler	4. Replace Steering Shaft Coupler
Excessive Steering Effort	1. Low Tire Pressure	1. Inflate All Tires To Recommended Pressure
	2. Lack Of Lubricant In Steering Gear	2. Replace Steering Gear
	3. Low Power Steering Fluid Level	3. Fill Power Steering Fluid Reservoir To Correct Level
	4. Loose Power Steering Pump Belt	4. Check and replace automatic belt tensioner as necessary. If drive belt is worn or glazed, replace belt.
	5. Lack Of Lubricant In Steering Ball Joints	5. Lubricate Or Replace Steering Ball Joints
	6. Steering Gear Malfunction	6. Replace Steering Gear

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
	7. Lack Of Lubricant In Steering Coupler	7. Replace Steering Coupler

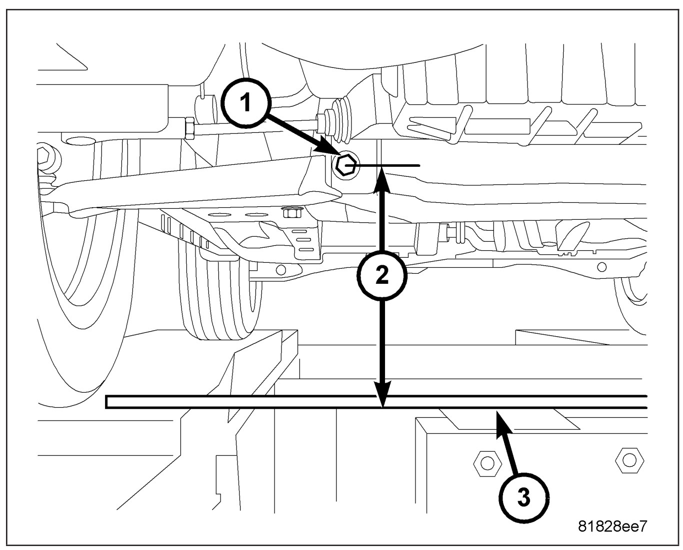
STANDARD PROCEDURE

CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

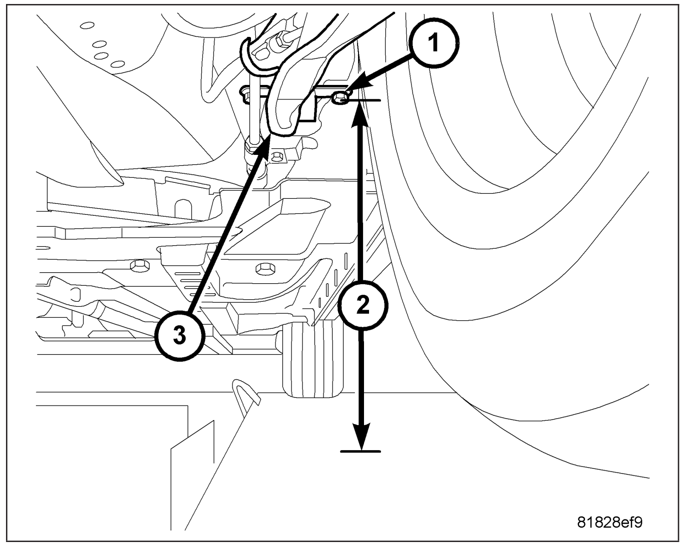
Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.



NOTE: Prior to reading the curb height measurement, the front and rear of the vehicle must be jounced to settle the suspension. Induce jounce by pushing down on the center of the bumper (fascia), using care not to damage the vehicle, moving the vehicle up and down, gradually increasing the suspension travel with each stroke. Release the bumper at the bottom of each stroke, repeating this action several times. Perform this to both front and rear suspensions an equal amount of times.

Measure curb height as follows:



1. Jounce the vehicle. Refer to above note.

NOTE: On some vehicles it may be necessary to remove an engine belly pan in order to gain access to the lower control arm pivot bolt.

2. Front – On each side of the vehicle, measure the distance (2) from the center of the lower control arm pivot bolt head (1) to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge, placed from lift runway to runway, to get an accurate measurement.

3. Rear – On each side of the vehicle, measure the distance (2) from the center of the outboard trailing arm-to-body mounting bolt (1) to the floor or alignment rack/lift runway surface.

4. Compare the measurements to specifications listed in the following CURB HEIGHT SPECIFICATIONS chart. Maximum left-to-right differential is not to exceed 12.5 mm (0.5 in.).
5. If curb height is found to be out of specification and there is no sign of excessive body damage, curb height can be changed by replacing the applicable spring with a spring offering a different check load. (Refer to 2 - SUSPENSION/FRONT/STRUT - REMOVAL)

CURB HEIGHT SPECIFICATIONS

VEHICLE	FRONT	REAR
ALL	205 mm ± 8 mm 8.07 in. ± 0.32 in.	328 mm ± 8 mm 12.91 in. ± 0.32 in.

WHEEL ALIGNMENT

PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to the vehicle to ensure proper alignment.

1. Verify the fuel tank is full of fuel. If the fuel tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment specifications.
2. The passenger and luggage compartments of the vehicle should be free of any load that is not factory equipment.
3. Check the tires on the vehicle. The tires are to be inflated to the recommended air pressure. All tires must be the same size and in good condition with approximately the same tread wear.
4. Check the front tire and wheel assemblies for excessive radial runout.
5. Inspect all suspension component fasteners for looseness and proper torque.
6. Inspect the lower front ball joints and all steering linkage for looseness and any sign of wear or damage.
7. Inspect the rubber bushings on all the suspension components for signs of wear or deterioration. If any bushings show signs of wear or deterioration, they should be replaced prior to aligning the vehicle.
8. Check vehicle curb height to verify it is within specifications. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE - CURB HEIGHT MEASUREMENT)

WHEEL ALIGNMENT SETUP

1. Position the vehicle on an alignment rack.
2. Install all required alignment equipment on the vehicle, per the alignment equipment manufacturer’s instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced. Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.

3. Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe-in. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS)

REAR CAMBER

Rear camber settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as Net Build. The result is no required adjustment of camber toe after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, rear camber is not considered an adjustable angle.

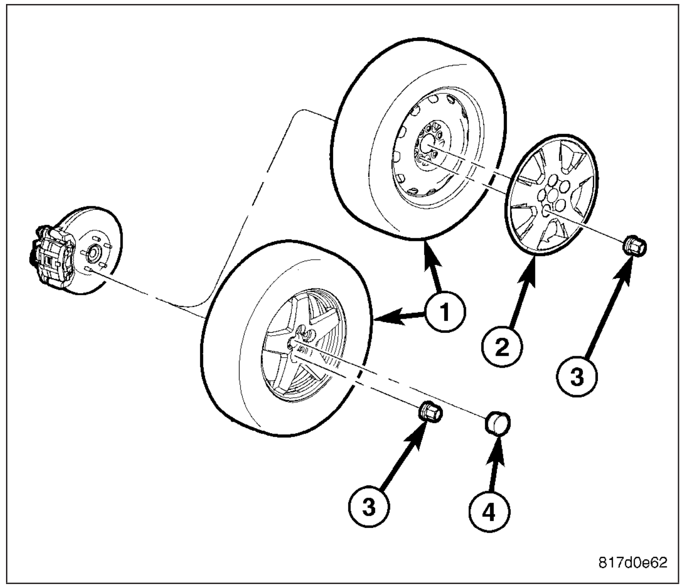
CAUTION: Do not attempt to adjust the vehicles wheel alignment by heating or bending any of the suspension components.

FRONT CAMBER AND CASTER

Front camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as Net Build. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles. Camber and caster should be checked to ensure they meet vehicle specifications. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS)

If front camber is found not to meet alignment specifications, it can be adjusted using an available camber adjustment bolt package. Before installing a camber adjustment bolt package on a vehicle found to be outside the specifications, inspect the suspension components for any signs of damage or bending.

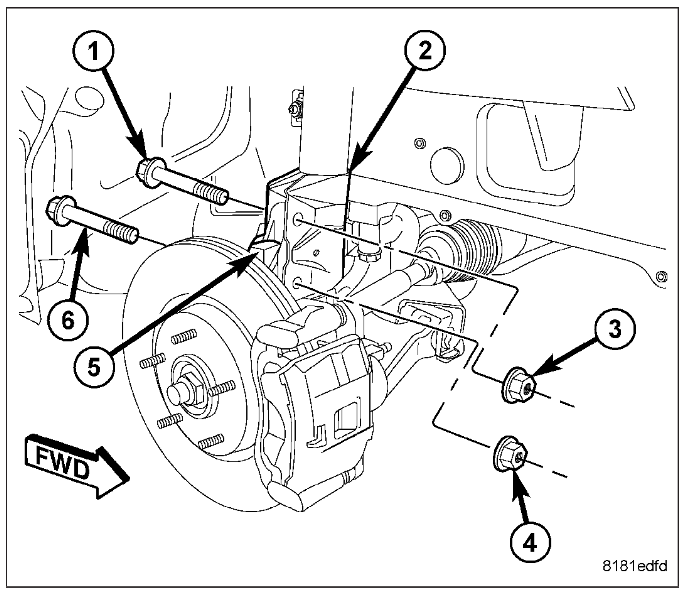
No adjustment can be made to the caster setting on this vehicle. If the vehicle's caster is not within alignment specifications, check for damaged suspension components or body parts.



CAUTION: Do not attempt to adjust the vehicles wheel alignment by heating or bending any of the suspension components.

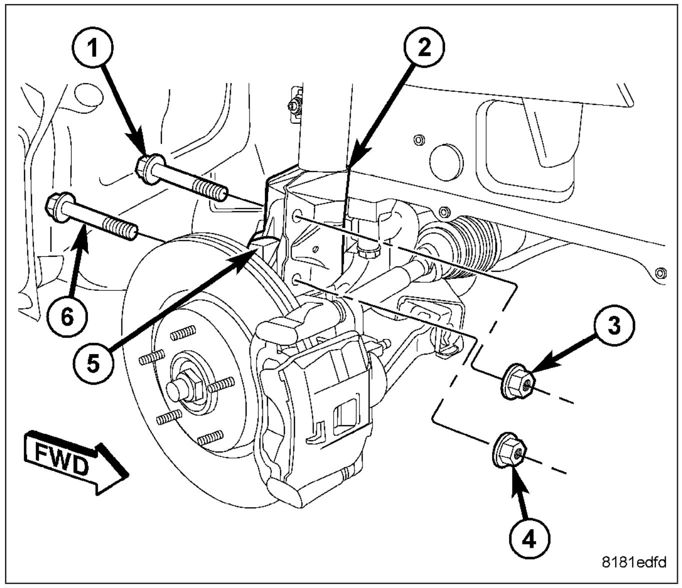
CAMBER ADJUSTMENT BOLT PACKAGE INSTALLATION

The camber adjustment bolt package contains new bolts and nuts for attaching the strut clevis bracket to the steering knuckle. The bolts contained in the package are slightly undersize allowing for movement between the strut clevis bracket and the steering knuckle. The movement allowed by the undersize bolts provide approximately two degrees of camber adjustment per side of the vehicle. To install and adjust the camber adjustment bolt package, follow the procedure below.

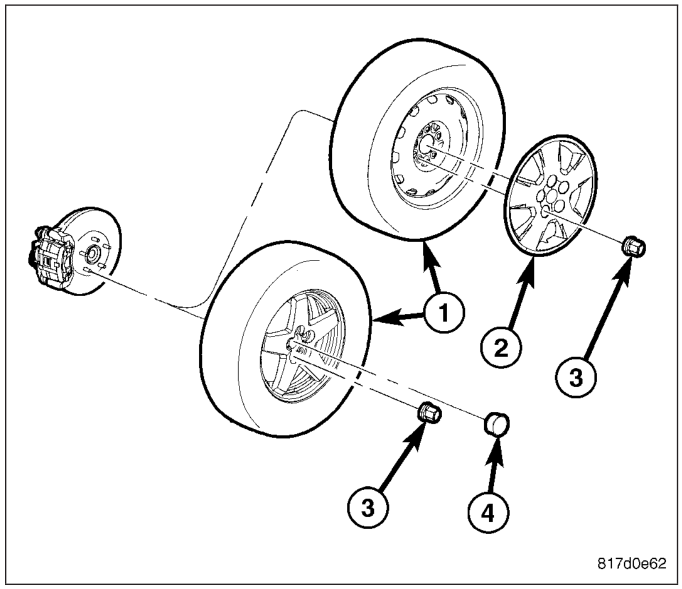


1. Raise the vehicle until its tires are not supporting the weight of the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

2. Remove the wheel mounting nuts (3), then the front tire and wheel assembly.

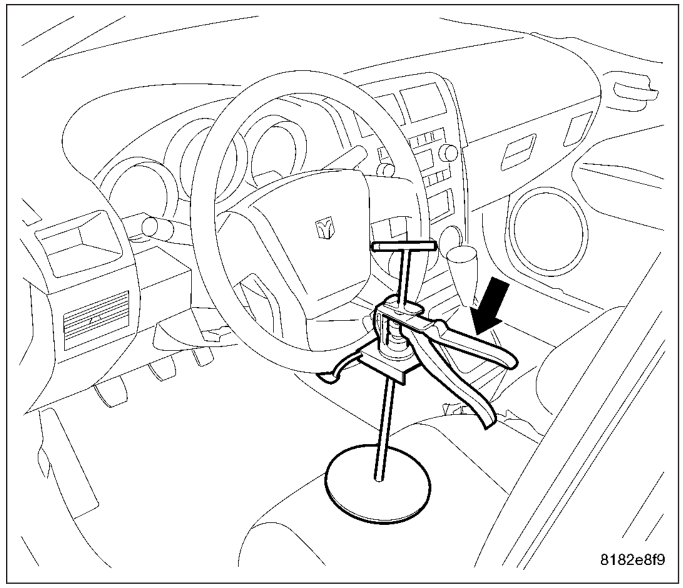


CAUTION: The knuckle-to-strut assembly bolt shanks are serrated and must not be turned during removal. Remove the nuts while holding the bolts stationary, then tap the bolts out using a punch.



3. Remove the original upper bolt (1) and nut (3) attaching the strut clevis bracket (2) to the knuckle (5).
4. Install a bolt from the adjustment package into the hole where the original bolt was removed. Install the bolt as indicated.
5. Install a nut provided in adjustment package on the replacement bolt. Tighten the nut until it's snug, but still allows the knuckle to slide in the clevis bracket.

6. Remove the original lower bolt (6) and nut (4) attaching the strut clevis bracket (2) to the knuckle (5).
7. Install a bolt from the adjustment package into the bottom hole of the strut clevis bracket. Install the bolt as indicated.
8. Install a nut provided in adjustment package on the replacement bolt. Tighten the nut until it's snug, but still allows the knuckle to slide in the clevis bracket.

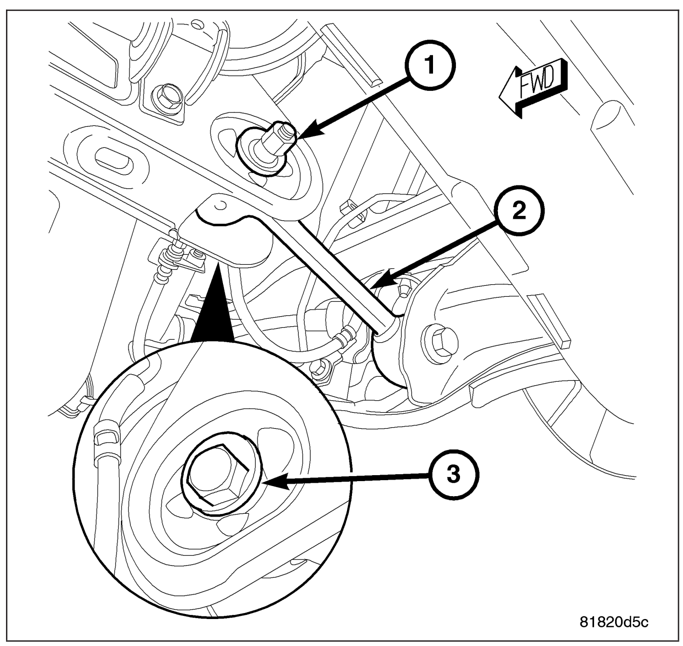


9. Install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).

10. Perform the above procedure to opposite strut as required.
11. Lower the vehicle and jounce the front and rear of the vehicle.
12. Adjust the front camber to the preferred setting by pushing or pulling on the top of the tire. When camber is set to specifications, tighten the upper and lower strut clevis bracket bolts. Again jounce the front and rear of the vehicle, then verify the camber settings.
13. Tighten front strut clevis bracket-to-steering knuckle attaching bolts to 84 N·m (62 ft. lbs.).
14. Once camber is within specifications, adjust toe to meet the preferred specification setting. Refer to FRONT TOE within this wheel alignment service procedure.

TOE

1. Center the steering wheel and lock it in place using a steering wheel clamp.

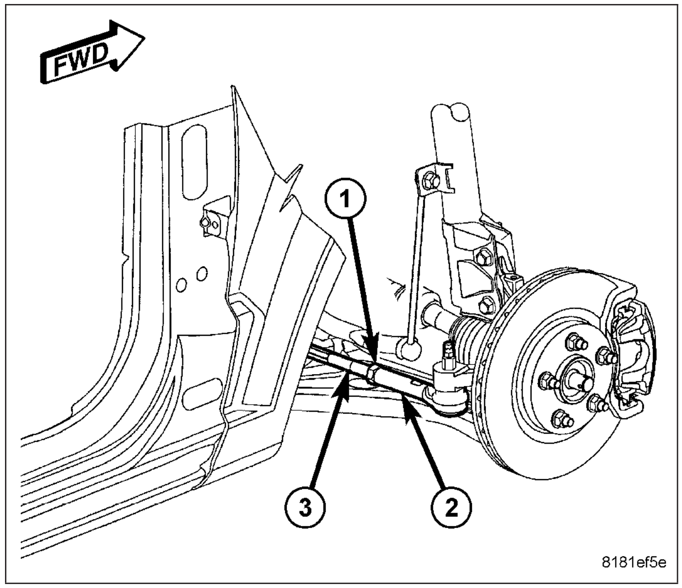


NOTE: When setting toe, make sure to set rear toe to the preferred specifications before setting front toe to the preferred specifications

REAR TOE

NOTE: Perform the following at each rear wheel as necessary.

1. While holding the cam bolt head (3) stationary, loosen the toe link mounting cam bolt nut (1).
2. Rotate the cam bolt head (3) left or right until the rear wheel toe for that rear wheel is set to the preferred specification. (Refer to 2 - SUSPENSION/ WHEEL ALIGNMENT - SPECIFICATIONS)
3. While holding the cam bolt head (3) stationary, tighten the toe link mounting cam bolt nut (1) to 25 N·m (18 ft. lbs.).



FRONT TOE

CAUTION: Do not twist the inner tie rod-to-steering gear rubber boots while turning the inner tie rods during the front toe adjustment.

NOTE: Perform the following at each front wheel as necessary.

1. Loosen the tie rod adjusting jam nut (1). Grasp the inner tie rod (3) and rotate it one way or the other until the front wheel toe is set to the preferred specification. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS)
2. Tighten the tie rod adjusting jam nut to of 75 N·m (55 ft. lbs.).
3. Make sure the inner tie rod-to-steering gear rubber boot is not twisted.

2. Remove the steering wheel clamp.
3. Remove the alignment equipment.
4. Road test the vehicle to verify the steering wheel is straight and the vehicle does not pull or wander.

SPECIFICATIONS

WHEEL ALIGNMENT

NOTE: All specifications are given in degrees.

NOTE: All wheel alignments are to be set with the vehicle at curb height. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

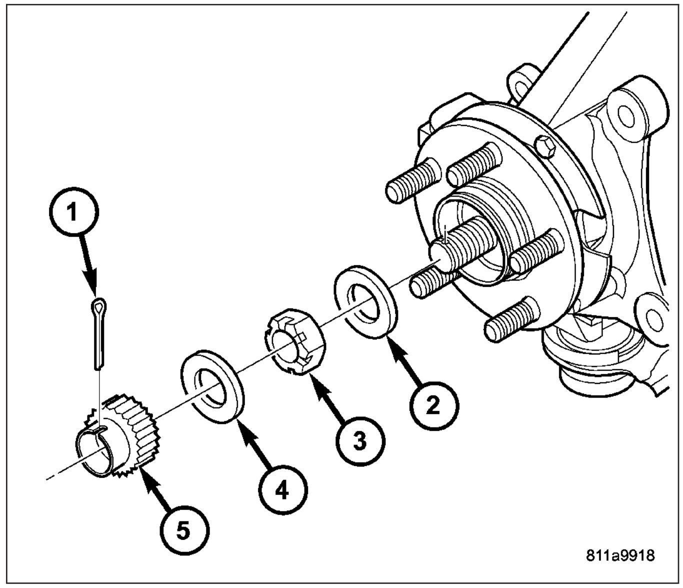
FRONT WHEEL ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE
CAMBER	-0.43°	-0.83° to -0.03°
Cross Camber (Maximum Side-To-Side Difference)	0.00°	0.50
CASTER*	+2.50°	+1.50° to +3.50°
Cross Caster (Maximum Side-To-Side Difference)	0.00°	1.00°
TOE - INDIVIDUAL	+0.05°	-0.05° to +0.15°
TOE - TOTAL**	+0.10°	-0.10° to +0.30°
REAR WHEEL ALIGNMENT	**PREFERRED SETTING**	**ACCEPTABLE RANGE**
CAMBER*	-0.50°	-0.90° to -0.10°
TOE - INDIVIDUAL	+0.10°	0.00° to +0.20°
TOE - TOTAL**	+0.20°	0.00° to +0.40°
THRUST ANGLE	0.00°	-0.10° to +0.10°
Notes: * For reference only. These are nonadjustable angles. ** TOTAL TOE is the sum of both the left and right wheel toe settings. TOTAL TOE must be equally split between each wheel on the same axle to ensure the steering wheel is centered after setting toe. Positive toe (+) is toe-in and negative toe (−) is Toe-out.		

DIFFERENTIAL & DRIVELINE

TABLE OF CONTENTS

HALF SHAFT-FRONT

TABLE OF CONTENTS



HALF SHAFT-FRONT

DESCRIPTION

Naturally aspirated models equipped with either an automatic or manual transmission use an unequal-length half-shaft system. The system incorporates two halfshaft assemblies (left and right) that consist of an inner and outer constant velocity (CV) joint and a solid interconnecting shaft. The right halfshaft is longer than the left due to trans-axle packaging and powertrain design.

Both halfshaft assemblies use the same type of inner and outer joints. The inner joint of both halfshaft assemblies is a tripod joint, and the outer joint of both halfshaft assemblies is a Rzeppa joint. Both tripod joints and Rzeppa joints are true constant velocity (CV) joint assemblies. The inner tripod joint allows for the changes in halfshaft length through the jounce and rebound travel of the front suspension.

The left halfshaft inner tripod joint and the intermediate shaft are both splined into the transaxle side gears. The inner tripod joints are retained using a snap ring located in the stub shaft of the tripod joint. The outer CV joint has a stub shaft that is splined into the wheel hub and retained by a hub nut (3) and washer (2), nut lock (5), spring washer (4) and cotter pin (1).

Halfshaft Retaining Hardware

1 - COTTER PIN
2 - WASHER
3 - HUB NUT
4 - SPRING WASHER
5 - NUT LOCK

OPERATION

Halfshaft assemblies are designed to transmit power from the transaxle to the front wheels, while allowing for pow-ertrain and suspension flex.

DIAGNOSIS AND TESTING

HALFSHAFT DIAGNOSIS

VEHICLE INSPECTION

1. Check for grease in the vicinity of the inboard tripod joint and outboard CV joint; this is a sign of inner or outer joint seal boot or seal boot clamp damage.

NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

1. Loose hub nut. Using a click-style torque wrench, torque hub nut to 244 N·m (180 ft. lbs.).

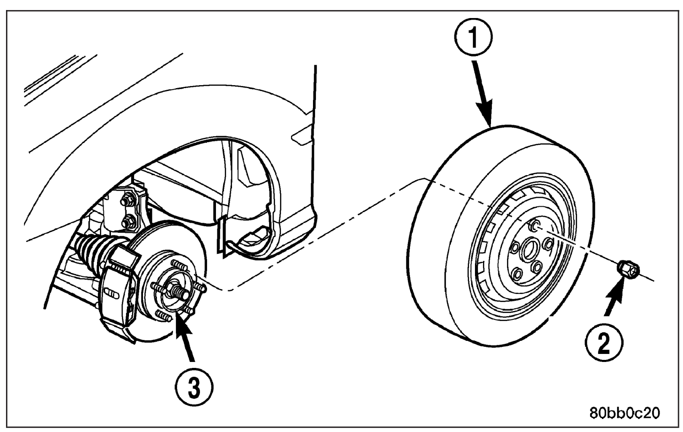
2. Damaged outer CV or inner tripod joint seal boot or seal boot clamps, which is evident by the presence of grease slung outward from the joint. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.
3. Noise may also be caused by another component of the vehicle coming in contact with the halfshafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

1. A torn seal boot on the inner or outer joint of the halfshaft assembly, which is evident by the presence of grease slung outward from the joint. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.
2. A loose or missing clamp on the inner or outer joint of the halfshaft assembly. This may be accompanied by the visible loss of grease.
3. A damaged or worn halfshaft CV joint. Isolate the noise to one side of the vehicle. Replace only the affected side. Replacing both halfshafts is not necessary.

SHUDDER OR VIBRATION DURING ACCELERATION

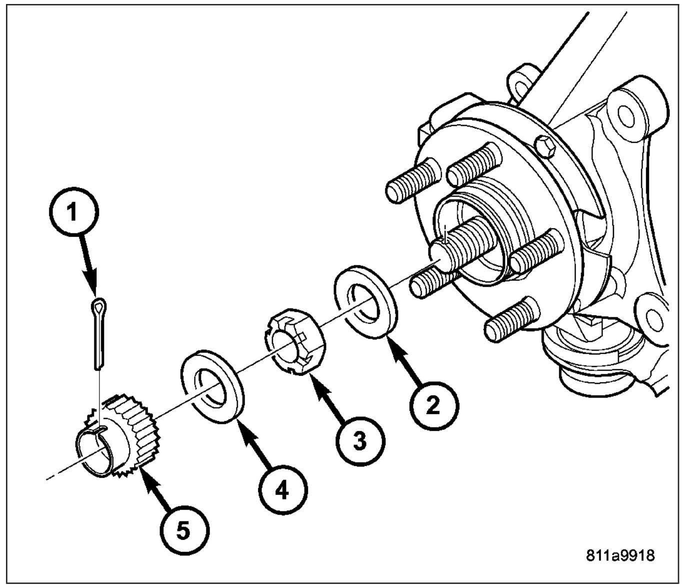


1. A worn or damaged halfshaft inner tripod joint. Isolate the condition to one side of the vehicle. Replace only the affected side. Replacing both halfshafts is not necessary.
2. A sticking tripod joint spider assembly (inner tripod joint only). Isolate the condition to one side of the vehicle. Replace only the affected side. Replacing both halfshafts is not necessary.
3. Improper wheel balance.

VIBRATION AT HIGHWAY SPEEDS

1. Foreign material (mud, etc.) packed on the backside of the wheel(s).
2. Out of balance front tires or wheels.
3. Improper tire and/or wheel runout.

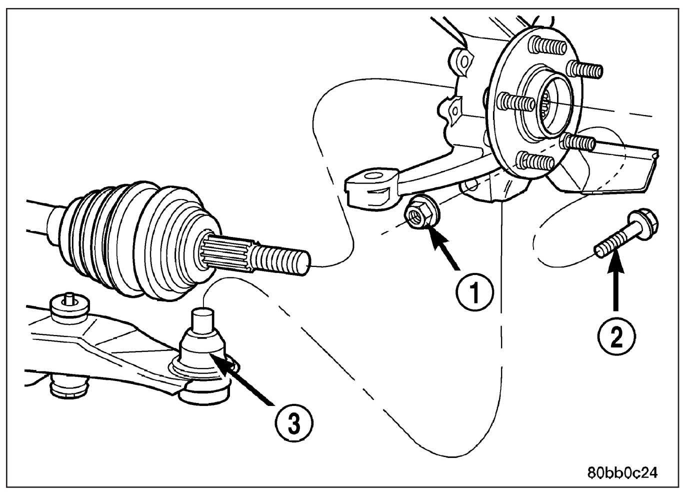
REMOVAL



CAUTION: Boot sealing is vital to retain special lubricants and to prevent foreign contaminants from entering the CV joint. Mishandling, such as allowing the assemblies to dangle unsupported, or pulling or pushing the ends can cut boots or damage CV joints. During removal and installation procedures, always support both ends of the halfshaft to prevent damage.

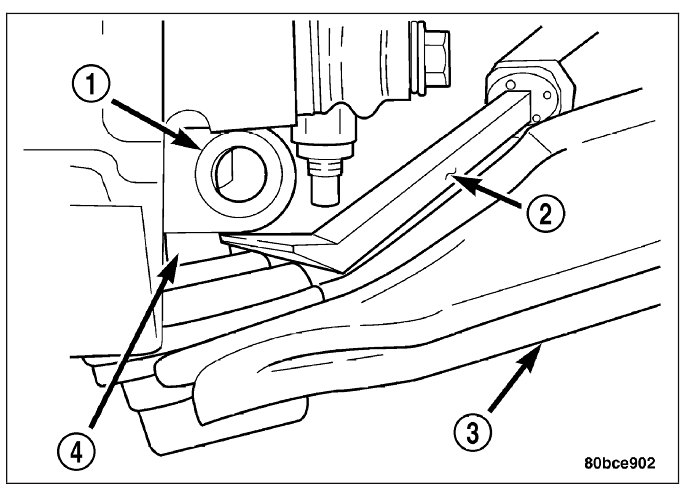
CAUTION: The halfshaft, when installed, acts as a bolt and secures the front hub/bearing assembly. If vehicle is to be supported or moved on its wheels with a halfshaft removed, install a PROPER–SIZED BOLT AND NUT through front hub. Tighten bolt and nut to 244 N·m (180 ft. lbs.). This will ensure that the hub bearing cannot loosen.

1. Disconnect battery negative cable.
2. Place transaxle in gated park.
3. Raise vehicle on hoist.
4. Remove wheel and tire assembly (1).



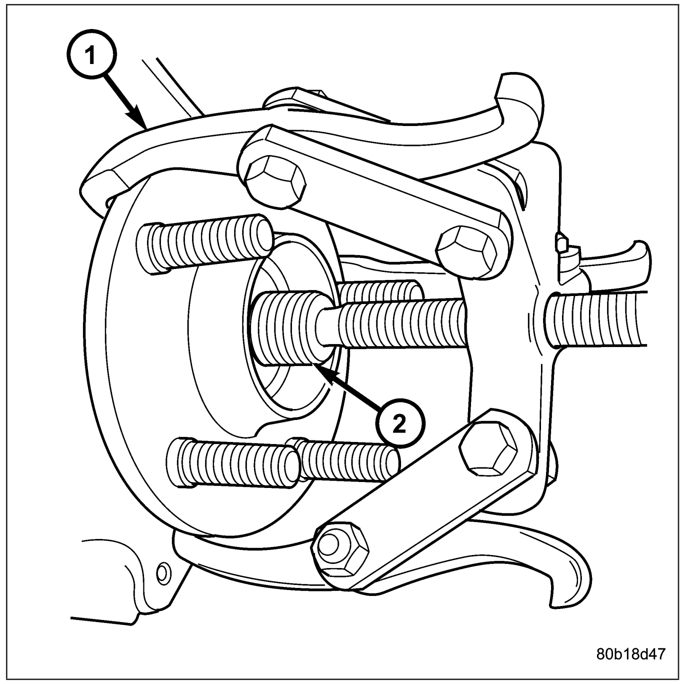
5. Remove the cotter pin (1), nut lock (5), spring washer (4), and hub nut (3) from the end of the outer C/V joint stub axle.

Halfshaft Retaining Hardware



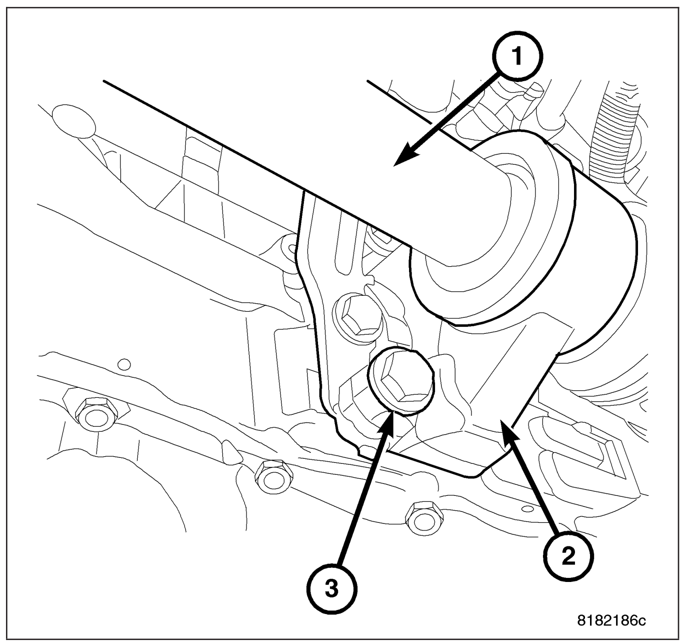
1 - COTTER PIN
2 - WASHER
3 - HUB NUT
4 - SPRING WASHER
5 - NUT LOCK

6. If equipped with ABS, disconnect the front wheel speed sensor and secure harness out of the way.
7. Remove nut and bolt (1,2) retaining ball joint stud (3) into steering knuckle.

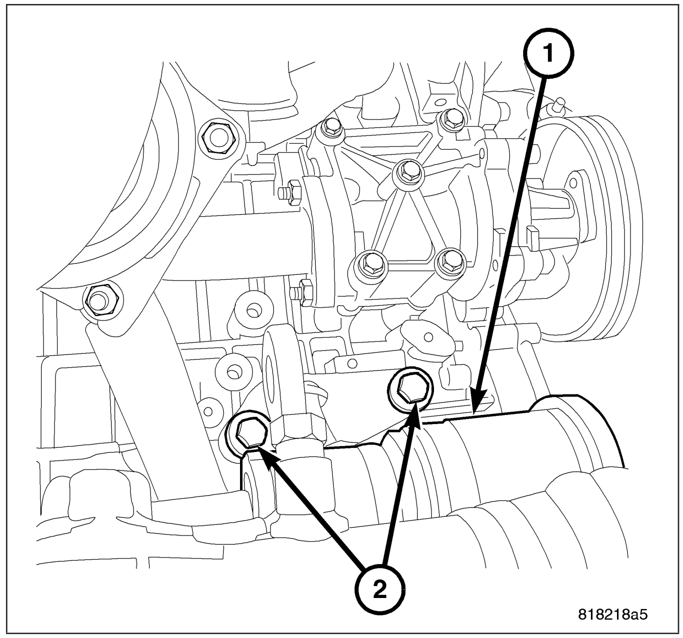


NOTE: Use caution when separating ball joint stud from steering knuckle, so ball joint seal does not get damaged.

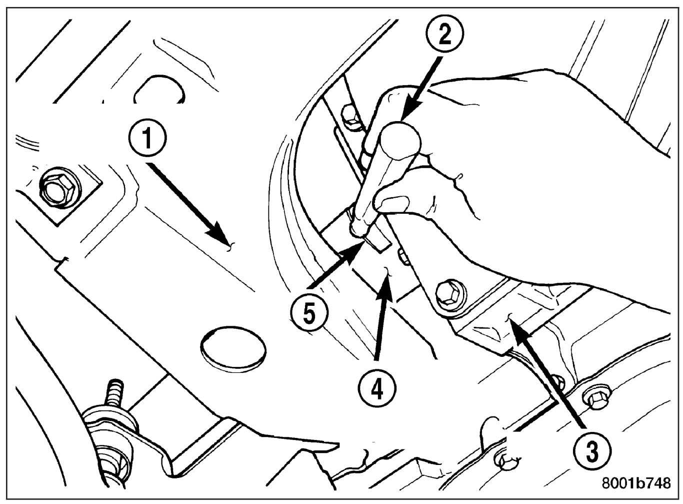
8. Separate ball joint stud (4) from steering knuckle (1) by prying down on lower control arm (3).



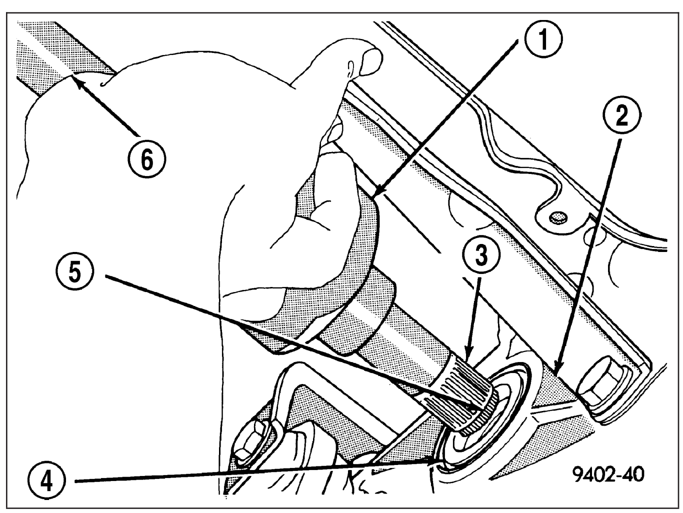
NOTE: Care must be taken not to separate the inner CV joint during this operation. Do not allow halfshaft to hang by inner CV joint, halfshaft must be supported.



9. Remove halfshaft (2) from steering knuckle by pulling outward on knuckle while pressing in on halfshaft. Support outer end of halfshaft assembly. If difficulty in separating halfshaft from hub is encountered, **do not strike shaft with hammer,** instead use Puller 1026 (1) to separate.

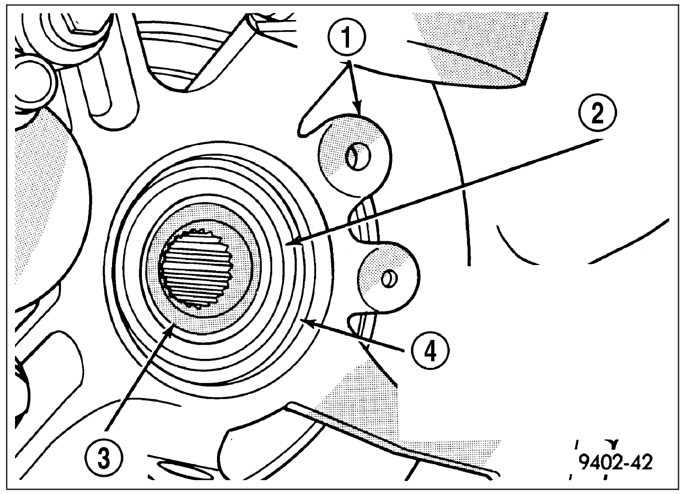


10. If the vehicle is two wheel drive remove the halfshaft bracket (2) to engine lower mounting bolt (3).



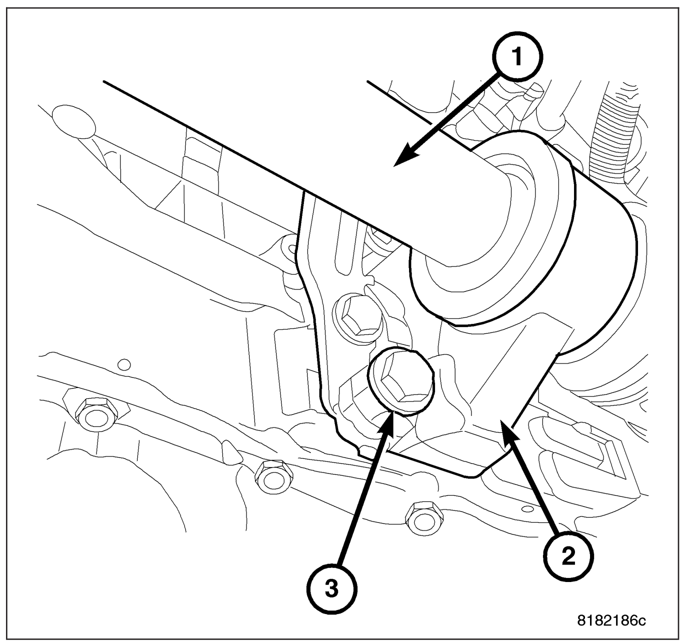
11. If the vehicle is two wheel drive remove the half-shaft bracket to engine upper mounting bolts (2).
12. Support outer end of the halfshaft assembly.

NOTE: Removal of the inner tripod joints is made easier if you apply outward pressure on the joint as you strike the punch with a hammer. Do not pull on interconnecting shaft to remove, as the inner joint will become separated.



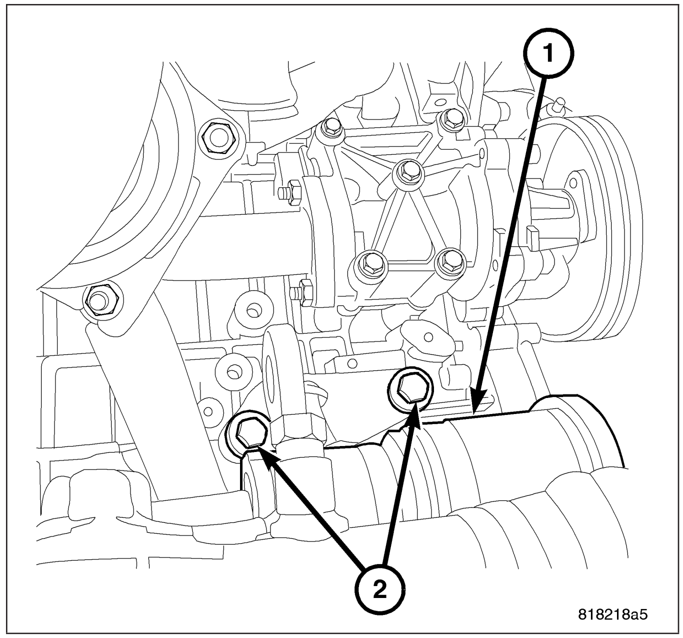
13. Remove the inner tripod joints (4) from the side gears of the transaxle using a punch (2) to dislodge the inner tripod joint retaining ring from the transaxle side gear. If removing the right side inner tripod joint, position the punch to the inner tripod joint extraction groove (5) (if equipped). Strike the punch sharply with a hammer to dislodge the right inner joint from the side gear. If removing the left side inner tripod joint, position the punch to the inner tripod joint extraction groove. Strike the punch sharply with a hammer to dislodge the left inner tripod joint from the side gear.
14. Hold inner tripod joint (1) and interconnecting shaft (6) of halfshaft assembly. Remove inner tripod joint from transaxle by pulling it straight out of transaxle side gear and transaxle oil seal (4). **When removing tripod joint, do not let spline or snap ring drag across sealing lip of the transaxle to tripod joint oil seal. When tripod joint is removed from transaxle, some fluid will leak out.**

CAUTION: The halfshaft, when installed, acts as a bolt and secures the front hub/bearing assembly. If vehicle is to be supported or moved on its wheels with a halfshaft removed, install a PROPER–SIZED BOLT AND NUT through front hub. Tighten bolt and nut to 244 N·m (180 ft. lbs.). This will ensure that the hub bearing cannot loosen.

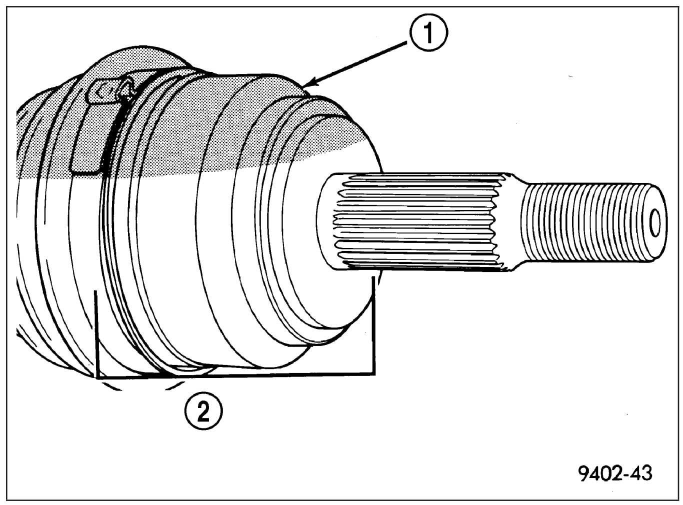


INSTALLATION

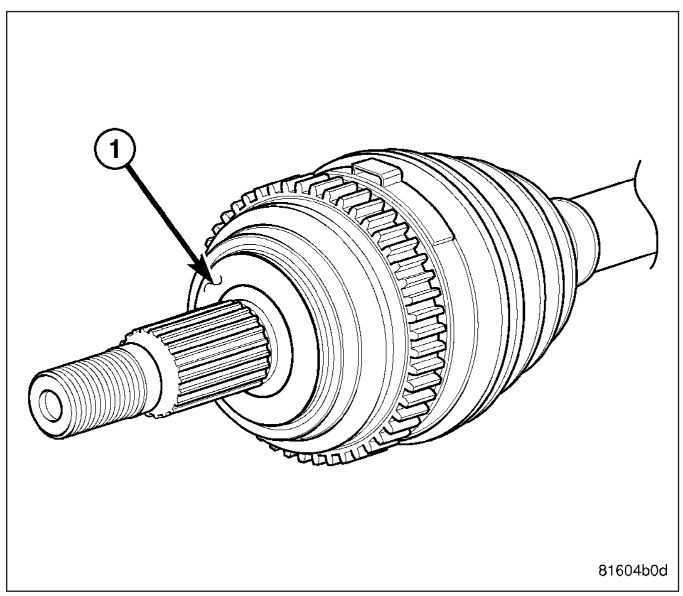
1. Clean all debris and moisture out of steering knuckle (4).



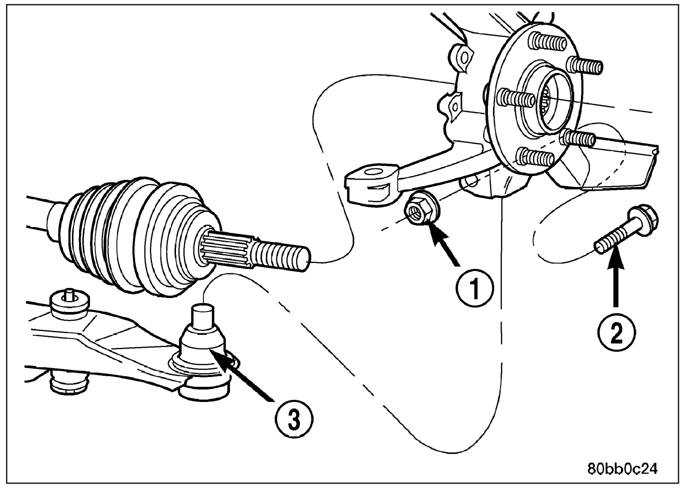
CAUTION: Boot sealing is vital to retain special lubricants and to prevent foreign contaminants from entering the CV joint. Mishandling, such as allowing the assemblies to dangle unsupported, or pulling or pushing the ends can cut boots or damage CV joints. During removal and installation procedures, always support both ends of the halfshaft to prevent damage.



2. Thoroughly clean spline and oil seal sealing surface, on tripod joint. Lightly lubricate oil seal sealing surface on tripod joint with fresh clean transmission lubricant.
3. Holding halfshaft assembly by tripod joint and interconnecting shaft, install tripod joint into transaxle side gear as far as possible by hand.
4. Carefully align tripod joint with transaxle side gears. Then grasp halfshaft interconnecting shaft and push tripod joint into transaxle side gear until fully seated. **Test that snap ring is fully engaged with side gear by attempting to remove tripod joint from transaxle by hand. If snap ring is fully engaged with side gear, tripod joint will not be removable by hand.**
5. If the vehicle is two wheel drive install the halfshaft bracket (2) to engine lower mounting bolt (3) and torque to 75 N·m (55 ft. lbs.).

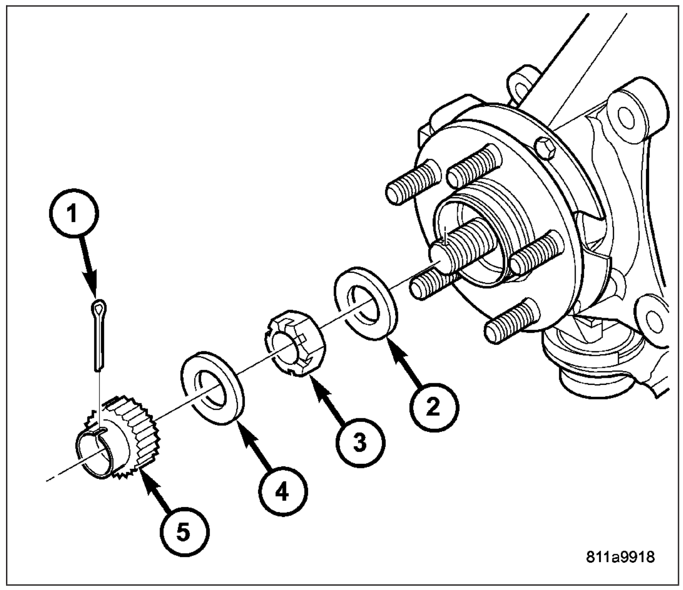


6. If the vehicle is two wheel drive install the halfshaft bracket upper mounting bolts (2) and torque to 75 N·m (55 ft. lbs.).



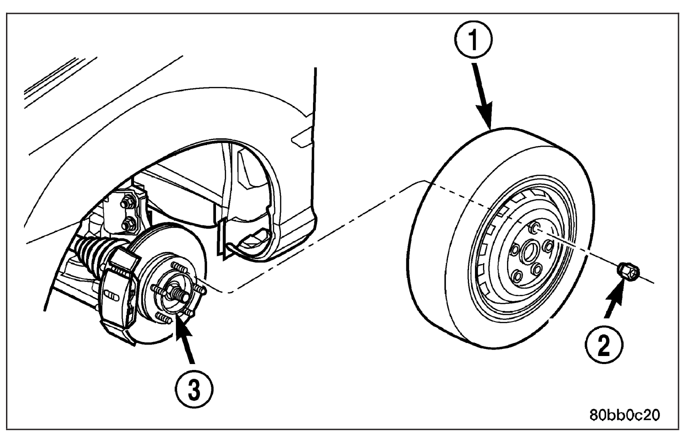
7. Ensure that front of outer CV joint (2) which fits into steering knuckle, is free of debris and moisture before assembling into steering knuckle.

8. Apply a light coating of MOPAR® multi-purpose wheel bearing grease around the circumference of the flat surface (1). **Do not apply too much grease, which could spill on to the non mating and adversely affect the function of the half-shaft.**
9. Wipe the rear of the hub and bearing in the knuckle clean where they contact the C/V joint.
10. Install halfshaft back into front hub.



11. Install steering knuckle onto the ball joint stud (3).

NOTE: At this point, the outer joint will not seat completely into the front hub. The outer joint will be pulled into hub and seated when the hub nut is installed and torqued.

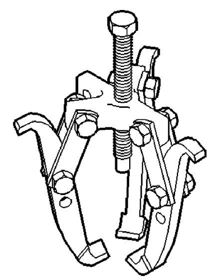


12. Install a **NEW** steering knuckle to ball joint stud bolt (2) and nut (1). Tighten the nut and bolt to 95 N·m (70 ft. lbs.).
13. Clean all foreign matter from threads of halfshaft outer stub axle. Install washer (2) and hub nut (3) onto the threads of the stub axle and tighten nut (3) to 244 N·m (180 ft. lbs.).
14. Install spring washer (4), nut lock (5), and cotter pin (1).

Halfshaft Retaining Hardware

1 - COTTER PIN
2 - WASHER
3 - HUB NUT
4 - SPRING WASHER
5 - NUT LOCK

15. Install front wheel and tire assembly (1). Install front wheel lug nuts (2) and tighten to 128 N·m (95 ft. lbs.).
16. Check for correct fluid level in transaxle assembly.
17. Lower vehicle.
18. Connect battery negative cable.



SPECIFICATIONS

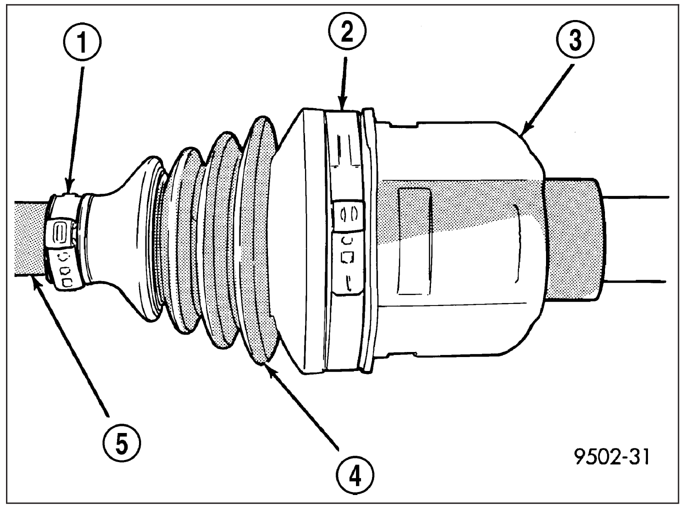
HALFSHAFT

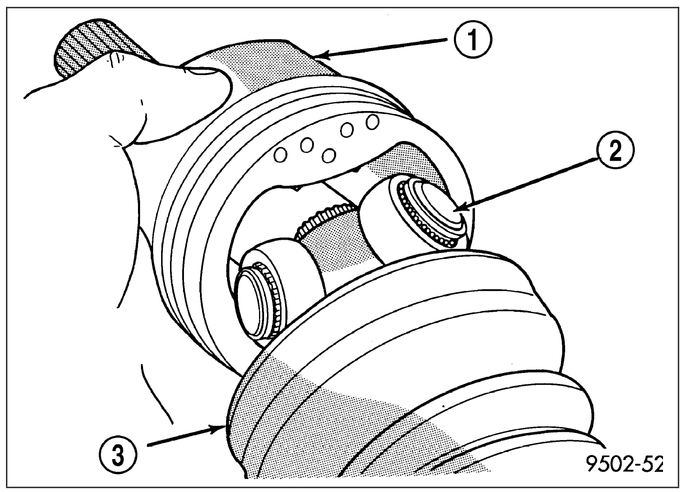
Puller 1026



Crimping Tool C-4975A

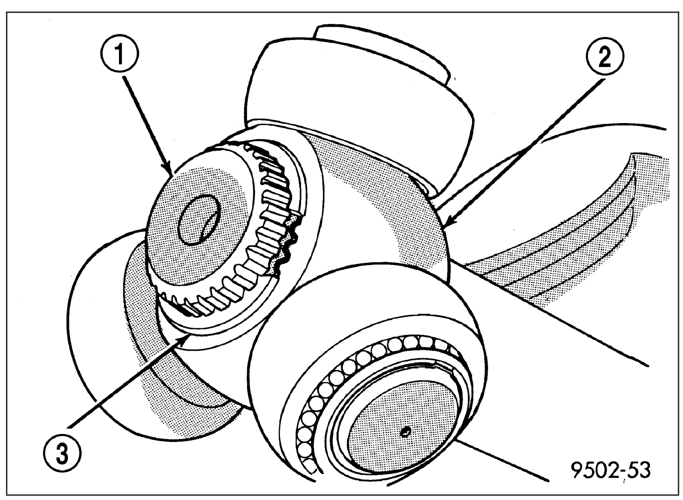
CV BOOT-INNER

REMOVAL

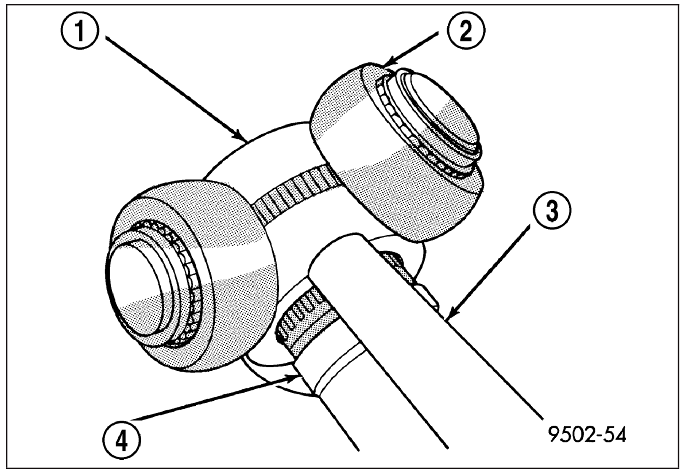


CAUTION: The inner tripod joints will use a retaining clips inside the housing to keep the spider assembly in the housing. Do not pull on the interconnecting shaft to disengage tripod housing from transmission stub shaft. Removal in this manner will cause damage to the inboard joint sealing boots.

1. Remove the halfshaft requiring boot replacement from the vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)
2. Remove large boot clamp (2) that retains inner tripod joint sealing boot to tripod joint housing (3) and discard. Then remove small clamp (1) that retains inner tripod joint sealing boot to interconnecting shaft (5) and discard. Remove the sealing boot (4) from the tripod housing and slide it down the interconnecting shaft.

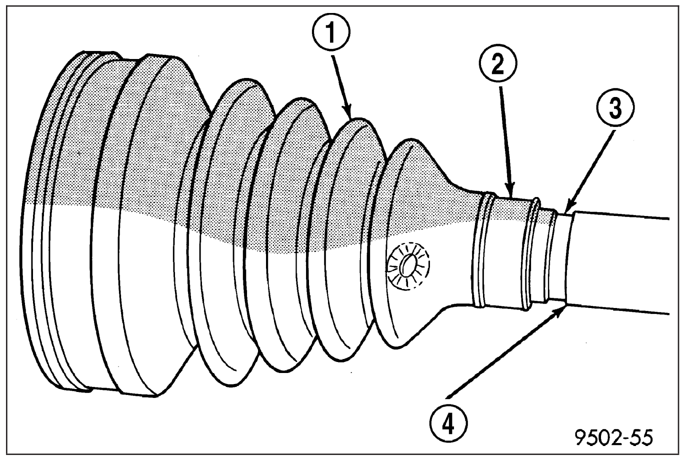


CAUTION: When removing the spider joint from the tripod joint housing, hold the rollers in place on the spider trunions to prevent the rollers and needle bearings from falling away.



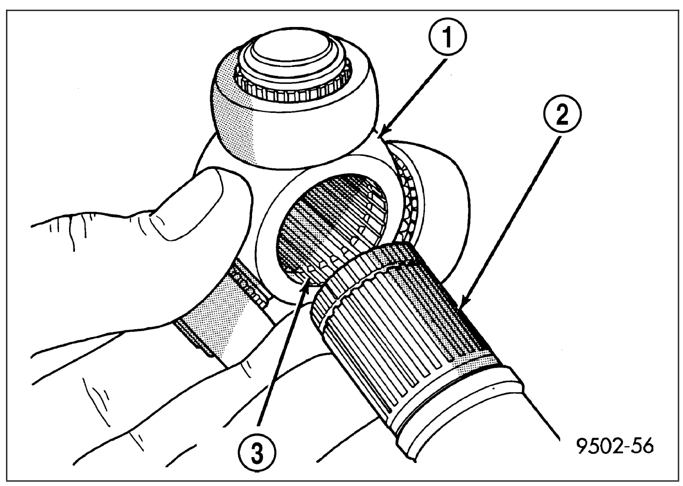
3. Slide the interconnecting shaft and spider assembly (2) out of the tripod joint housing (1).

4. Remove snap ring (3) that retains spider assembly (2) to interconnecting shaft (1).

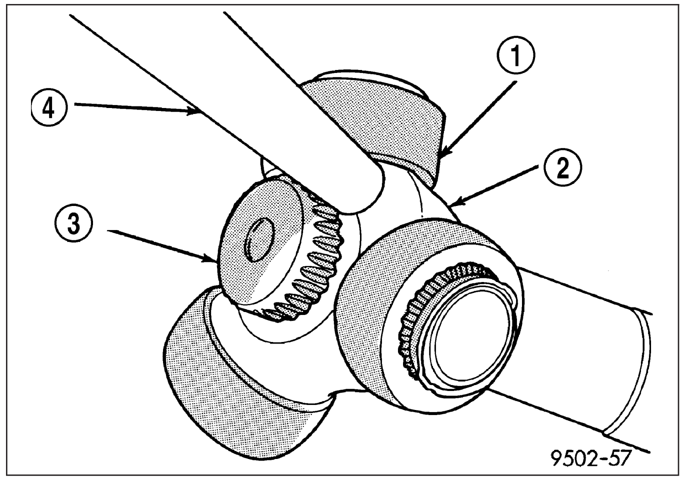


5. Remove the spider assembly (1) from interconnecting shaft (4). If spider assembly will not come off interconnecting shaft by hand, it can be removed by tapping spider assembly with a brass drift (3). **Do not hit the outer tripod bearings in an attempt to remove spider assembly from interconnecting shaft.**
6. Slide sealing boot off interconnecting shaft.
7. Thoroughly clean and inspect spider assembly, tripod joint housing, and interconnecting shaft for any signs of excessive wear. **If any parts show signs of excessive wear, the halfshaft assembly will require replacement. Component parts of these halfshaft assemblies are not serviceable.**

INSTALLATION

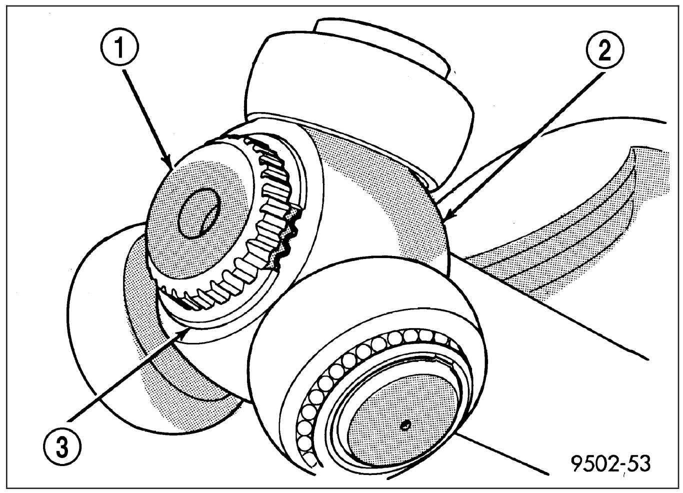


NOTE: The inner tripod joint sealing boots are made from two different types of material. High-temperature applications (close to exhaust system) use silicone rubber whereas standard temperature applications use Hytrel plastic. The silicone sealing boots are soft and pliable. The Hytrel sealing boots are stiff and rigid. The replacement sealing boot MUST BE the same type of material as the sealing boot that was removed.

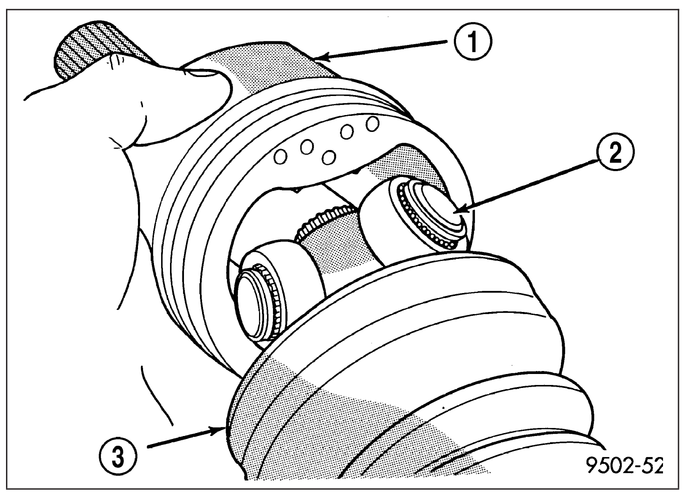


1. Slide inner tripod joint seal boot retaining clamp onto interconnecting shaft (4). Then slide the replacement inner tripod joint sealing boot (1) onto interconnecting shaft. **Inner tripod joint seal boot MUST be positioned on interconnecting shaft, so the raised bead on the inside of the seal boot is in groove (3) on interconnecting shaft.**

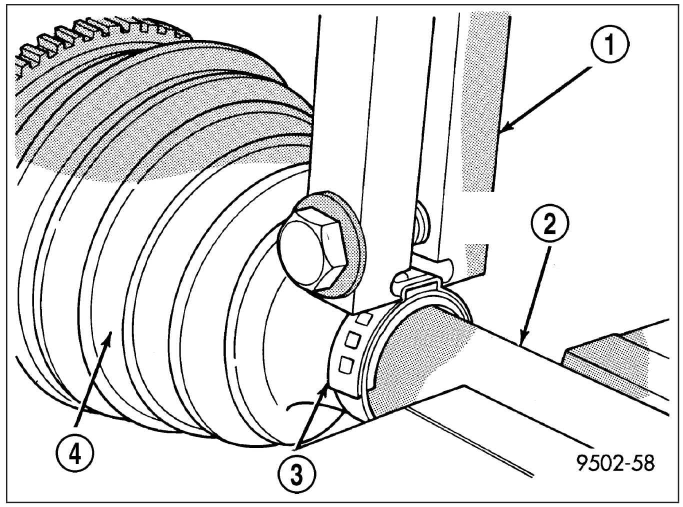
NOTE: The rollers can fall off use, caution when installing the tripod



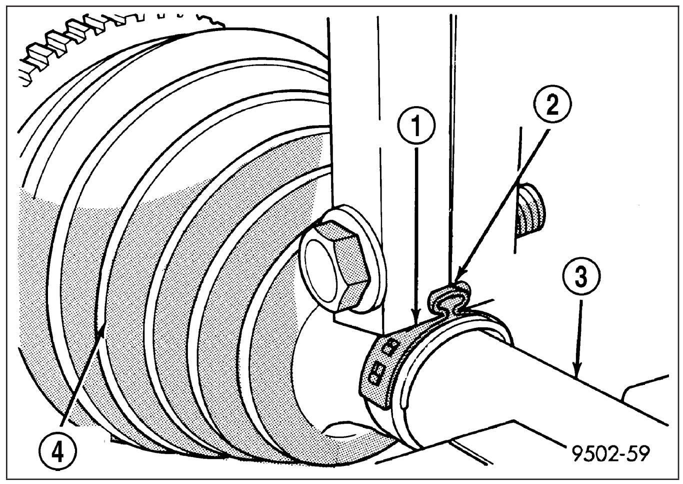
2. Install spider assembly (1) onto interconnecting shaft with chamfer (3) on spider assembly toward interconnecting shaft (3).



3. Spider assembly (2) must be installed on interconnecting shaft (3) far enough to fully install spider retaining snap ring. If spider assembly will not fully install on interconnecting shaft by hand, it can be installed by tapping the spider body with a brass drift (4). **Do not hit the outer tripod bearings in an attempt to install spider assembly on interconnecting shaft.**

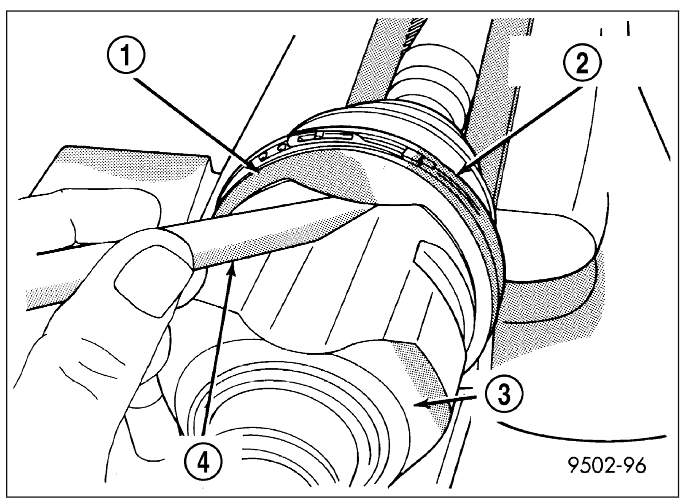


4. Install the spider assembly (2) to interconnecting shaft retaining snap ring (3) into groove on end of interconnecting shaft. Be sure the snap ring is fully seated into groove on interconnecting shaft (1).



5. Distribute 1/2 the amount of grease provided in the seal boot service package (DO NOT USE ANY OTHER TYPE OF GREASE) into tripod housing. Put the remaining amount into the sealing boot (3).
6. Align tripod housing (1) with spider assembly (2) and then slide tripod housing over spider assembly and interconnecting shaft.

7. Install inner tripod joint seal boot to interconnecting shaft clamp (3) evenly on sealing boot (4).
8. Clamp sealing boot onto interconnecting shaft using Crimping Tool C-4975-A and the following procedure. Place Crimping Tool C-4975-A over bridge of clamp.

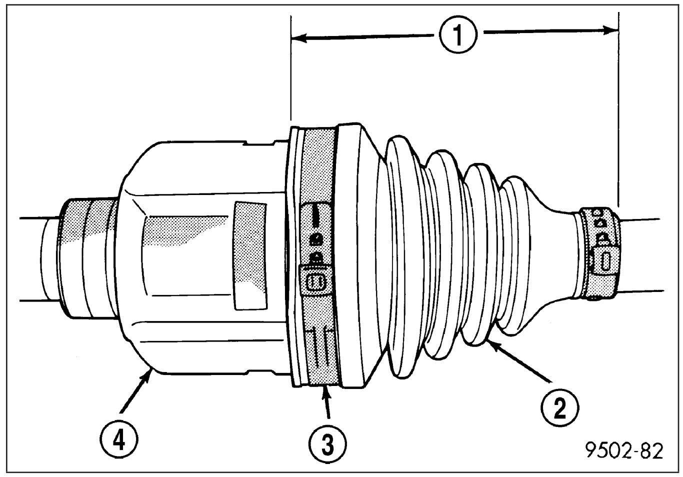


9. Tighten nut on crimping tool C-4975-A (2) until jaws on tool are closed completely together (2), face to face.

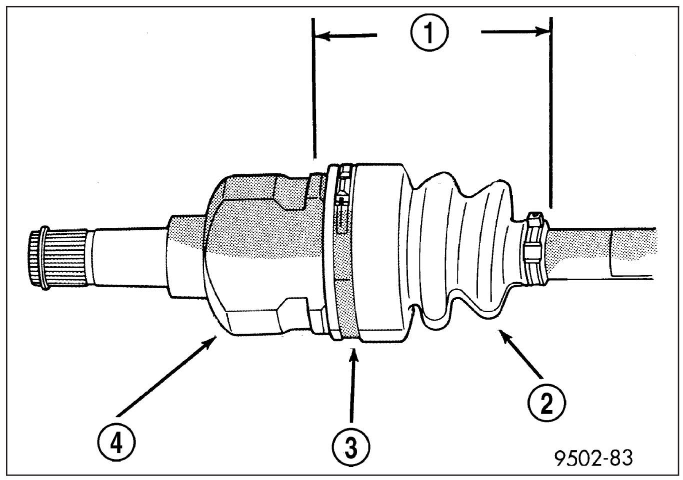
CAUTION: Seal must not be dimpled, stretched, or out–of–shape in any way. If seal is NOT shaped correctly, equalize pressure in seal and shape it by hand.

10. Position sealing boot into the tripod housing (3) retaining groove. Install seal boot retaining clamp (2) evenly on sealing boot (1).

CAUTION: The following positioning procedure determines the correct air pressure inside the inner tripod joint assembly prior to clamping the sealing boot to inner tripod joint housing. If this procedure is not done prior to clamping sealing boot to tripod joint housing, boot durability can be adversely affected.

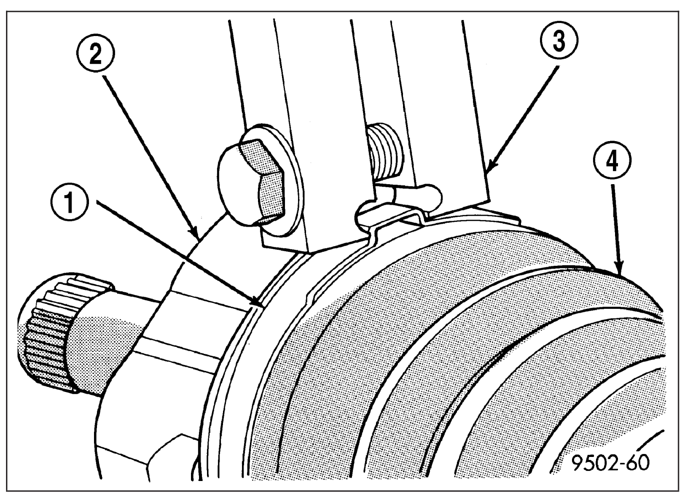


CAUTION: When venting the inner tripod joint assembly, use care so inner tripod sealing boot does not get punctured or, in any other way, damaged. If sealing boot is punctured or damaged while being vented, the sealing boot can not be used.

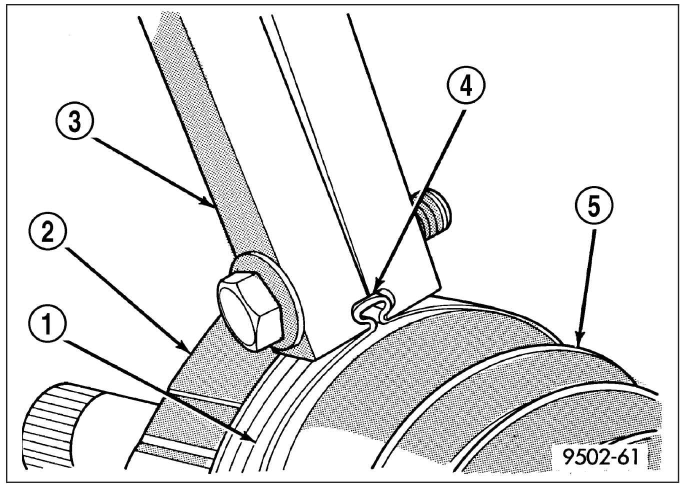


11. Insert a trim stick (4) between the tripod joint (3) and the sealing boot (1) to vent inner tripod joint assembly. **When inserting trim stick between tripod housing and sealing boot, ensure trim stick is held flat and firmly against the tripod housing. If this is not done, damage to the sealing boot can occur.** If inner tripod

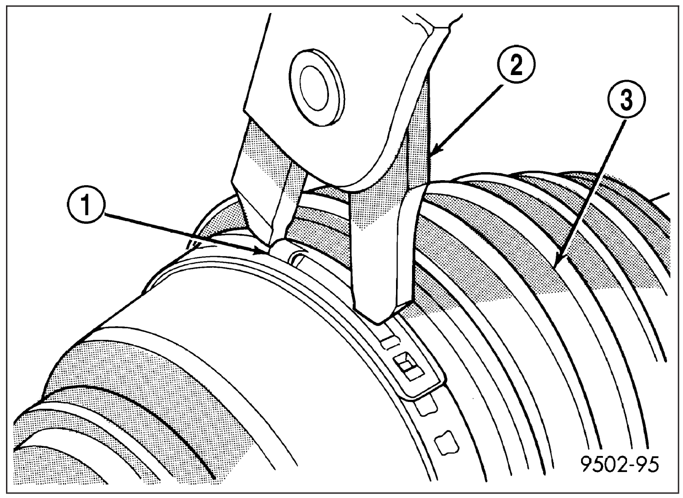
joint has a Hytrel (hard plastic) sealing boot, be sure trim stick is inserted between soft rubber insert and tripod housing, and not the hard plastic sealing boot and soft rubber insert.



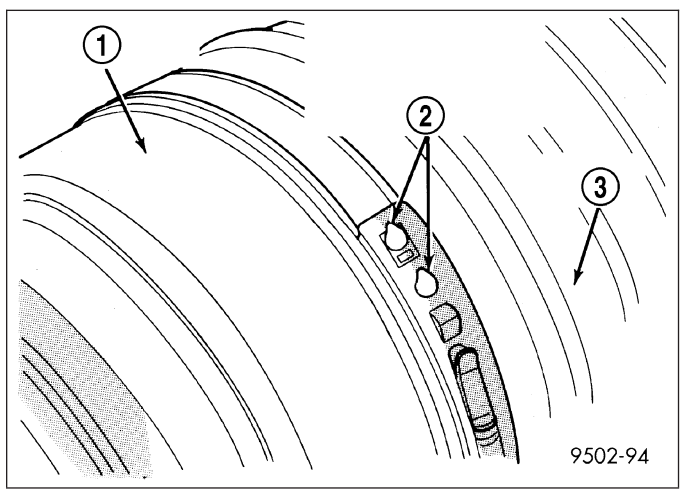
12. With trim stick inserted between sealing boot (2) and tripod joint housing (4), position inner tripod joint on halfshaft until correct sealing boot edge to edge length (1) is obtained for type of sealing boot material being used. Then remove the trim stick.



13. With trim stick inserted between sealing boot (2) and tripod joint housing (4), position inner tripod joint on halfshaft until correct sealing boot edge to edge length (1) is obtained for type of sealing boot material being used. Then remove the trim stick.

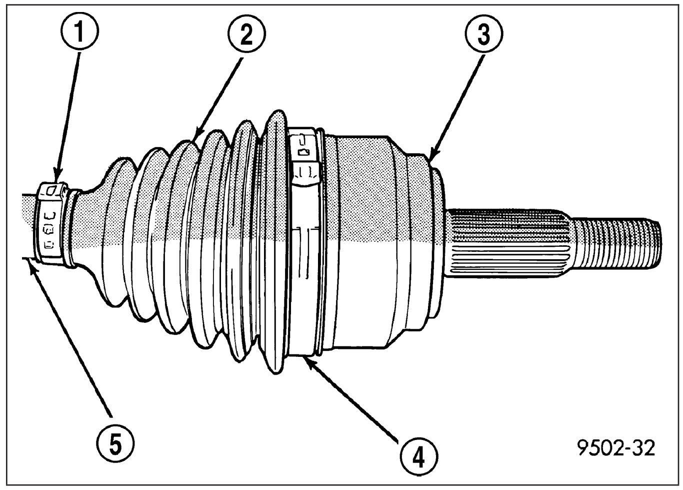


14. Clamp (1) tripod joint sealing boot (4) to tripod joint (2) using required procedure for type of boot clamp application. If seal boot uses crimp type boot clamp, clamp sealing boot onto tripod housing using crimper, Crimping Tool C-4975-A (3). Place Crimping Tool C-4975-A over bridge of clamp (1).

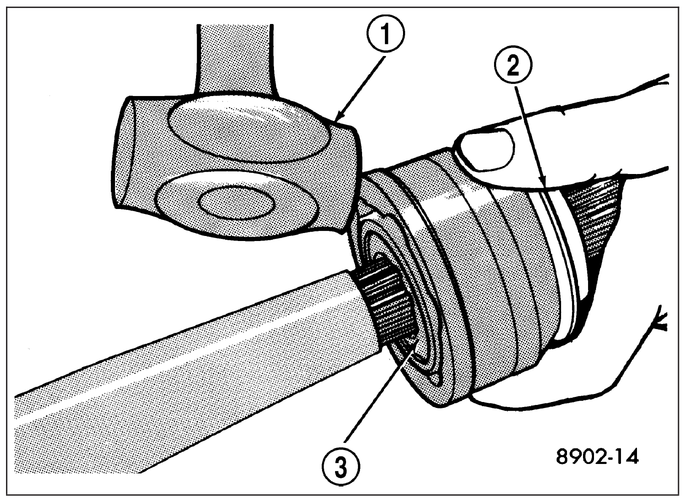


15. Tighten nut on Crimping Tool C-4975-A (3) until jaws on tool (4) are closed completely together (4), face–to–face.

16. If seal boot (3) uses low profile latching type boot clamp, clamp sealing boot onto tripod housing using Clamping Tool, Snap-On® YA3050 (2) (or an equivalent). Place prongs of Clamp Locking Tool in the holes of the clamp (1).

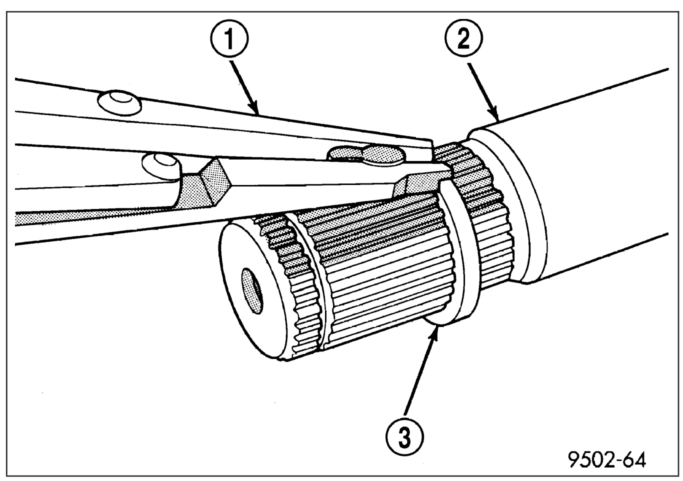


17. Squeeze tool together until top band of clamp is latched behind the two tabs (2) on lower band of clamp.
18. Install the halfshaft requiring boot replacement back on the vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)



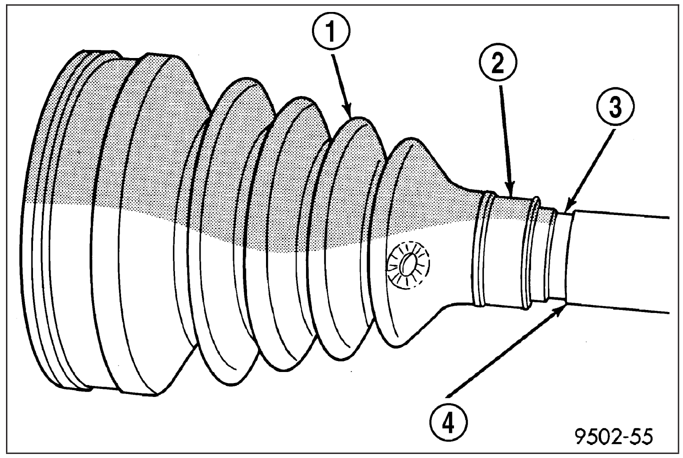
CV BOOT-OUTER

REMOVAL

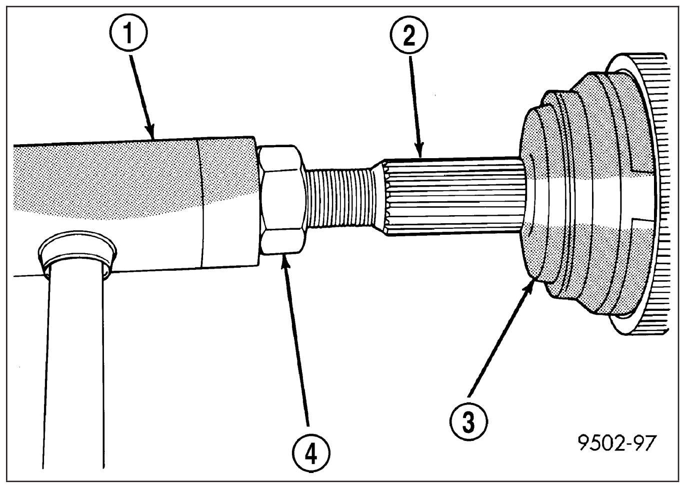


1. Remove halfshaft assembly requiring boot replacement from vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)
2. Remove large boot clamp (4) retaining CV joint sealing boot to CV joint housing (3) and discard. Remove small clamp (1) that retains outer CV joint sealing boot to interconnecting shaft (5) and discard. Remove sealing boot (2) from outer CV joint housing and slide it down interconnecting shaft.
3. Wipe away grease to expose outer CV joint and interconnecting shaft.

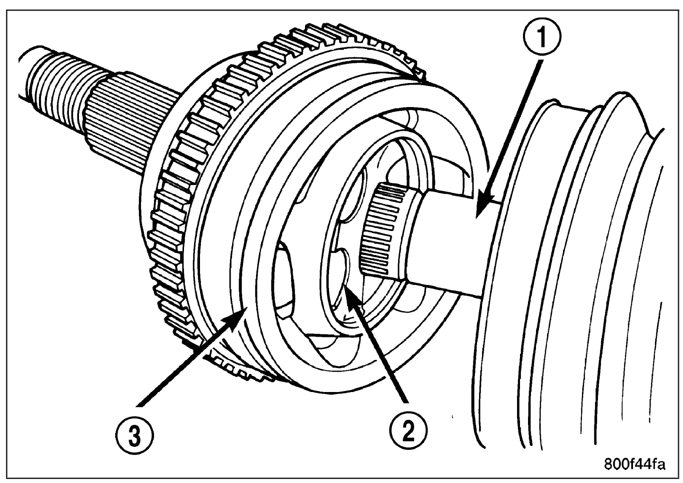
4. Remove outer CV joint from interconnecting shaft using the following procedure: Support interconnecting shaft in a vise equipped with protective caps on jaws of vise to prevent damage to interconnecting shaft. Then, using a soft–faced hammer (1), sharply hit the end of the CV joint housing to dislodge housing from internal circlip (3) on interconnecting shaft. Then slide outer CV joint off end of interconnecting shaft, joint may have to be tapped off shaft using a **soft–faced** hammer.



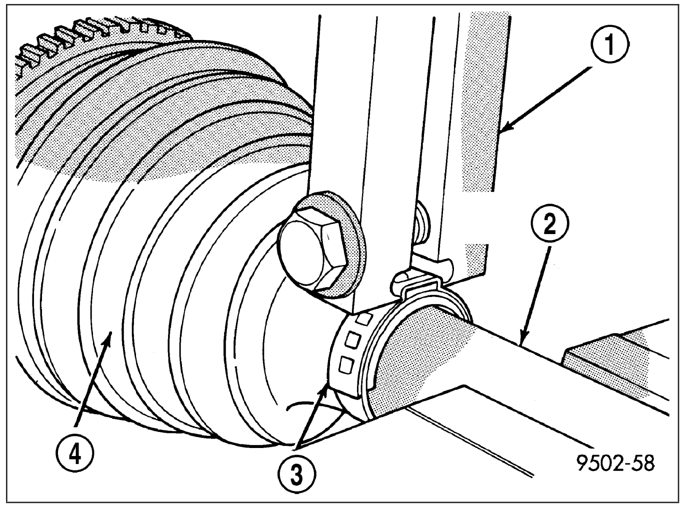
5. Remove large circlip (3) from the interconnecting shaft (2) before attempting to remove outer CV joint sealing boot.
6. Slide sealing boot off interconnecting shaft.
7. Thoroughly clean and inspect outer CV joint assembly and interconnecting joint for any signs of excessive wear. **If any parts show signs of excessive wear, the halfshaft assembly will require replacement. Component parts of these halfshaft assemblies are not serviceable.**



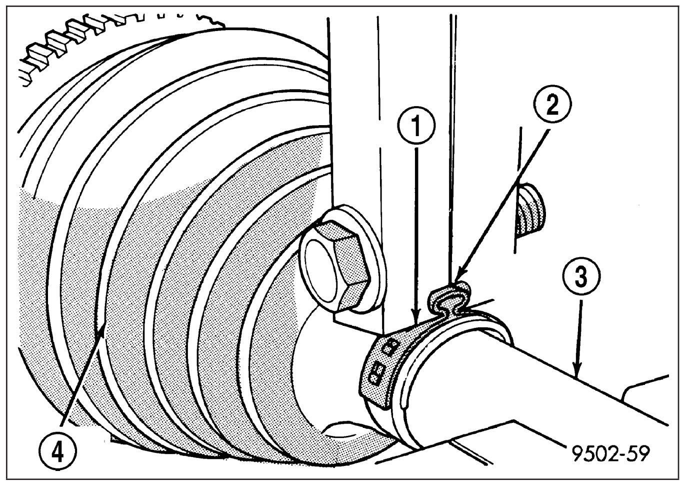
INSTALLATION



1. Slide new sealing boot clamp (2) onto interconnecting shaft (4). Slide the outer CV joint assembly sealing boot (1) onto the interconnecting shaft (4). **Seal boot MUST be positioned on interconnecting shaft so the raised bead on the inside of the seal boot is in groove on interconnecting shaft.**

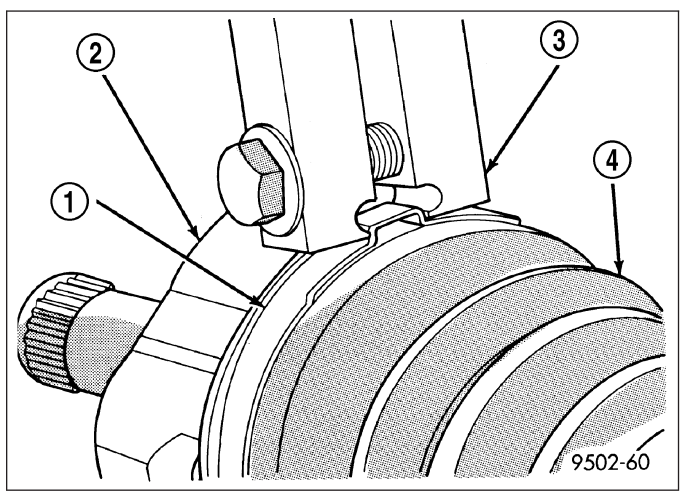


2. Align splines on interconnecting shaft with splines on cross of outer CV joint assembly and start outer CV joint onto interconnecting shaft.
3. Install outer CV joint assembly onto interconnecting shaft by using a **soft–faced** hammer (1) and tapping end of stub axle (2) (with hub nut (4) installed) until outer CV joint (3) is fully seated on interconnecting shaft.

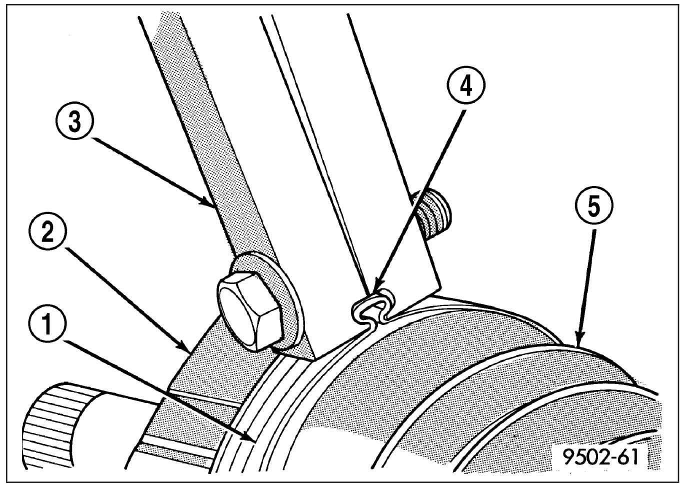


4. Outer CV joint assembly must be installed on interconnecting shaft until cross (2) of outer CV joint assembly (3) is seated against circlip on interconnecting shaft (1).

5. Distribute 1/2 the amount of grease provided in seal boot service package (DO NOT USE ANY OTHER TYPE OF GREASE) into outer CV joint assembly housing. Put the remaining amount into the sealing boot (4).
6. Install outer CV joint sealing boot to interconnecting shaft clamp evenly on sealing boot.
7. Clamp sealing boot onto interconnecting shaft (2) using crimper, Crimping Tool C-4975-A and the following procedure. Place Crimping Tool C-4975-A (1) over bridge of clamp (3).



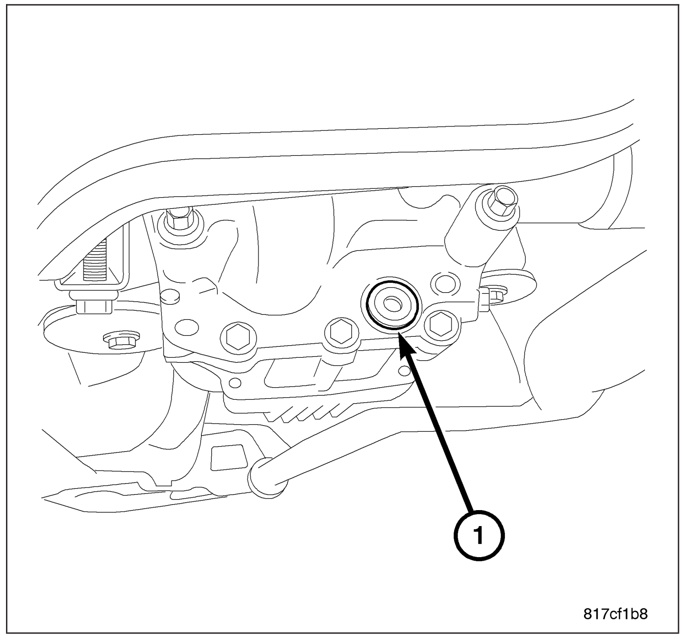
8. Tighten nut on Crimping Tool C-4975-A until jaws on tool (2) are closed completely together, face to face.



CAUTION: Seal must not be dimpled, stretched, or out–of–shape in any way. If seal is NOT shaped correctly, equalize pressure in seal and shape it by hand.

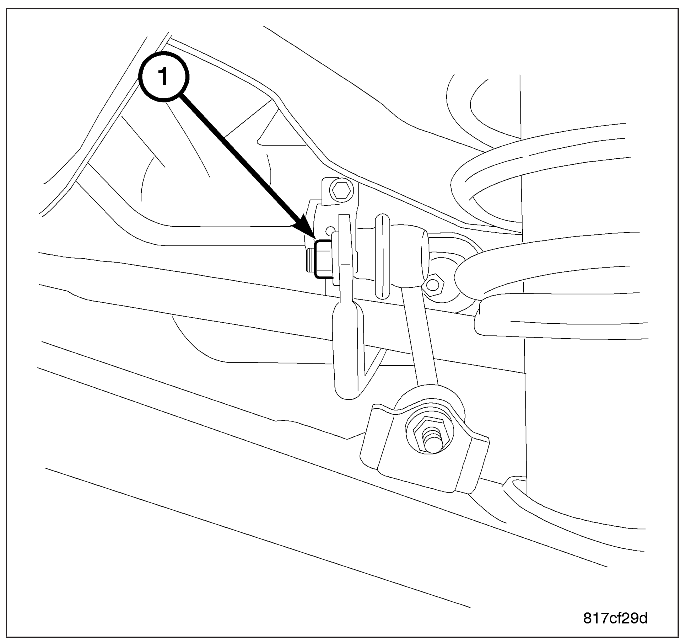
9. Position outer CV joint sealing boot (4) into its retaining groove on outer CV joint housing. Install sealing boot to outer CV joint retaining clamp (1) evenly on sealing boot.
10. Clamp sealing boot onto outer CV joint housing using Crimping Tool C-4975-A (3) and the following procedure. Place Crimping Tool C-4975-A over bridge of clamp (1).

11. Tighten nut on Crimping Tool C-4975-A until jaws on tool are closed completely together (4), face to face.
12. Install the halfshaft requiring boot replacement back on the vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)



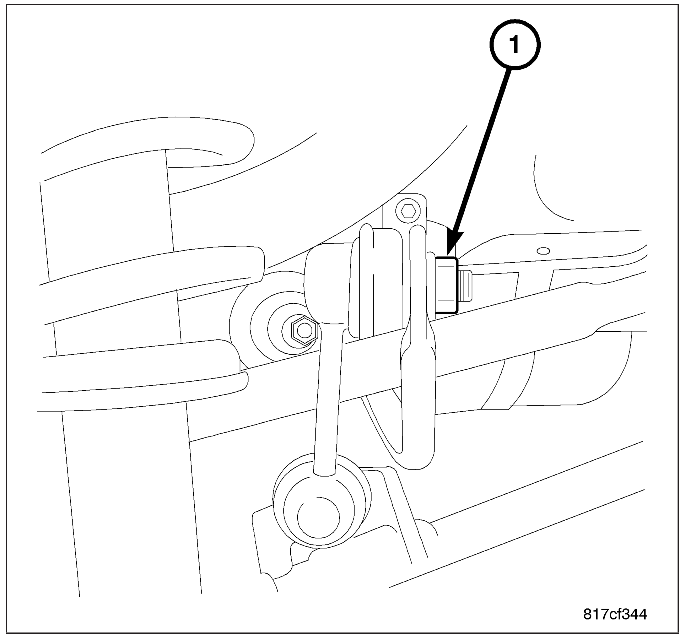
HALF SHAFT-LEFT REAR

TABLE OF CONTENTS

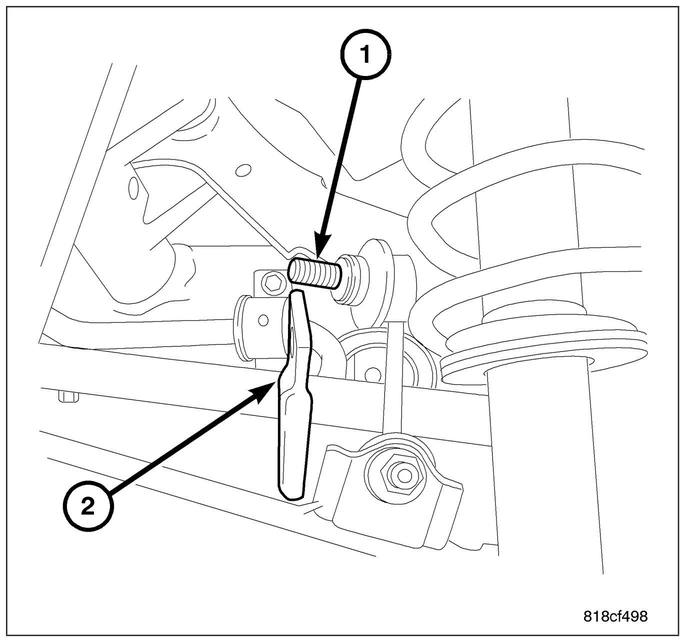


HALF SHAFT-LEFT REAR

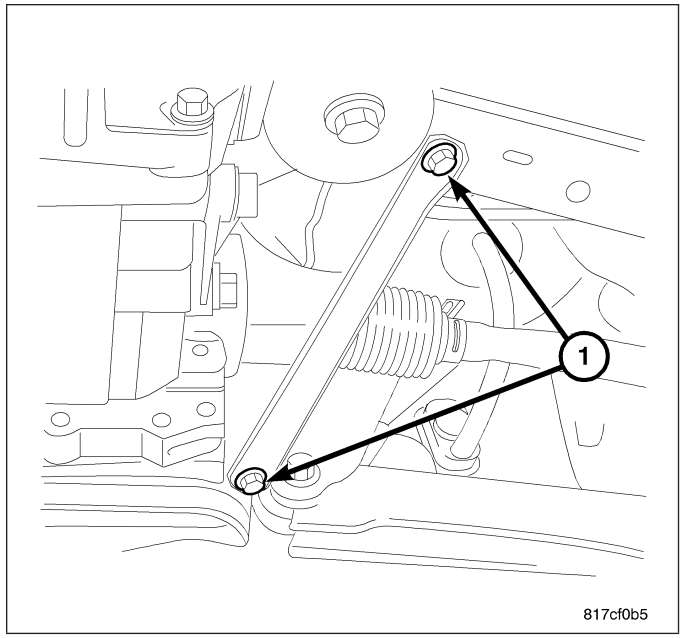
REMOVAL



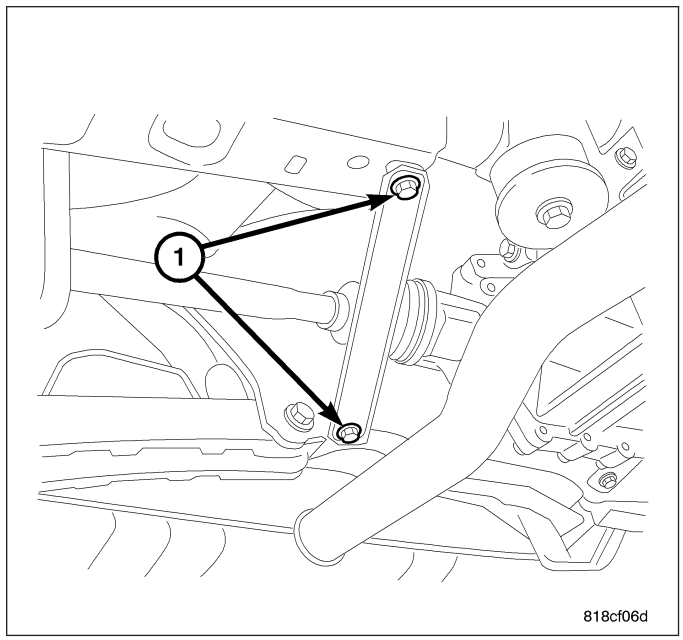
1. Raise vehicle on a hoist.
2. Remove the rear tires.
3. Drain the fluid from the rear drive line module.
4. Remove the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL)



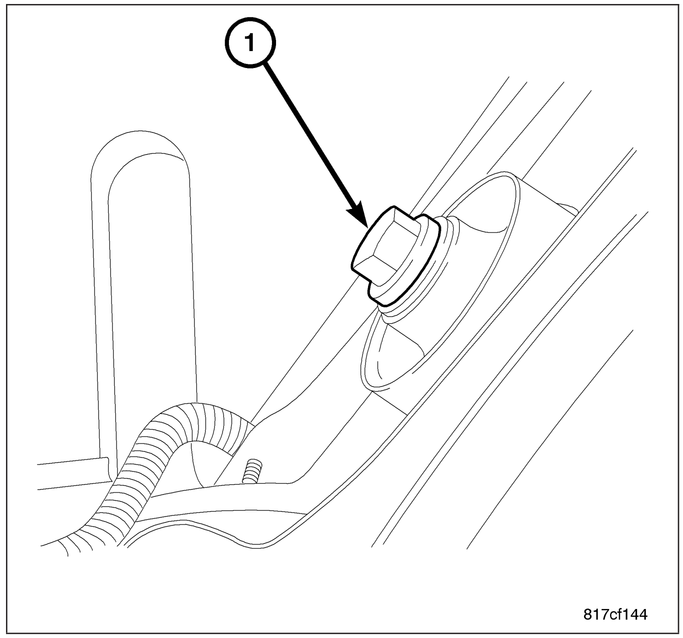
5. Remove right side sway bar nut (if equipped).



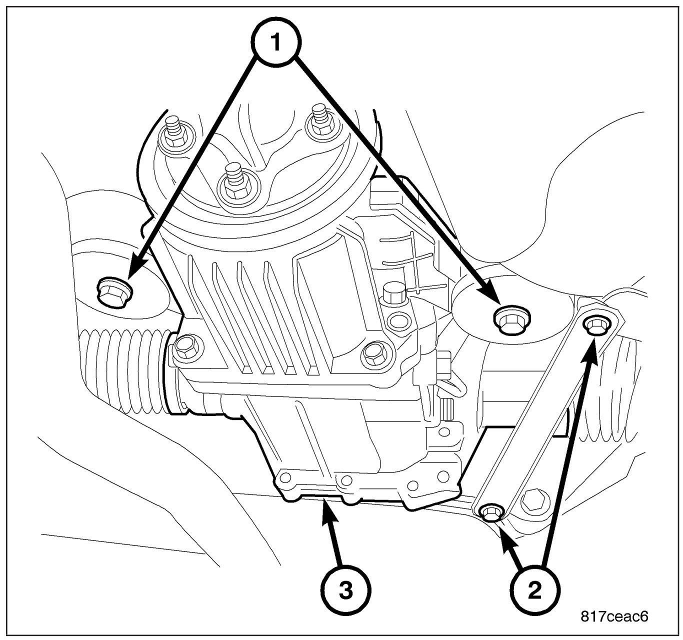
6. Remove left side sway bar nut (if equipped).



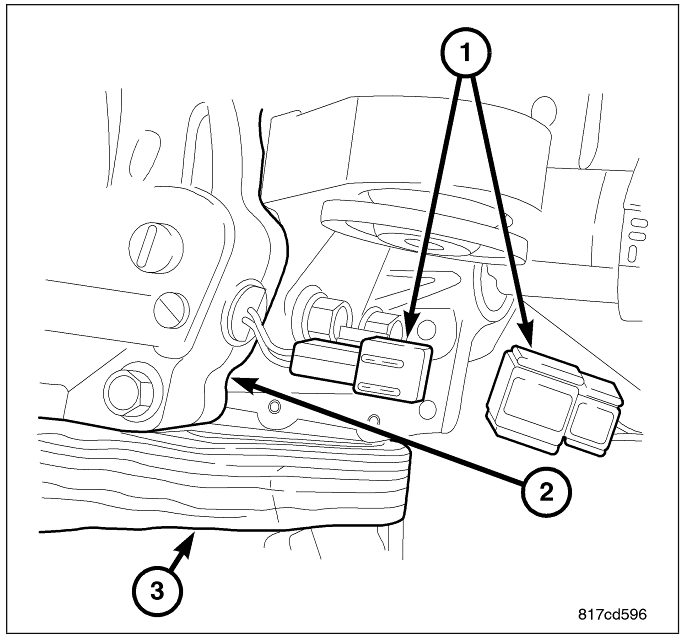
7. Roll sway bar down and out of the way (2) (if equipped).



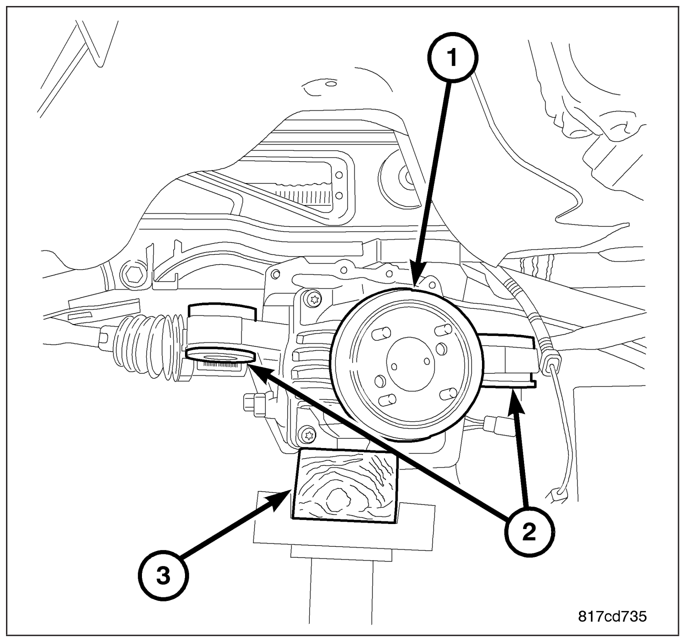
8. Remove the left side stay bracket bolts (1).



9. Remove the right side stay bracket bolts (1).
10. Remove the exhaust system up to the catalytic converter. (Refer to 11 - EXHAUST SYSTEM/ MUFFLER - REMOVAL)
11. Support the rear driveline module with a transmission jack.

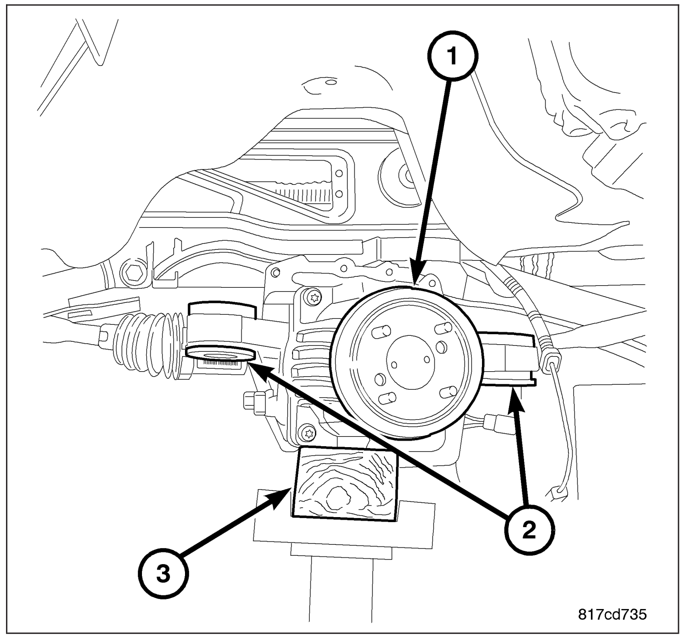


12. Remove the rear bolt (1) at the driveline module.

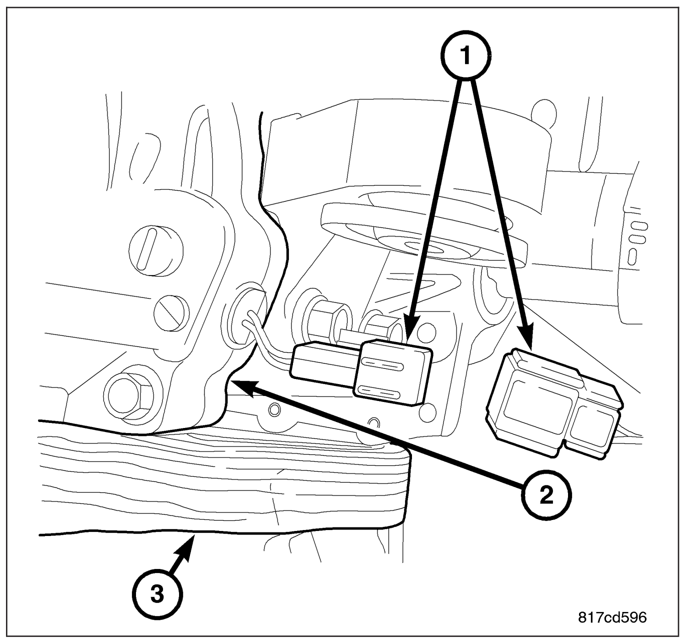


13. Remove the two side bolts (1) at driveline module (3).

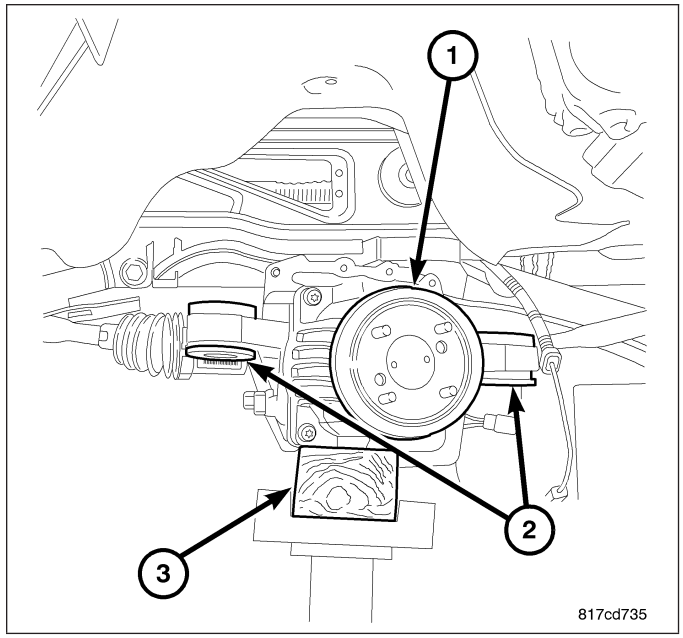
14. Lower drive line module enough gain access to the electrical connector and bracket.
15. Remove the routing bracket bolt.
16. Unplug the electrical connector (1).



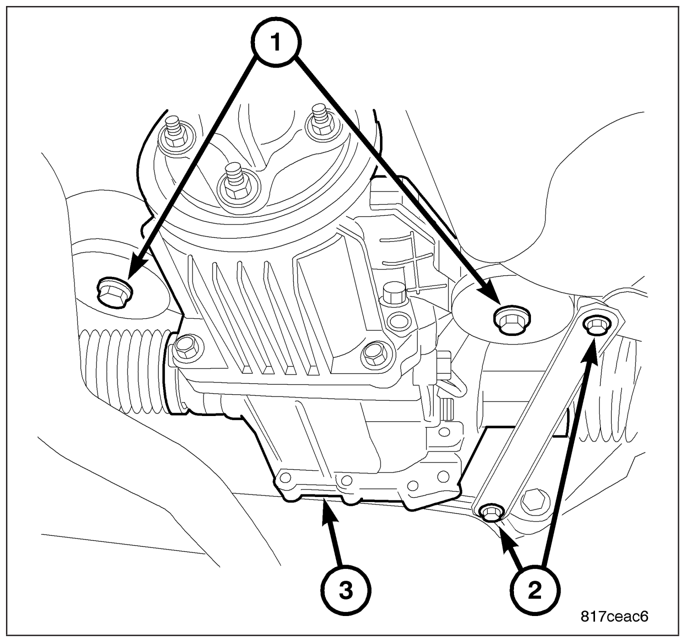
17. Lower the drive line module (1).
18. Disengage axle shaft.
19. Remove wheel if necessary.
20. Remove nut and washer halfshaft to left rear hub.
21. Remove halfshaft from rear hub, if hard to remove or sticking, use a punch and hammer to tap out.



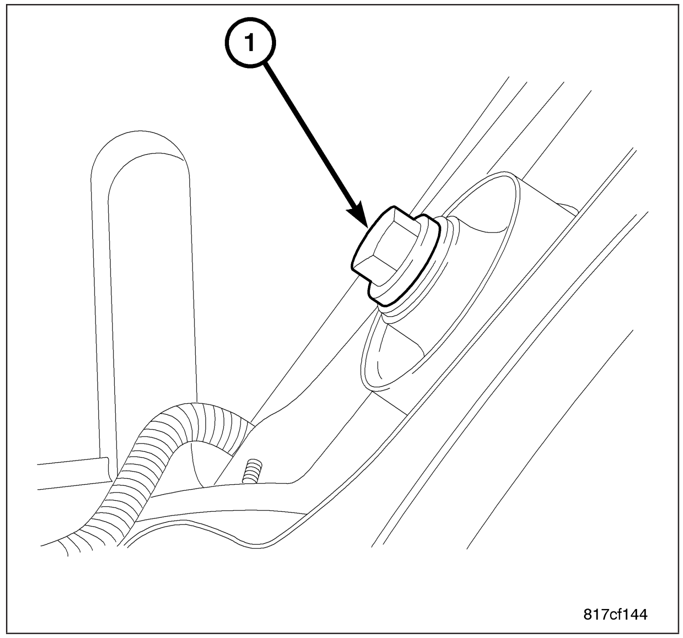
INSTALLATION



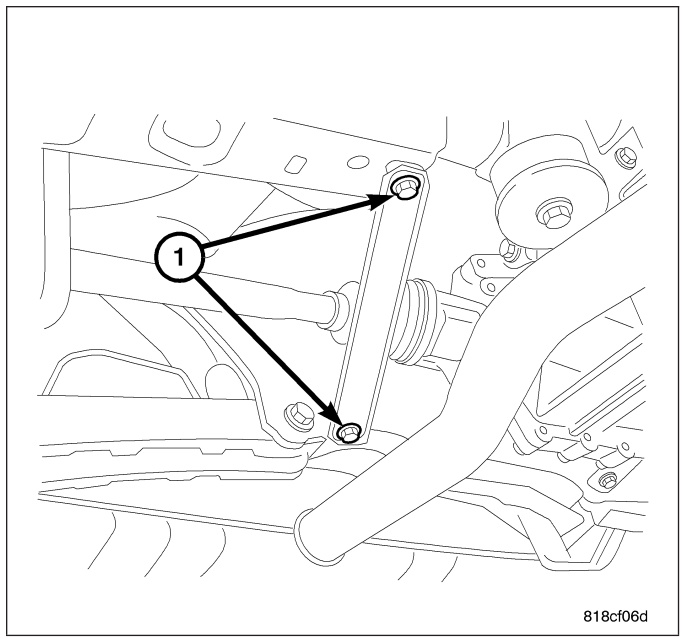
1. Lift driveline module (1) with a transmission jack while installing halfshaft.
2. Install nut and washer halfshaft to left rear hub and torque to 244 N·m (180 ft.lbs.).



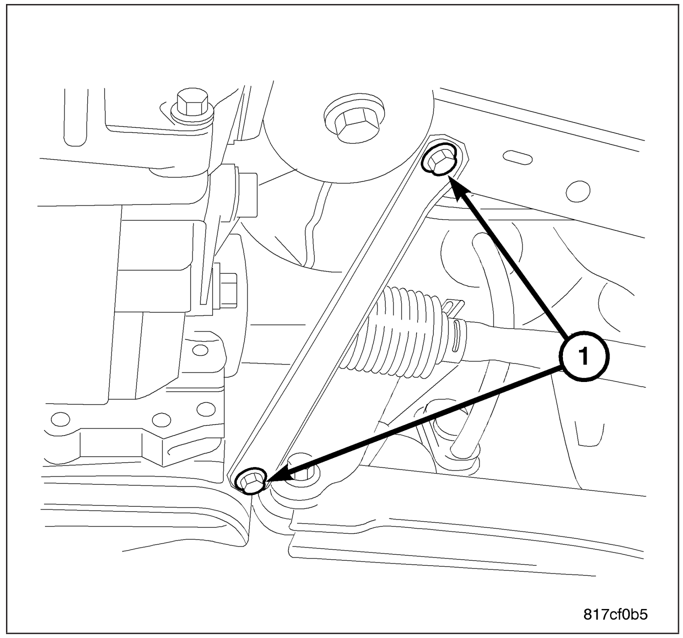
3. Connect the electrical connector (1).
4. Install wire harness bracket and two mounting bolts and torque to 45 Nm (33 ft. lbs.).



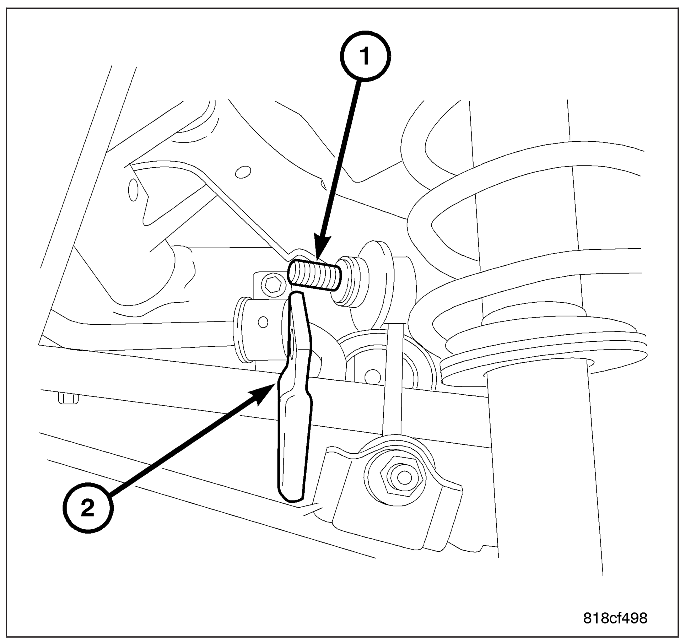
5. Lift driveline module into place.



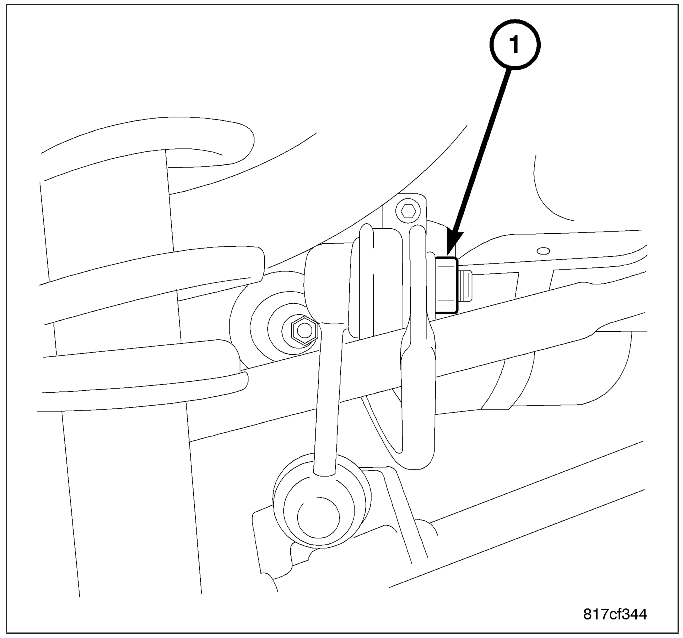
6. Install the two driveline module side mounting bolts (1) and torque to 102 N·m (75 ft. lbs.).



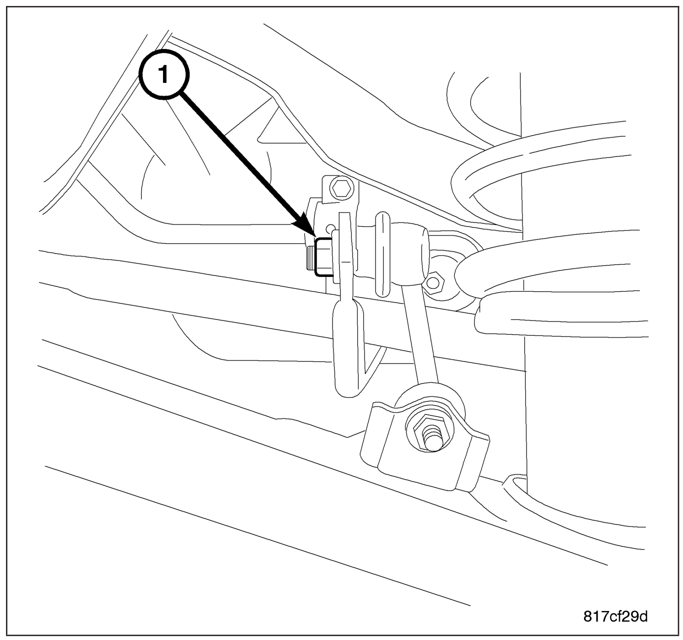
7. Install the rear driveline module mounting bolt (1) and torque to 102 N·m (75 ft. lbs.).



8. Install the right side stay bracket and bolts (1) torque to 61 N·m (45 ft. lbs.)



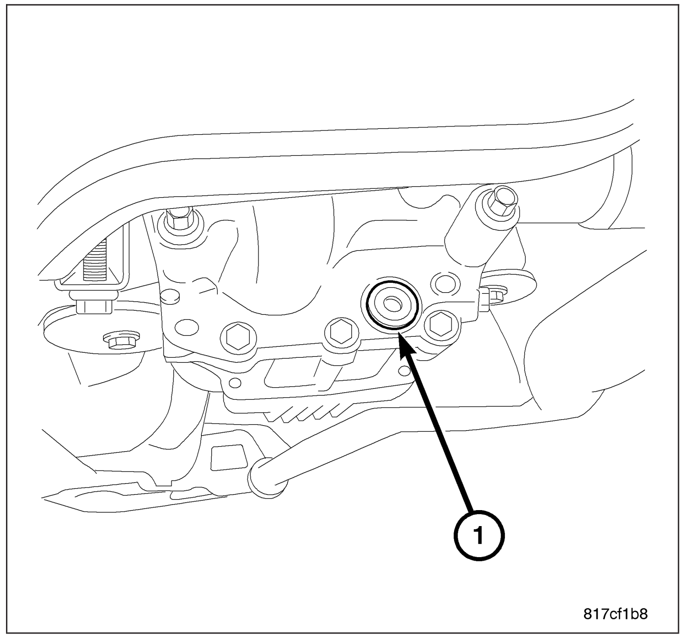
9. Install the left side stay bracket and bolts (1) torque to 61 N·m (45 ft. lbs.).



10. Install the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).
11. Fill the rear axle with fluid.
12. Roll sway bar into place (2) (if equipped).

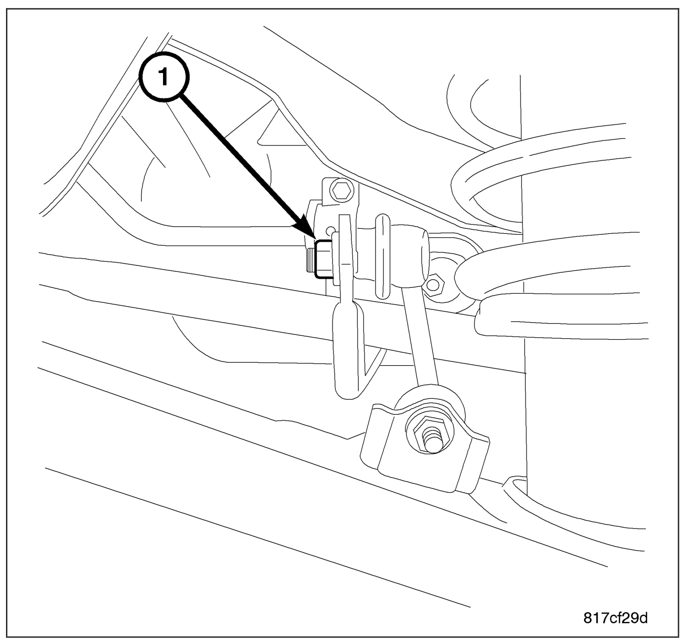
13. Install left side sway bar nut (1) and torque to 61 N·m (45 ft. lbs.) (if equipped).

14. Install right side sway bar nut (1) and torque to 61 N·m (45 ft. lbs.) (if equipped).
15. install the exhaust (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).
16. Install the wheels (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING).



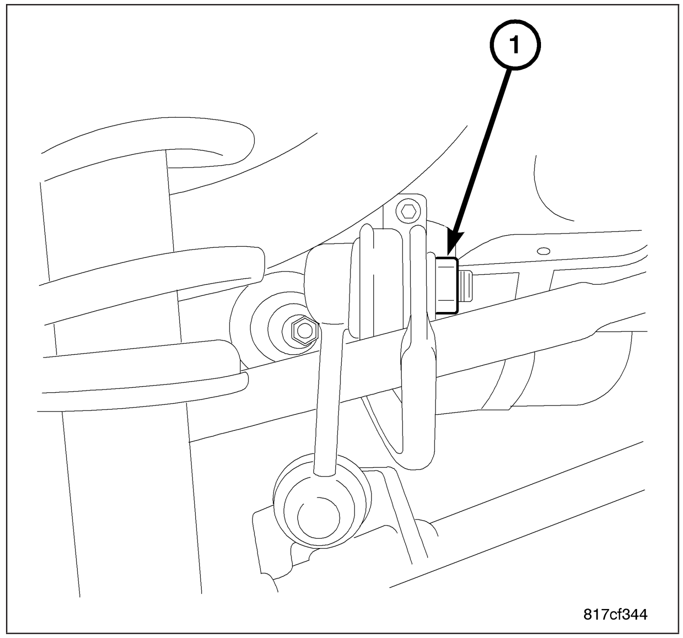
HALF SHAFT-RIGHT REAR

TABLE OF CONTENTS

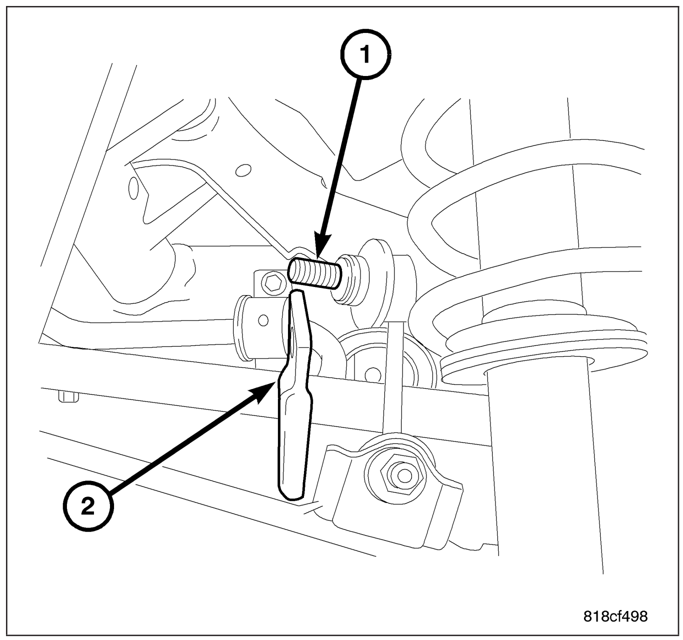


HALF SHAFT-RIGHT REAR

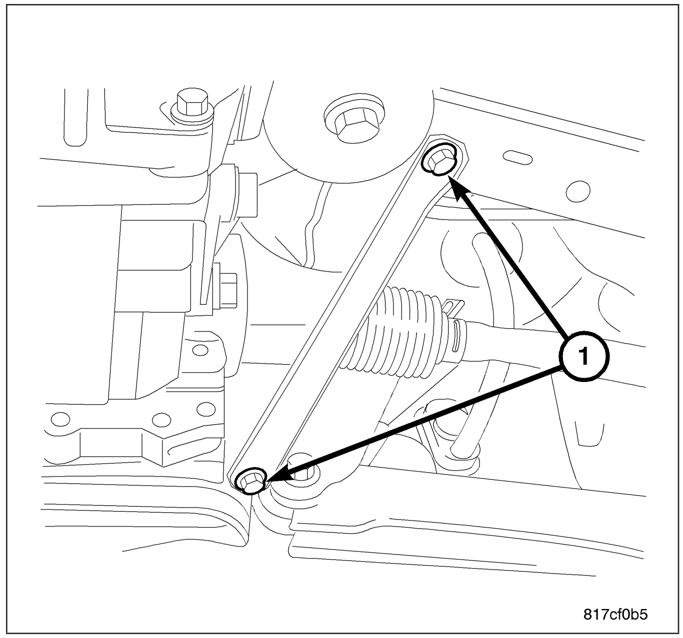
REMOVAL



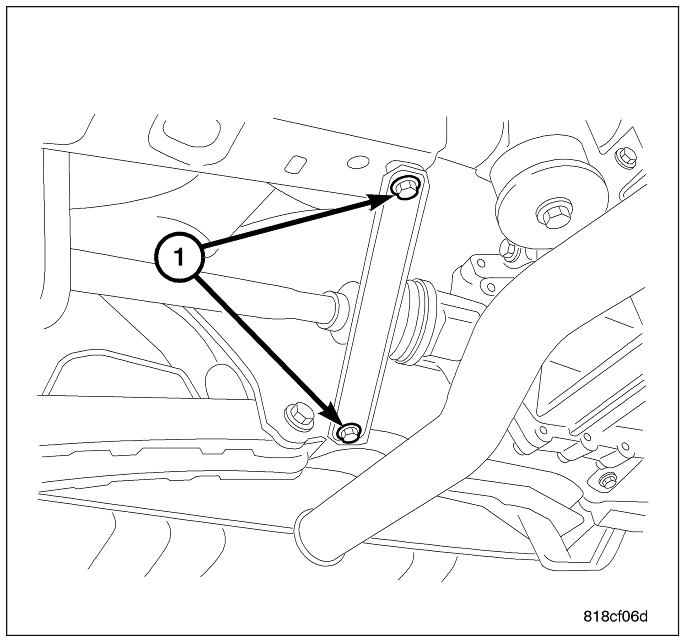
1. Raise vehicle on a hoist.
2. Remove the rear tires.
3. Drain the fluid from the rear drive line module.
4. Remove the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL)



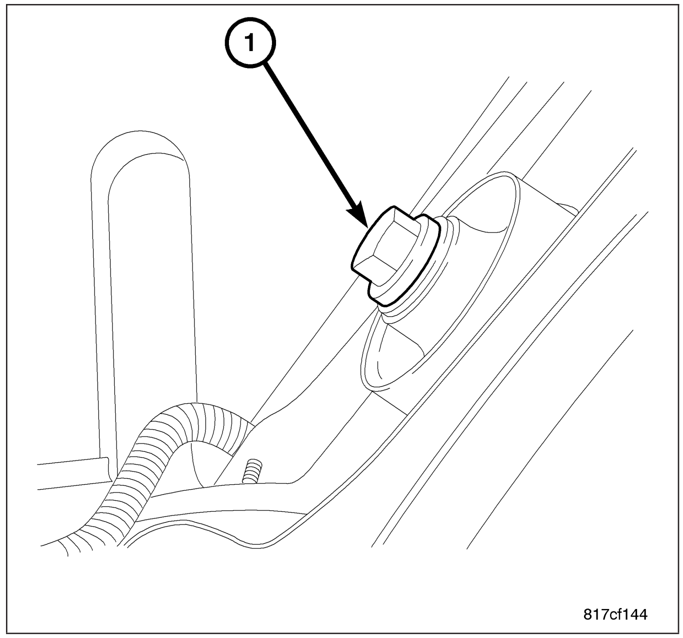
5. Remove right side sway bar nut (if equipped).



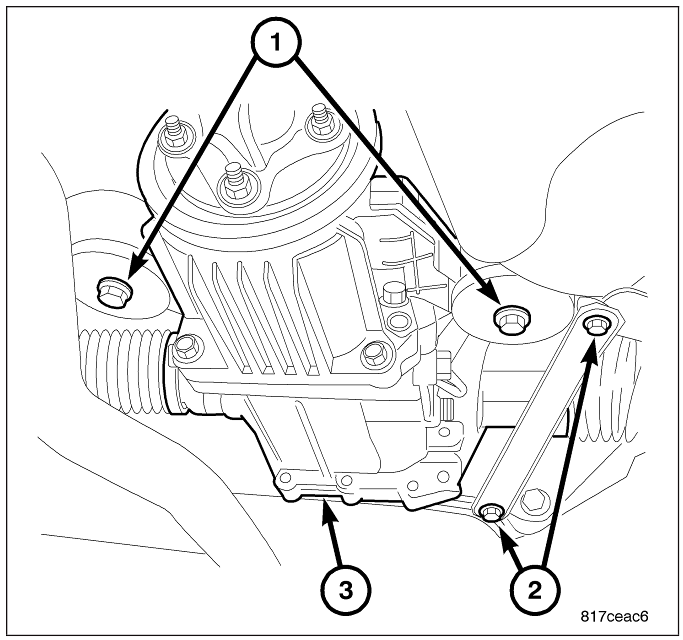
6. Remove left side sway bar nut (if equipped).



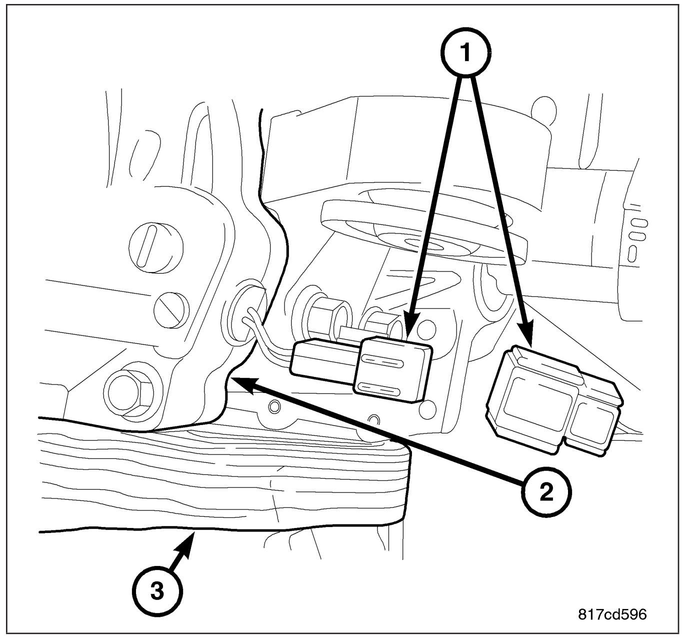
7. Roll sway bar down and out of the way (2) (if equipped).



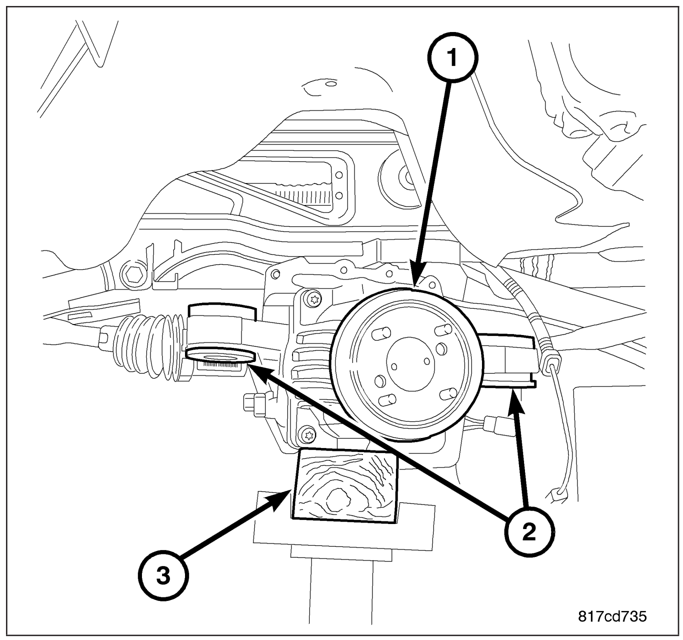
8. Remove the left side stay bracket bolts (1).



9. Remove the right side stay bracket bolts (1).
10. Remove the exhaust system up to the catalytic converter. (Refer to 11 - EXHAUST SYSTEM/ MUFFLER - REMOVAL)
11. Support the rear driveline module with a transmission jack.

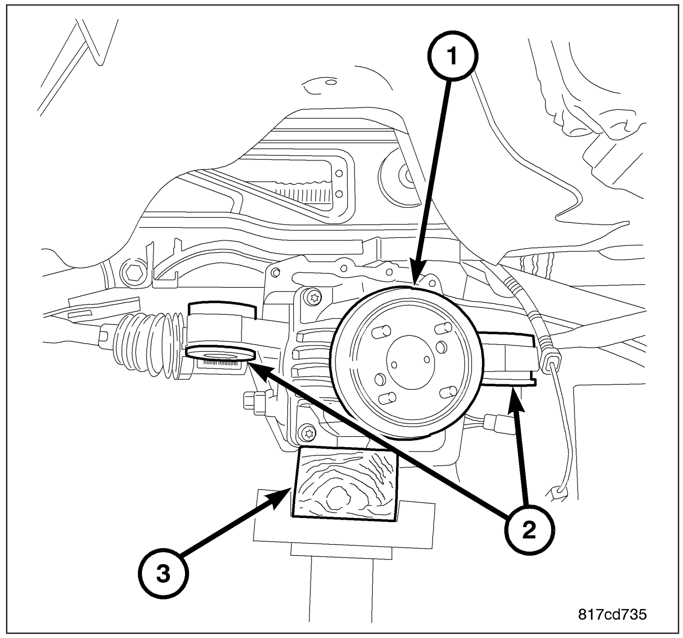


12. Remove the rear bolt (1) at the driveline module.

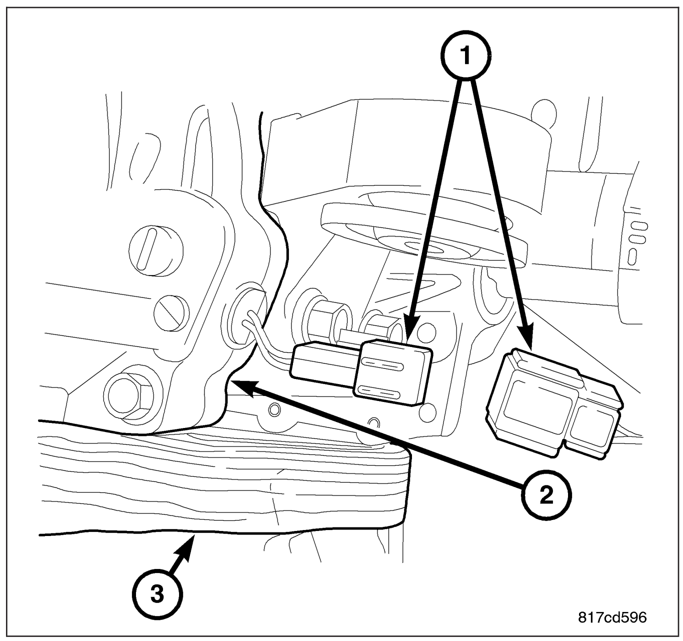


13. Remove the two side bolts (1) at driveline module (3).

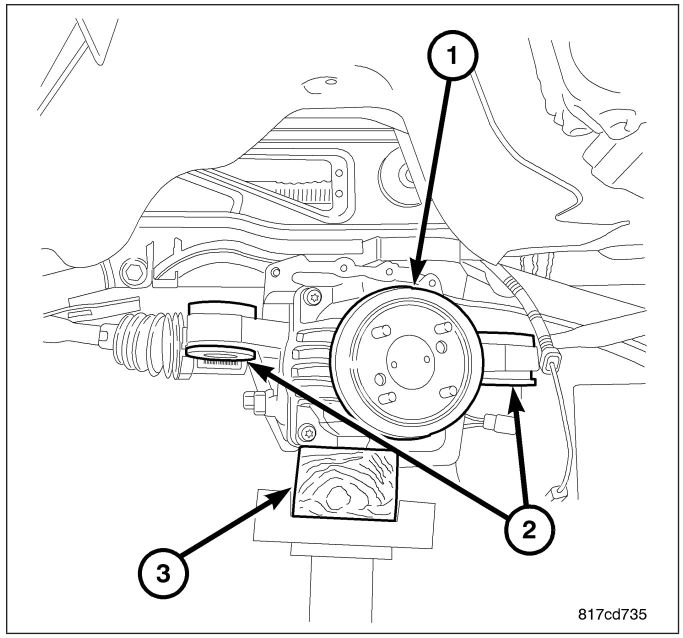
14. Lower driveline module enough gain access to the electrical connector and bracket.
15. Remove the routing bracket bolt.
16. Unplug the electrical connector (1).



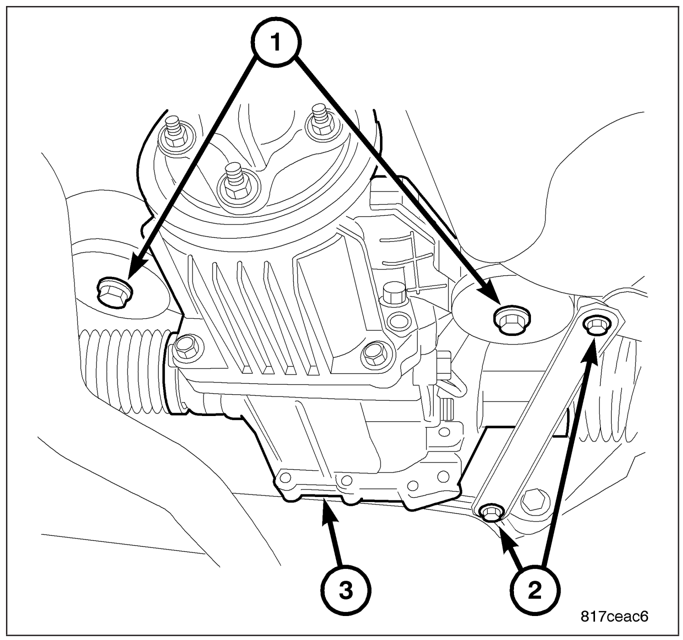
17. Lower the drive line module (1).
18. Disengage axle shaft (2).
19. Remove wheel if necessary.
20. Remove nut and washer halfshaft to left rear hub.
21. Remove half shaft from rear hub, if hard to remove, or sticking, use a punch and hammer to tap out.



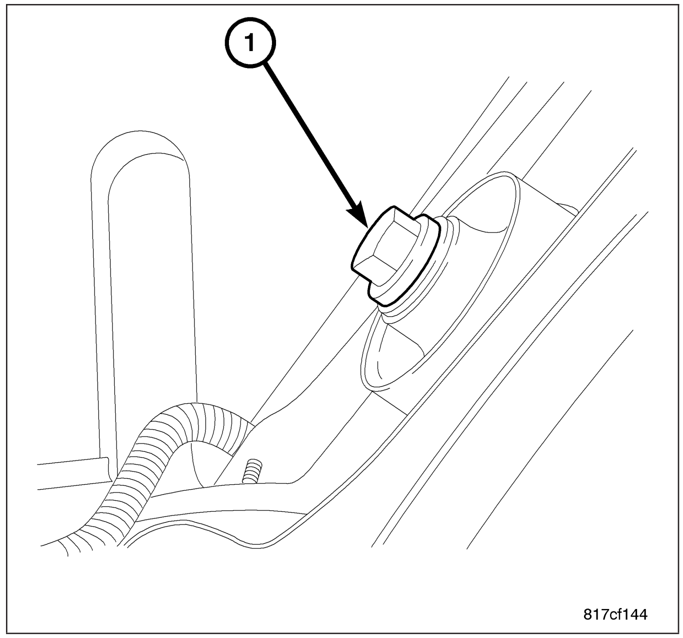
INSTALLATION



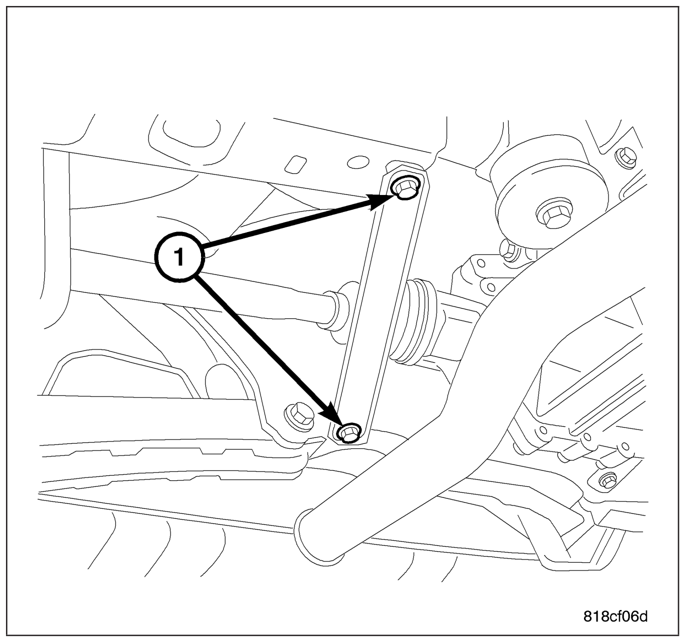
1. Lift driveline module (1) with a transmission jack while installing halfshaft (2).
2. Install nut and washer halfshaft to left rear hub and torque to 244 N·m (180 ft.lbs.).



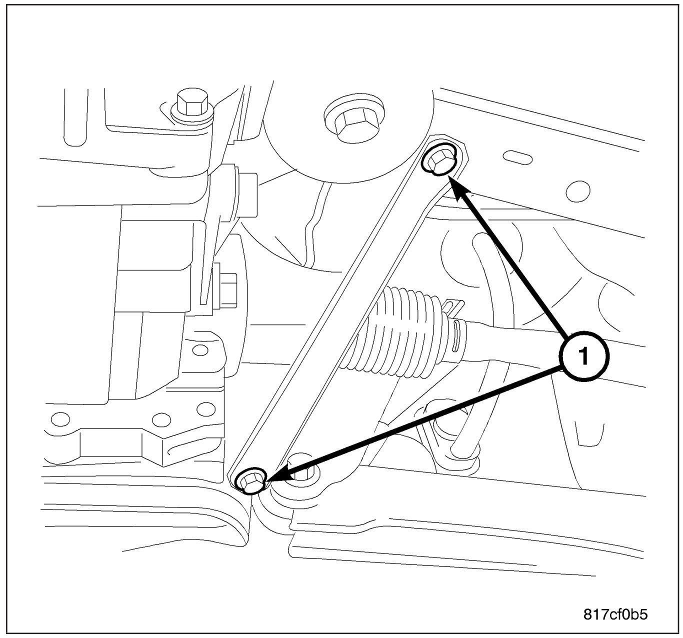
3. Connect the electrical connector (1).
4. Install wire harness bracket and two mounting bolts and torque to 45 N·m (33 ft. lbs.).



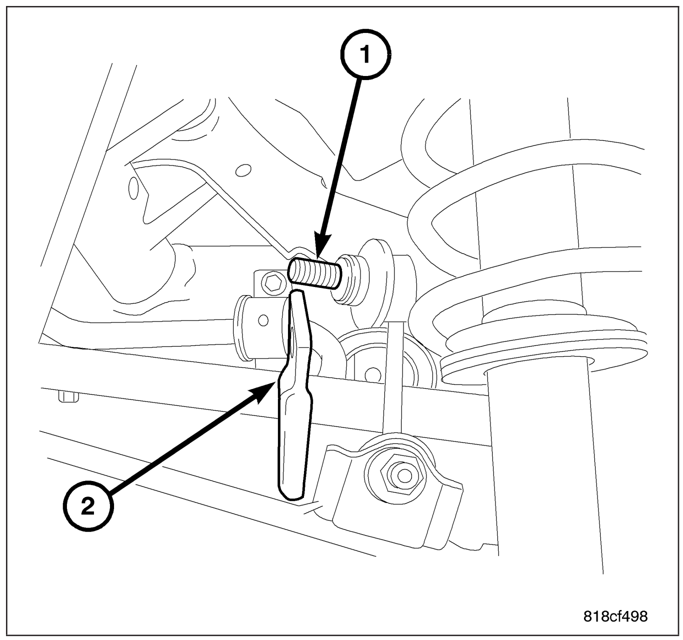
5. Lift driveline module into place.



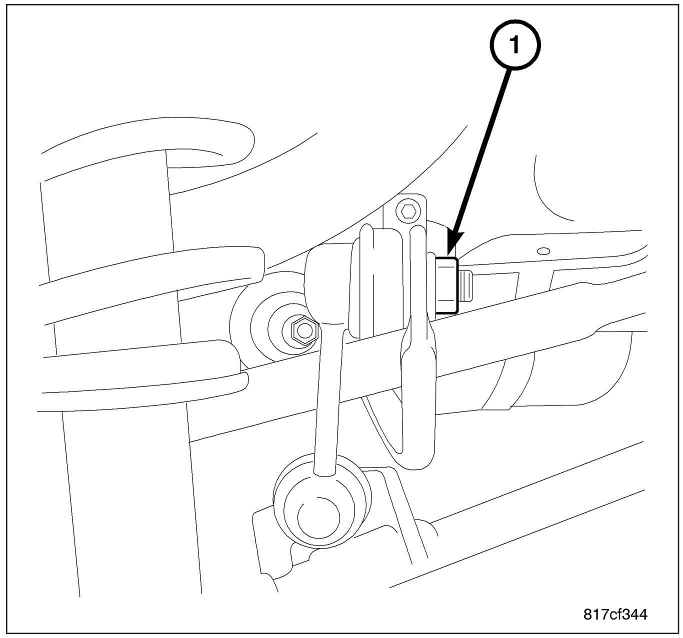
6. Install the two driveline module side mounting bolts (1)and torque to 102 N·m (75 ft.lbs.).



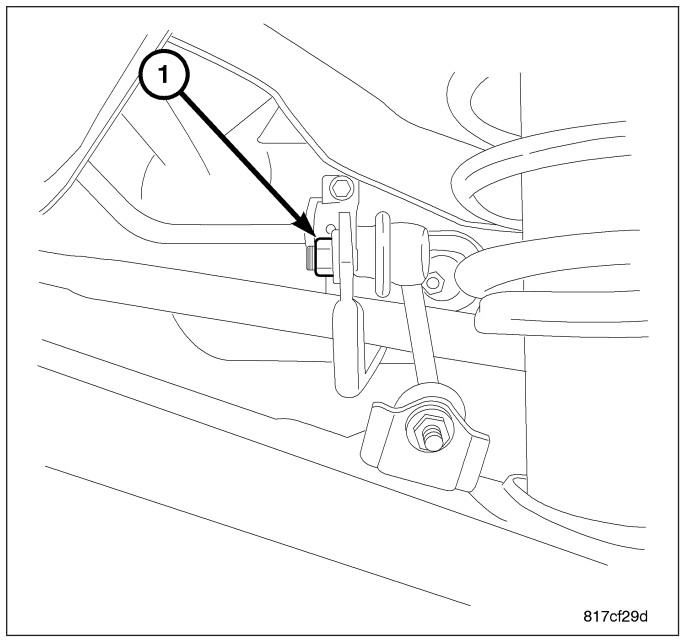
7. Install the one rear driveline module mounting bolt (1) and torque to 102 N·m (75 ft. lbs.).



8. Install the right side stay bracket and bolts,(1) torque to 61 N·m (45 ft. lbs.)



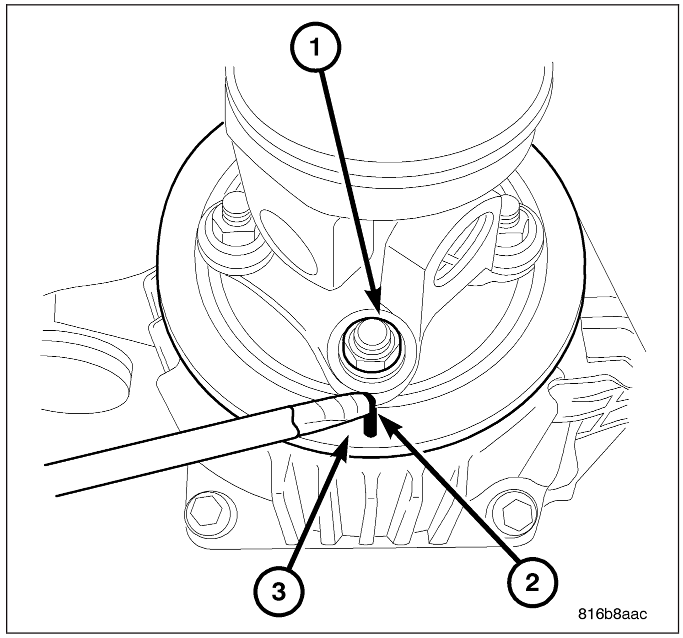
9. Install the left side stay bracket bolts, (1) torque to 61 N·m (45 ft. lbs.).
10. Install the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).
11. Fill the rear axle with fluid.



12. Roll sway bar into place (2) (if equipped).

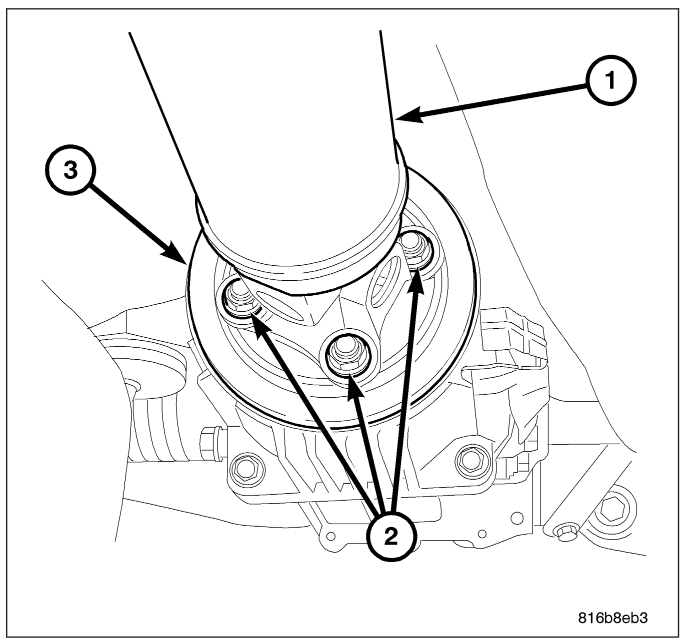
13. Install left side sway bar nut (1) and torque to 61 N·m (45 ft. lbs) (if equipped).

14. Install right side sway bar nut (1) and torque to 61 N·m (45 ft. lbs.) (if equipped).
15. install the exhaust (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).
16. Install the wheels (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING).



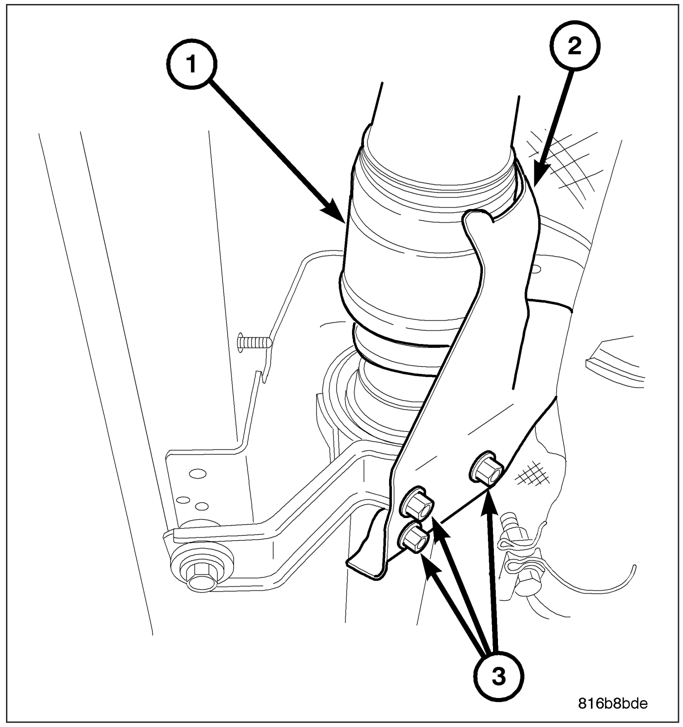
SHAFT-PROPELLER

TABLE OF CONTENTS



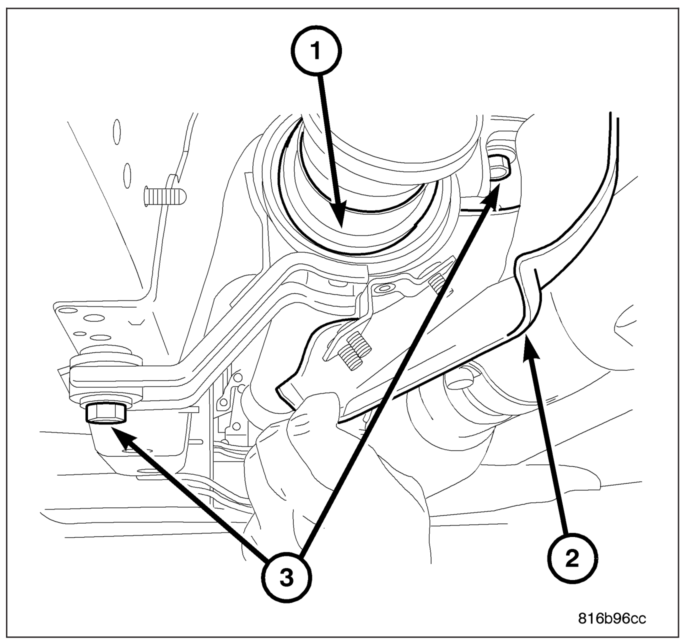
SHAFT-PROPELLER

REMOVAL

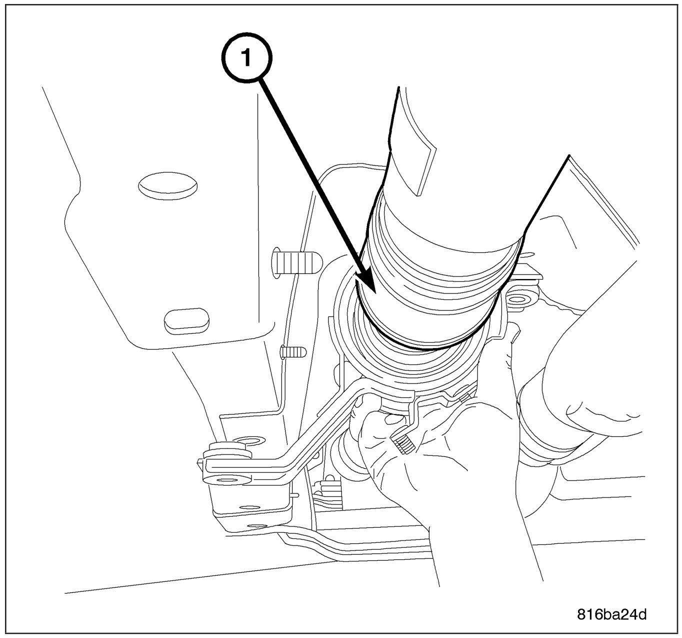


1. Raise the vehicle on the hoist.
2. Mark (2) prop shaft and differential (3) for proper installation.

3. Remove the four rear prop shaft to rear axle retaining nuts (2).

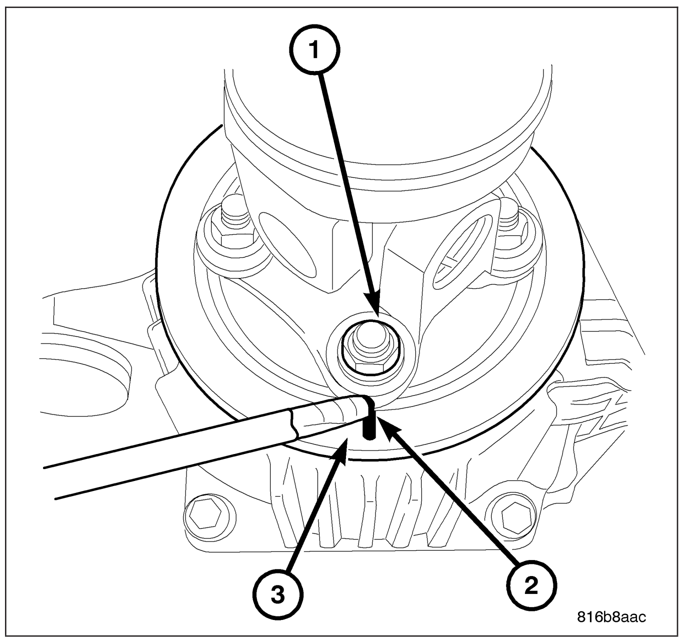


4. Remove the three bolts (3) from the center support heat shield (2).

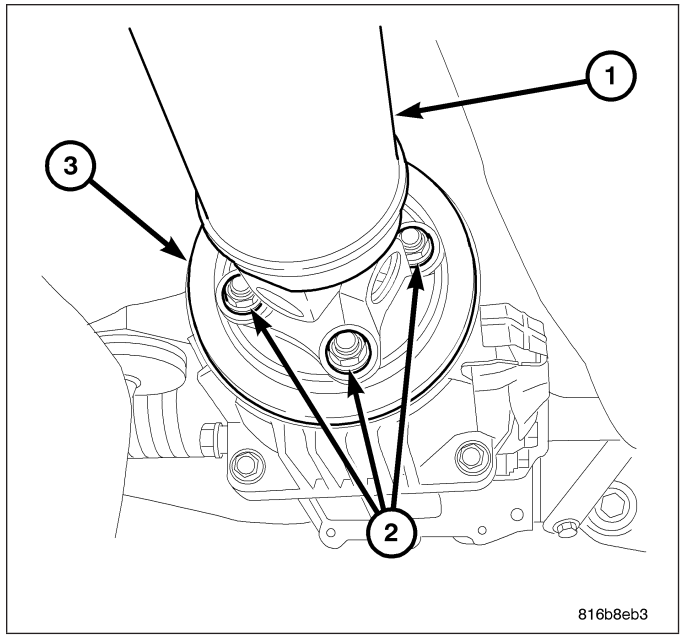


CAUTION: Propeller shaft removal. Never allow propeller shaft to hang while connected to Power Transfer Unit (PTU), rear driveline module flanges or center bearings. If propeller shaft section is hung unsupported, damage may occur to joint, boot and/or center bearing from over-angulation. This may result in vibration/balance issues. A helper may be needed.

5. Remove the heat shield (2).
6. Remove the two center support mounting bolts (3)

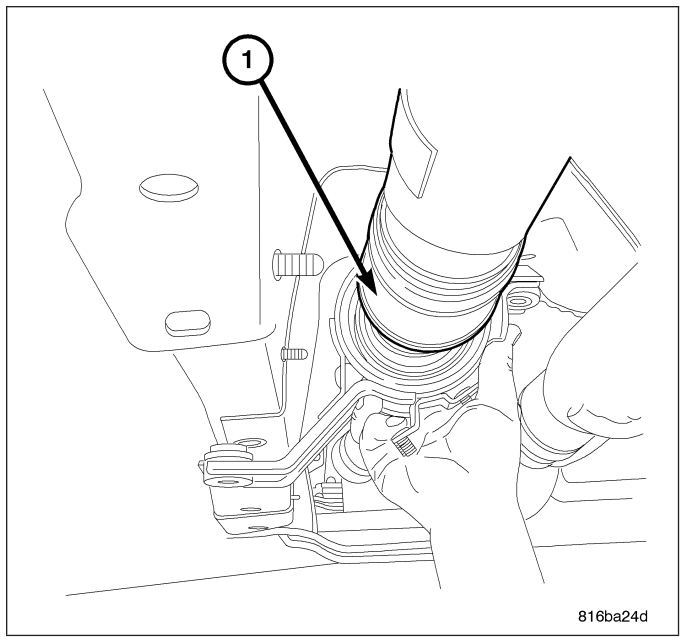


7. Remove the propeller shaft (1).

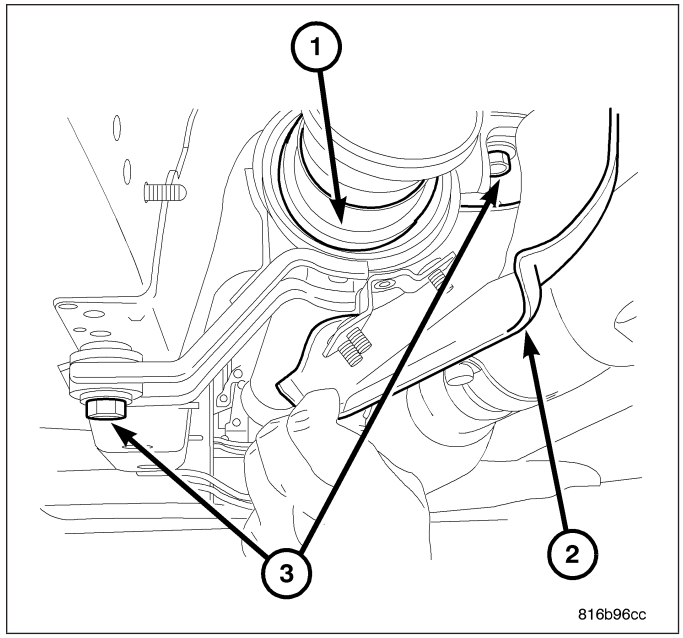


INSTALLATION

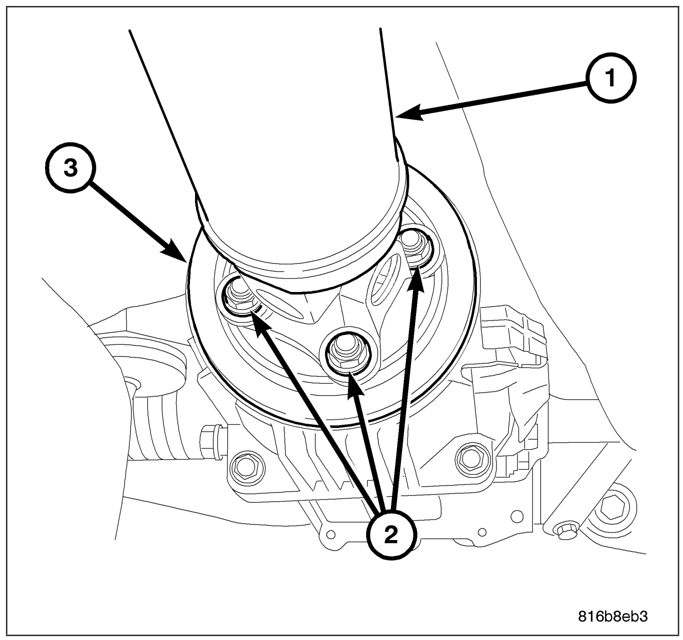
CAUTION: Propeller shaft installation. Never allow propeller shaft to hang while connected to Power Transfer Unit (PTU), rear driveline module flanges or center bearings. If propeller shaft section is hung unsupported, damage may occur to joint, boot and/or center bearing from over-angulation. This may result in vibration/balance issues. A helper may be needed.



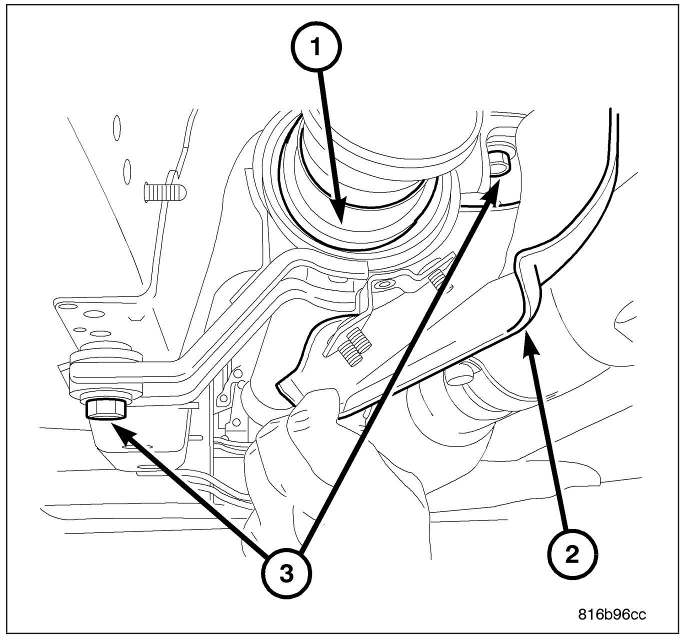
1. Make sure transaxle is in Neutral (N) position.
2. Obtain a helper if needed and lift propeller shaft assembly into position. Install propeller shaft spline into PTU.
3. Align index marks (2) on propeller shaft with marks on rear axle flange, slide propeller shaft over studs on rear axle flange.



4. Install the four retaining nuts (2).



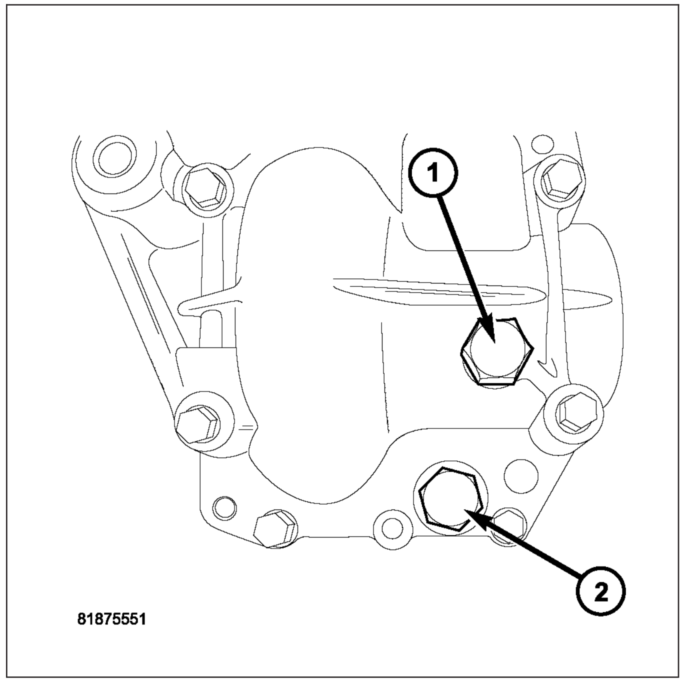
5. Raise the center support into position (1).



6. Install the two mounting bolts (3) and torque to 41 N·m (30 lbs.ft.).

7. Torque the four retaining nuts (2) to 47 N·m (35 ft. lbs.).

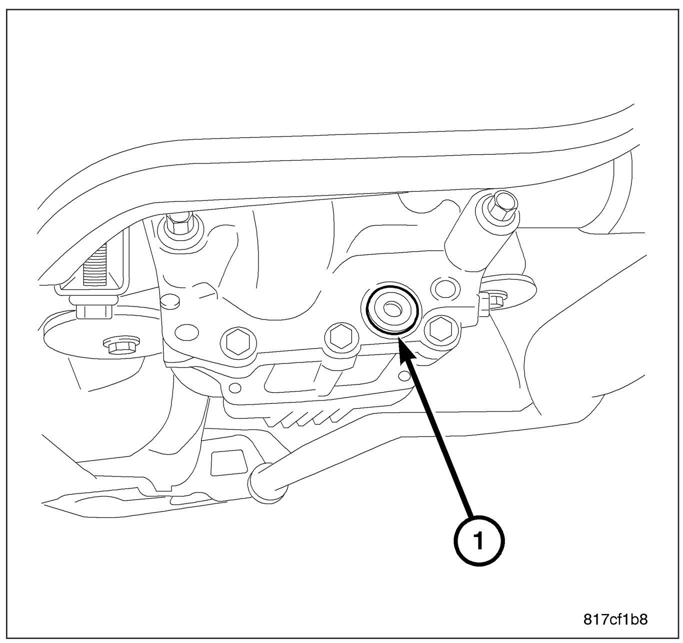
8. Install heat shield (2) and torque the retaining nuts and torque to 21 N·m (15 ft. lbs.).
9. Check fluid levels starting with PTU.



MODULE-REAR DRIVELINE

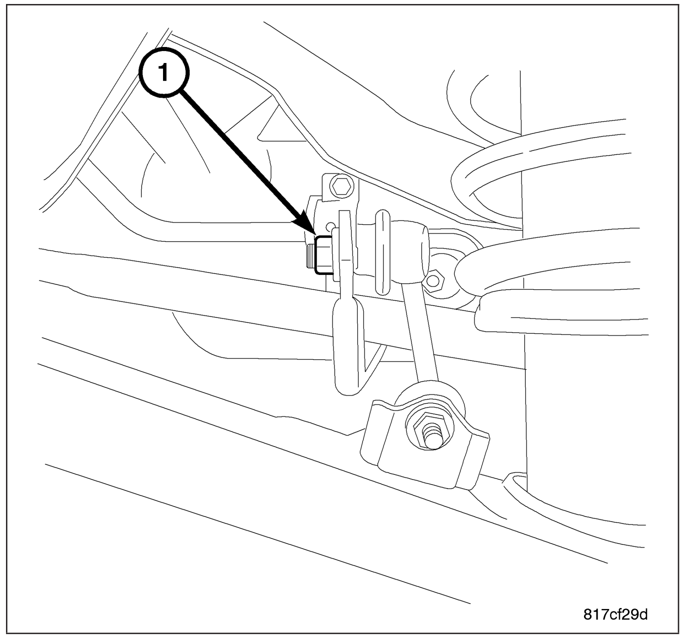
TABLE OF CONTENTS

MODULE-REAR DRIVELINE

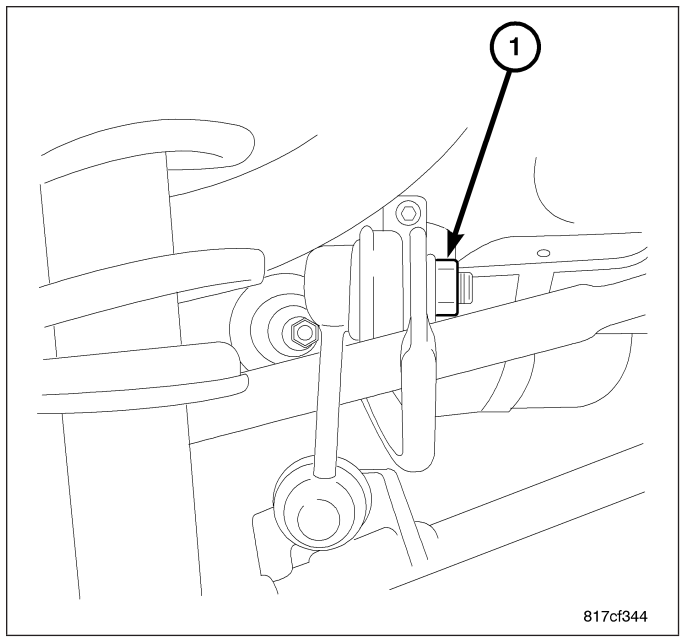


STANDARD PROCEDURE -

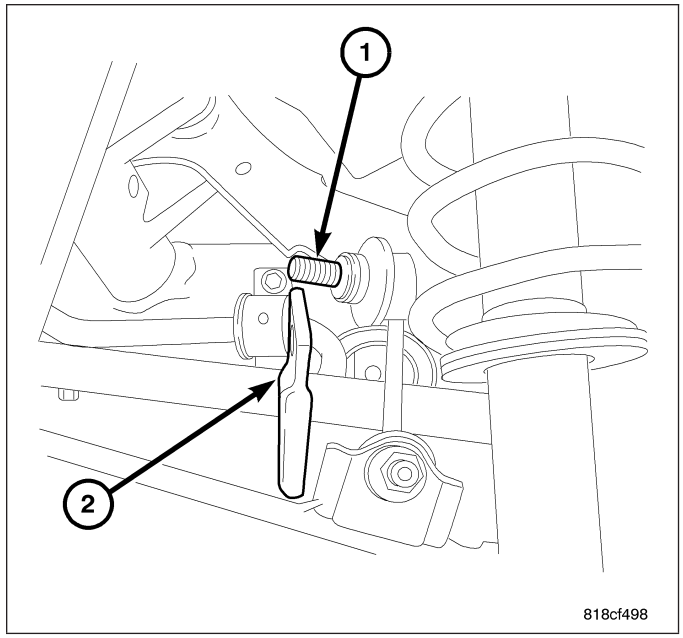
1. If fluid level is low or fluid change is required fill with PN 4874468 Mopar MS9020 SAE80W90 Gear Lube until to bottom of fill plug.
2. Torque fill plug (1) to 32 N-m (24 lbf-ft).
3. Torque drain plug (2) to 32 N-m (24 lbf-ft).



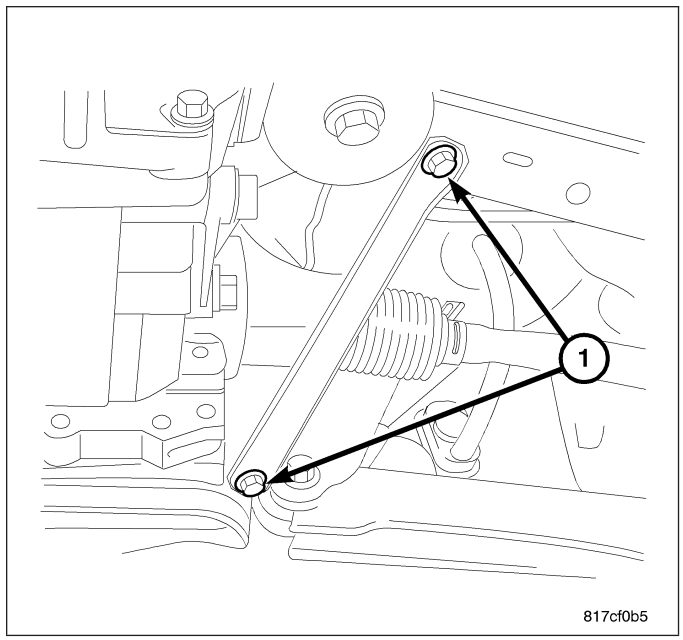
REMOVAL



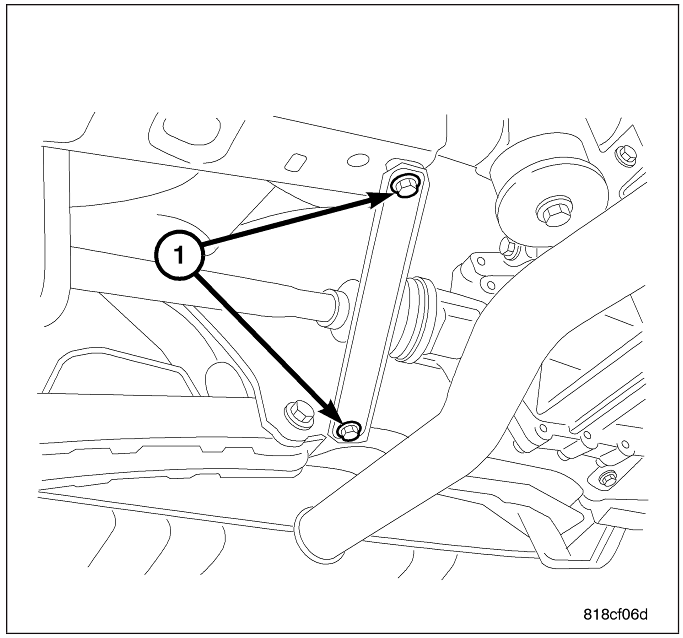
1. Raise vehicle on a hoist.
2. Remove the rear tires.
3. Remove the drain plug (1) and drain the fluid from the rear drive line module.
4. Remove the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL)



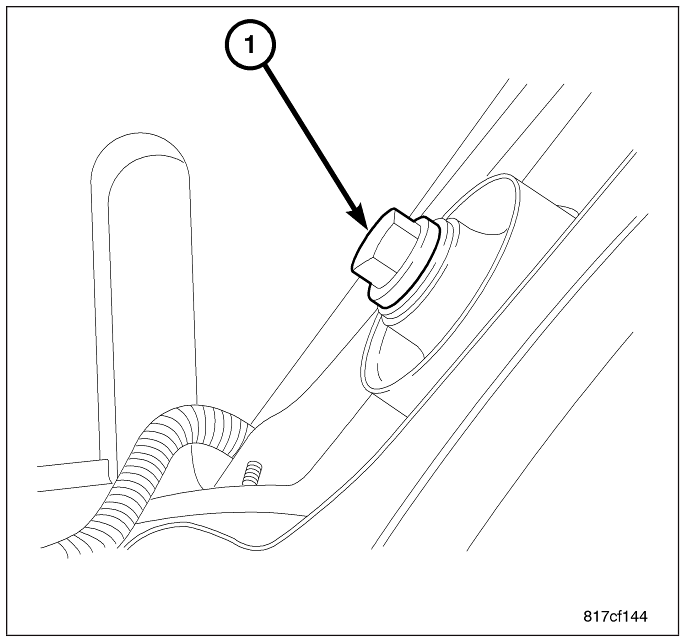
5. Remove right side sway bar nut (if equipped).



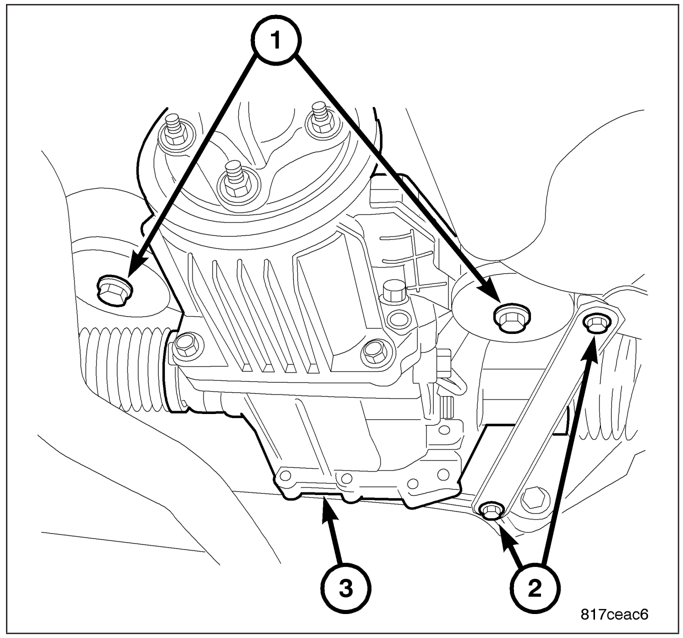
6. Remove left side sway bar nut (if equipped).



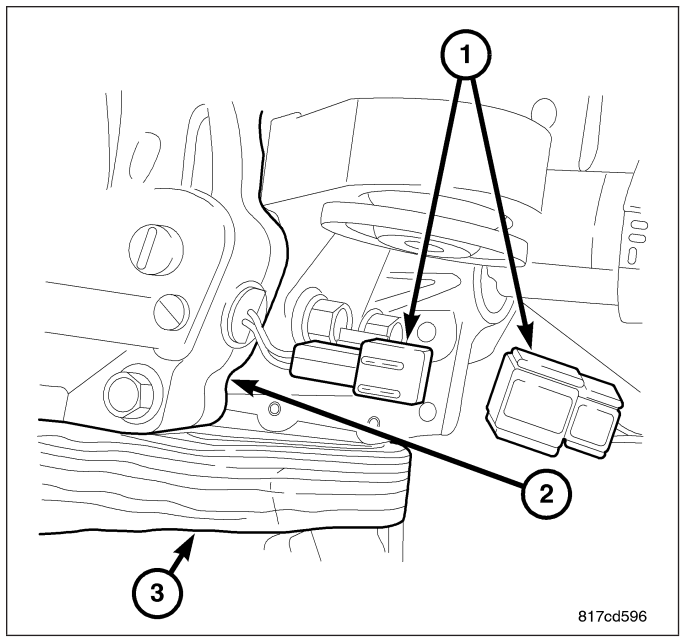
7. Roll sway bar down and out of the way (2) (if equipped).



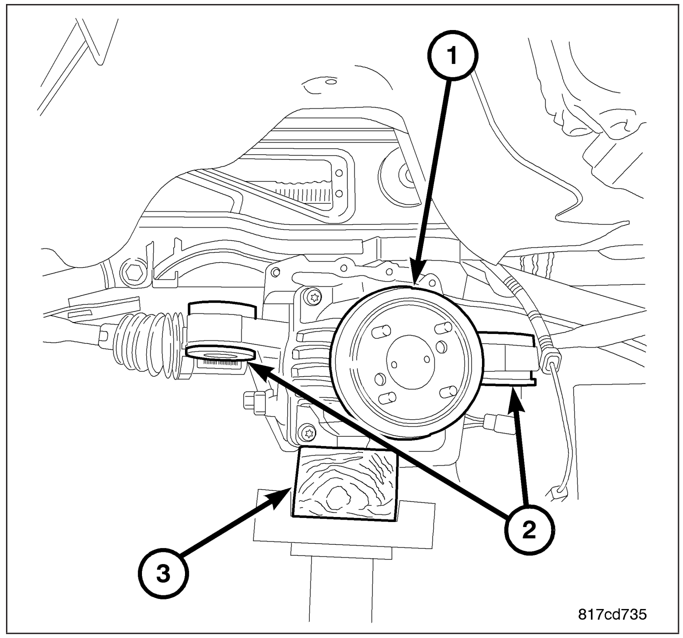
8. Remove the left side stay bracket bolts (1).



9. Remove the right side stay bracket bolts (1).
10. Remove the exhaust system up to the catalytic converter. (Refer to 11 - EXHAUST SYSTEM/ MUFFLER - REMOVAL).
11. Support the rear driveline module with a transmission jack.

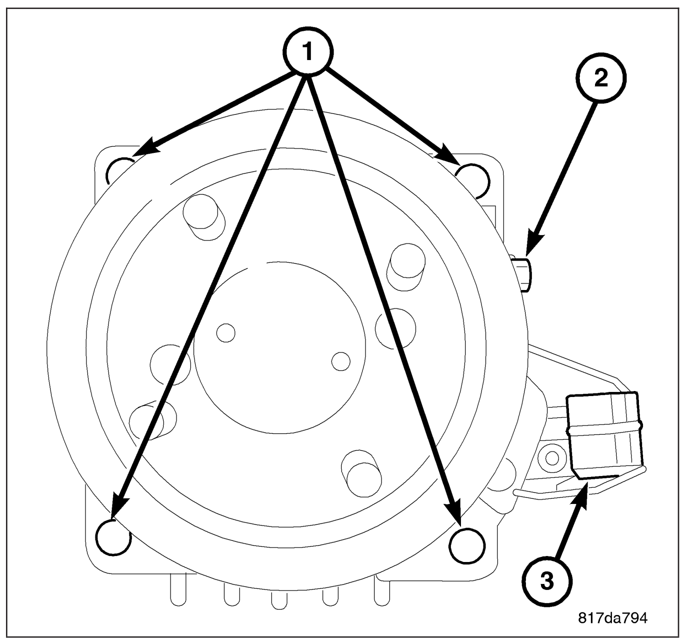


12. Remove the rear bolt (1) at the driveline module.

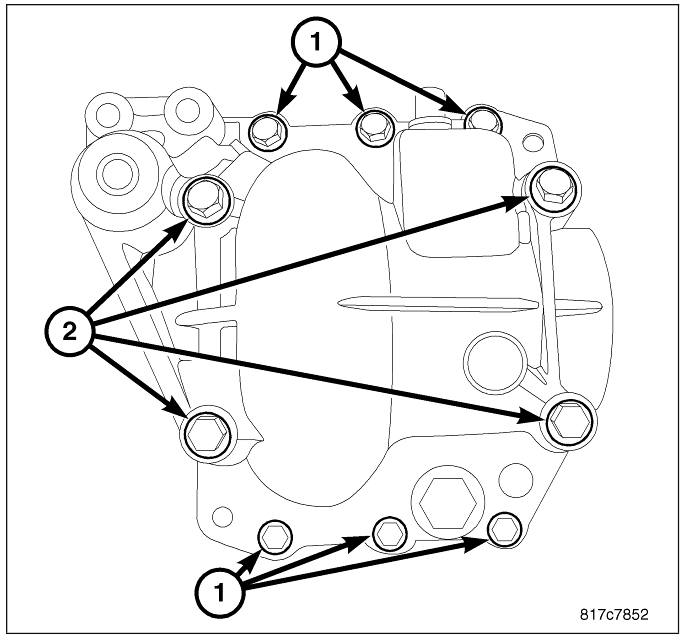


13. Remove the two side bolts (1) at driveline module (3).

14. Lower driveline module enough gain access to the electrical connector and bracket.
15. Remove the routing bracket bolt.
16. Unplug the electrical connector (1).

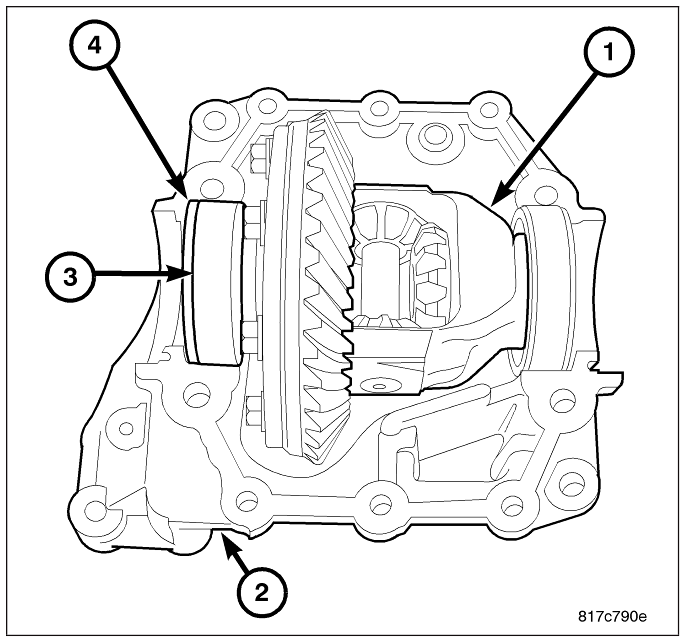


17. Lower the driveline module (1).
18. Disengage both axle shafts (2).
19. Remove driveline module.
20. Remove the ECC bolts.
21. Separate the ECC form the RDA.

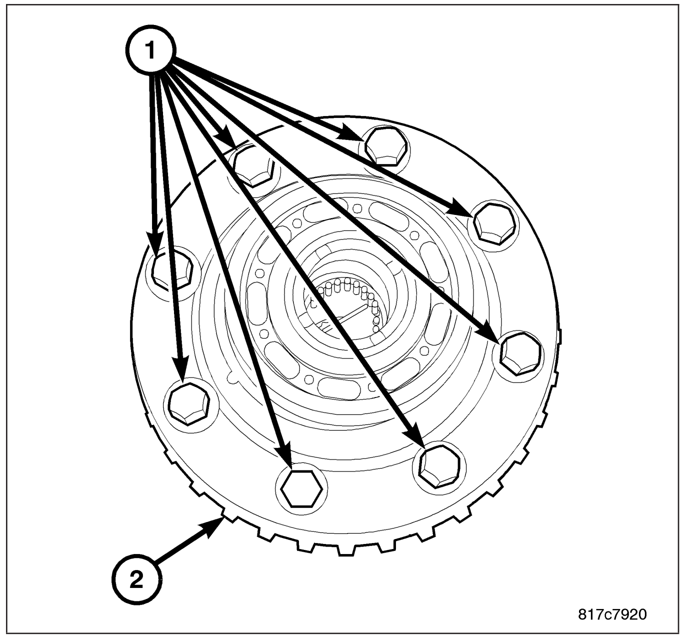


DISASSEMBLY

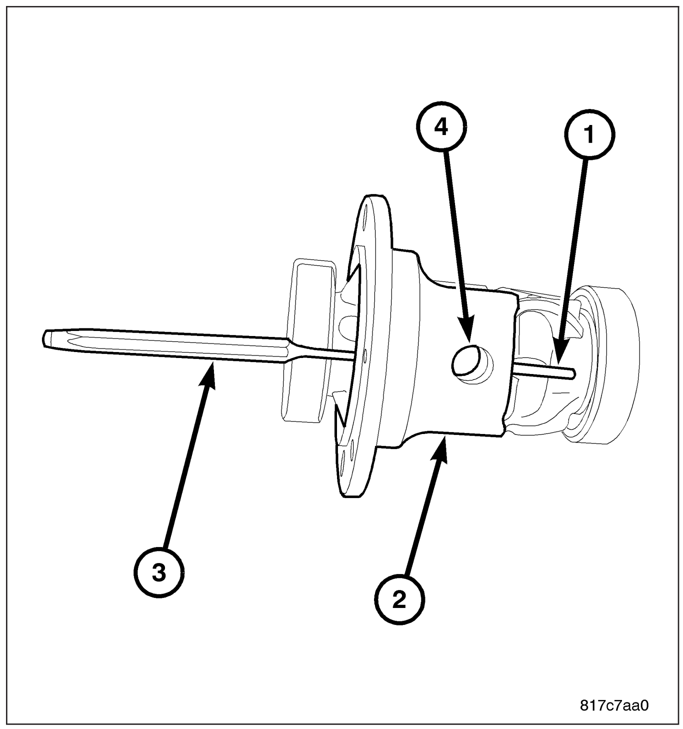
1. Remove the four bolts (1) holding the rear axle electric clutch.
2. Separate the rear axle electric clutch from the rear axle.



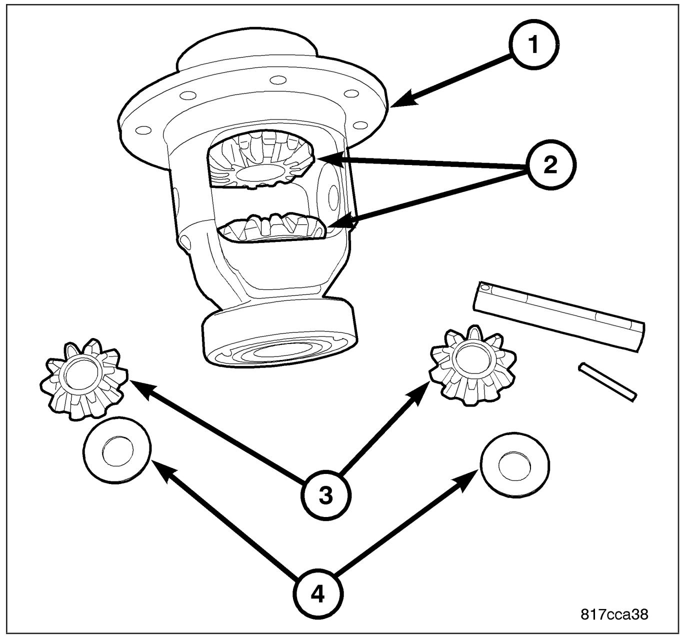
3. Remove the differential case bolts (1).
4. Remove the cap bolts (2).
5. Remove the differential cover and the both axle seals.



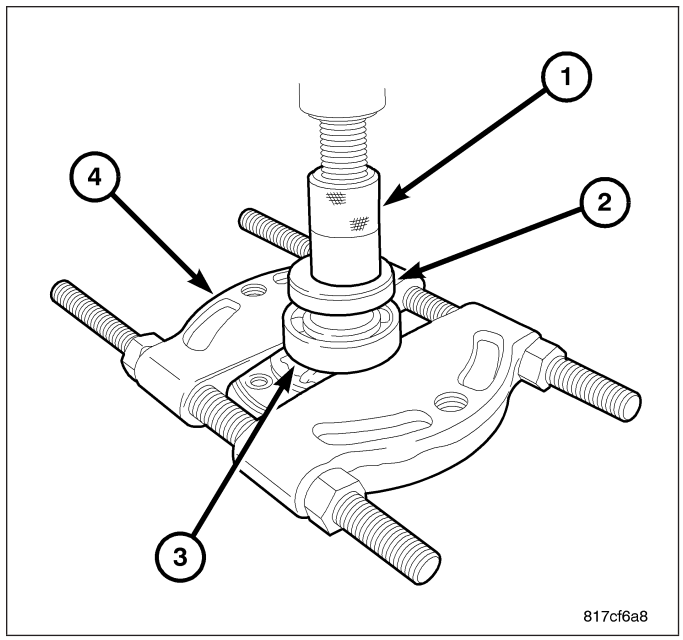
NOTE: There are select shims at each side of the carrier



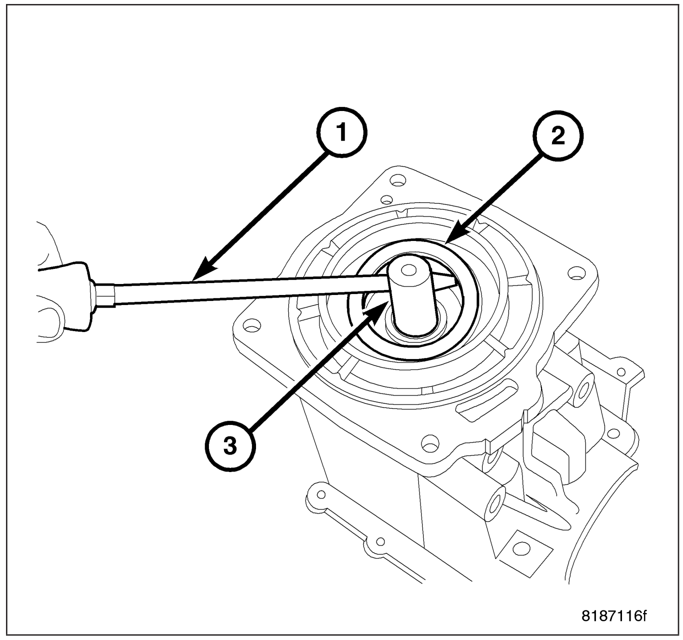
6. Remove the carrier (1) from the differential housing (2).
7. Measure the select shims on each side of the carrier roller bearings and note for installation.



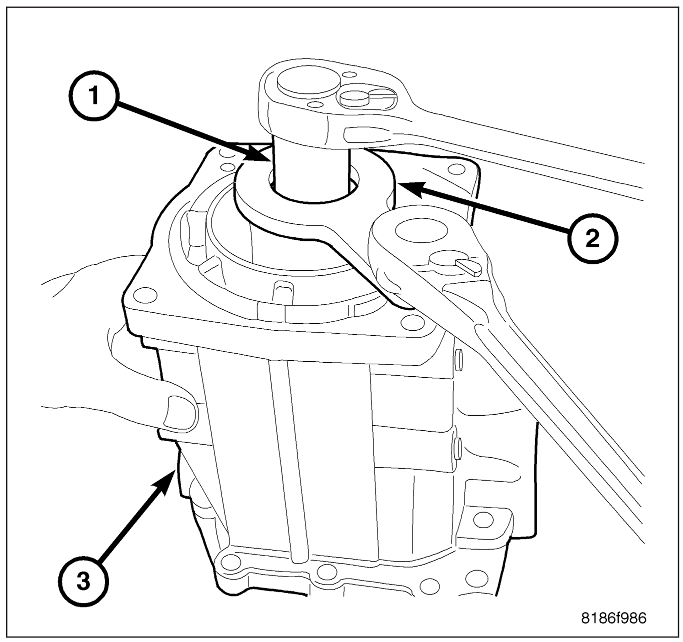
8. Remove the ring gear bolts (1).
9. Remove the ring gear (2).



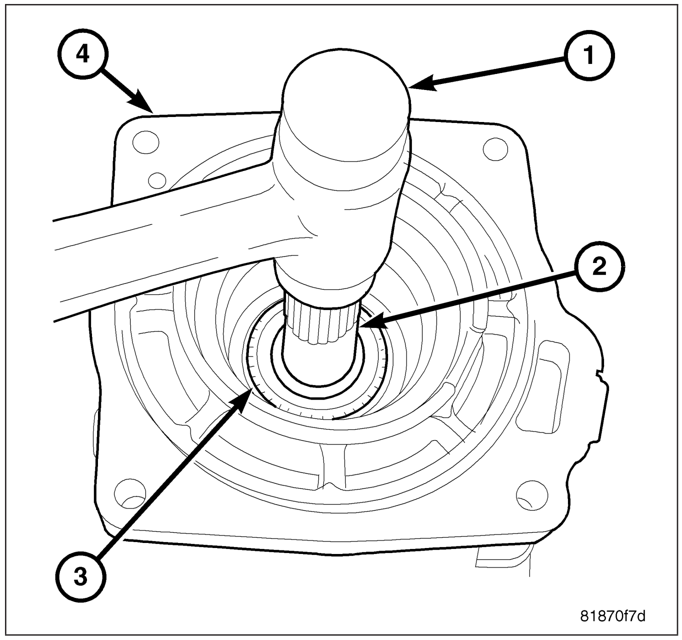
10. Remove roll pin (1) in carrier case (2) and through the pinion mate shaft (4) using a punch (3).



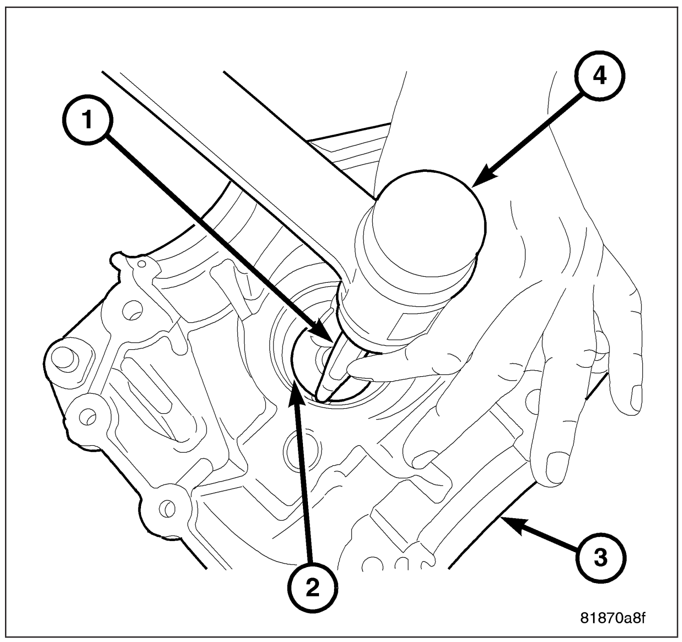
11. Remove spider gears, (3) thrust washers (4) and side gears (2).



12. Remove carrier bearings (3) using Splitter 1130, (4) Installer 9643 (2) and a Press (1).

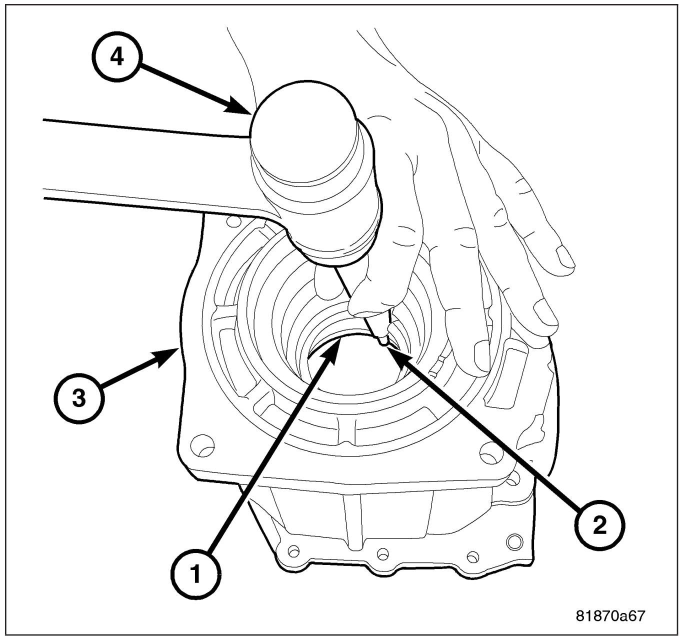


13. Use a screw driver to remove the pinion seal.

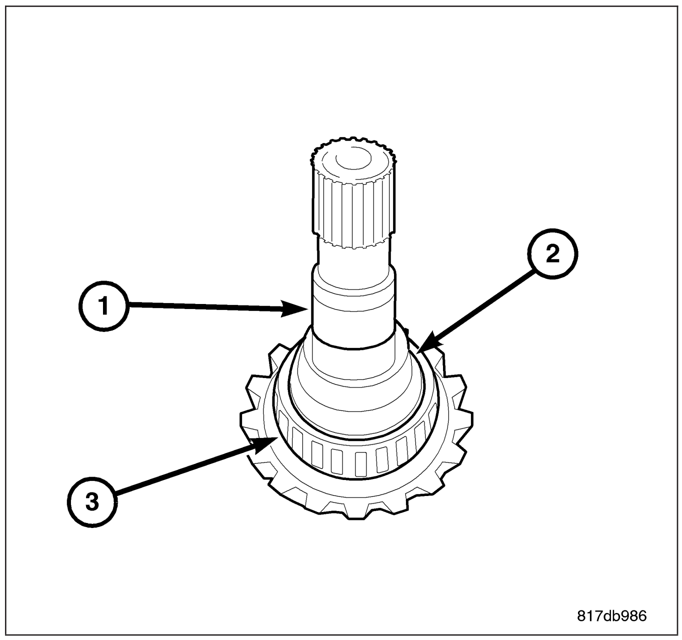


14. Remove the pinion retaining nut pinion nut using Spline Holder 9742 (1) and Socket 9921(2).

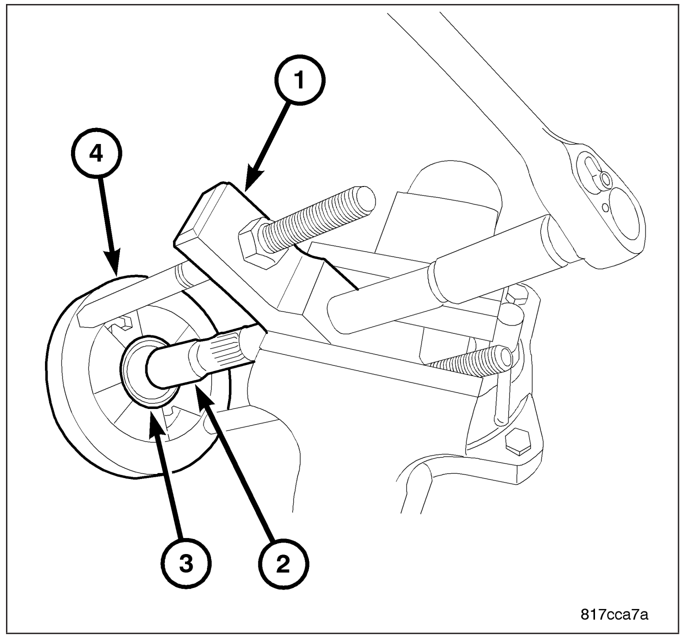
15. Tap the pinion (3) with a soft hammer (1) to remove it from case (4).



16. Using a hammer (4) and a punch (1) remove the outer pinion bearing cup (2)

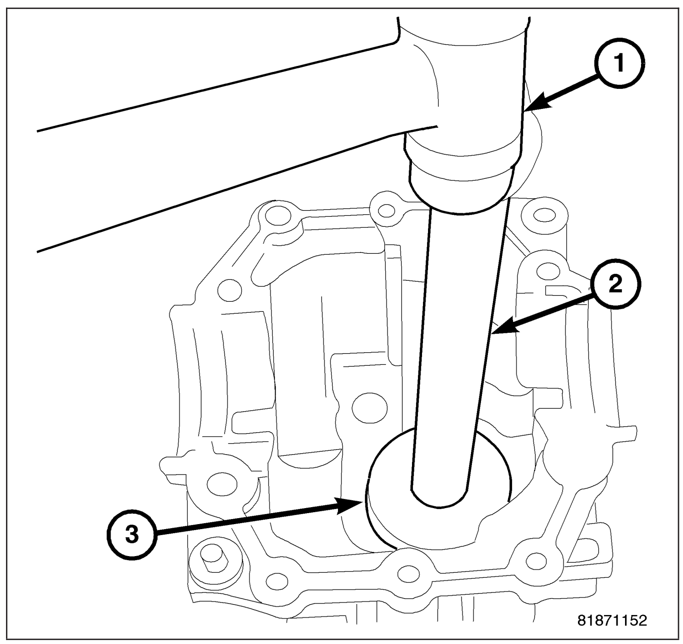


.

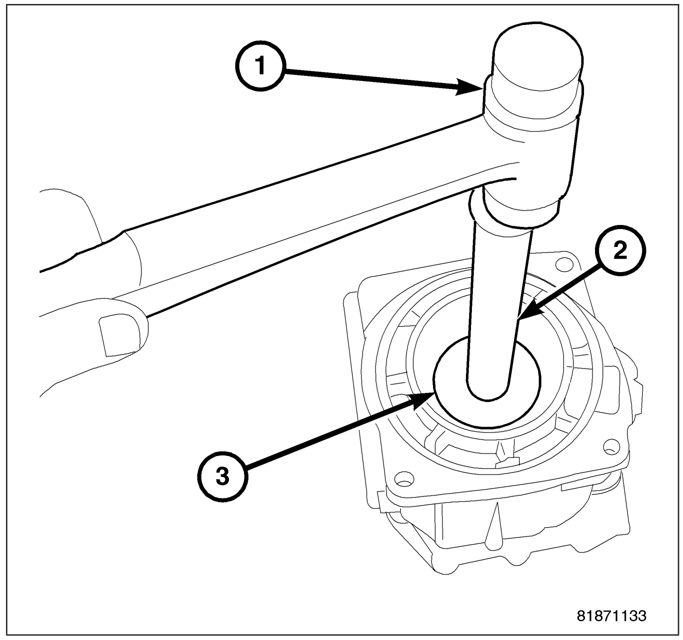


17. Using a hammer (4) and a punch (2) remove the pinion head bearing cup (1).

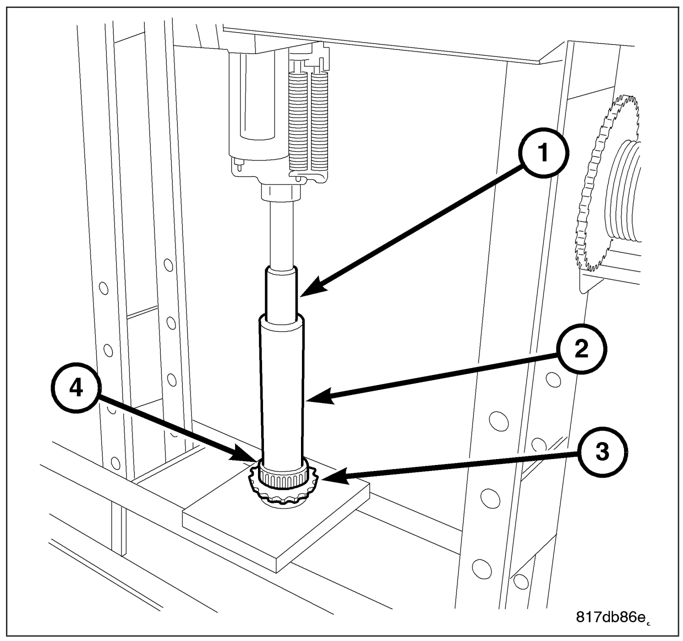
18. Remove collapsible spacer (2) from the pinion shaft (1).



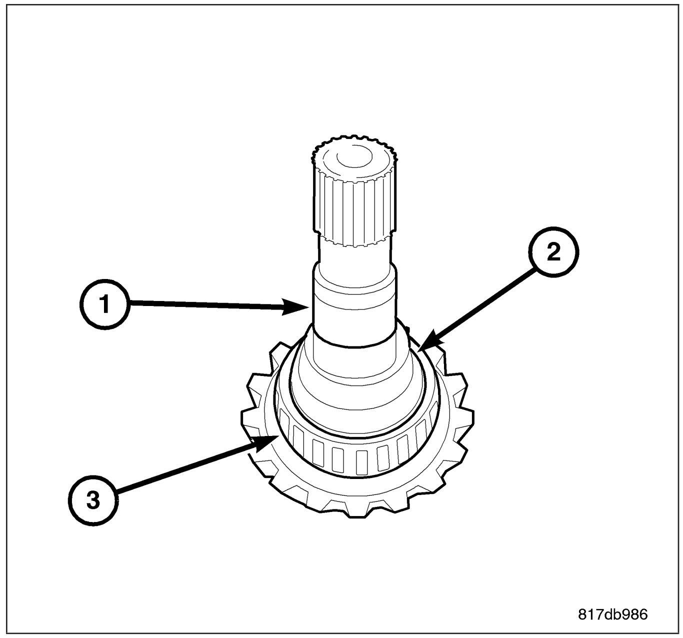
19. Remove the pinion bearing (3) using Puller C-293–PA (1) and Iinserts C293–45 (2).



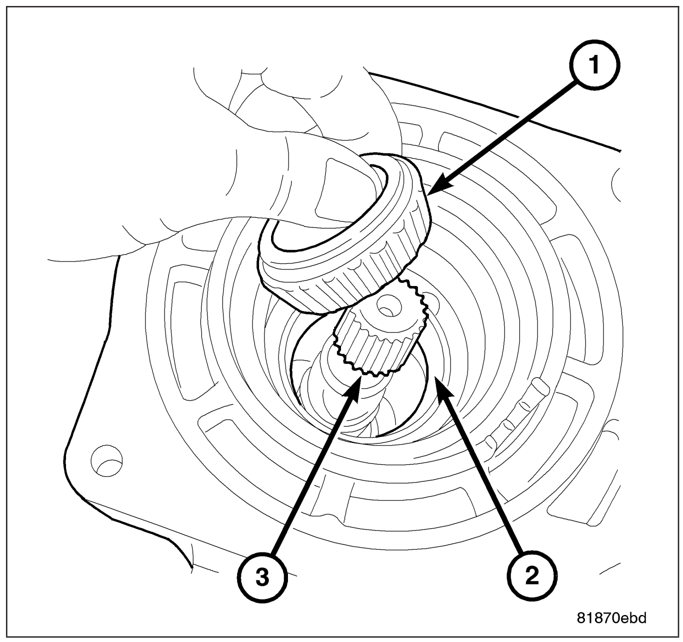
ASSEMBLY



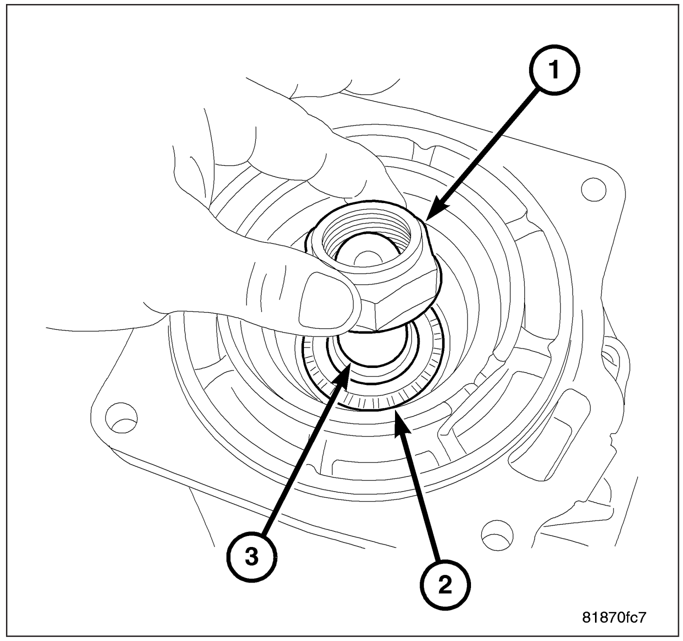
1. Install the pinion head bearing using Installer 5050A (3) and Handle C-4171 (2).



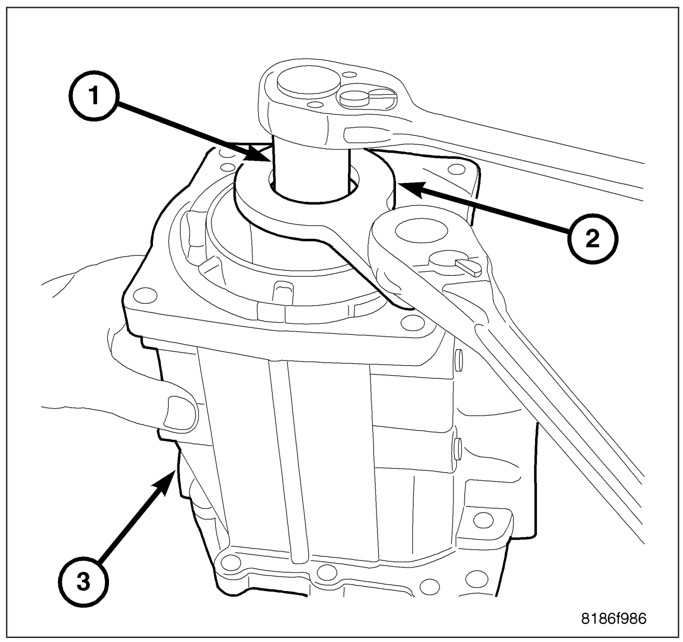
2. Install the outer pinion bearing cup using Installer 8594 and Handle C-4171.



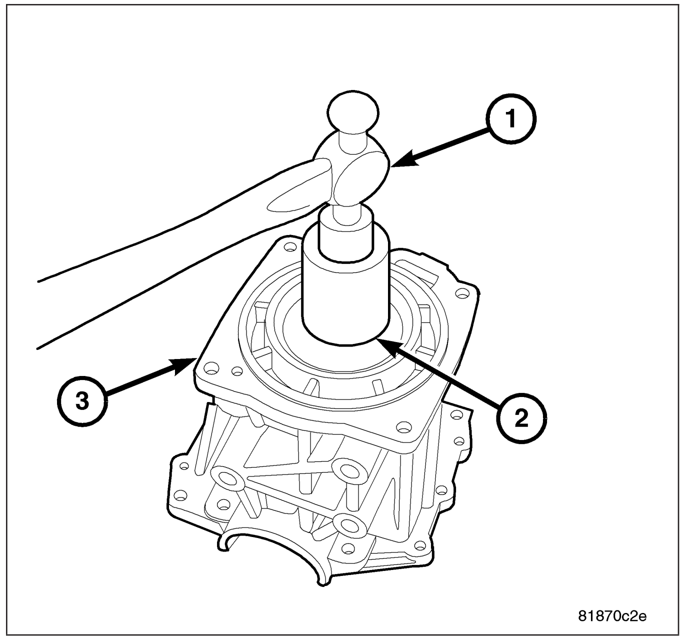
3. Install bearing (4) on pinion (3) using Installer 6052 (2) and a Press (1).



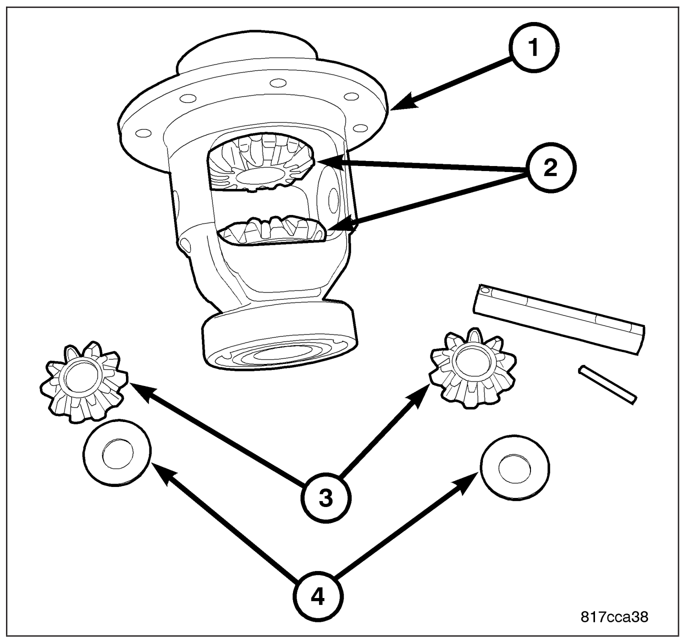
4. Install a new collapsible (2) spacer onto the pinion shaft (1).



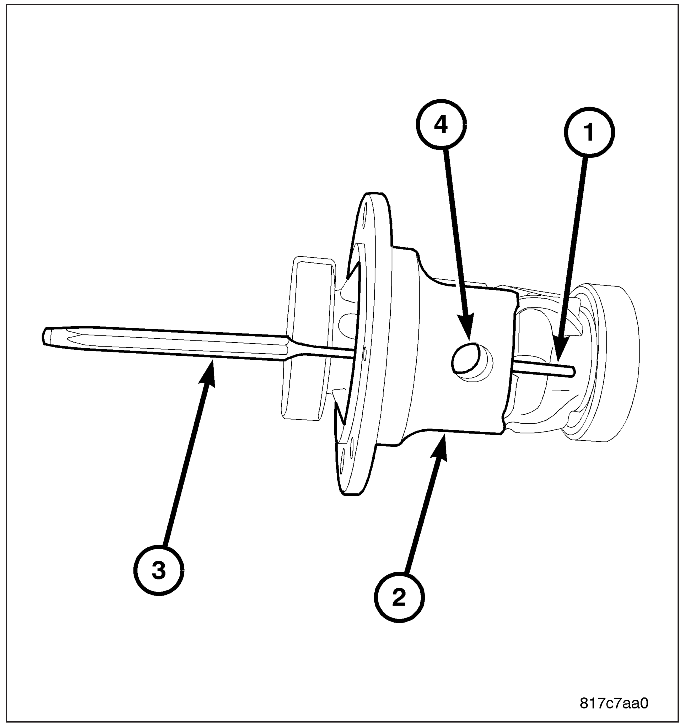
5. Install the pinion into the housing and place the outer bearing over the pinion.



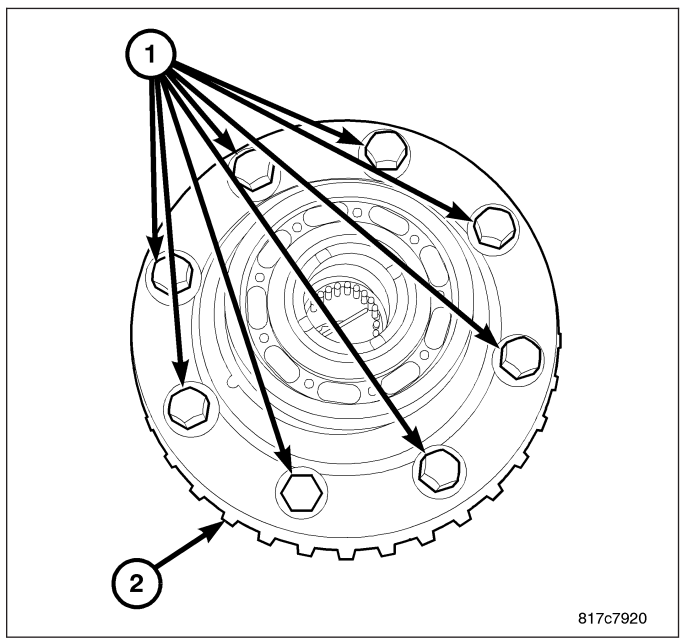
6. Install the pinion nut (1) onto the pinion shaft (3).



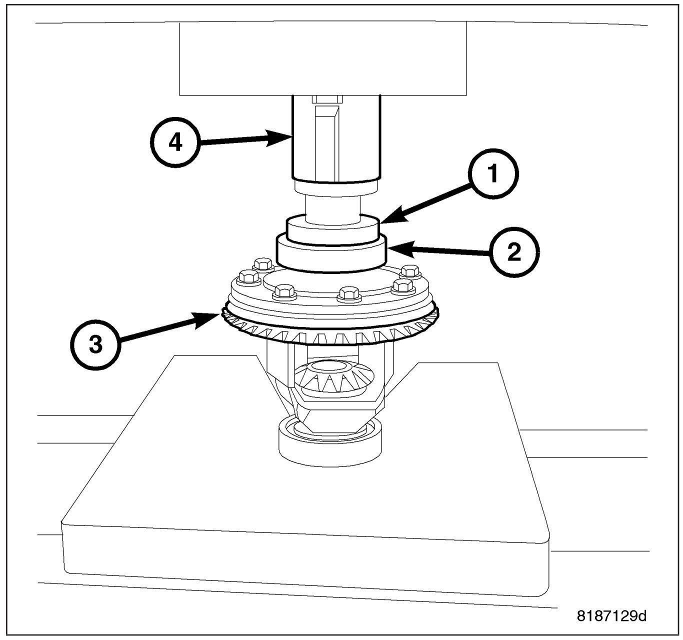
7. Install the pinion retaining nut pinion nut using Spline Holder 9742 (1) and Socket 9921 (2), torque the pinion nut to 74 N·m (133 ft. lbs.).



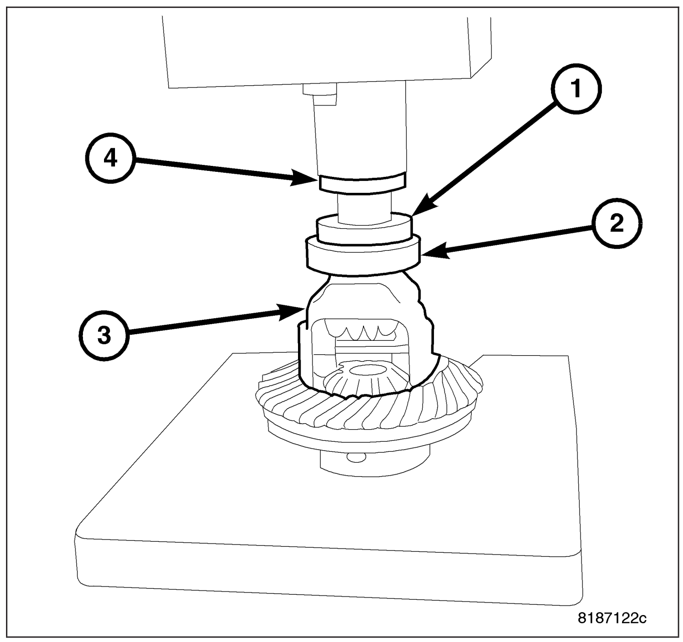
8. Install the pinion seal using Installer 9931(2) and a hammer (1).



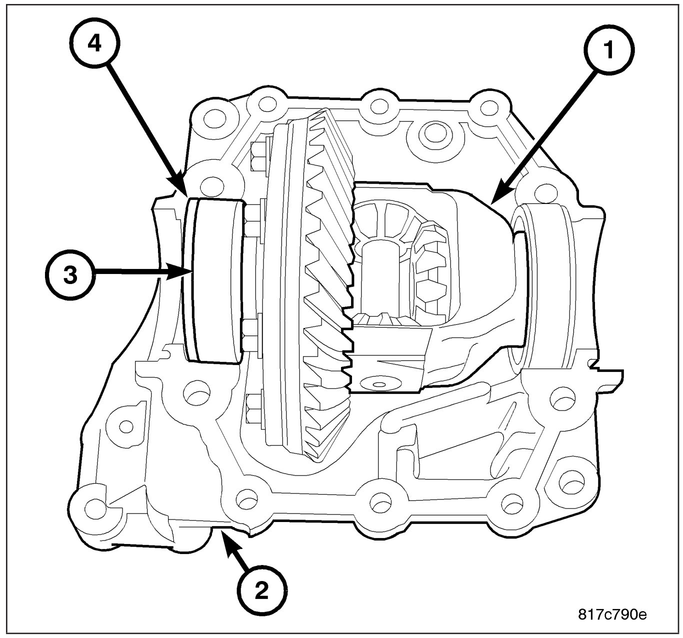
9. Install side gears (2), shims (4) and pinion gears (3) into carrier (1).
10. Install the pinion gear shaft into the pinion gears and start the roll pin.



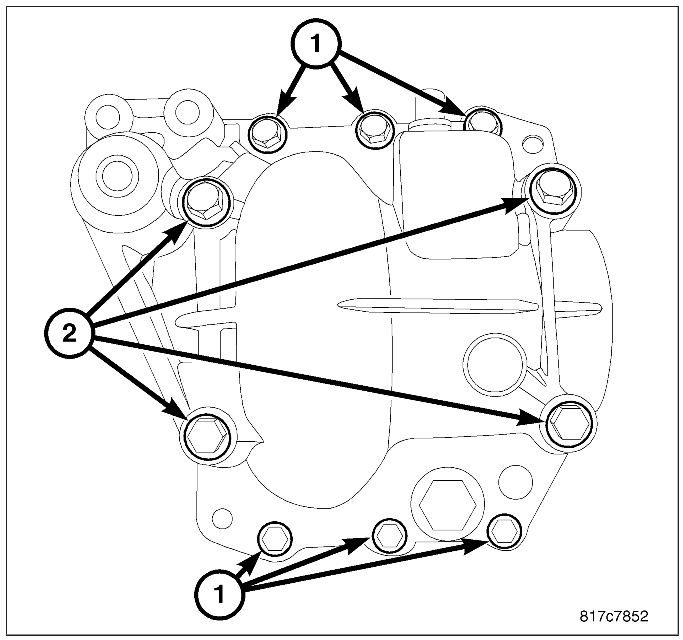
11. Use a Pin Punch to install the roll pin (1).



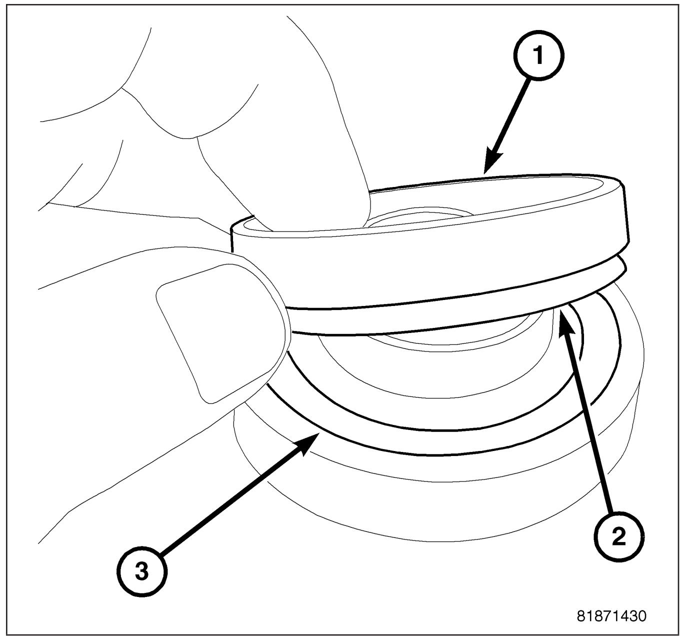
12. Install the ring gear (2) onto the carrier.
13. Install the ring gear bolts (1) and torque to 41 N·m (30 ft. lbs.).



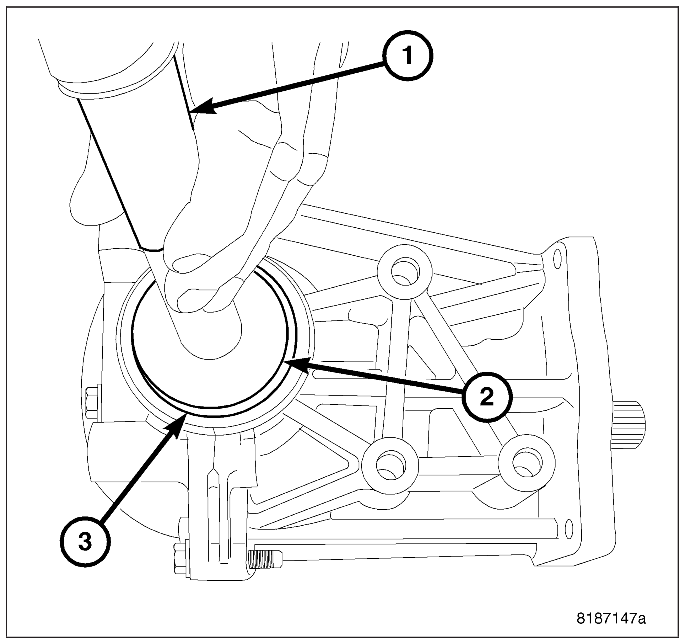
14. Press ring gear side (3) carrier bearing (2) on shaft using Installer 9643 (1) and a Press (4).



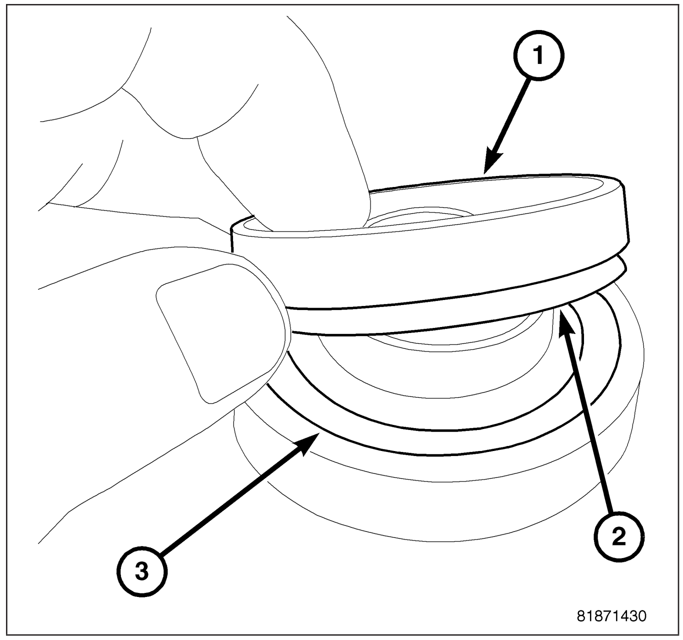
15. Press pinion gear side (3) carrier bearing (2) on shaft using Installer 9643 (1) and a Press (4).



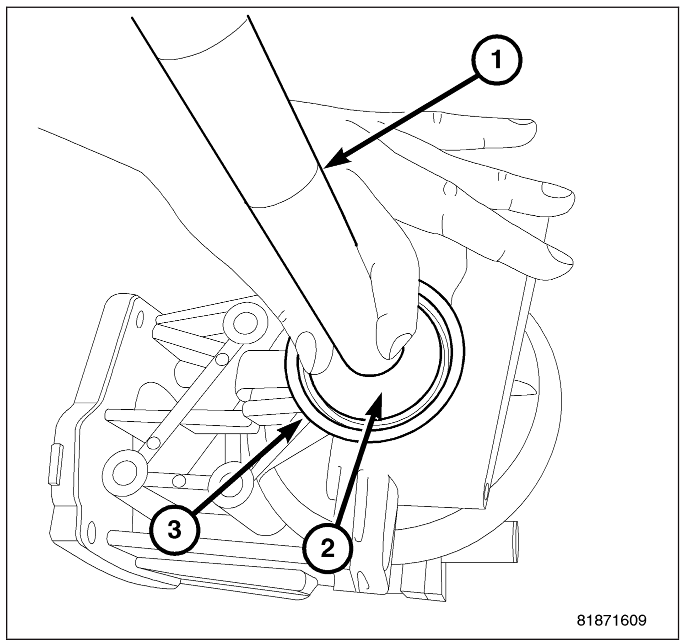
16. Install the pre measured side shims (3) and carrier (1) into the carrier housing (2).
17. Apply a bead of MOPAR© AXLE RTV on the case to seal the cover.



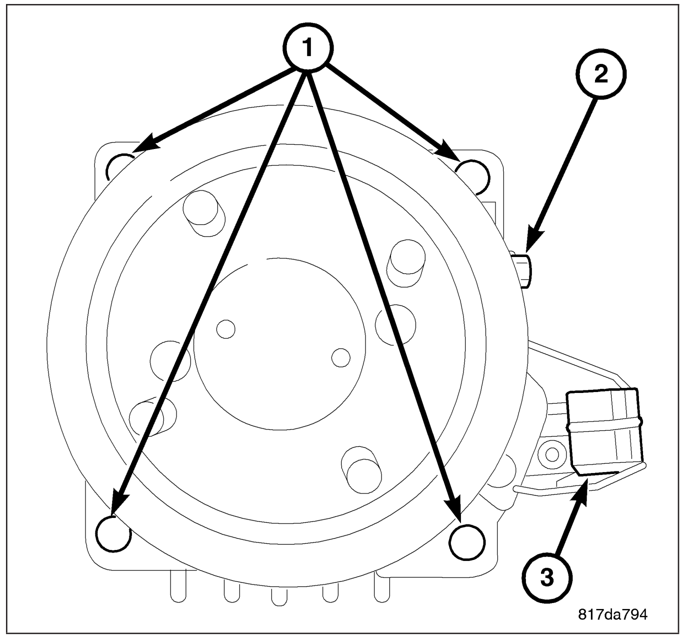
18. Install the cover onto the carrier case.
19. Install the cover bolts (1, 2).
20. Torque the cap bolts (2) to 48 N·m (35 ft. lbs.).
21. Torque the cover bolts (1) to 23 N·m (16 ft. lbs.).



22. Install the pinion side axle seal (1) onto Installer 9893 (3) insure that the lip is down (2).

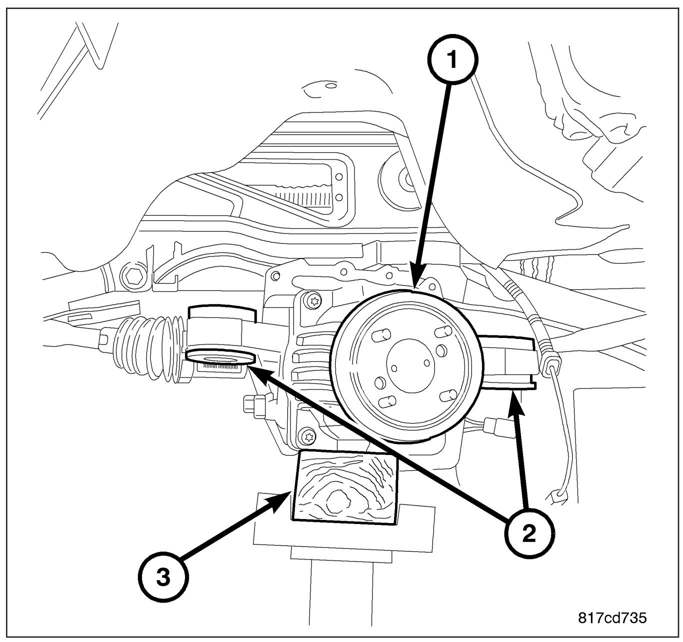


23. Install the pinion side axle seal using Installer 9893 (2) and Handle C-4171 (1).

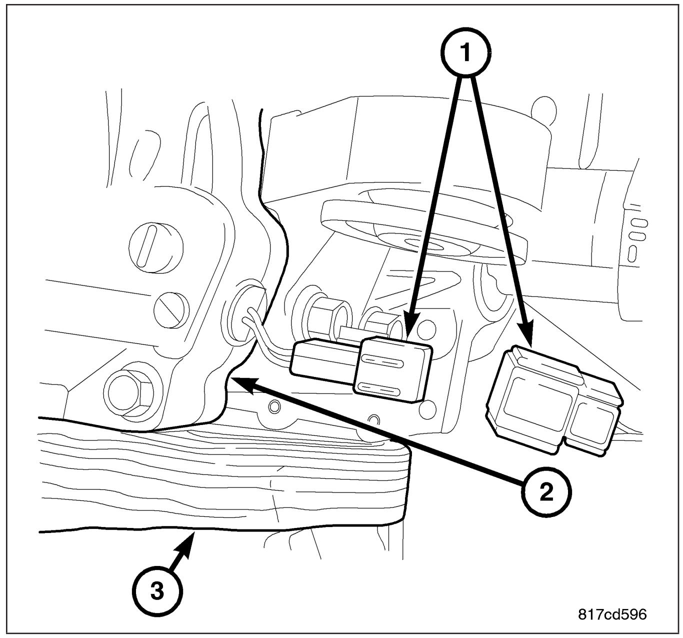


24. Install the pinion side axle seal (1) onto Installer 9893 (3) insure that the lip is down (2).

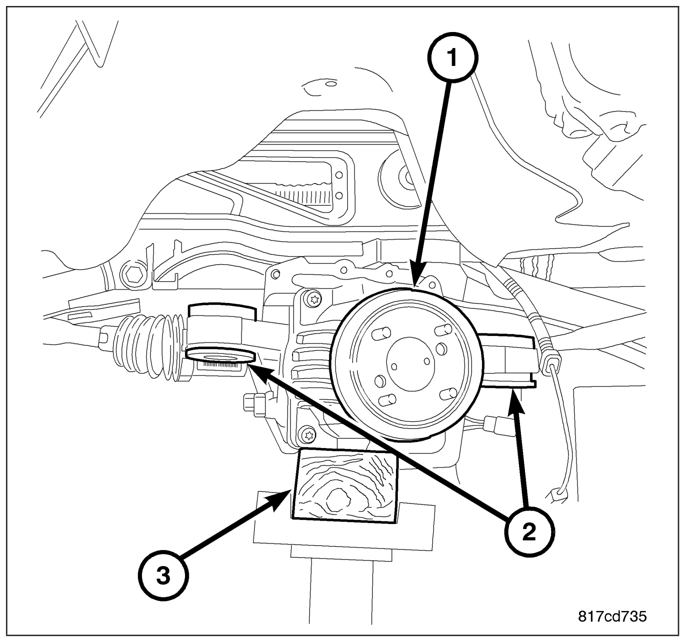
25. Install the ring gear side axle seal using Installer 9893 (2) and Handle C-4171 (1).



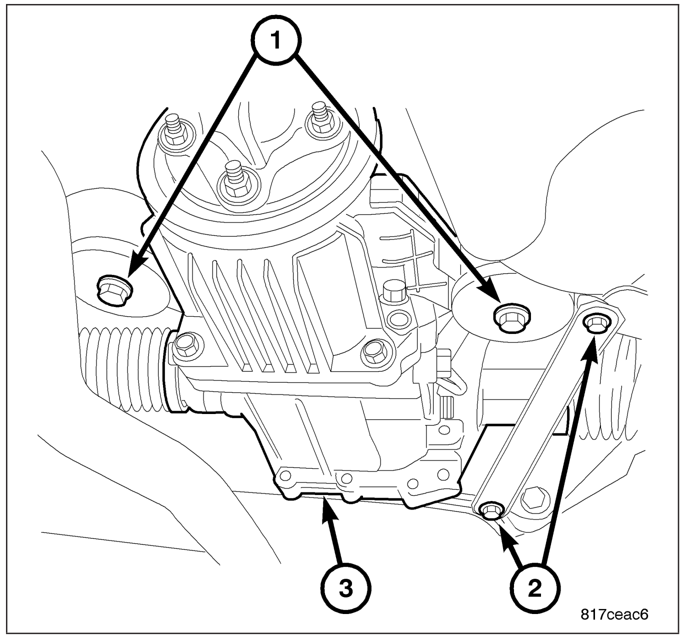
26. Install the ECC to the RDA and torque the bolts to 78 N·m (58 ft. lbs.).



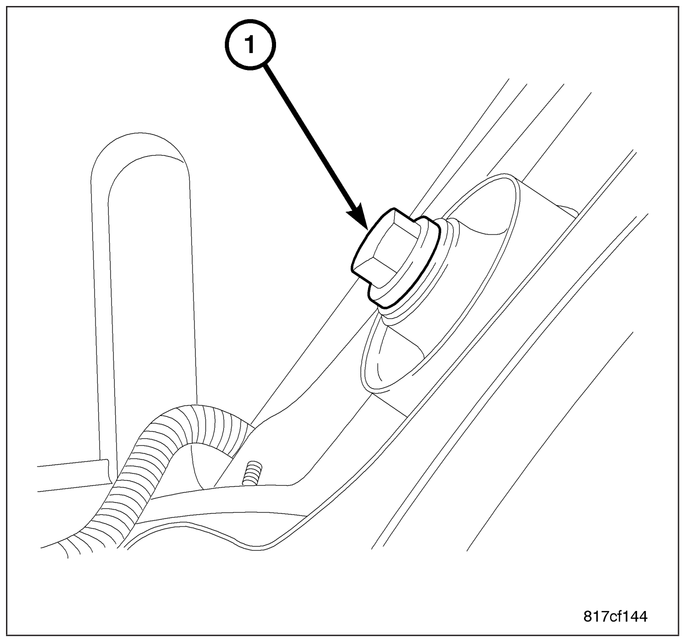
INSTALLATION



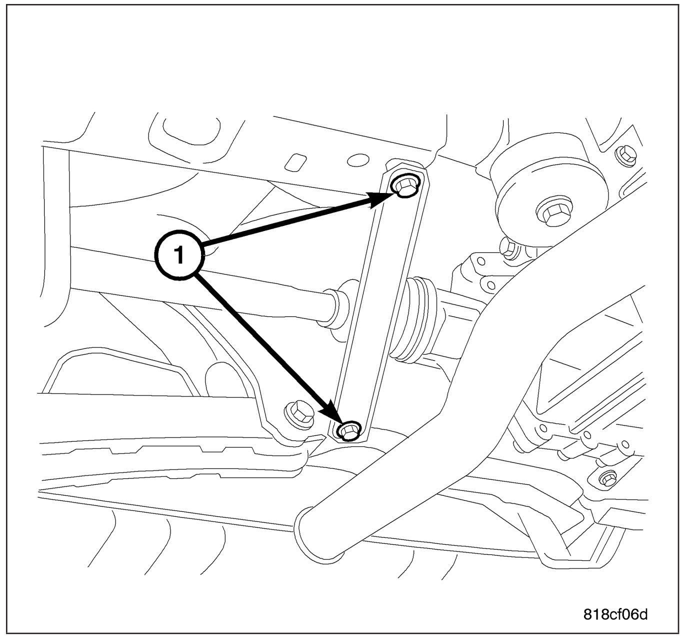
1. Lift driveline module (1) with a transmission jack while installing both axles (2).



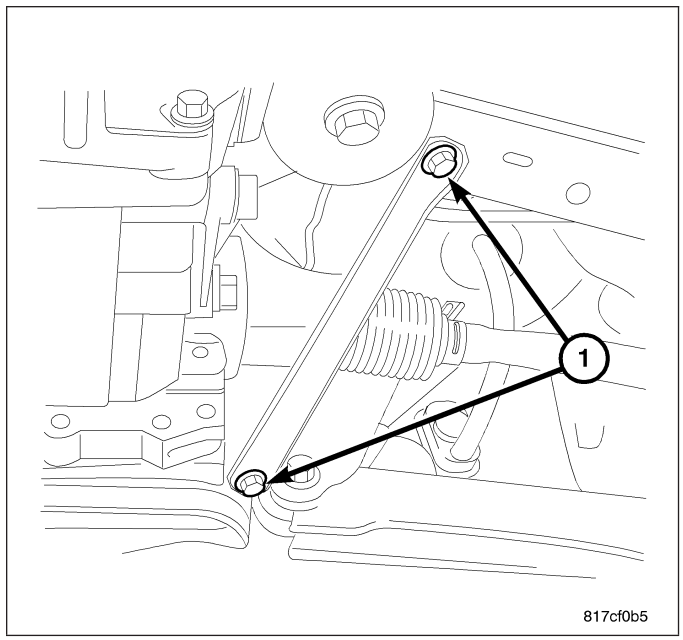
2. Connect the electrical connector (1).
3. Install wire harness bracket and two mounting bolts and torque to 45 N·m (33 ft. lbs.).



4. Lift driveline module into place.

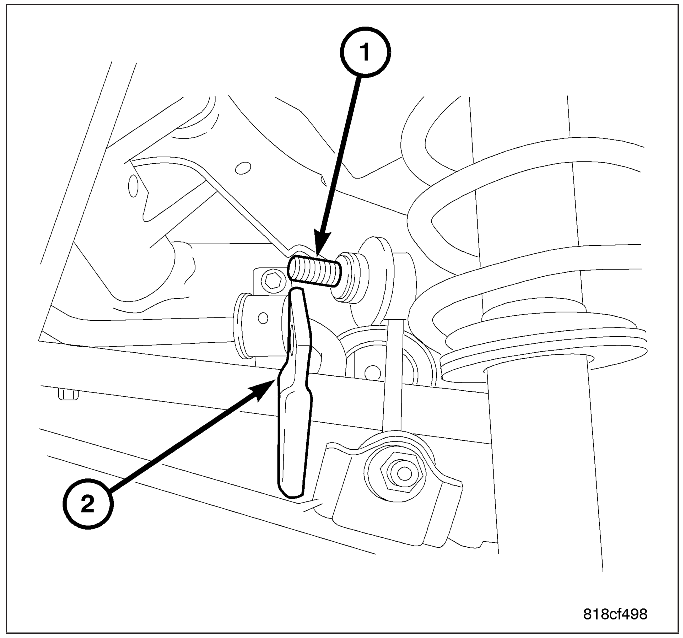


5. Install the two driveline module side mounting bolts (1) and torque to 102 N·m (75 ft. lbs.).

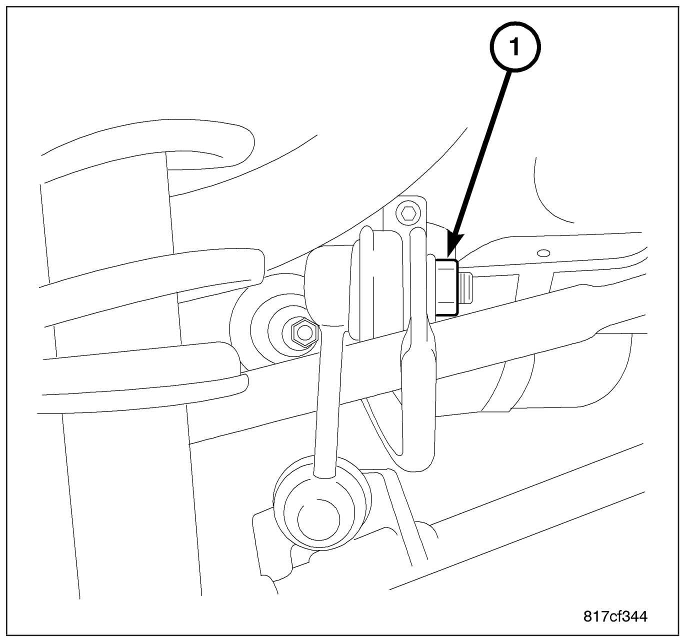


6. Install the one rear driveline module mounting bolt (1) and torque to 102 N·m (75 ft. lbs.).

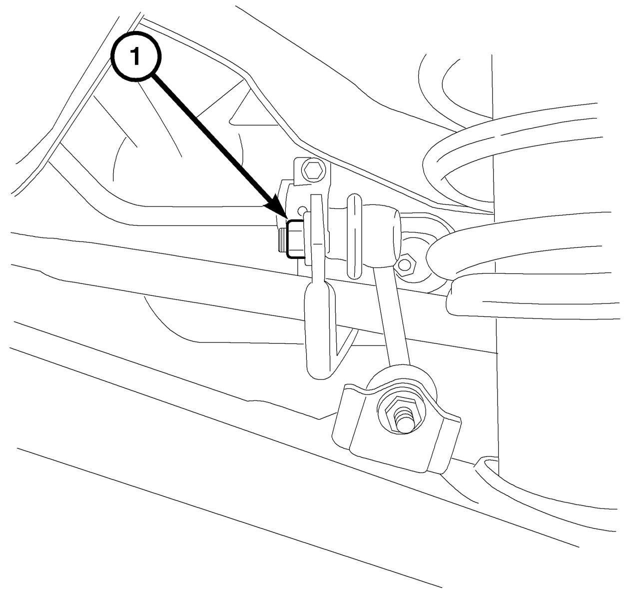
7. Install the right side stay bracket and bolts, (1) torque to 61 N·m (45 ft. lbs.)



8. Install the left side stay bracket and bolts, (1) and torque to 61 N·m (45 ft. lbs.).



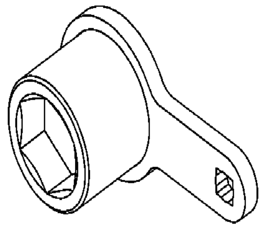
9. Install the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).
10. Fill the rear axle with fluid.



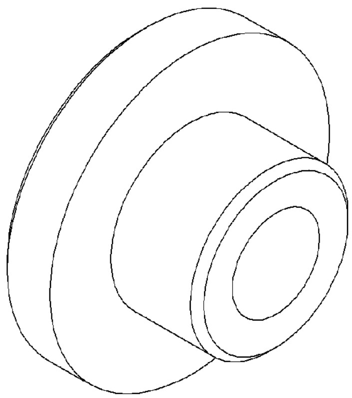
11. Roll sway bar into place (2) (if equipped).

12. Install left side sway bar nut and torque to 61 N·m (45 ft. lbs) (1) (if equipped).

13. Install right side sway bar nut and torque to 61 N·m (45 ft. lbs) (1) (if equipped).
14. Install the exhaust (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).
15. Install the wheels (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING).



SPECIFICATIONS -



TORQUE SPECIFICATIONS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.

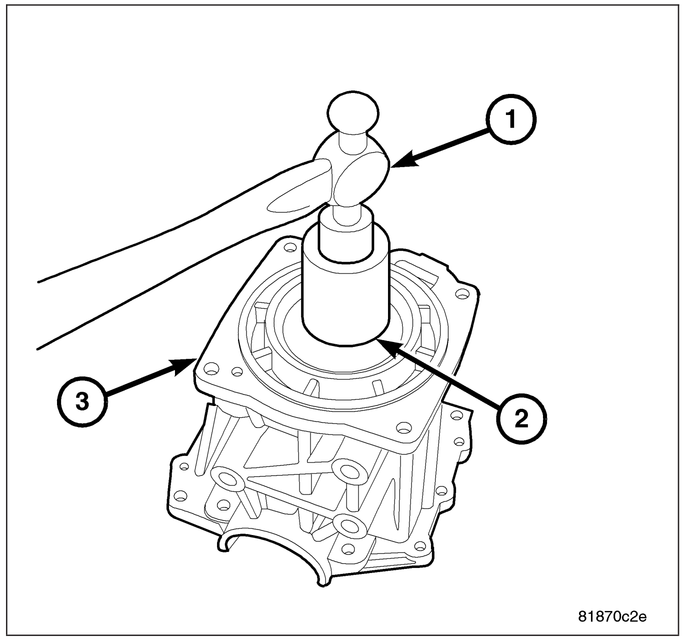
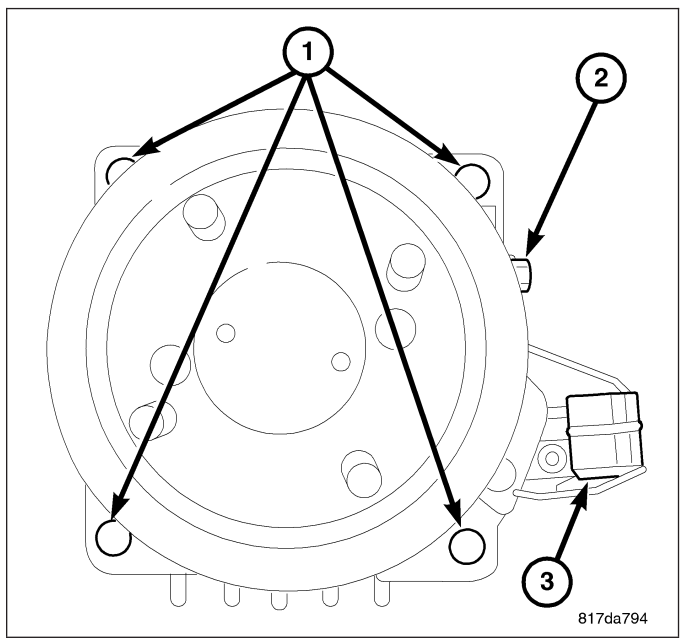
SEAL-INPUT FLANGE

REMOVAL

1. Raise the vehicle on a hoist.
2. Remove the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL).
3. Unplug the electrical connector (3) at the ECC.
4. Remove the ECC to RDA mounting bolts.
5. Separate and lower ECC.

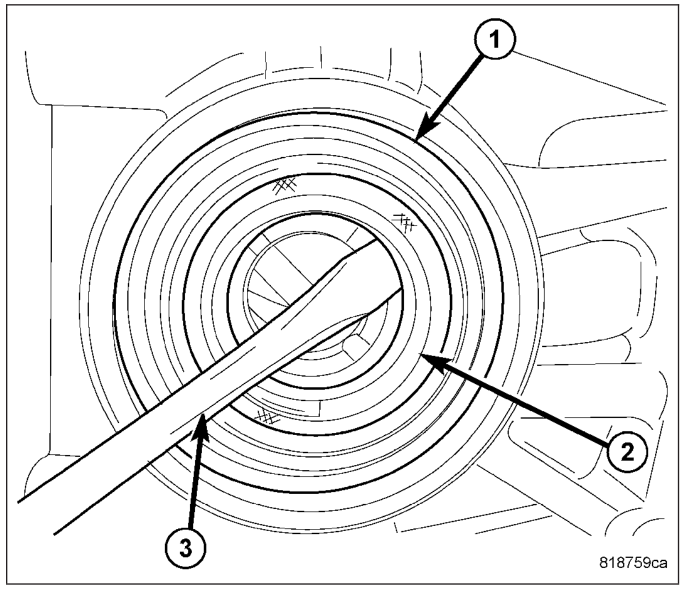


6. Remove the input flange seal.

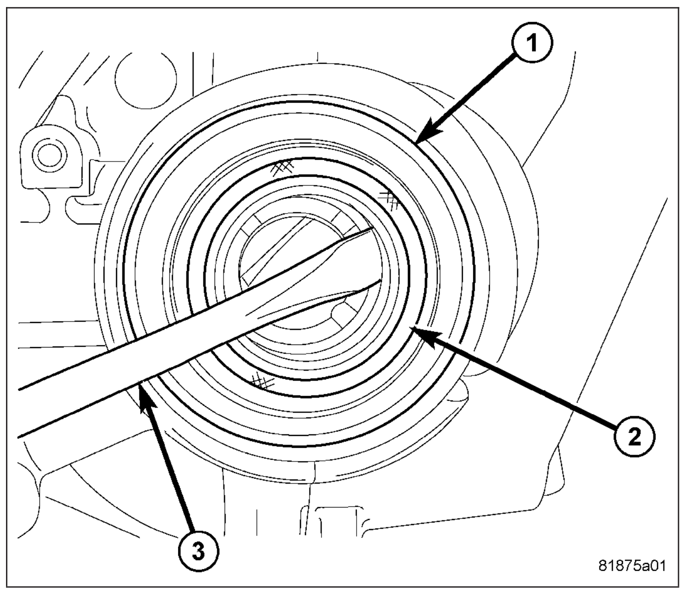


INSTALLATION

1. Install the pinion seal using Installer 9931.



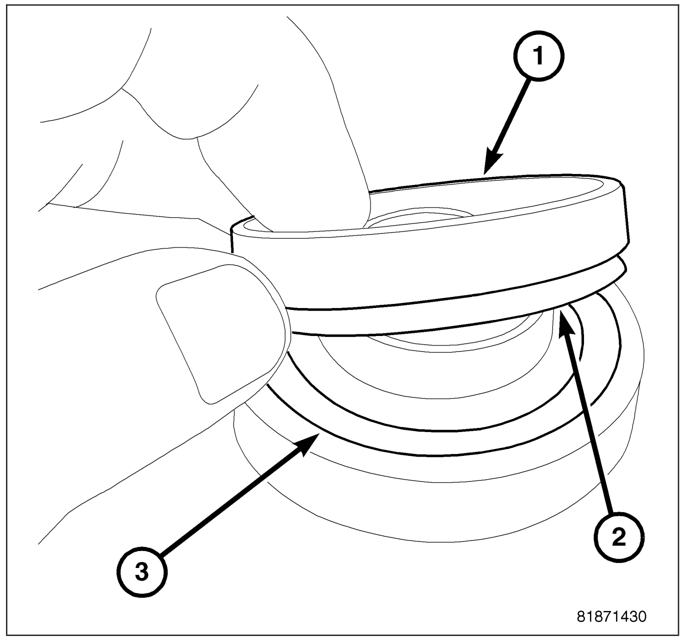
2. Install the ECC onto the RDA.
3. Install the mounting bolts (1) that hold the ECC to the RDA and Torque to 78 N·m (58 ft. lbs.).
4. Plug in the electrical connector (3).
5. Install the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL).
6. Fill RDA as needed (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL).
7. Lower vehicle and road test.



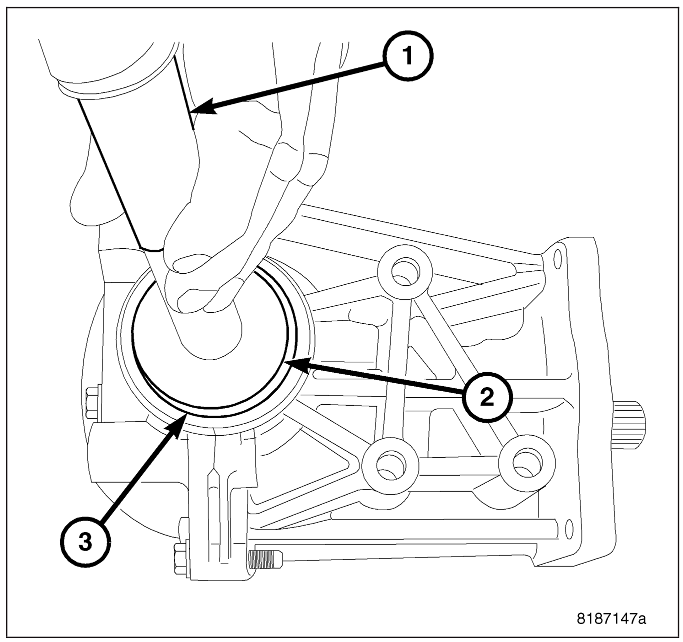
SEALS-OUTPUT FLANGE

REMOVAL

1. Raise the vehicle on a hoist.
2. Remove right side halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).
3. Remove the pinion side seal (2).

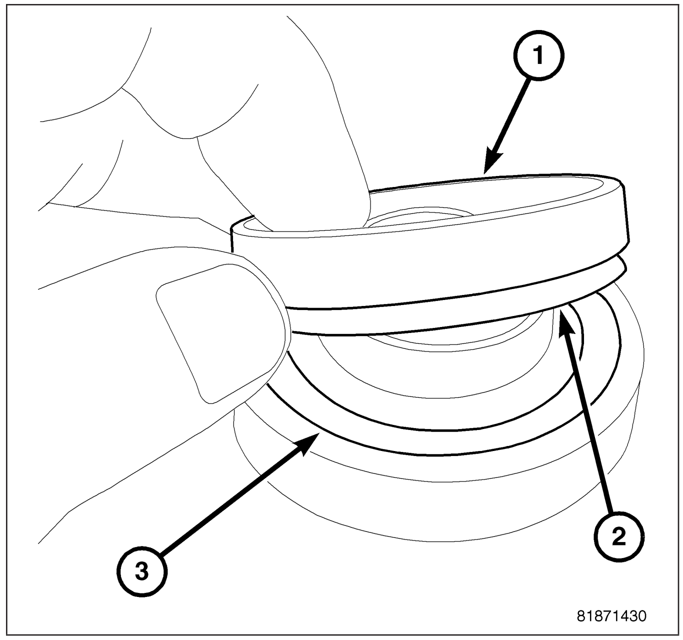


4. Remove left side halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).
5. Remove ring gear side seal.

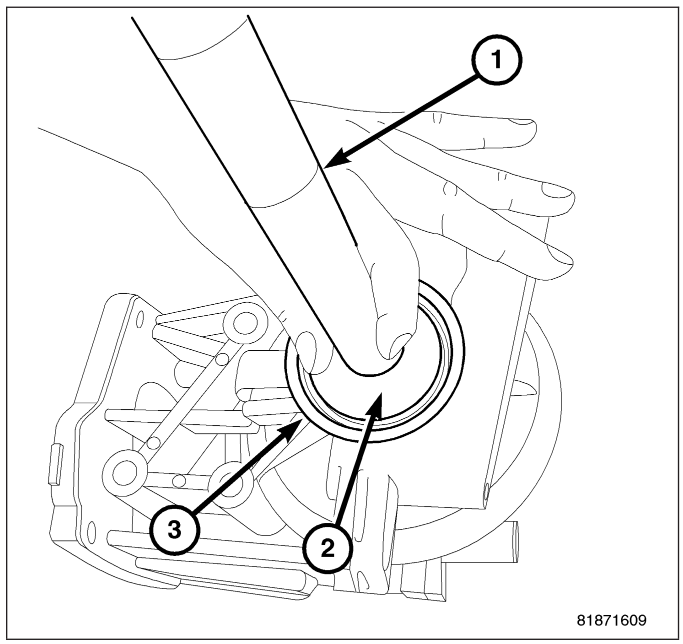


INSTALLATION

1. Place the seal on the installer.



2. Install the pinion side seal using Installer 9893 and Handle C-4171.
3. Install right side halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).



.

4. Place the seal on the installer.

5. Install the ring gear side seal using Installer 9893 and Handle C-4171.
6. Install left side halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
7. Fill RDA as needed (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR DRIVELINE MODULE - STANDARD PROCEDURE).
8. Lower vehicle and road test.

CLUTCH-ELECTRONICALLY CONTROLLED-ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

CLUTCH-ELECTRONICALLY CONTROLLED-ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous.
- **Set Condition:**
  Programmed value for tire size is not within acceptable range.

Possible Causes
INCORRECT VALUE PROGRAMMED INTO TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK FOR A DTC C1078-TIRE REVOLUTIONS RANGE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs.

Does the scan tool display: C1078-TIRE REVOLUTIONS RANGE PERFORMANCE?

Yes >> Go To 2

No >> Go To 3 Diagnostic Test

2. INCORRECT VALUE PROGRAMMED INTO TIPM

TIRE SIZE	BODY STYLE	ENGINE SIZE	SALES CODE	TIRE CIRCUMFERENCE (MM PER REV)
P205/70R 15 Dunlop SP50	PM	ALL	TPB	2112
P215/60R 17 BSW AS Touring Firestone Affinity 3	PM	ALL	TTU	2087
P215/55R 18 AS Performance Firestone Firehawk GTA 03	PM	ALL	TT1	2115
P215/60R 17 BSW Summer Performance Continental Premium Contact 2	PM	ALL	TMQ	2115
P215/55R 18BSW Summer Performance Continental Premium Contact 2	PM	ALL	TMZ	2117

Verify the correct tire/wheel information is programmed in the TIPM.

Is the correct value programmed in the TIPM according to the chart?

Yes >> Test complete.
Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Program the correct Tire/Wheel information in the TIPM.
Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

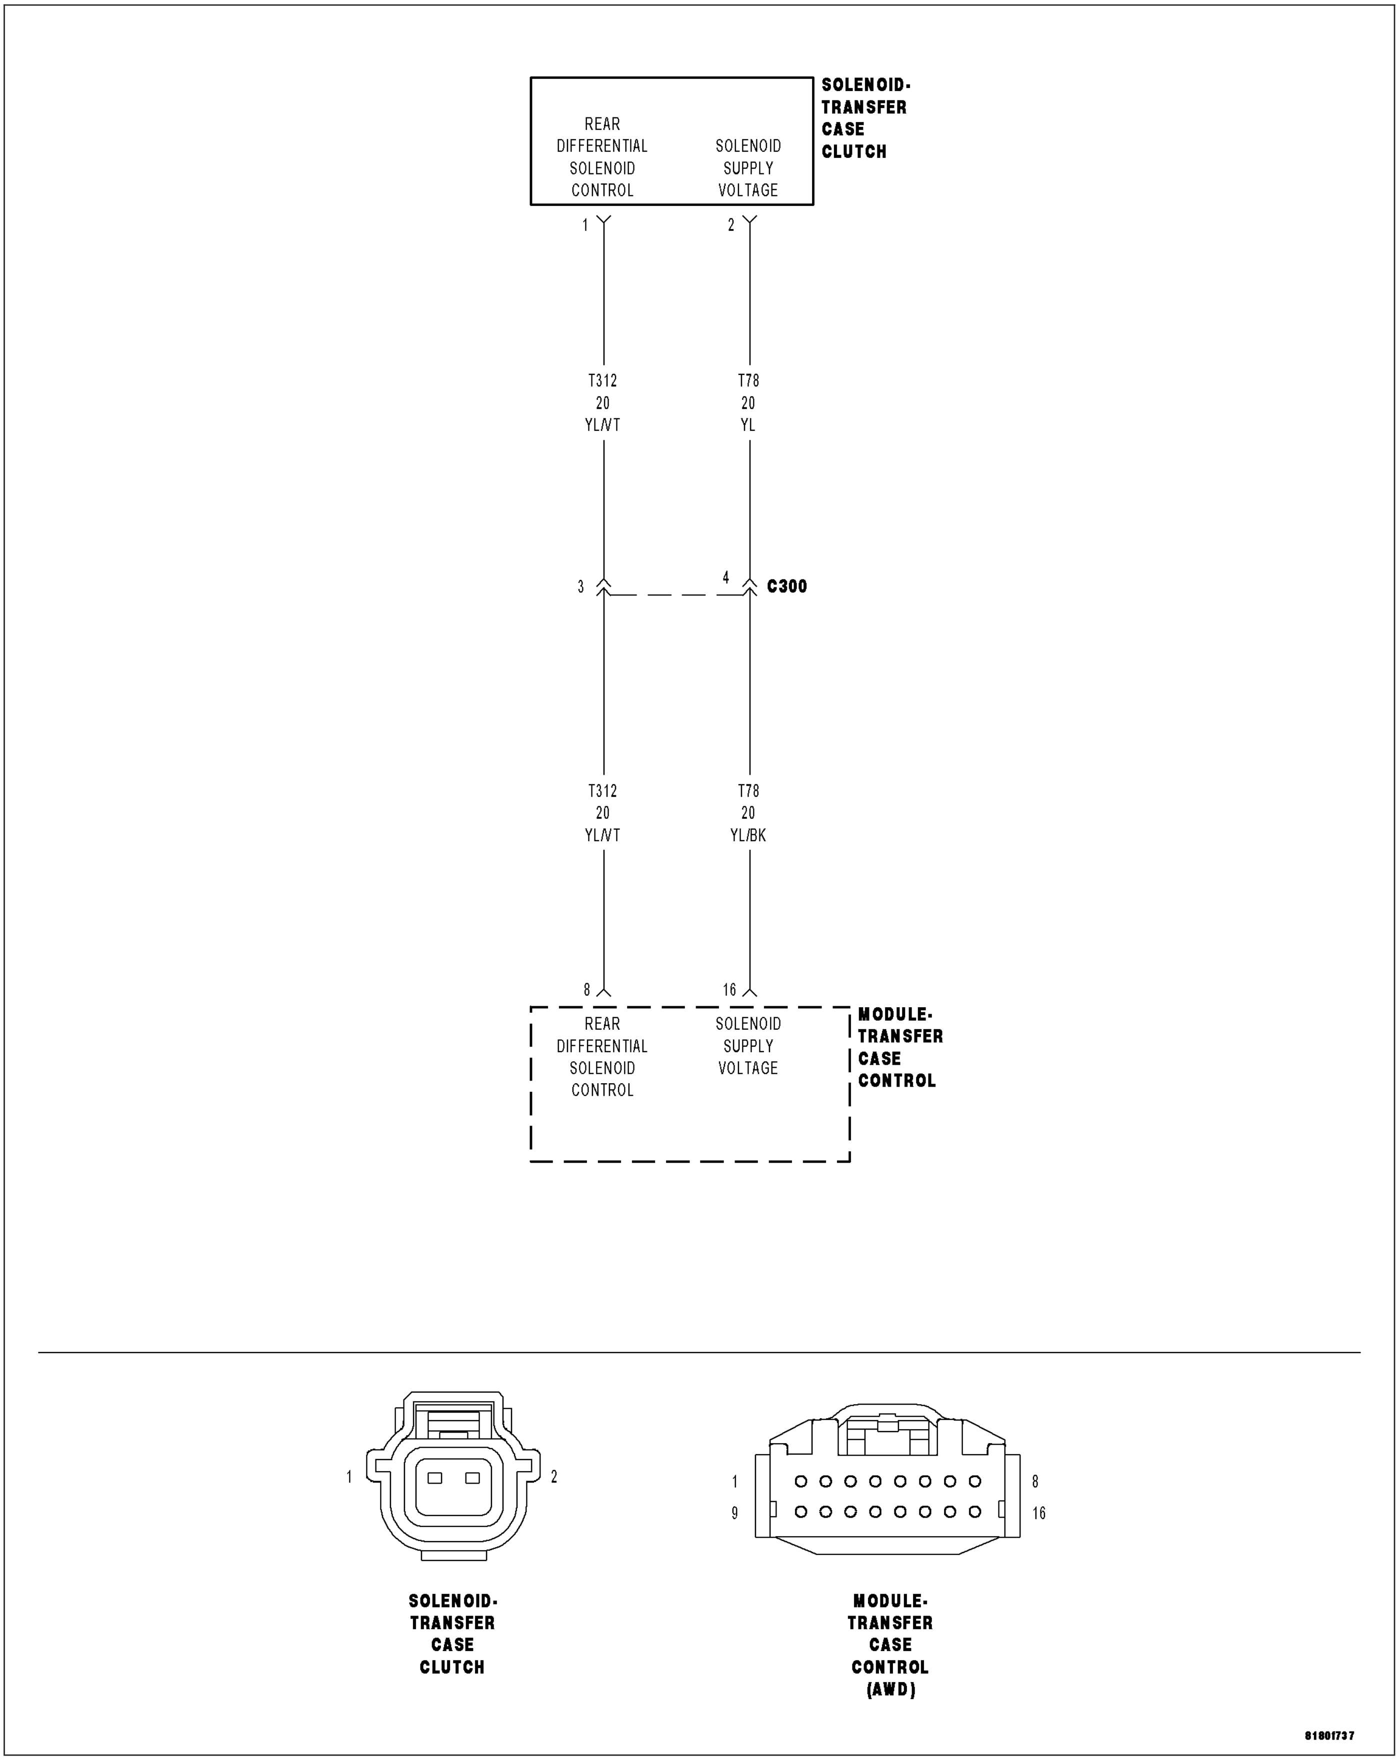
3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.



Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C1456-AWD CLUTCH POWER CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Solenoid is active, no solenoid supply circuit DTCs are present and battery voltage is normal.
- **Set Condition:**
  The AWD Module detects the ECC Solenoid Power Control is shorted low.

Possible Causes
(T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN
(T78) SOLENOID SUPPLY VOLTAGE OPEN
(T78) SOLENOID SUPPLY VOLTAGE SHORTED TO GROUND
ALL WHEEL DRIVE (AWD) CONTROL MODULE
ELECTRONIC CONTROLLED CLUTCH (ECC)

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

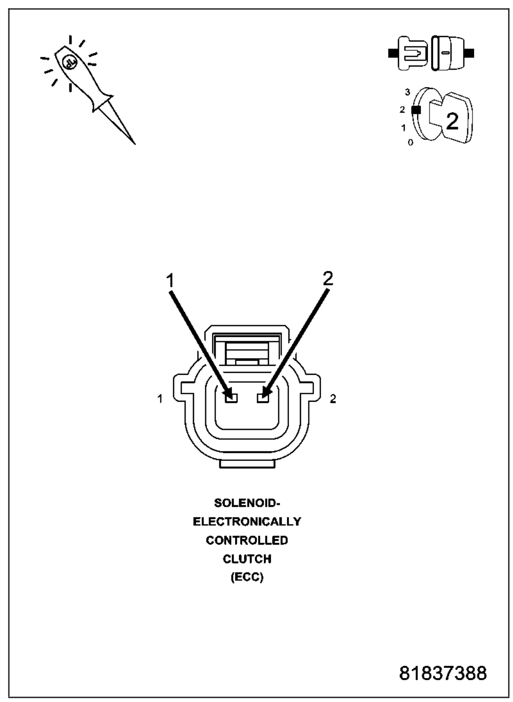
With the scan tool, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 9

2. ECC SOLENOID OPERATION



Turn the ignition off.

Disconnect the ECC Solenoid harness connector.

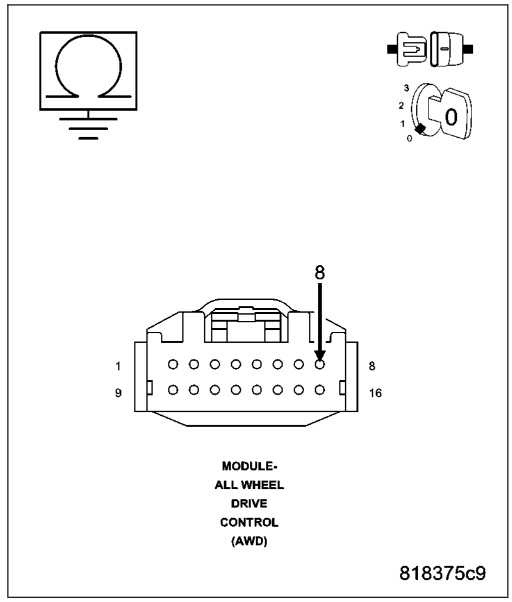
Ignition on, engine not running.

Using a 12-volt test light, jump across from the (T78) Solenoid Supply Voltage circuit and the (T312) Rear Differential Solenoid Control circuit in the ECC Solenoid harness connector.

With the scan tool, actuate the ECC Solenoid.

Does the test light illuminate brightly and flash on and off?

Yes >> Go To 8



No >> Go To 3

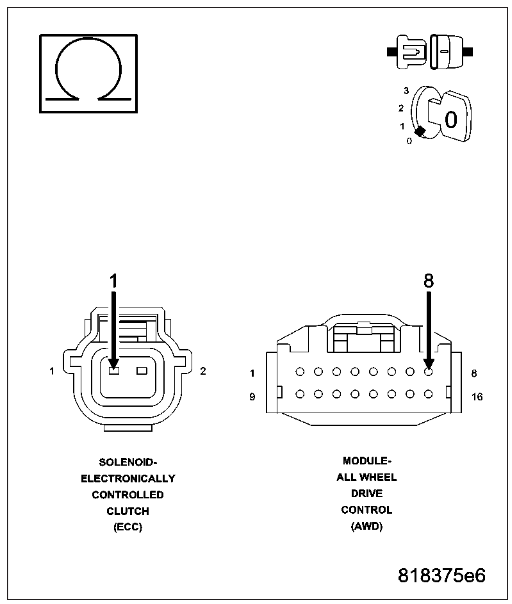
3. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the AWD Control Module harness connector.

Measure the resistance between ground and the (T312) Rear Differential Solenoid Control circuit at the AWD Module harness connector.

Is the resistance below 100 ohms?



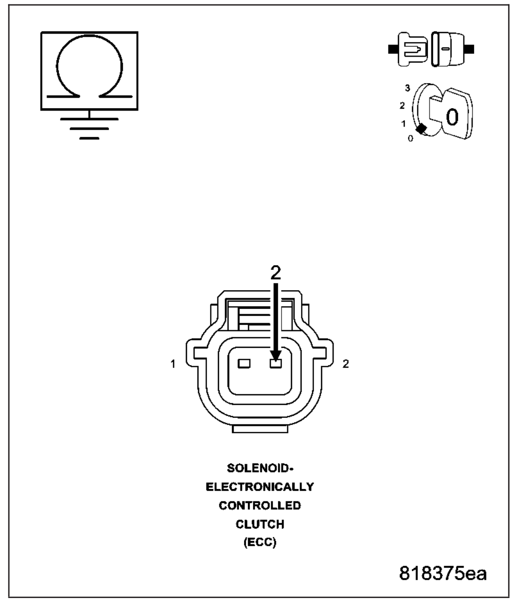
Yes >> Repair the short to ground in the (T312) Rear Differential Solenoid Control circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Go To 4

4. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN

Measure the resistance of the (T312) Rear Differential Solenoid Control circuit between the ECC Solenoid harness connector and the AWD Control Module harness connector.



Is the resistance below 5.0 ohms?

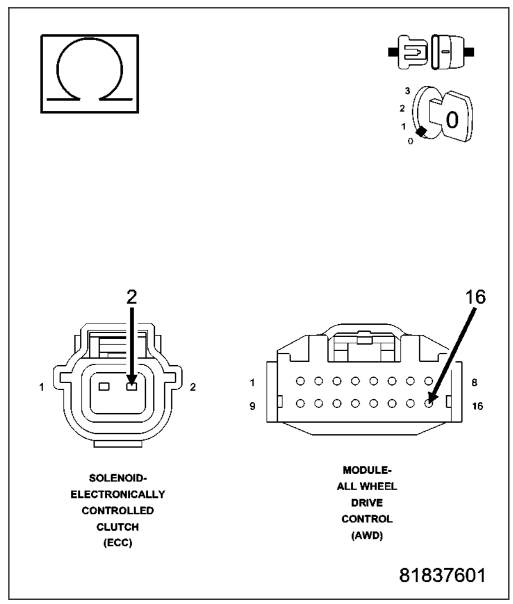
Yes >> Go To 5

No >> Repair the open in the (T312) ECC Solenoid Control circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

5. (T78) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (T78) Solenoid Supply Voltage circuit at the ECC Solenoid harness connector.



Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (T78) Solenoid Supply Voltage circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Go To 6

6. (T78) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT OPEN

Measure the resistance of the (T78) Solenoid Supply Voltage circuit between the ECC Solenoid harness connector and the AWD Control Module harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 7

No >> Repair the open in the (T78) Solenoid Supply Voltage circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

7. AWD CONTROL MODULE

NOTE: Before continuing, check the AWD Control Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Replace AWD Control Module in accordance with Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

8. ELECTRONICALLY CONTROLLED CLUTCH (ECC)

NOTE: Before continuing, check the ECC Solenoid jumper harness connector terminals for corrosion, damage, or terminals push out, repair/replace as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Replace ECC in accordance with Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

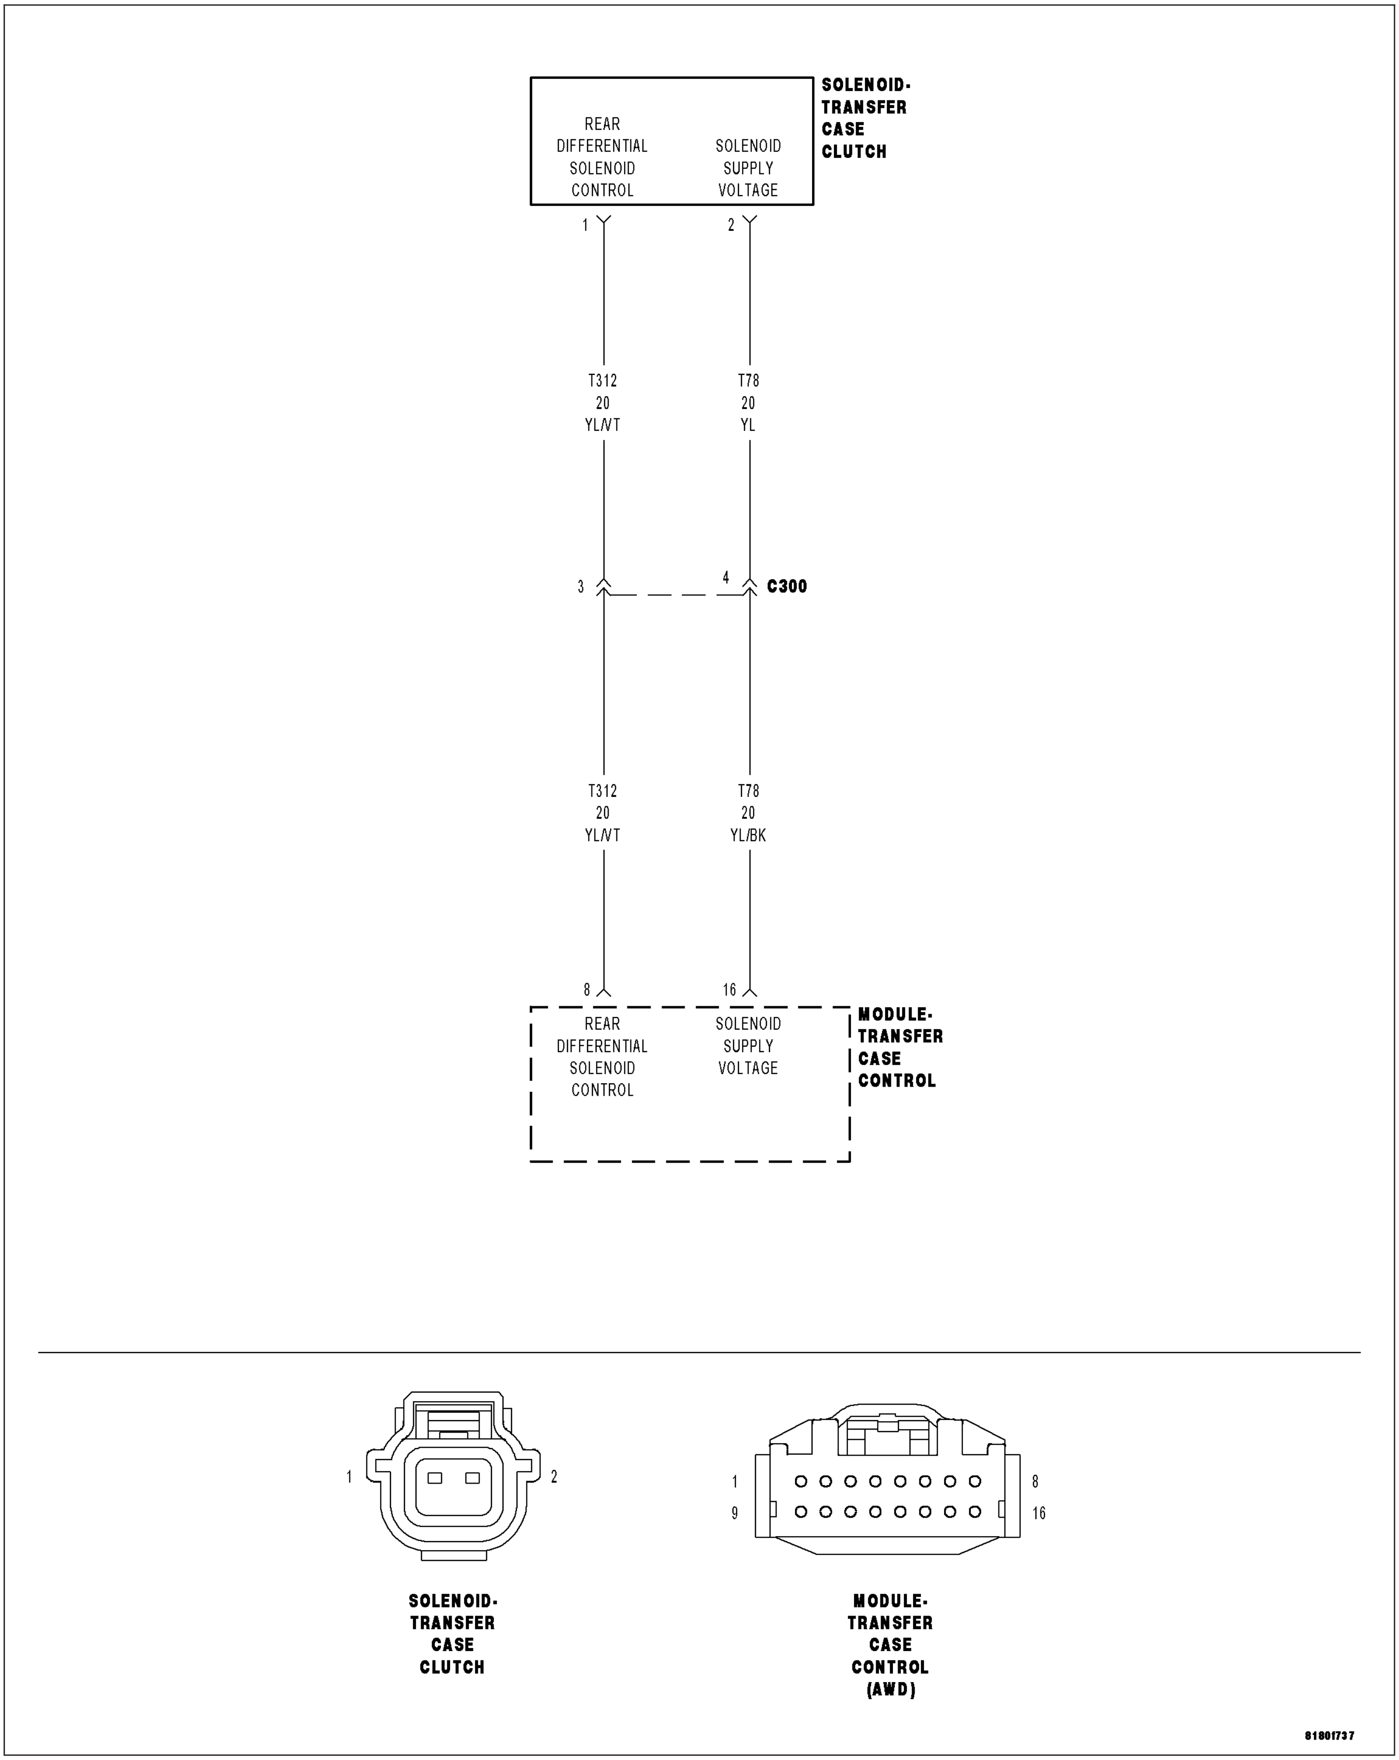
9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.



Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C145A-AWD CLUTCH RETURN CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Solenoid is active, no solenoid supply circuit DTCs are present and battery voltage is normal.
- **Set Condition:**
  The AWD Module detects the Rear Differential Solenoid Supply is shorted low.

Possible Causes
(T78) SOLENOID SUPPLY VOLTAGE OPEN
(T78) SOLENOID SUPPLY VOLTAGE SHORTED TO GROUND
(T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN
(AWD) CONTROL MODULE
ELECTRONIC CONTROLLED CLUTCH (ECC)

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

With the scan tool, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

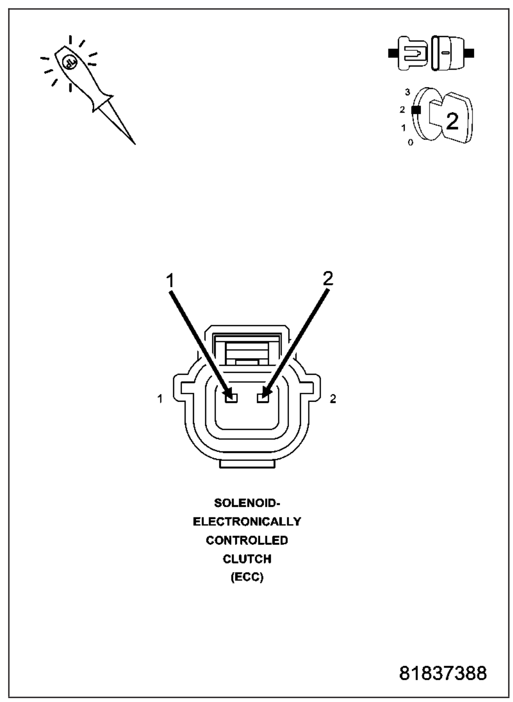
No >> Go To 9

2. ECC SOLENOID OPERATION

Turn the ignition off.

Disconnect the ECC Solenoid harness connector.

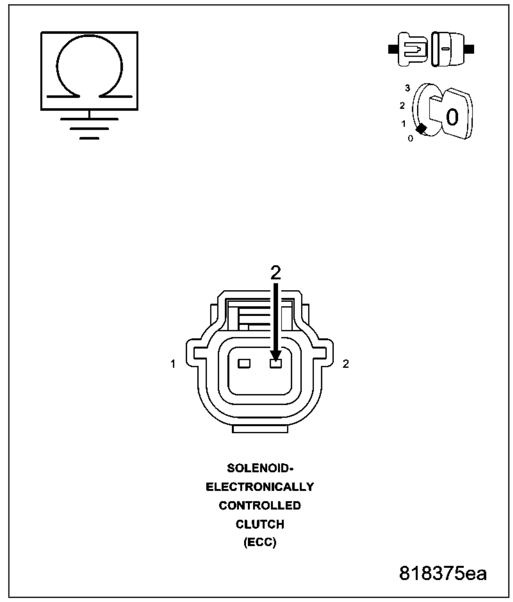
Ignition on, engine not running.



Using a 12-volt test light, jump across from the (T78) Solenoid Supply Voltage circuit and the (T312) Rear Differential Solenoid Control circuit in the ECC Solenoid harness connector.

With the scan tool, actuate the ECC Solenoid.

Does the test light illuminate brightly and flash on and off?



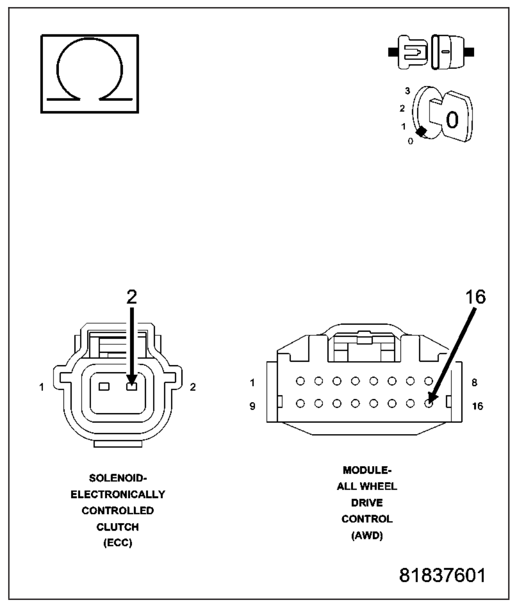
Yes >> Go To 8

No >> Go To 3

3. (T78) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (T78) Solenoid Supply Voltage circuit at the ECC Solenoid harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the short to ground in the (T78) Solenoid Supply Voltage circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Go To 4

4. (T78) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT OPEN

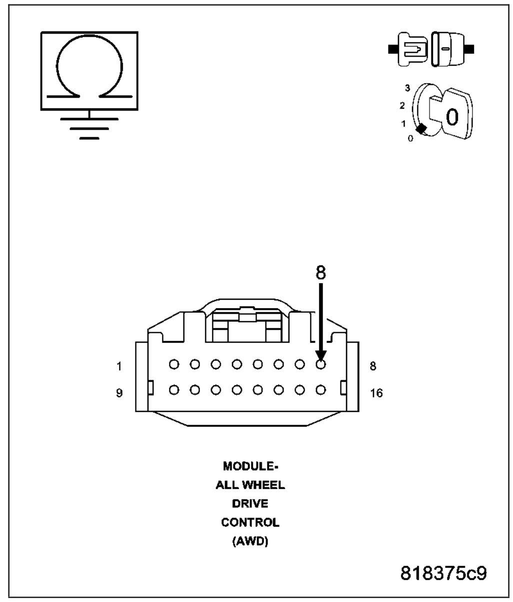
Measure the resistance of the (T78) Solenoid Supply Voltage circuit between the ECC Solenoid harness connector and the AWD Control Module harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the open in the (T78) Solenoid Supply Voltage circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)



5. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

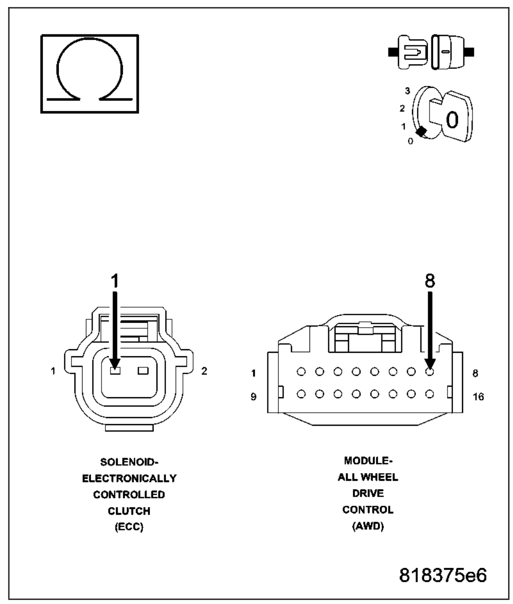
Turn the ignition off.

Disconnect the AWD Control Module harness connector.

Measure the resistance between ground and the (T312) Rear Differential Solenoid Control circuit at the AWD Module harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (T312) Rear Differential Solenoid Control circuit.



Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Go To 6

6. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN

Measure the resistance of the (T312) Rear Differential Solenoid Control circuit between the ECC Solenoid harness connector and the AWD Control Module harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 7

No >> Repair the open in the (T312) Rear Differential Solenoid Control circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

7. AWD CONTROL MODULE

NOTE: Before continuing, check the AWD Control Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Replace AWD Control Module in accordance with Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

8. ELECTRONICALLY CONTROLLED CLUTCH (ECC)

NOTE: Before continuing, check the ECC Solenoid jumper harness connector terminals for corrosion, damage, or terminals push out, repair/replace as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Replace ECC in accordance with Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

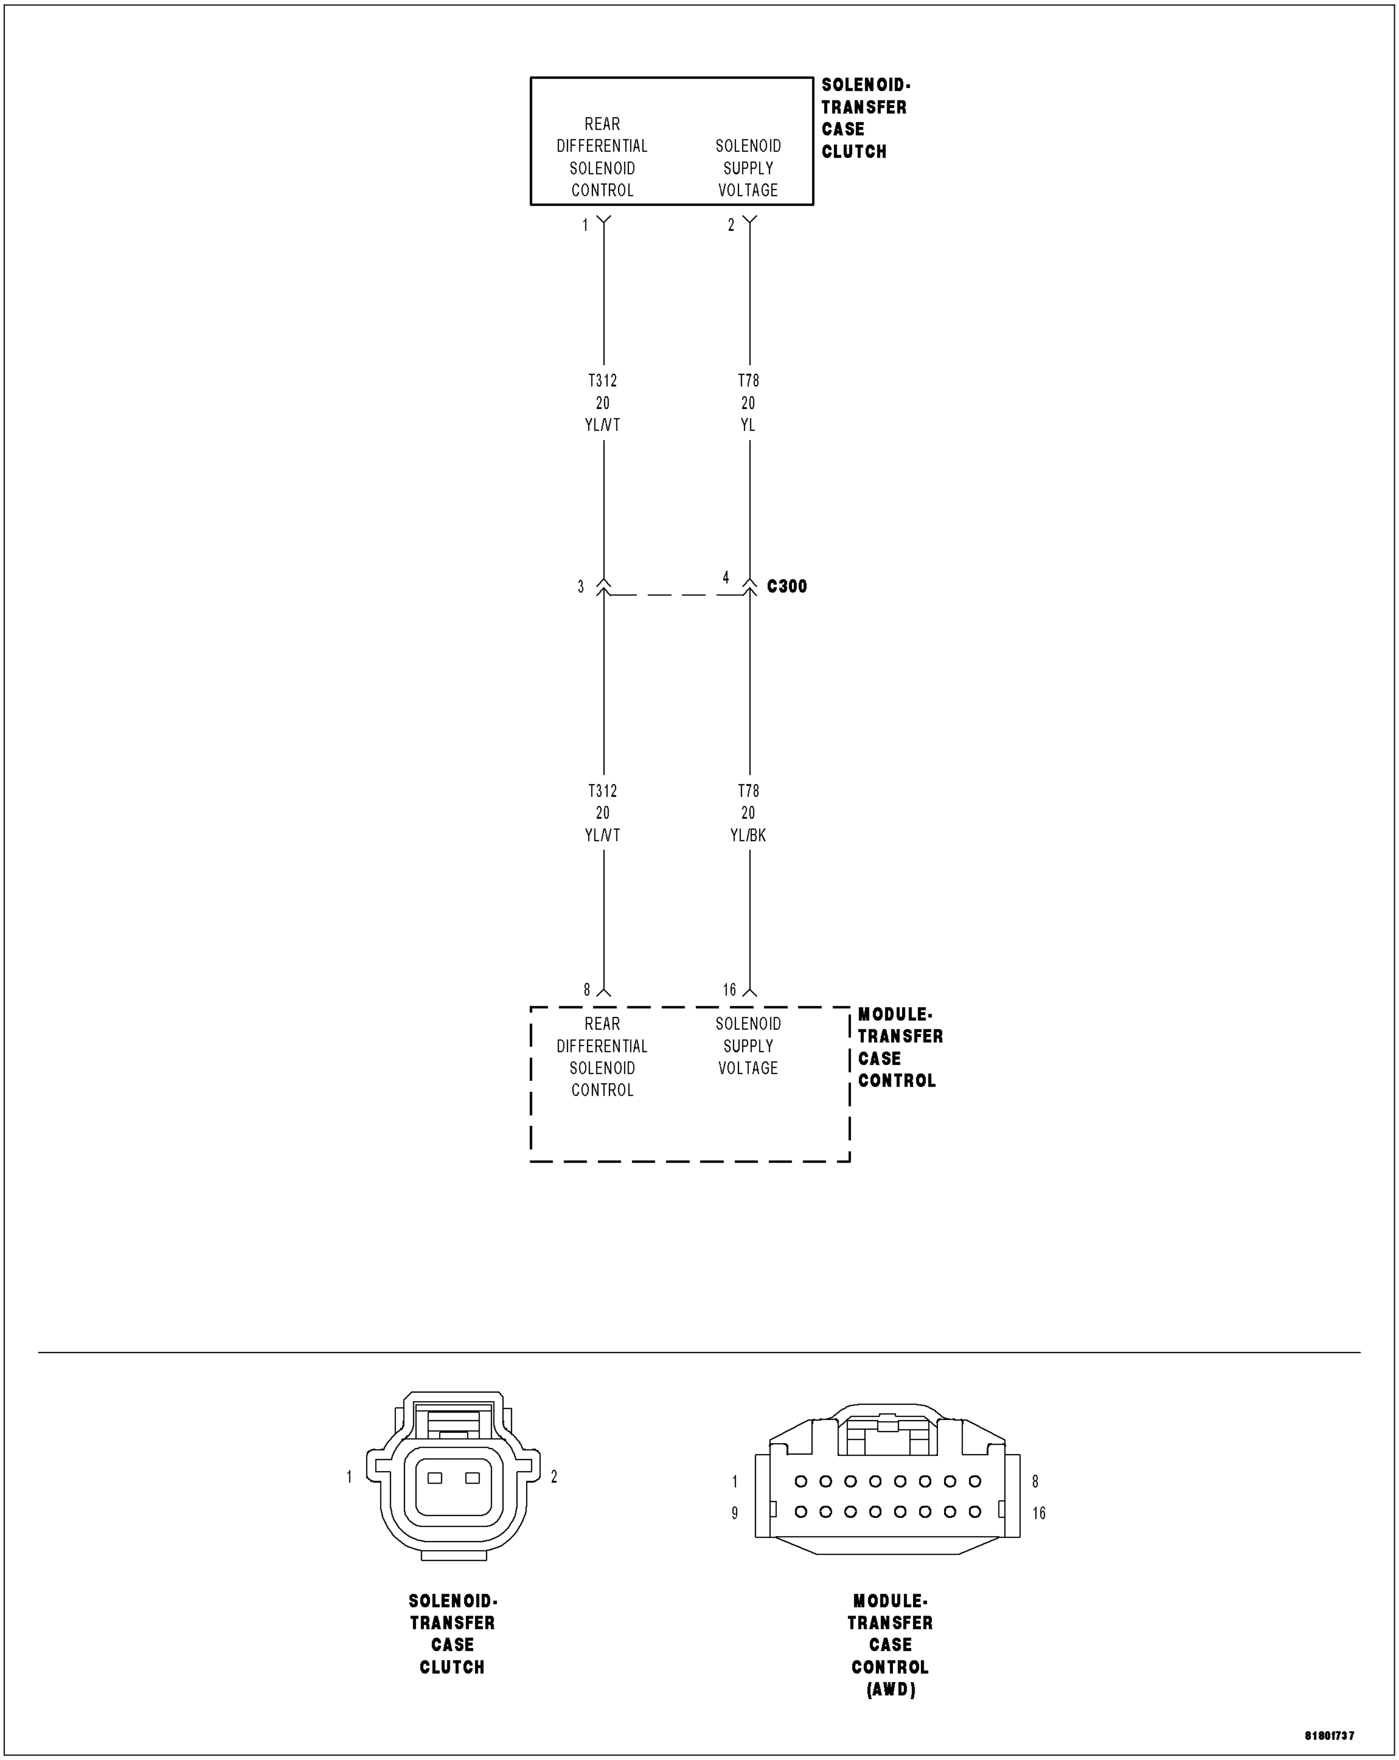
9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.



Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C145D-AWD CLUTCH POWER/RETURN CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Solenoid is active, no solenoid supply circuit DTCs are present and battery voltage is normal.
- **Set Condition:**
  The AWD Module detects the Rear Differential Solenoid Power Control or Rear Differential Solenoid Return Control is open.

Possible Causes
(T78) SOLENOID SUPPLY VOLTAGE OPEN
(T78) SOLENOID SUPPLY VOLTAGE SHORTED TO GROUND
(T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN
ELECTRONIC CONTROLLED CLUTCH (ECC)
ALL WHEEL DRIVE (AWD) CONTROL MODULE

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

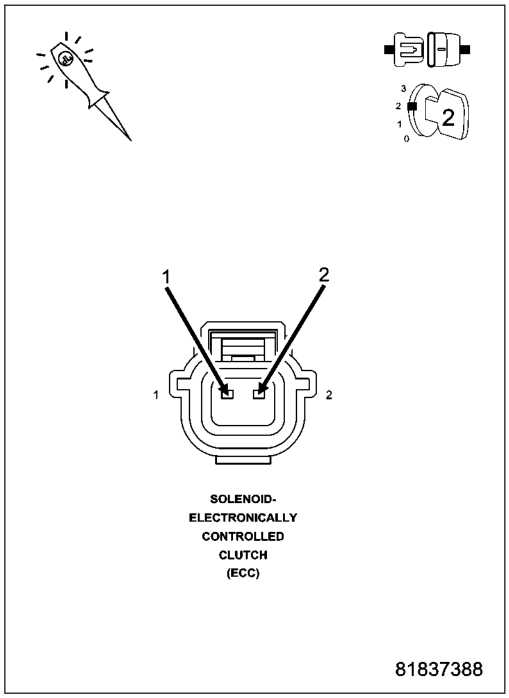
With the scan tool, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 8

2. ECC SOLENOID OPERATION



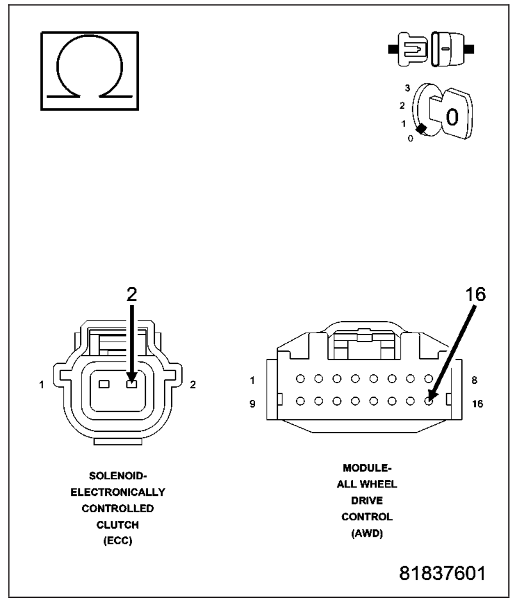
Turn the ignition off.

Disconnect the ECC Solenoid harness connector.

Ignition on, engine not running.

Using a 12-volt test light, jump across from the (T78) Solenoid Supply Voltage circuit and the (T312) Rear Differential Solenoid Control circuit in the ECC Solenoid harness connector.

With the scan tool, actuate the ECC Solenoid.



Does the test light illuminate brightly and flash on and off?

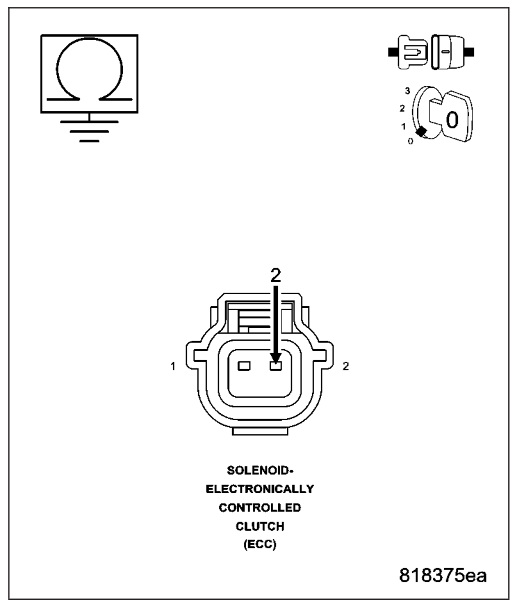
Yes >> Go To 7

No >> Go To 3

3. (T78) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT OPEN

Measure the resistance of the (T78) Solenoid Supply Voltage circuit between the ECC Solenoid harness connector and the AWD Control Module harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go To 4

No >> Repair the open in the (T78) Solenoid Supply Voltage circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

4. (T78) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (T78) Solenoid Supply Voltage circuit at the ECC Solenoid harness connector.

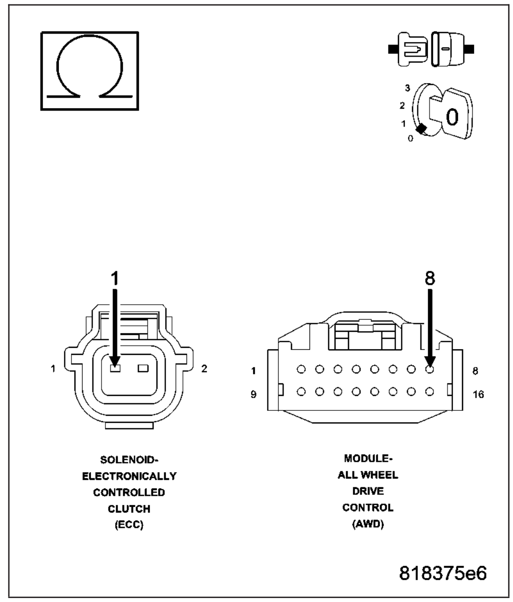
Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (T78) Solenoid Supply Voltage circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Go To 5

5. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN



Measure the resistance of the (T312) Rear Differential Solenoid Control circuit between the ECC Solenoid harness connector and the AWD Control Module harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 6

No >> Repair the open in the (T312) Rear Differential Solenoid Control circuit.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

6. AWD CONTROL MODULE

NOTE: Before continuing, check the AWD Control Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Replace AWD Control Module in accordance with Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

7. ELECTRONICALLY CONTROLLED CLUTCH (ECC)

NOTE: Before continuing, check the ECC Solenoid jumper harness connector terminals for corrosion, damage, or terminals push out, repair/replace as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Replace ECC in accordance with Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C145F–AWD SYSTEM TEMPORARILY DISABLED — OVERTEMPERATURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The AWD Control Module detects overload condition due to excessive torque being applied to the ECC from hard driving conditions (Mud, Sand, Snow etc.).

Possible Causes
DRIVING CONDITIONS
ALL WHEEL DRIVE (AWD) CONTROL MODULE
ELECTRONICALLY CONTROLLED CLUTCH (ECC)

Always perform the AWD Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If C1456, C145A or C145D has set along with this DTC, diagnose those DTC(s) first before continuing.

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2
Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Go To 4

2. VERIFY SET CONDITION

Check with customer on driving terrain (e.g. mud, sand, snow) for set condition.

With the scan tool, erase DTC's.

Test drive vehicle on dry paved road.

With the scan tool, read DTC's.

Is the status Active for this DTC?

Yes >> Go To 3

No >> Test Complete.
Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

3. AWD CONTROL MODULE

NOTE: Before continuing, check the AWD Control Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Replace AWD Control Module in accordance with Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

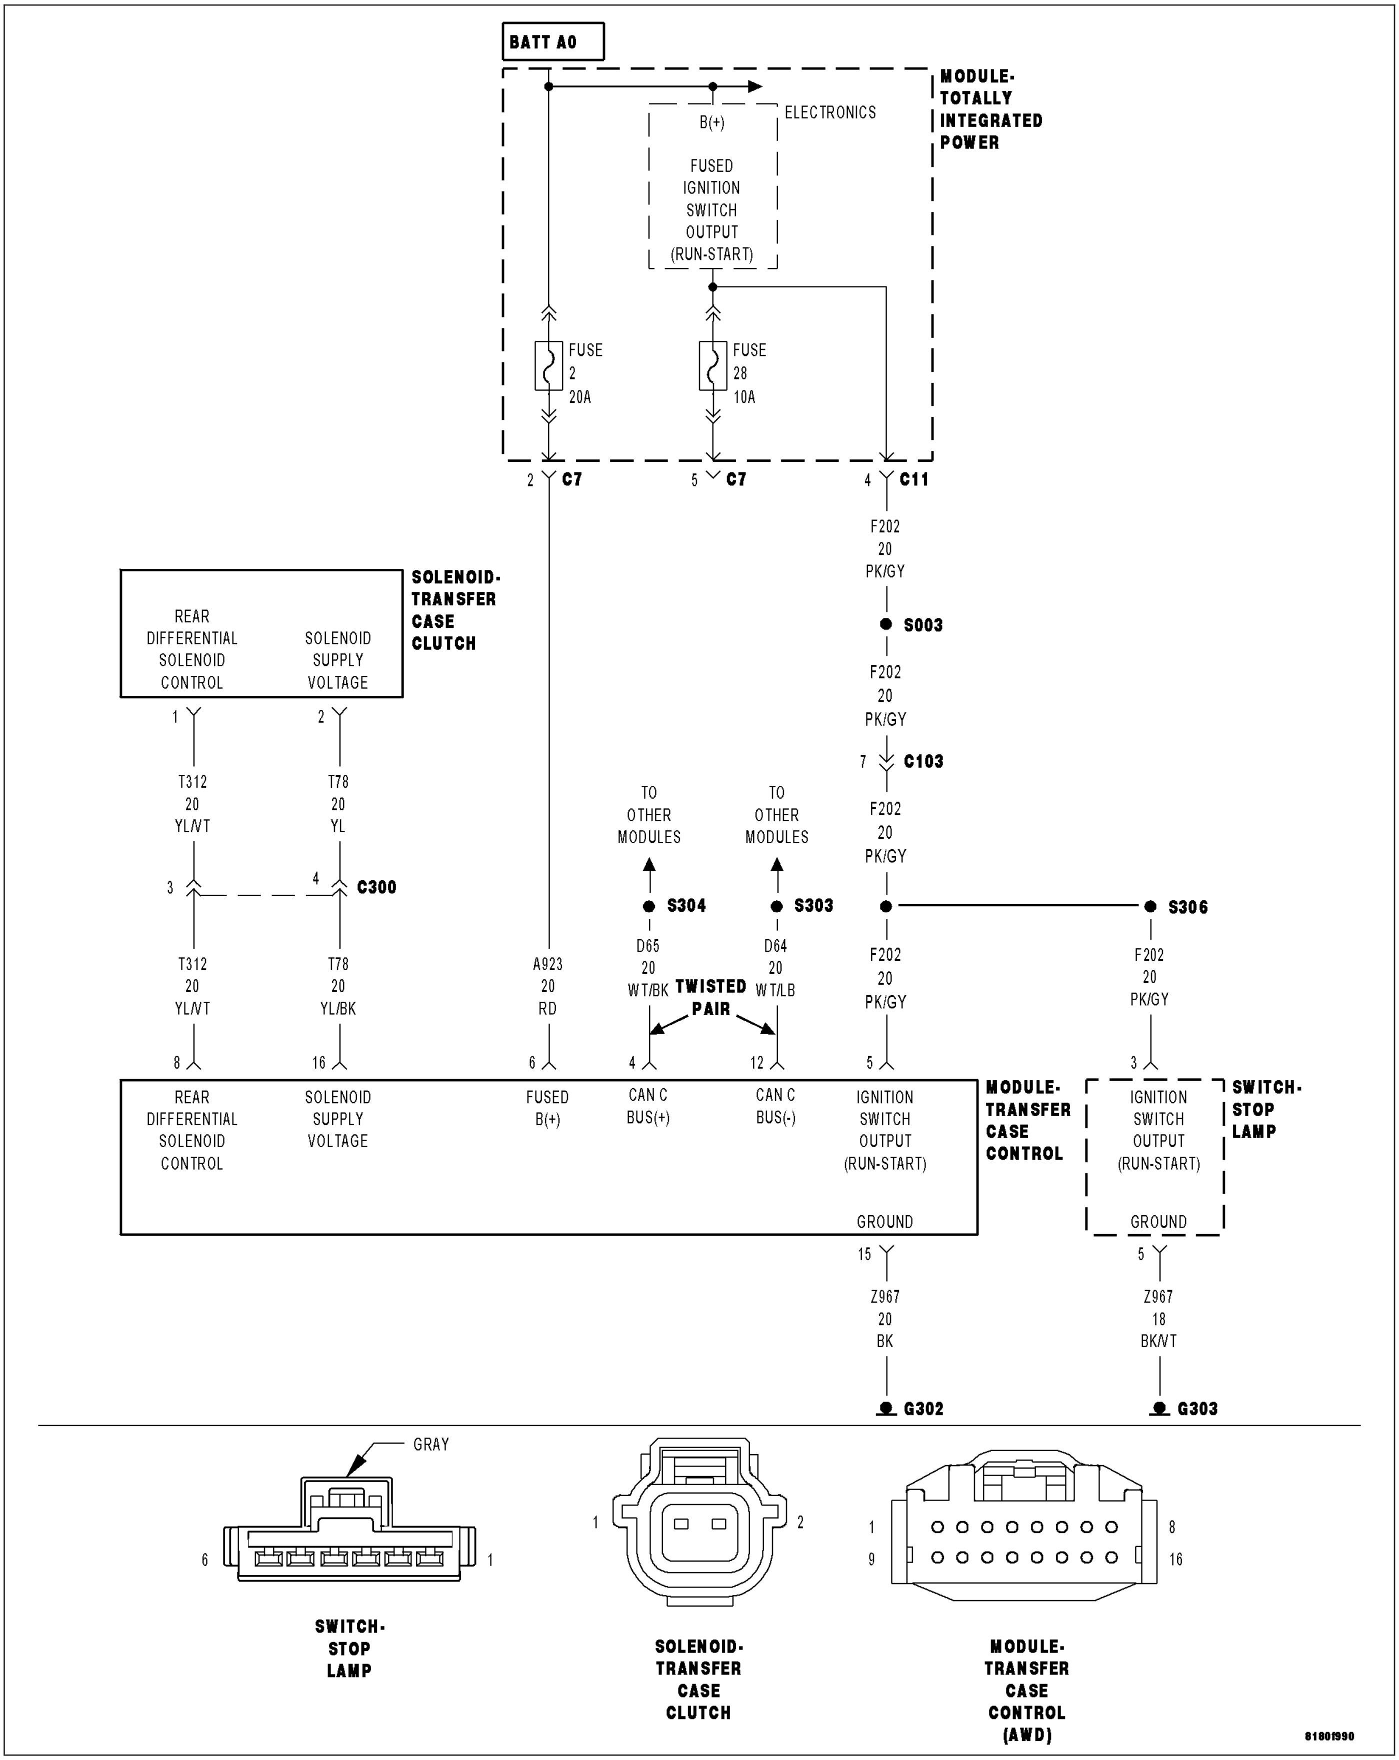
4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.



Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C2100–BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The All Wheel Drive Control Module detects that system voltage is below 9.0 volts for 60 seconds.

Possible Causes
CHARGING SYSTEM DTCS PRESENT
(F202) IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR HIGH RESISTANCE
(A923) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ALL WHEEL DRIVE (AWD) CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHARGING SYSTEM DTCS PRESENT

Ignition on, engine not running.

With the scan tool, select View DTCs in the Powertrain Control Module.

Are there any Charging System or related voltage DTCs present?

Yes >> Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No >> Go to 2

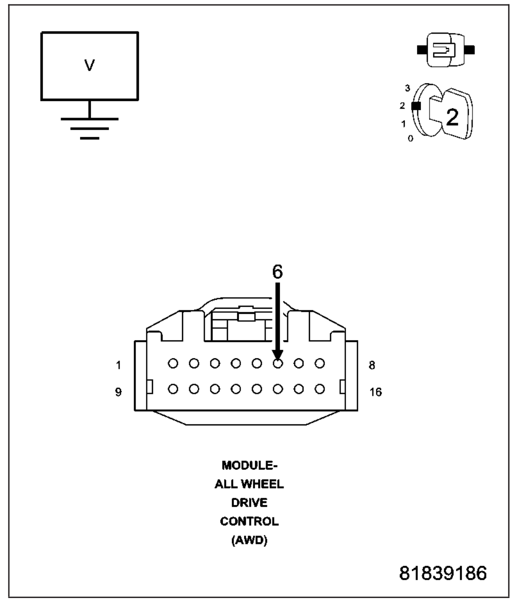
2. CHECK FOR ACTIVE DTC

With the scan tool, select View DTCs.

Is the DTC active at this time?

Yes >> Go to 3

No >> Go to 10



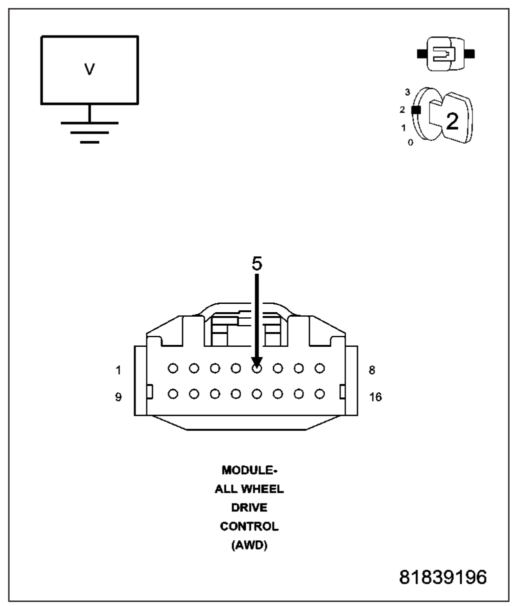
3. CHECK THE TIPM FUSED B(+) VOLTAGE

While back probing, measure the voltage of the (A923) Fused B(+) circuit in the TIPM C7 harness connector.

Is the voltage above 9 volts?

Yes >> Go to 4

No >> Go to 9



4. CHECK THE TIPM IGNITION SWITCH OUTPUT RUN/START VOLTAGE

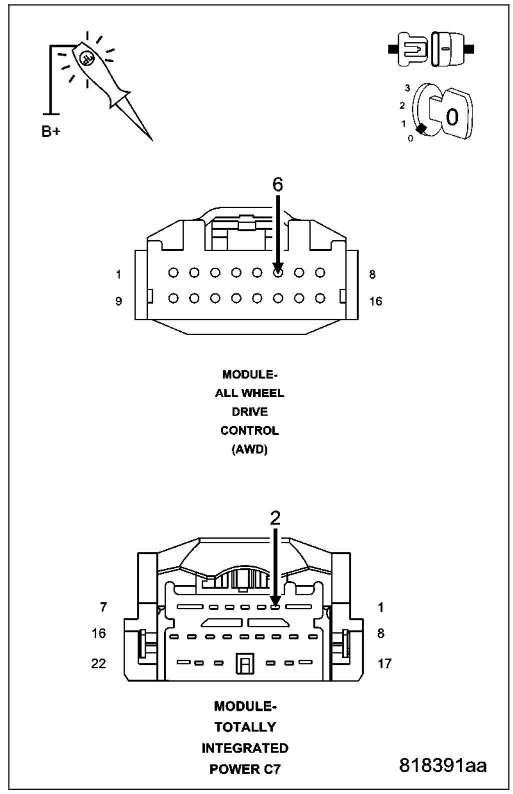
While back probing, measure the voltage of the (F202) Ignition Switch Output Run/Start circuit in the TIPM C11 harness connector.

Is the voltage above 9 volts?

Yes >> Go to 5

No >> Go to 9

5. (A923) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE



Turn the ignition off.

Disconnect the AWD Module harness connector.

Disconnect the TIPM C7 harness connector.

Connect a jumper wire between the (A923) Fused B(+) circuit and Ground in the TIPM C7 harness connector.

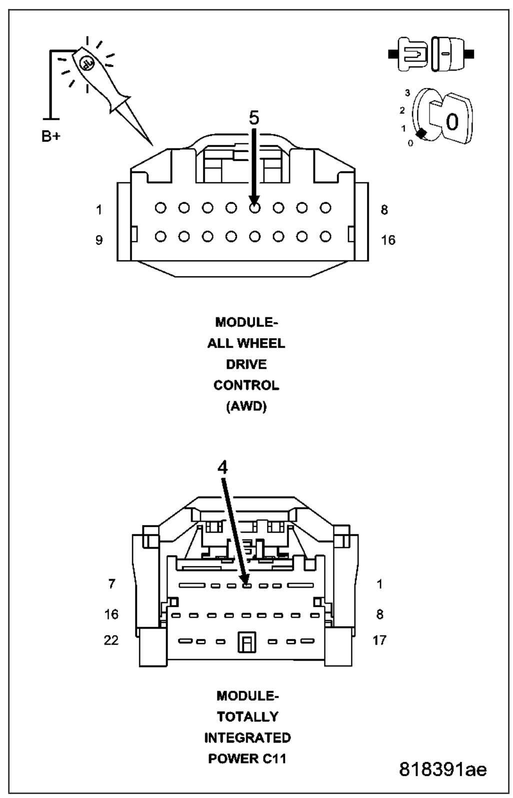
With a 12-volt test light connected to B(+), check the (A923) Fused B(+) circuit in the AWD Control Module harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 6

No >> Repair the (F202) Ignition Switch Output (RUN/START) circuit for an open circuit or high resistance.



Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

6. (F202) IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR HIGH RESISTANCE

Disconnect the TIPM C11 harness connector.

Connect a jumper wire between the (F202) Ignition Switch Output (RUN/START) circuit and ground in the TIPM C11 harness connector.

With a 12-volt test light connected to B(+), check the (F202) Ignition Switch Output (RUN/START) circuit in the AWD Control Module harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

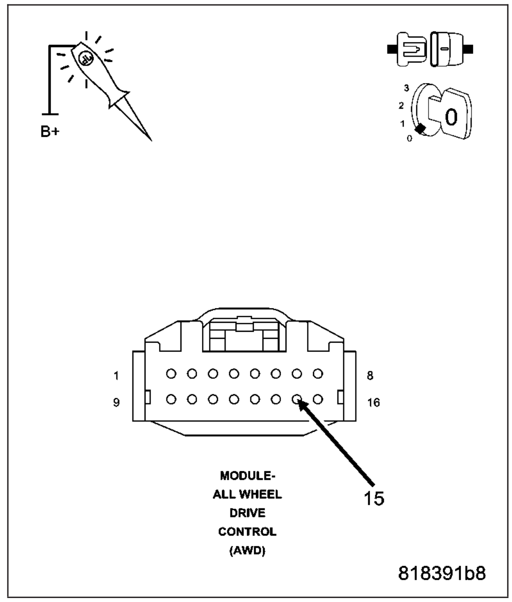
Yes >> Go to 7

No >> Repair the (F202) Ignition Switch Output (RUN/START) circuit for an open circuit or high resistance.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

7. (Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

With a 12–volt test light connected to B(+), check the (Z967) ground circuit in the AWD Control Module harness connector.



NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 8

No >> Repair the (Z967) Ground circuit for an open circuit or high resistance.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

8. AWD CONTROL MODULE

NOTE: Before continuing, check the AWD Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Repair

Replace the AWD Control Module in accordance with the Service information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

9. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Repair

Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

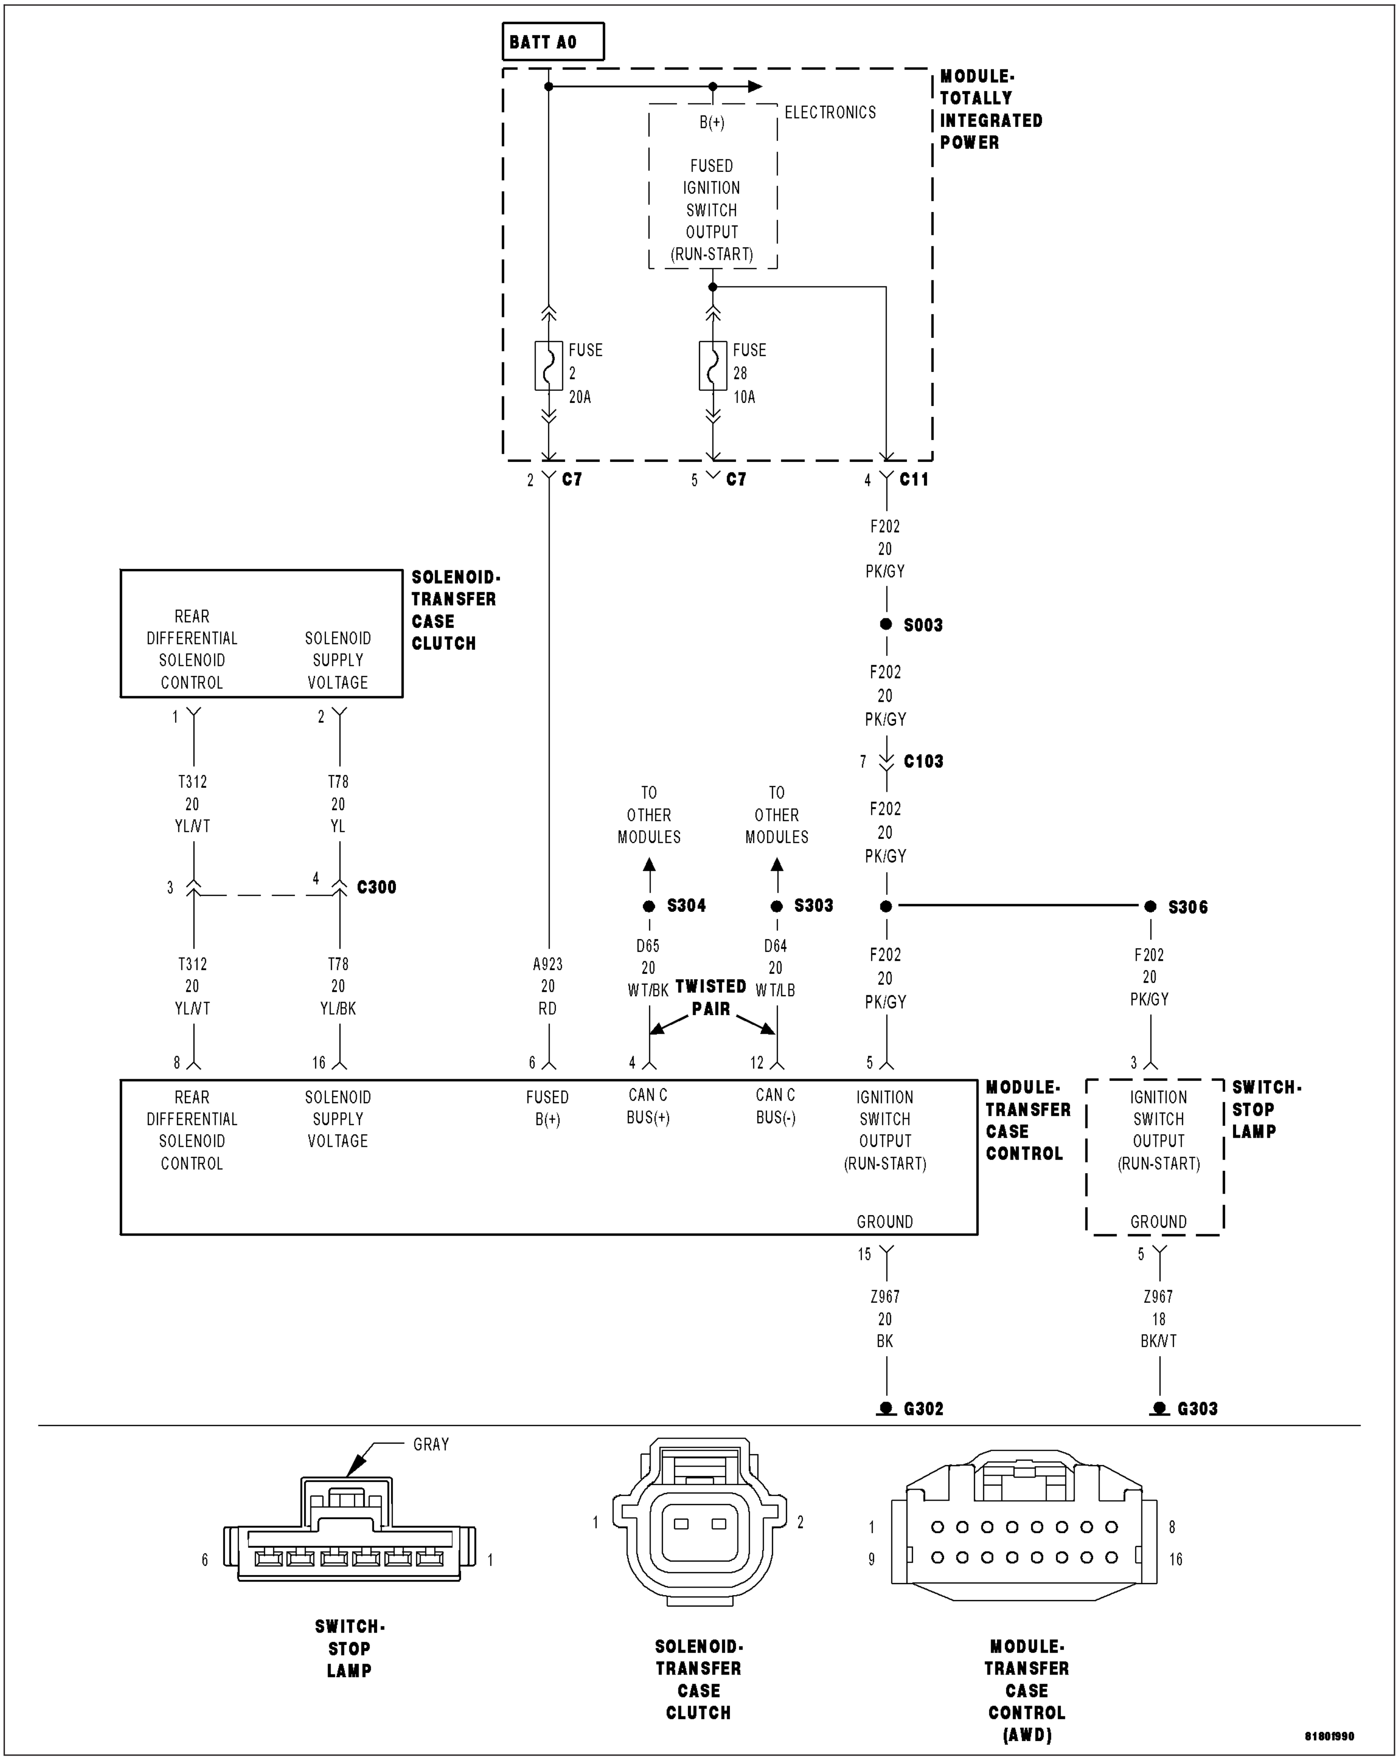
10. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.



Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C2101–BATTERY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The All Wheel Drive Control Module detects that system voltage is above 16.0 volts for 10 seconds with engine RPM greater than 350.

Possible Causes
CHARGING SYSTEM DTCS PRESENT
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ALL WHEEL DRIVE (AWD) CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHARGING SYSTEM DTCS PRESENT

Ignition on, engine not running.

With the scan tool, select View DTCs in the Powertrain Control Module.

Are there any Charging System or related voltage DTCs present?

Yes >> Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No >> Go to 2

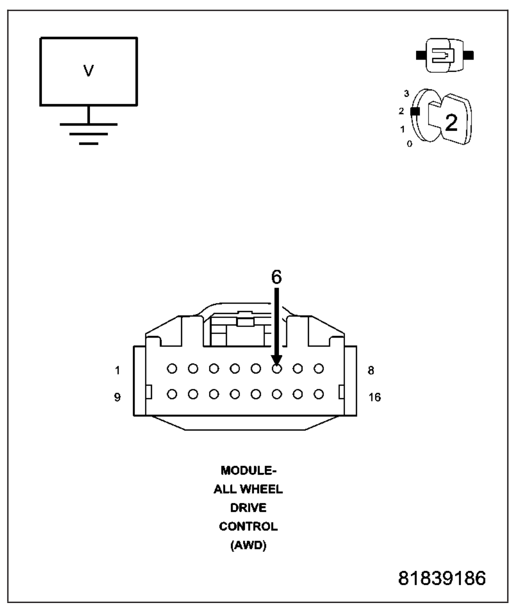
2. CHECK FOR ACTIVE DTC

With the scan tool, select View DTCs.

Is the DTC active at this time?

Yes >> Go to 3

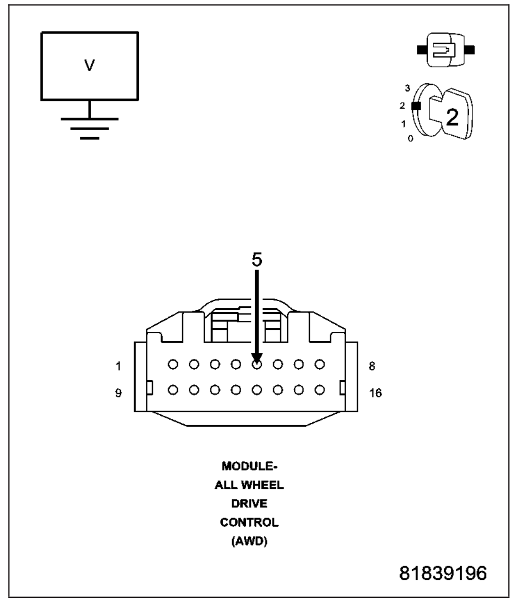
No >> Go to 7



3. CHECK THE TIPM FUSED B(+) VOLTAGE

While back probing, measure the voltage of the (A923) Fused B(+) circuit in the TIPM C7 harness connector.

Is the voltage below 16 volts?



Yes >> Go to 4

No >> Go to 6

4. CHECK THE TIPM IGNITION SWITCH OUTPUT RUN/START VOLTAGE

While back probing, measure the voltage of the (F202) Ignition Switch Output Run/Start circuit in the TIPM C11 harness connector.

Is the voltage below 16 volts?

Yes >> Go to 5

No >> Go to 6

5. AWD CONTROL MODULE

NOTE: Before continuing, check the AWD Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Repair

Replace the AWD Control Module in accordance with the Service information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

6. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Repair

Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

7. INTERMITTENT WIRING AND CONNECTORS

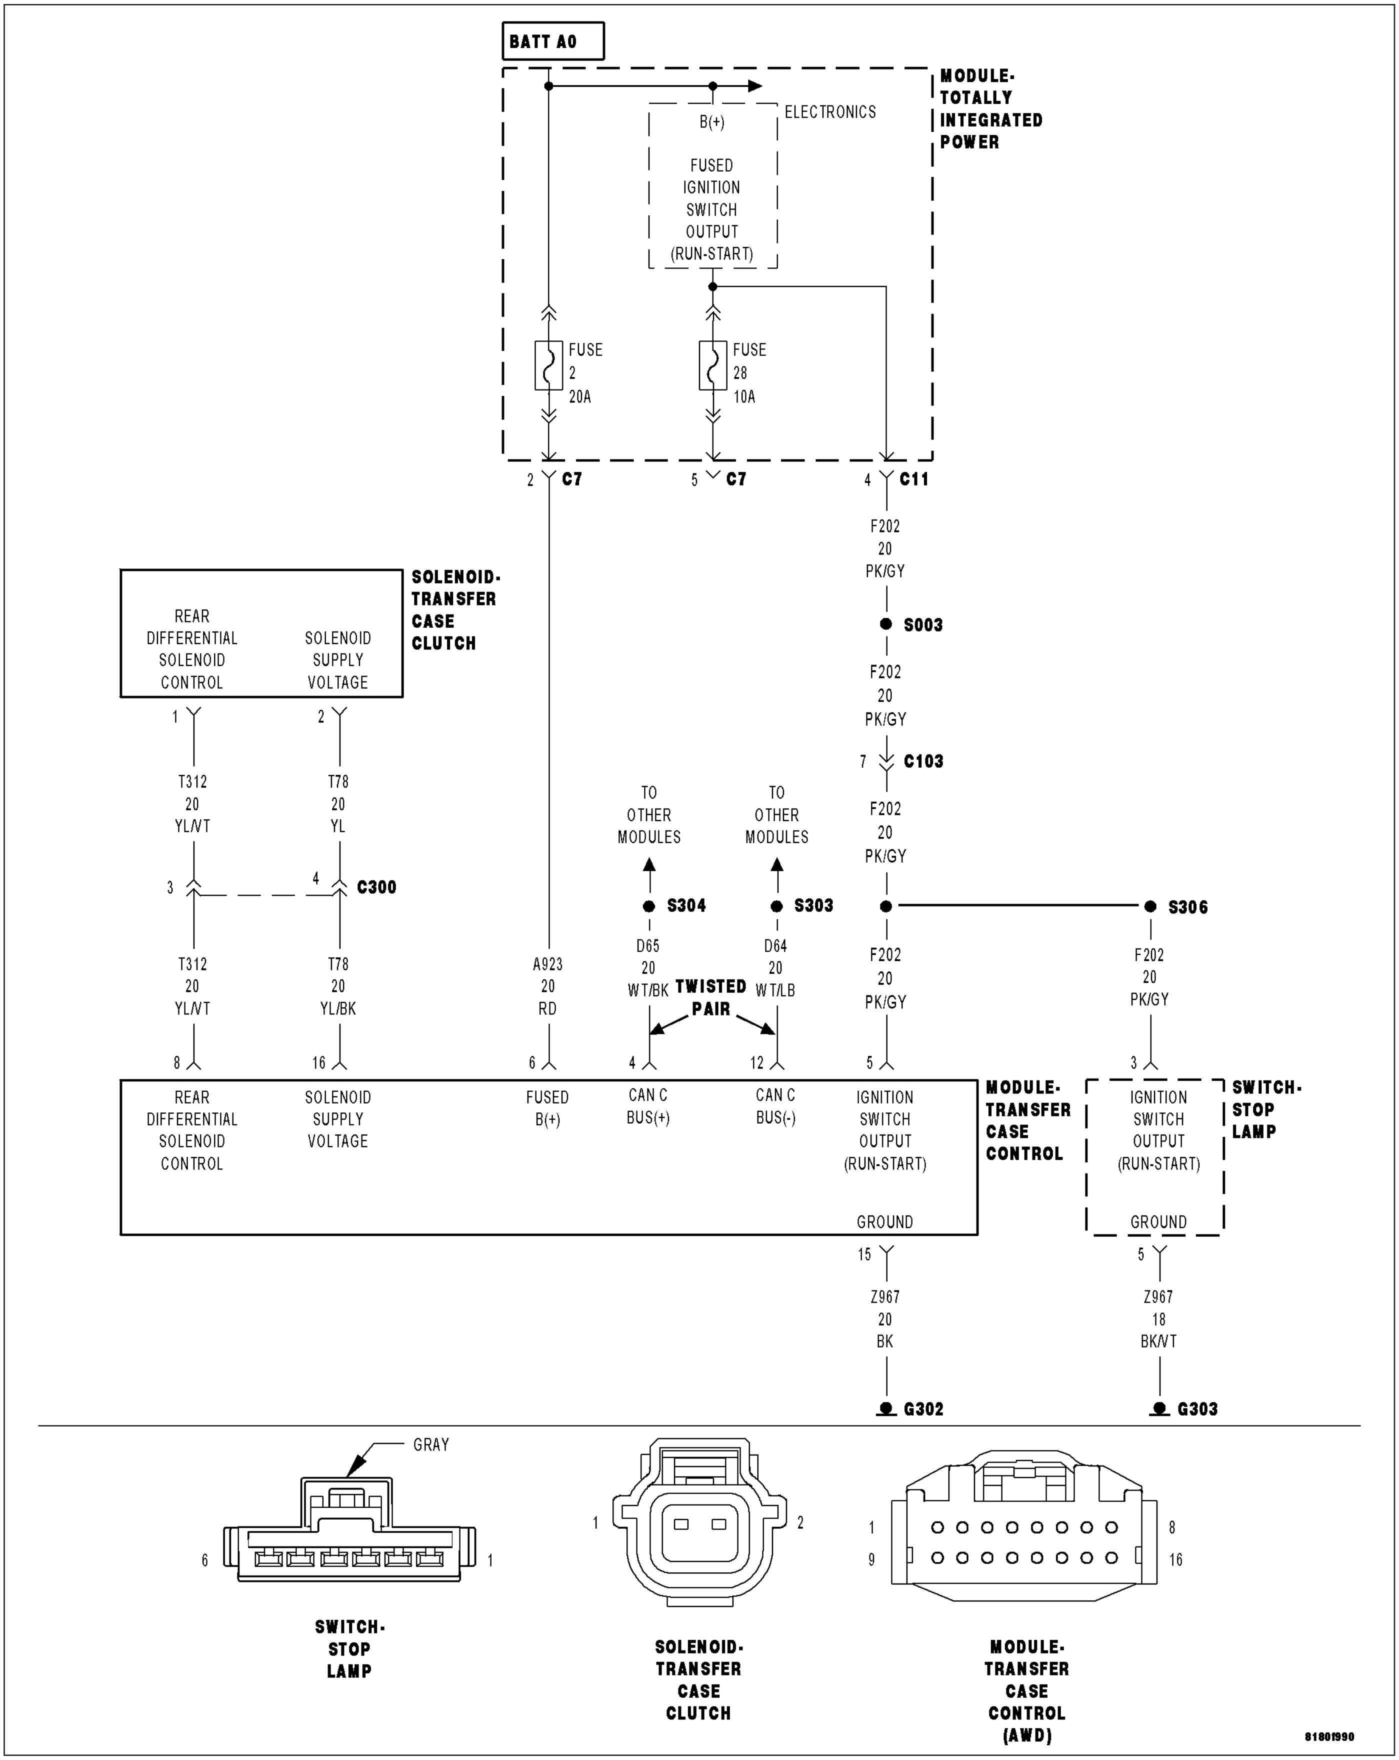
The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?



Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C211C-IGNITION RUN/START INPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The AWD will set this DTC within 20ms if the Ignition Run/Start circuit voltage is less than the expected value.

Possible Causes
(F202) IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ALL WHEEL DRIVE (AWD) CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, read the active DTC.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

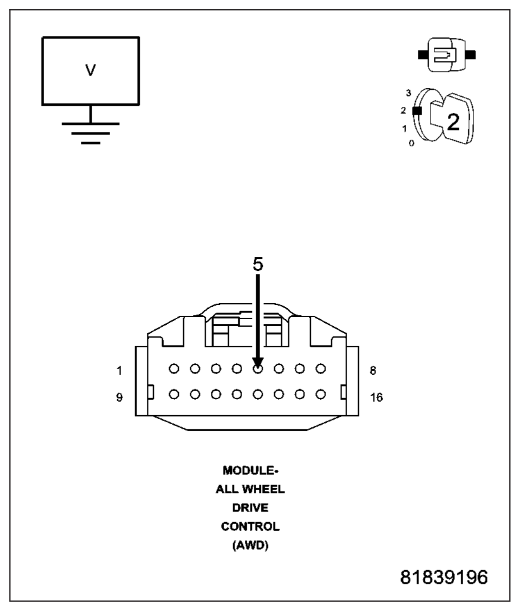
With the scan tool, read the active DTC.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> Go to 7

2. (F202) IGNITION SWITCH OUTPUT (RUN/START)



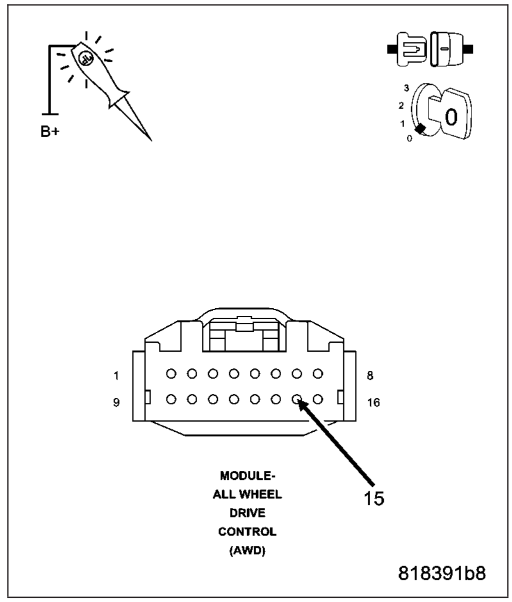
With a 12-volt test light connected to ground, backprobe the (F202) Ignition Switch Output (RUN/START) circuit in the TIPM C11 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 3

No >> Go to 6



3. (Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the AWD Control Module harness connector.

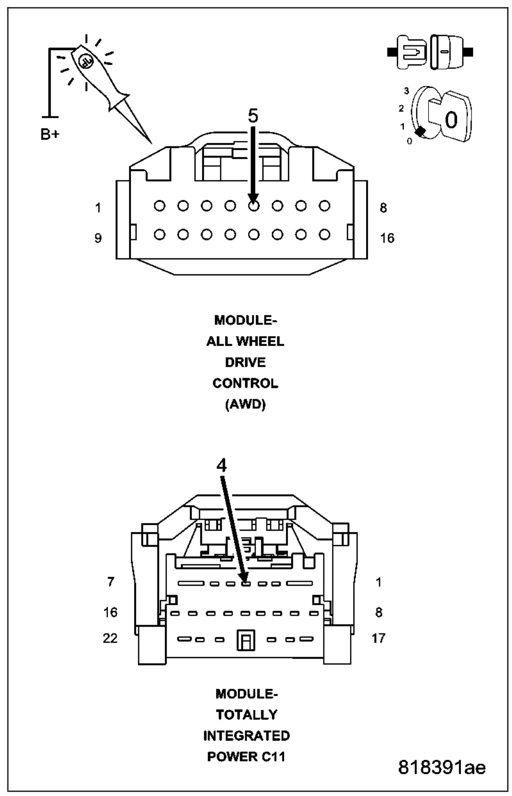
With a 12-volt test light connected to B+, check the (Z967) Ground circuit in the AWD Control Module harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 4

No >> Repair the (Z967) Ground circuit for an open circuit or high resistance.



Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

4. (F202) IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR HIGH RESISTANCE

Disconnect the TIPM C11 harness connector.

Connect a jumper wire between the (F202) Ignition Switch Output (RUN/START) circuit and B(+) in the TIPM C11 harness connector.

With a 12-volt test light connected to ground, check the (F202) Ignition Switch Output (RUN/START) circuit in the AWD Control Module harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 5

No >> Repair the (F202) Ignition Switch Output (RUN/START) circuit for an open circuit or high resistance.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

5. AWD CONTROL MODULE

View repair.

Repair

Replace the AWD Control Module in accordance with the Service information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

6. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Repair

Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

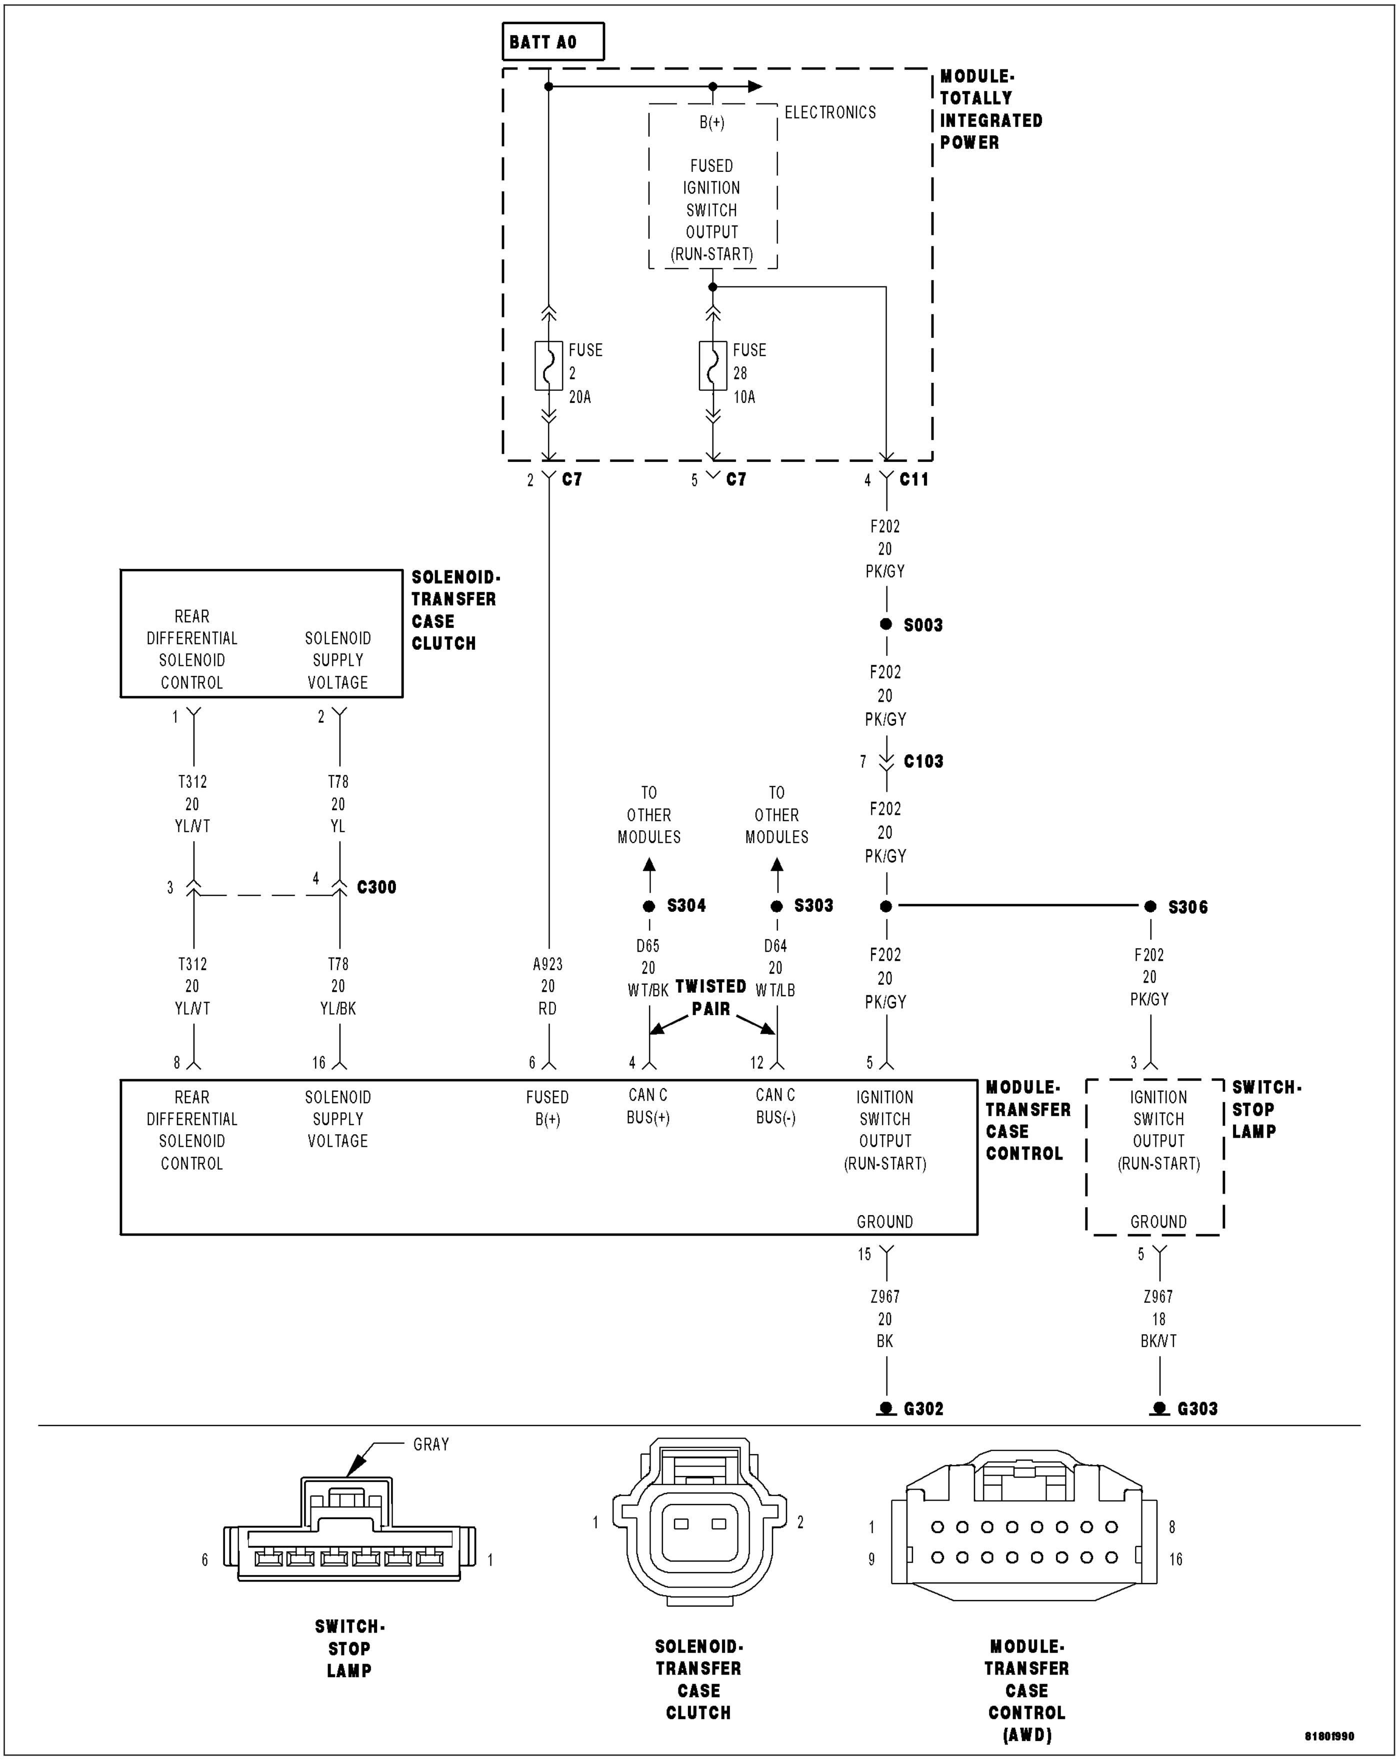
7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.



Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C211D-IGNITION RUN/START INPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition off.
- **Set Condition:**
  The AWD will set this DTC within 20ms if the Ignition Run/Start circuit voltage is above 17 volts or voltage is detected with the ignition in the OFF position for more than 1sec.

Possible Causes
(F202) IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR HIGH RESISTANCE
ALL WHEEL DRIVE (AWD) CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHARGING SYSTEM DTCS PRESENT

Ignition on, engine not running.

With the scan tool, select View DTCs in the Powertrain Control Module.

Are there any Charging System or related voltage DTCs present?

Yes >> Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No >> Go to 2 Diagnostic Test

2. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, read the active DTC.

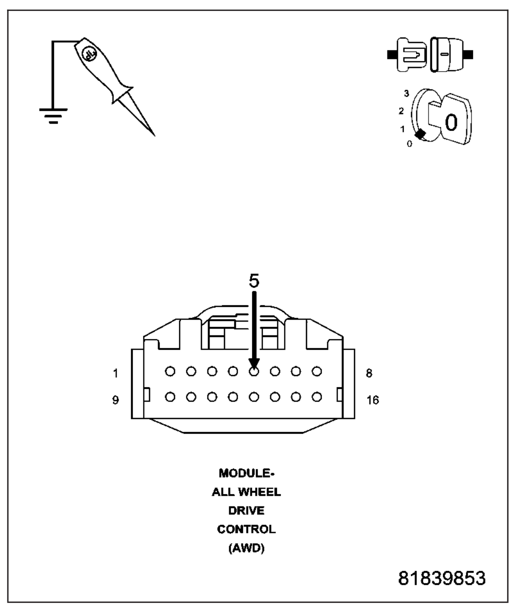
Cycle the ignition switch from the OFF to ON position, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC.

Does the scan tool display this DTC as active?

Yes >> Go To 3

No >> Go to 7



3. (F202) IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C11 harness connector.

Disconnect the AWD Control Module harness connector.

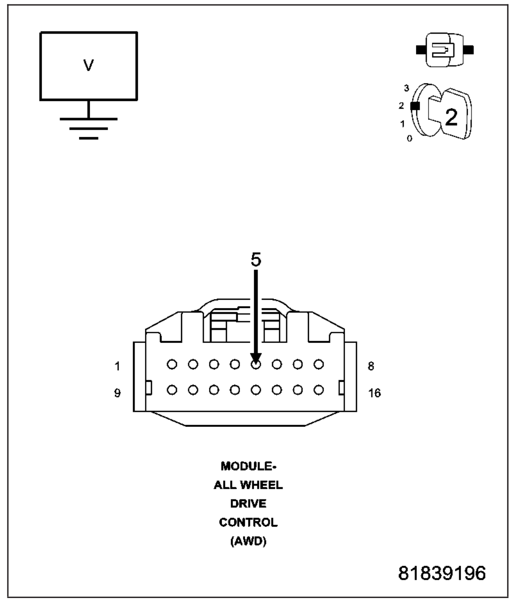
With a 12-volt test light connected to ground, check the (F202) Ignition Switch Output (RUN/START) circuit in the AWD Control Module harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Repair the (F202) Ignition Switch Output (RUN/START) circuit for a short to voltage.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).



No >> Go to 4

4. (F202) IGNITION SWITCH OUTPUT (RUN/START)

Reconnect the AWD Control Module harness connector.

Reconnect the TIPM C11 harness connector.

With a 12-volt test light connected to ground, backprobe the (F202) Ignition Switch Output (RUN/START) circuit in the TIPM C11 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 6

No >> Go to 5

5. AWD CONTROL MODULE

View repair.

Repair

Replace the AWD Control Module in accordance with the Service information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

6. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

View repair.

Repair

Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

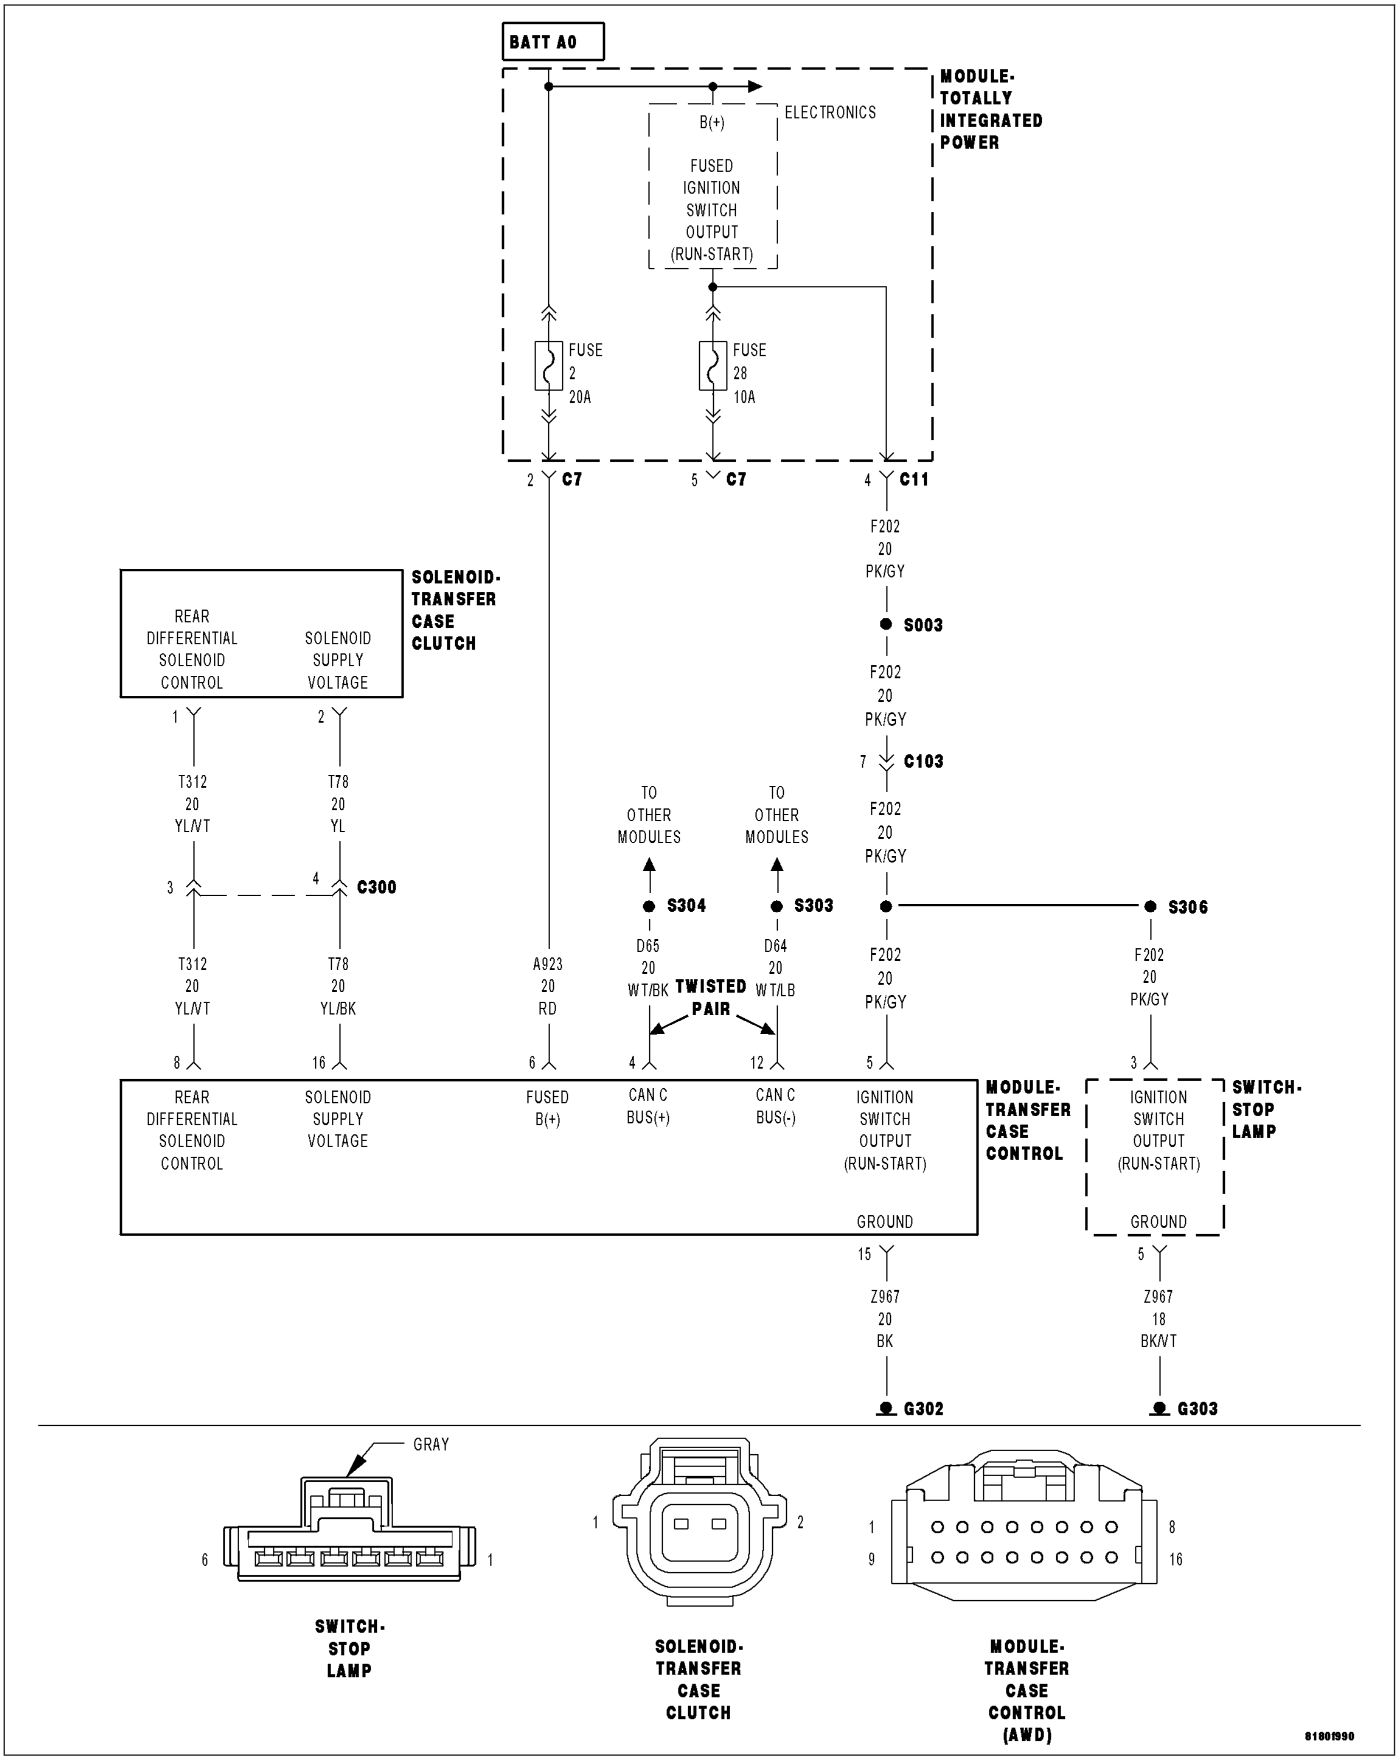
7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.



Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C211E-BATTERY SUPPLY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The All Wheel Drive Control Module detects that system voltage is below 9.0 volts for 60 seconds.

Possible Causes
CHARGING SYSTEM DTCS PRESENT
(A923) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ALL WHEEL DRIVE (AWD) CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHARGING SYSTEM DTCS PRESENT

Ignition on, engine not running.

With the scan tool, select View DTCs in the Powertrain Control Module.

Are there any Charging System or related voltage DTCs present?

Yes >> Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No >> Go to 2

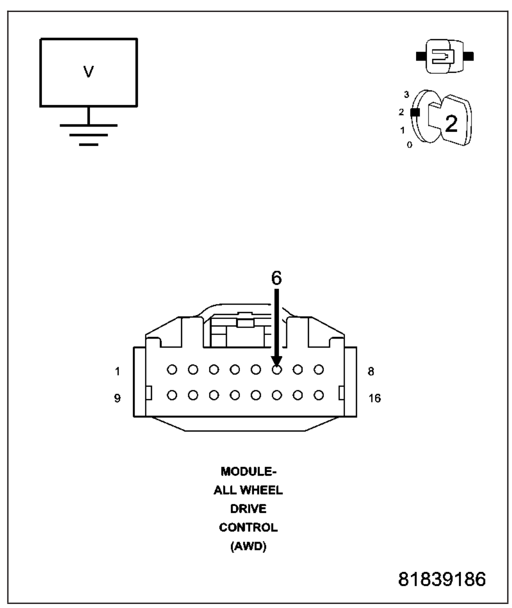
2. CHECK FOR ACTIVE DTC

With the scan tool, read DTCs.

Is the DTC active at this time?

Yes >> Go to 3

No >> Go to 8



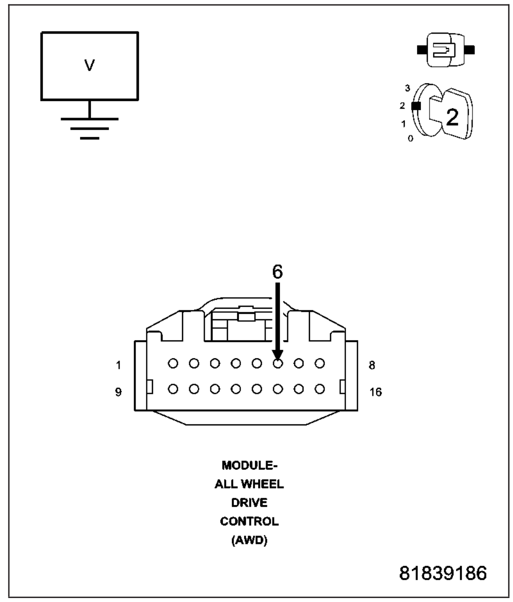
3. CHECK THE TIPM FUSED B+ VOLTAGE

While back probing, measure the voltage of the (A923) Fused B+ circuit in the TIPM C7 harness connector.

Is the voltage below 9 volts?

Yes >> Go to 7

No >> Go to 4



4. (A923) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

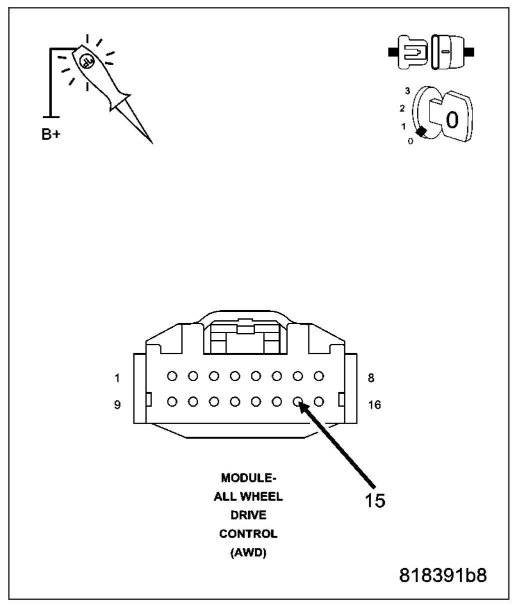
Disconnect the AWD module harness connector.

Ignition on, engine not running.

With a 12-volt test light connected to ground, check the (A923) Fused B(+) circuit in the AWD Control Module harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?



Yes >> Go to 5

No >> Repair the (A923) Fused B+ circuit for an open circuit or high resistance.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

5. (Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12-volt test light connected to B(+), check the (Z967) Ground circuit in the AWD Control Module harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 6

No >> Repair the (Z967) Ground circuit for an open circuit or high resistance.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

6. AWD CONTROL MODULE

View repair.

Repair

Replace the AWD Control Module in accordance with the Service information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

7. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

View repair.

Repair

Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

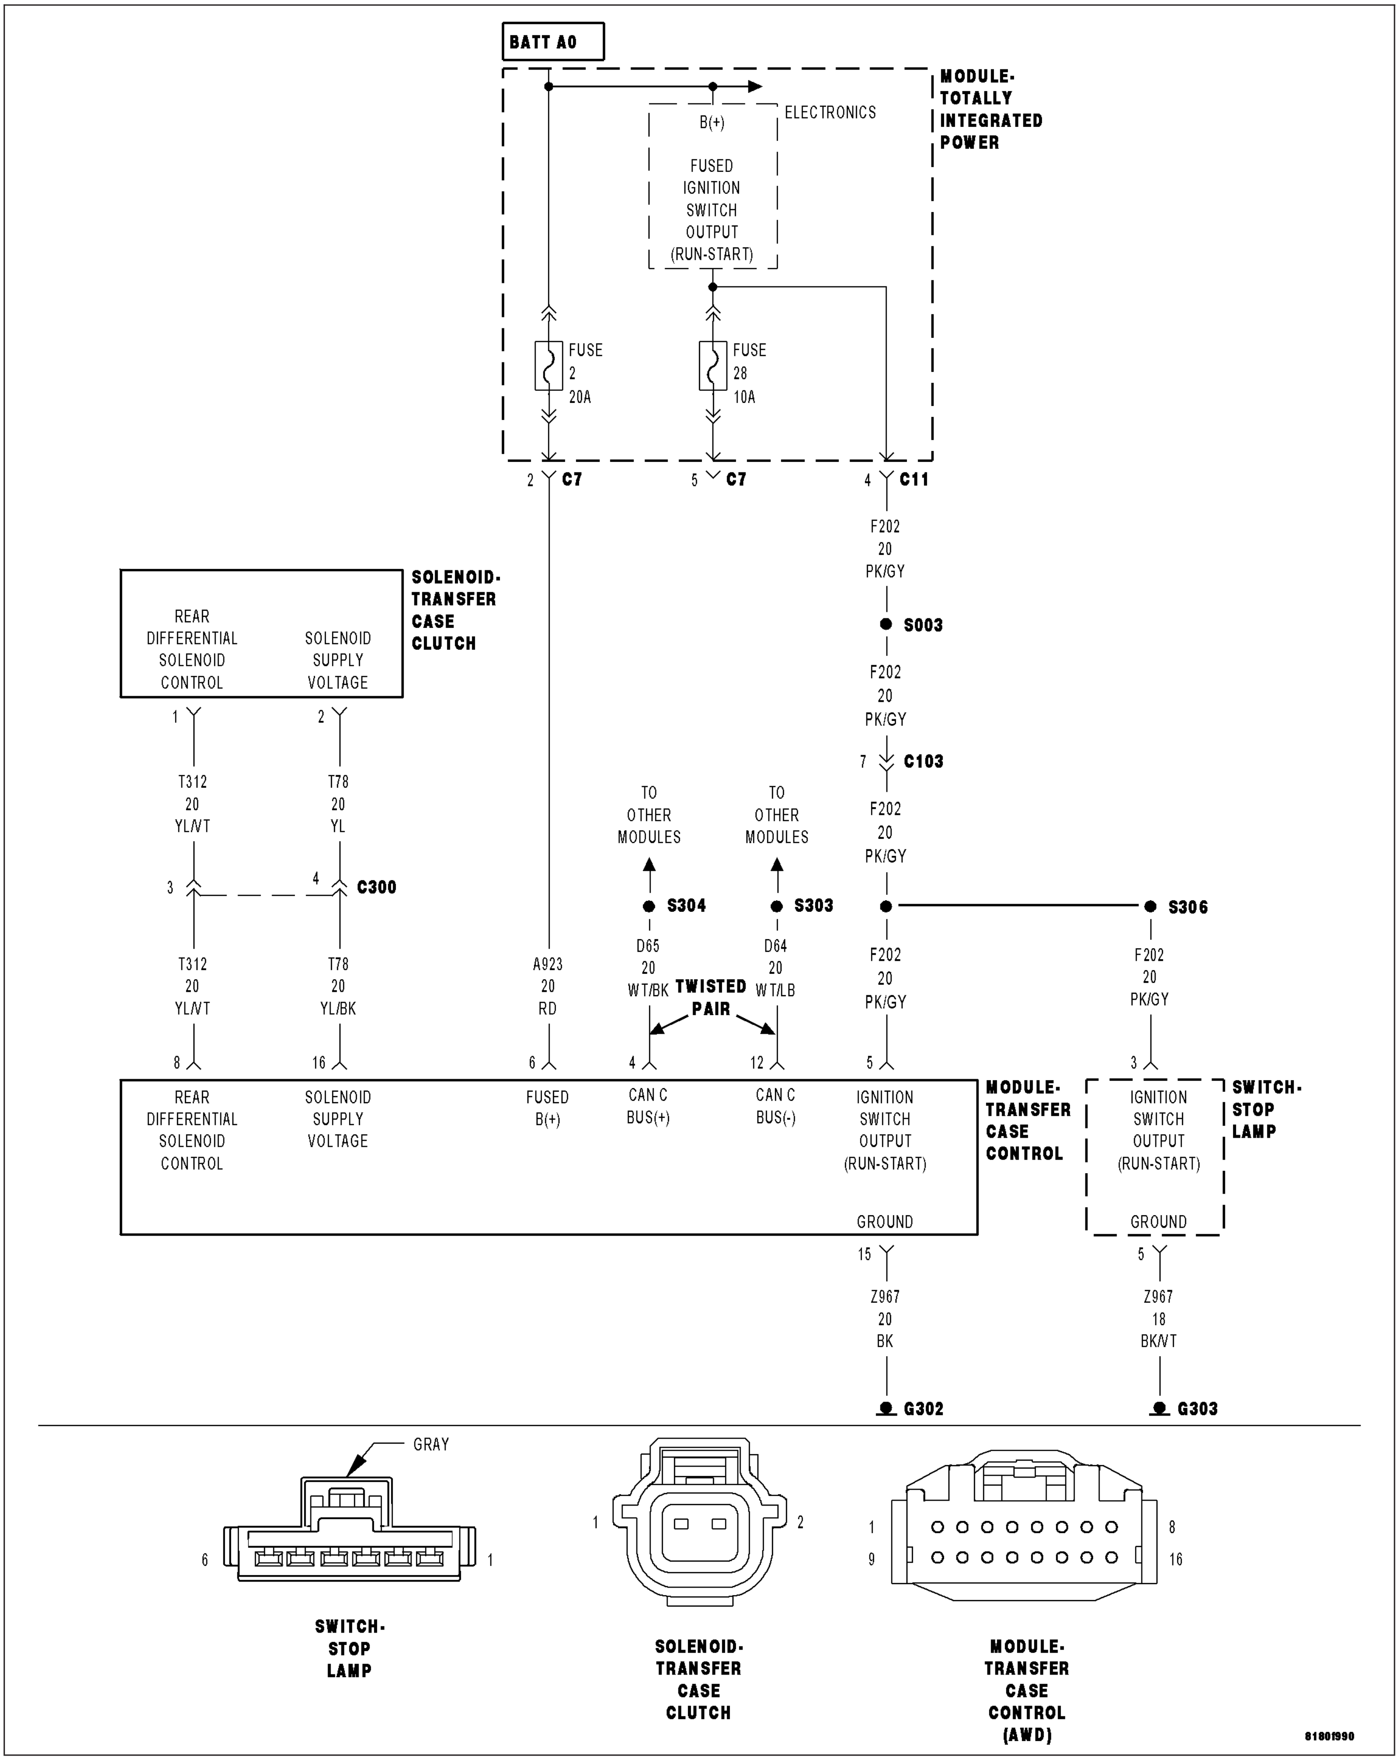
8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.



Were there any problems found?

Yes >> Repair as necessary.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Test Complete.

C211F–BATTERY SUPPLY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The All Wheel Drive Control Module detects that the battery supply voltage is above 16.0 volts for 10 seconds.

Possible Causes
CHARGING SYSTEM DTCS PRESENT
ALL WHEEL DRIVE (AWD) CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. CHARGING SYSTEM DTCS PRESENT

Ignition on, engine not running.

With the scan tool, select View DTCs in the Powertrain Control Module.

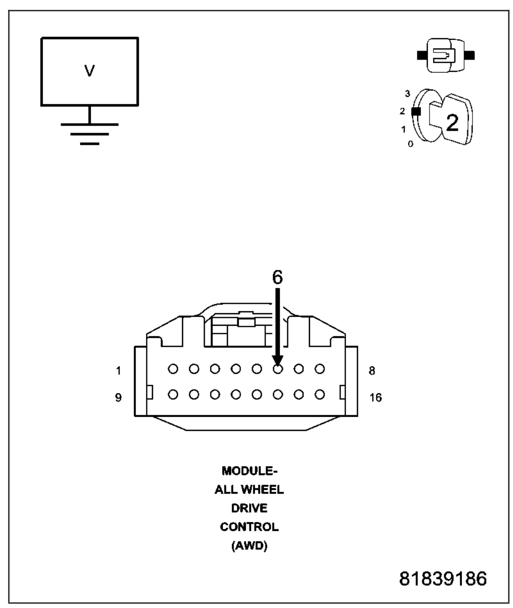
Are there any Charging System or related voltage DTCs present?

Yes >> Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No >> Go to 2

2. CHECK FOR ACTIVE DTC

With the scan tool, select View DTCs.



Is the DTC active at this time?

Yes >> Go to 3

No >> Go to 6

3. CHECK THE TIPM FUSED B+ VOLTAGE

While back probing, measure the voltage of the (A923) Fused B+ circuit in the TIPM C7 harness connector.

Is the voltage below 16 volts?

Yes >> Go to 4

No >> Go to 5

4. AWD CONTROL MODULE

View repair.

Repair

Replace the AWD Control Module in accordance with the Service information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

5. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

View repair.

Repair

Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

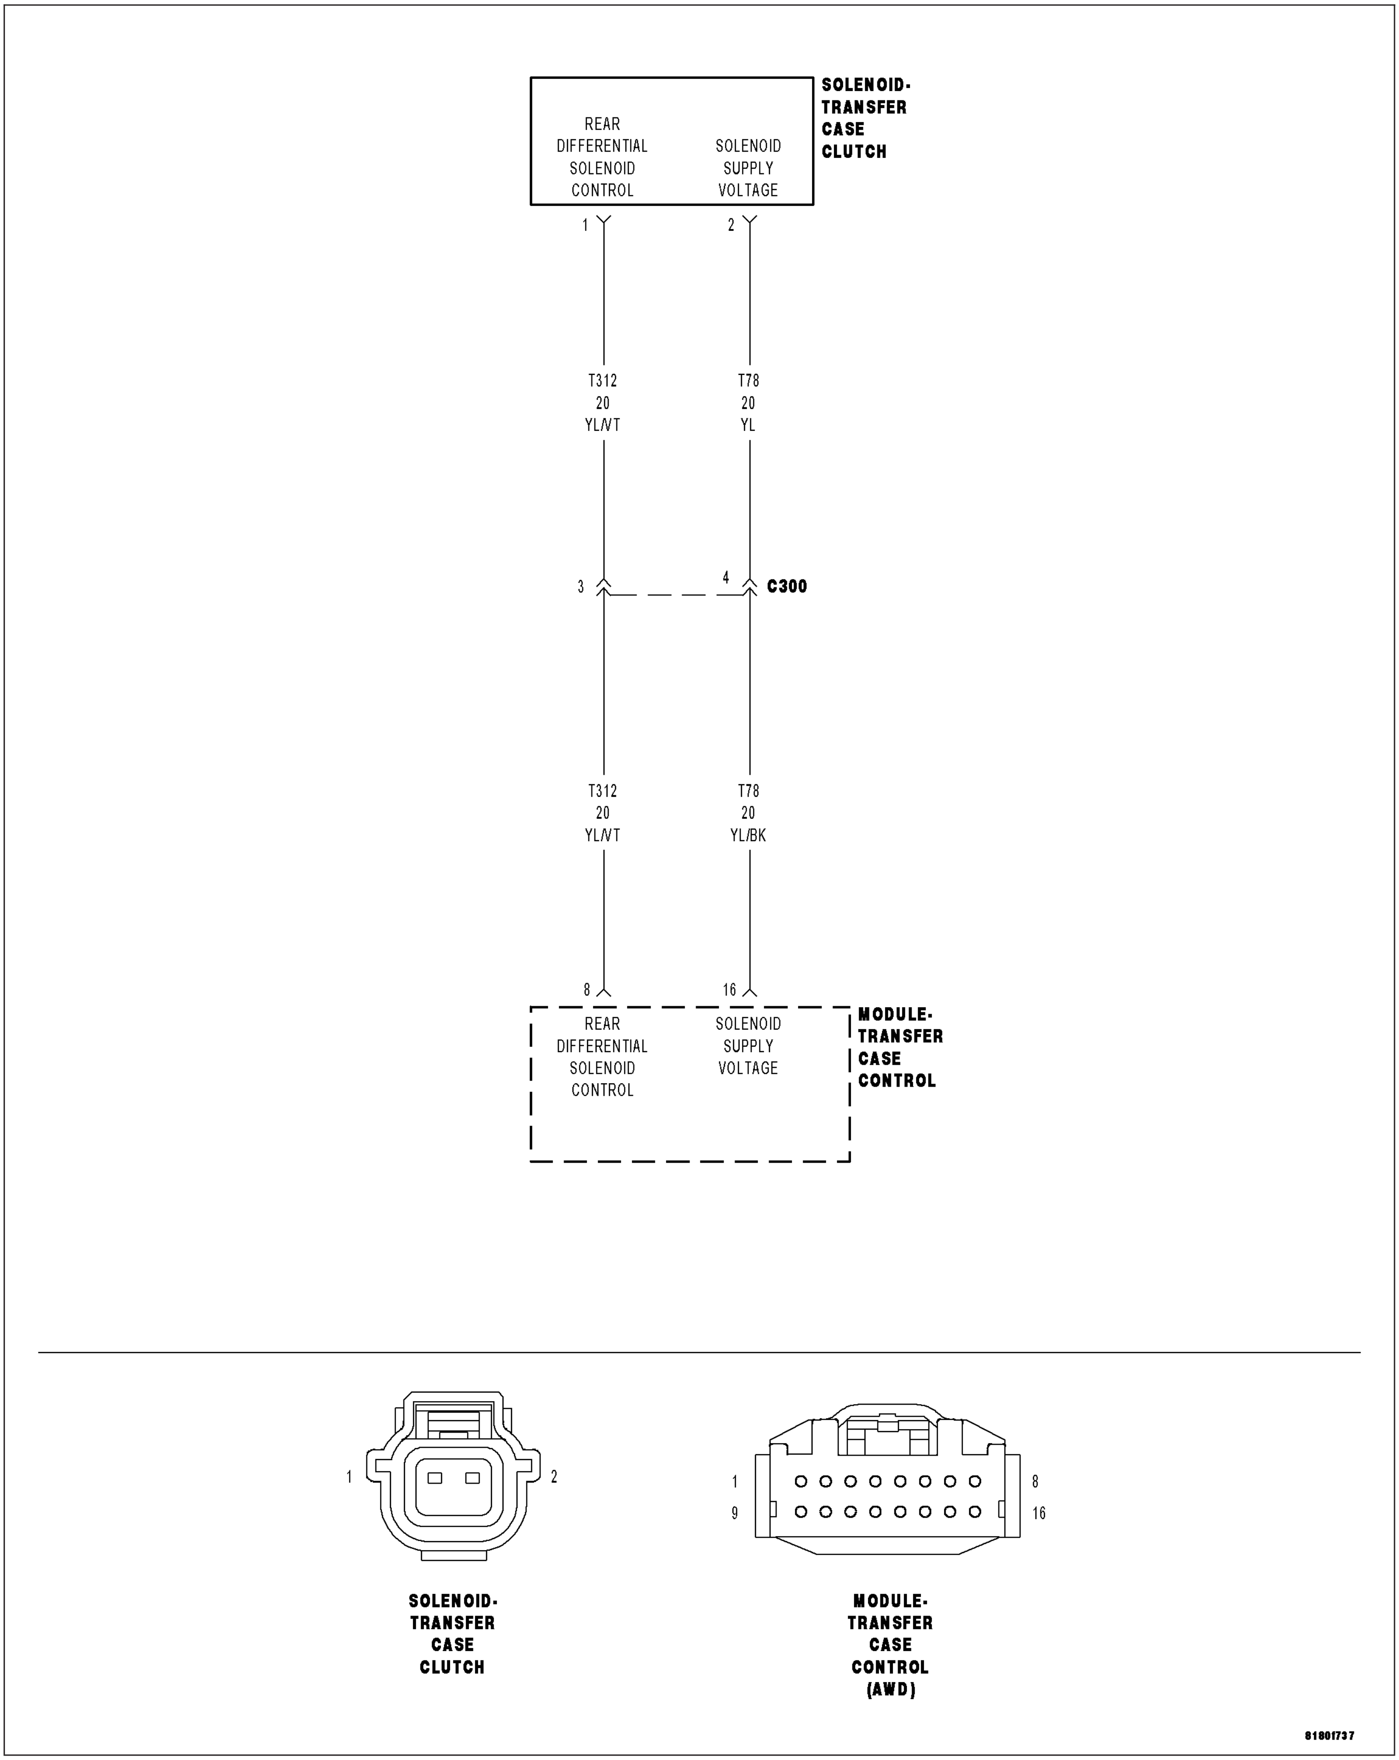
6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.



Were any problems found?

Yes >> Repair as necessary.

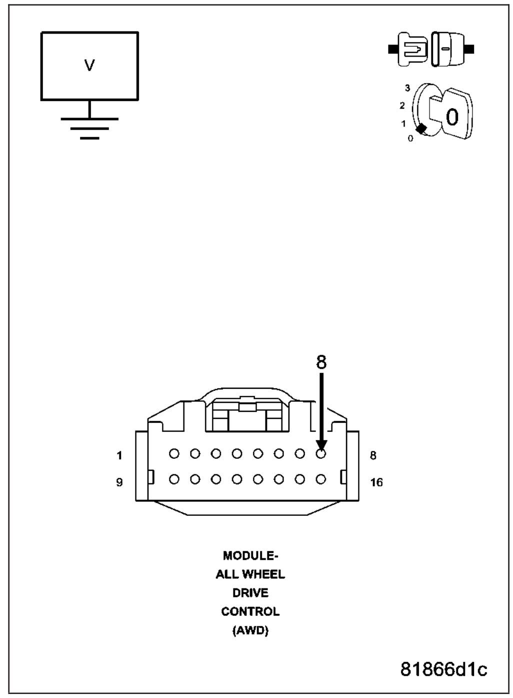
Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

No >> Test complete.

C2208-AWD ECU INTERNAL

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The All Wheel Drive (AWD) Module has detected a failure internal to the controller.



Possible Causes
(T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE
ALL WHEEL DRIVE (AWD) MODULE

1. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the AWD Control Module harness connector.

Measure the voltage of the (T312) Rear Differential Solenoid Control circuit in the AWD Module harness connector.

) Is there any voltage present?

Yes >> Repair the short to voltage in the (T312) Rear Differential Solenoid Control circuit.
Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Go To 2

2. ALL WHEEL DRIVE MODULE

The AWD Module has detected an internal failure.

View repair

Repair

Replace the All Wheel Drive Module in accordance with the Service Information.

Perform the AWD VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE) .

U0001-CAN C BUS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.
- **Set Condition:**
  The PCM loses communication over the CAN C Bus circuit. The circuit is continuously monitored. One Trip fault.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
ALL WHEEL DRIVE (AWD) CONTROL MODULE
POWERTRAIN CONTROL MODULE (PCM)
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

With a scan tool, read TIPM DTCs.

Is the DTC active at this time?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

U0100-LOST COMMUNICATION WITH ECM/PCM (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - TIPM is configured correctly
- **Set Condition:**
  Bus messages not received from the ECM/PCM for approximately 2 to 5 seconds.

Possible Causes
CAN C+ OR CAN C– BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ECM/PCM POWER AND GROUND
ECM/PCM
TIPM
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN C+ or C– hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS

Ignition on, engine not running.
With the scan tool, select Network Diagnostics.
Verify that the PCM is active on the bus.

Is the PCM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the PCM?

Yes >> Replace the PCM in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

No >> Replace the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

U0121-LOST COMMUNICATION WITH ABS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Every 7 msec. Conditions: 1) Engine speed greater than 500 RPM. 2) Battery voltage greater than 10v but less than 16v.
- **Set Condition:**
  CAN C bus messages not received for 10 seconds.

Theory of Operation

The ABS communicates with other controllers over the CAN C bus. The AWD Module continuously monitors the bus activity and receives the messages it needs. The CAN C bus is also used to communicate AWD Control Module MIL status to the Engine Controller, therefor if the Engine Controller is unable to communicate with the AWD Control Module, the Engine Controller will light the MIL.

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

U0141 LOST COMMUNICATION WITH FCM (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Every 7 msec. Conditions: 1) Engine speed greater than 500 RPM. 2) Battery voltage greater than 10v but less than 16v.
- **Set Condition:**
  CAN C bus messages not received for 10 seconds.

Theory of Operation

Some NGC controllers communicate with other controllers over the CAN C bus. The AWD Control Module continuously monitors the bus activity and receives the messages it needs. The CAN C bus is also used to communicate PCM MIL status to the Engine Controller, therefor if the Engine Controller is unable to communicate with the AWD Control Module, the Engine Controller will light the MIL.

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.
- **Set Condition:**
  When the AWD Control Module detects an incorrect CAN message from the Power Control Module (PCM).

Possible Causes
TIPM NOT CONFIGURED CORRECTLY
ABM CAN BUS DTCS
ENGINE DTCS
ALL WHEEL DRIVE (AWD) CONTROL MODULE

Diagnostic Test

1. CHECK FOR DTC U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC’s.

Cycle the ignition switch from off to on.

With the scan tool, read DTC’s.

Does the scan tool display: U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE). Diagnostic Test

2. CHECK IF TIPM CAN BUS DTC’S ARE PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTC’s present?

Yes >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK IF ENGINE DTC’S ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTC’s present?

Yes >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

No >> Using the schematics as a guide, check the AWD Control Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the AWD Control Module per the Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

U0415-IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The messages sent on the CAN bus are distinguished by an identifier (ID). Each CAN ID is defined to contain a certain number of bytes. The Transmission Control Module (TCM) verifies that it has received the proper number of bytes for each ID.

- **When Monitored:**
  Continuously with the ignition on, one valid CAN ID received at least once, and no U0002-CAN Bus Off Performance DTC present.
- **Set Condition:**
  When the TCM detects an incorrect CAN ID from the ABS control module.

Possible Causes
TIPM CAN BUS DTC'S PRESENT
ABS DTC'S PRESENT
ALL WHEEL DRIVE (AWD) CONTROL MODULE

Diagnostic Test

1. CHECK FOR TIPM CAN BUS DTCS

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTC's present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

No >> Go To 2

2. CHECK IF ABS DTC'S ARE PRESENT

With the scan tool, read ABS DTCs.

Are there any ABS DTC's present?

Yes >> (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

No >> Using the schematics as a guide, check the AWD Control Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - REMOVAL)

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The messages sent on the CAN bus are distinguished by an identifier (ID). Each CAN ID is defined to contain a certain number of bytes. The All Wheel Drive (AWD) Control Module verifies that it has received the proper number of bytes for each ID.

- **When Monitored:**
  Continuously with the ignition on, one valid CAN ID received at least once, and no U0002-CAN Bus Off Performance DTC present.
- **Set Condition:**
  When the AWD Control Module detects an incorrect CAN ID from the CLUSTER/CCN.

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM) NOT CONFIGURED CORRECTLY
CAN BUS DTC'S PRESENT
CLUSTER/CCN MODULE DTC'S PRESENT
ALL WHEEL DRIVE (AWD) CONTROL MODULE

Diagnostic Test

1. CHECK FOR TIPM CAN BUS DTCS

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

No >> Go To 2

2. CHECK IF CLUSTER/CCN DTCS ARE PRESENT

With the scan tool, read CLUSTER/CCN DTCs.

Are there any CLUSTER/CCN DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING) category and perform the appropriate symptom.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

No >> Using the schematics as a guide, check the AWD Control Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the AWD Control Module per the Service Information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

U1120-LOST WHEEL SPEED MESSAGES

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The AWD doesn't receive a vehicle speed signal from the Anti-lock brake Module over the CAN C bus.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
ANTI-LOCK BRAKE (ABS) MODULE
ALL WHEEL DRIVE (AWD) CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Theory of Operation

The AWD receives the wheel speed signal over the CAN C bus from the Anti-lock Brake Module.

Diagnostic Test

1. **ACTIVE DTC**

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

2. **U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE ALSO SET**

With a scan tool, select View DTCs.

Is the DTC U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE also set?

Yes >> Perform the diagnostic procedure for U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Replace the AWD Control Module in accordance with the Service information.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE).

U1415-IMPLAUSIBLE/MISSING VEHICLE CONFIGURATION RECEIVED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on.
- **Set Condition:**
  When the All Wheel Drive (AWD) Module detects an incorrect CAN messages from the Engine Control Module (ECM).

Possible Causes
TOTALLY INTEGRATED POWER MODULE (TIPM) NOT CONFIGURED CORRECTLY
TIPM CAN BUS DTCS
ENGINE DTCS
ALL WHEEL DRIVE (AWD) CONTROL MODULE

Diagnostic Test

1. CHECK IF TIPM CAN BUS DTC'S ARE PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTC's present?

Yes >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.

Perform AWD VERIFICATION TEST - VER 1. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Go To 2

2. CHECK IF ENGINE DTC'S ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTC's present?

Yes >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.

Perform AWD VERIFICATION TEST - VER.

No >> Using the schematics as a guide, check the AWD Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the AWD Module per the Service Information.

Perform AWD VERIFICATION TEST - VER. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

STANDARD PROCEDURE

AWD - PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram **Refer to Section 8W**.

Perform the following pre-diagnostic troubleshooting procedures prior to performing any diagnostic test.

Always perform diagnostics with a fully charged battery to avoid false symptoms.

1. With the scan tool, read ABS DTCs. If ABS DTCs are present, (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) and perform to the appropriate diagnostic procedure(s) before proceeding.
2. Check the vehicles repair history.
3. If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.
4. Check for any TSBs related to the customer's complaint.
5. Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.
6. With the scan tool, read All Wheel Drive (AWD) Control Module DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
7. Use the wiring diagram as a guide, inspect the wiring and connectors related to this circuit and repair as necessary.
8. Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, driving under specific conditions, and after controller diagnostic monitors have run or otherwise know as a Good Trip.
9. Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply. Check for controller software update information. Some conditions can be corrected by upgrading the Engine (PCM) controller software.

1.

Did any of the above procedures repair the vehicle?

Yes >> Testing is complete.

Perform AWD Control Module VERIFICATION TEST. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - STANDARD PROCEDURE)

No >> Refer to the identified category and perform the appropriate symptom(s). (Refer to 3 - DIFFERENTIAL & DRIVELINE/ELECTRONICALLY CONTROLLED CLUTCH - DIAGNOSIS AND TESTING)

AWD CONTROL MODULE VERIFICATION TEST

Diagnostic Test

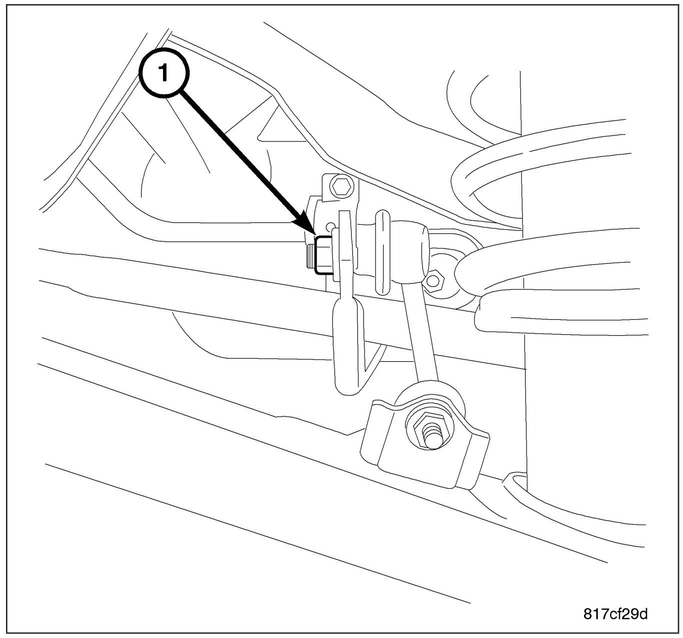
1. AWD CONTROL MODULE VERIFICATION TEST

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
With the scan tool, select Clear Stored DTCs.
Make sure that all accessories are turned off and that the battery is fully charged.
Test drive the vehicle and verify proper operation.
With the scan tool, select View DTCs in the AWD Control Module.

Are there any DTCs present in the AWD Control Module?

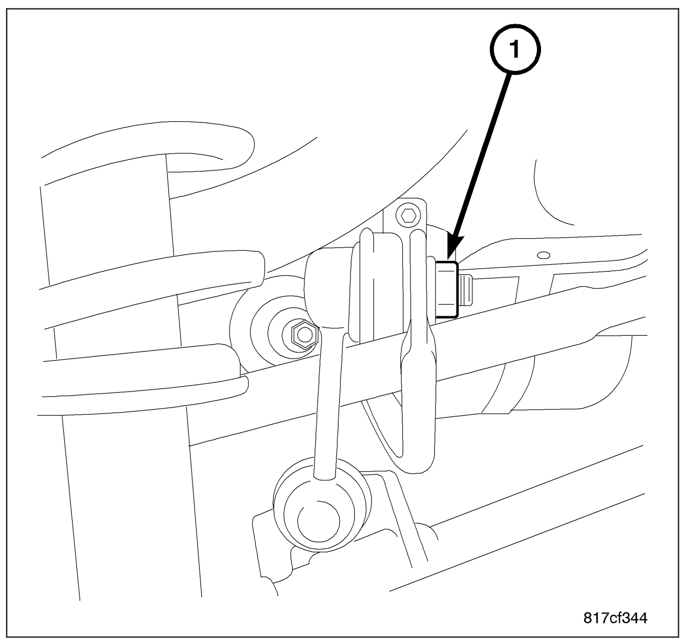
Yes >> Return to the symptom list and perform the appropriate diagnostic test.

No >> Repair is complete.



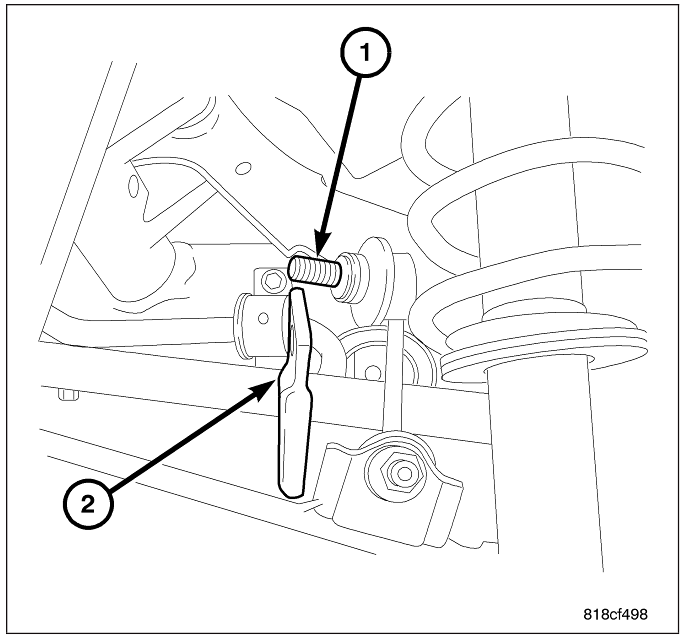
CLUTCH-ELECTRONICALLY CONTROLLED-SERVICE INFORMATION

TABLE OF CONTENTS

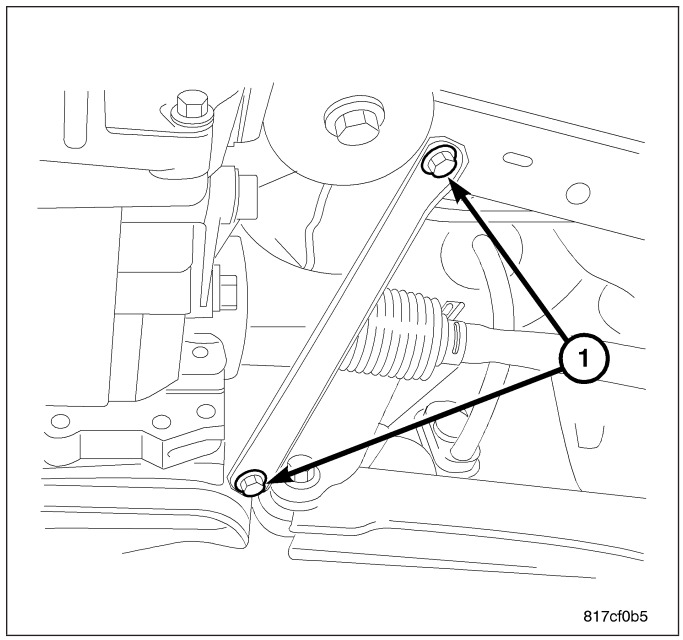


CLUTCH-ELECTRONICALLY CONTROLLED-SERVICE INFORMATION

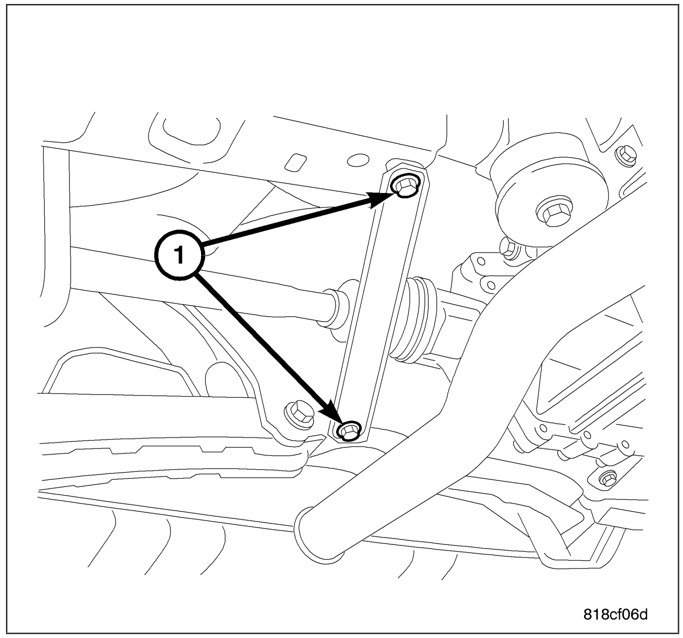
REMOVAL



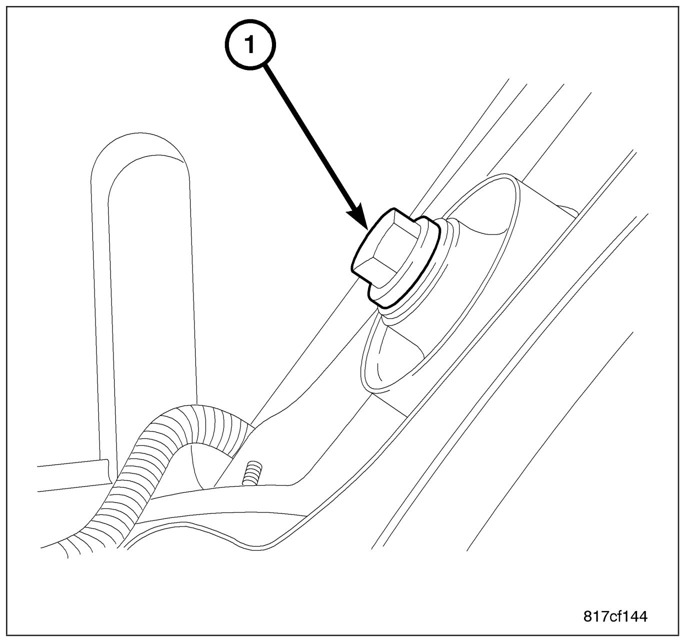
1. Raise vehicle on a hoist.
2. Remove the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL)
3. Remove right side sway bar nut (if equipped).



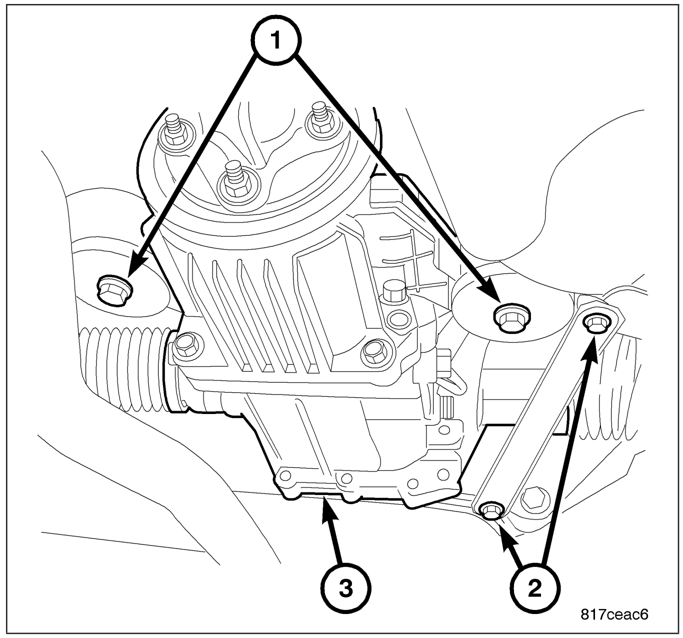
4. Remove left side sway bar nut (if equipped).



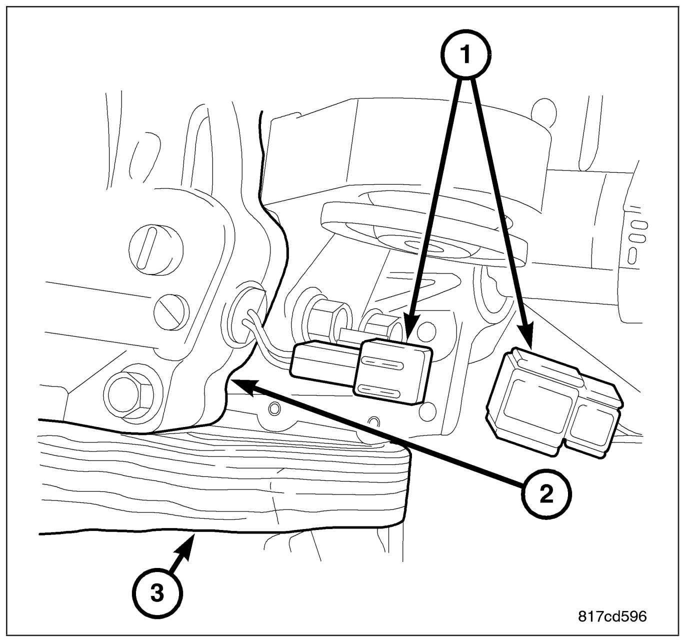
5. Roll sway bar down and out of the way (2) (if equipped).



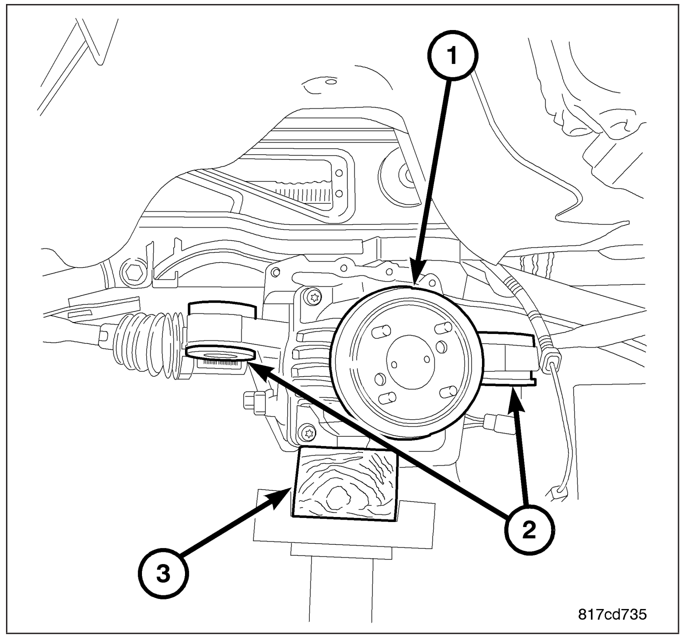
6. Remove the left side stay bracket bolts (1).



7. Remove the right side stay bracket bolts (1).
8. Remove the exhaust system up to the catalytic converter. (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL)
9. Support the rear driveline module with a transmission jack.

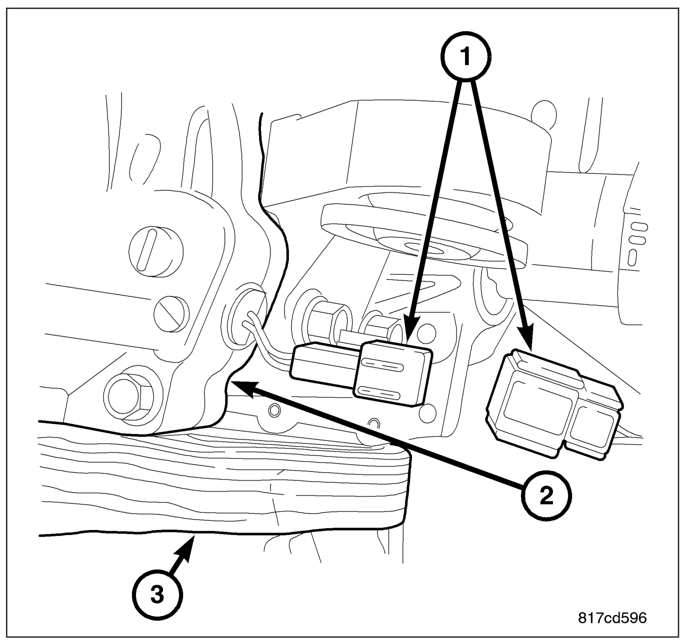


10. Remove the rear bolt (1) at the driveline module.

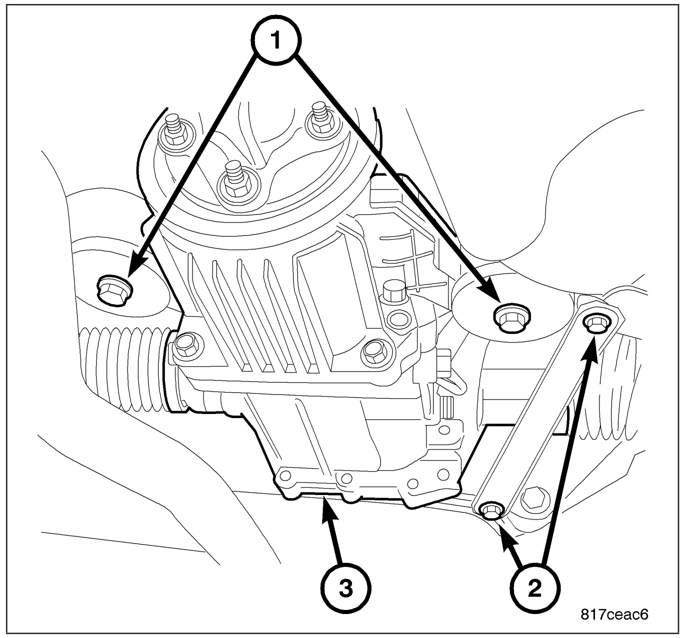


11. Remove the two side bolts (1) at driveline module (3).

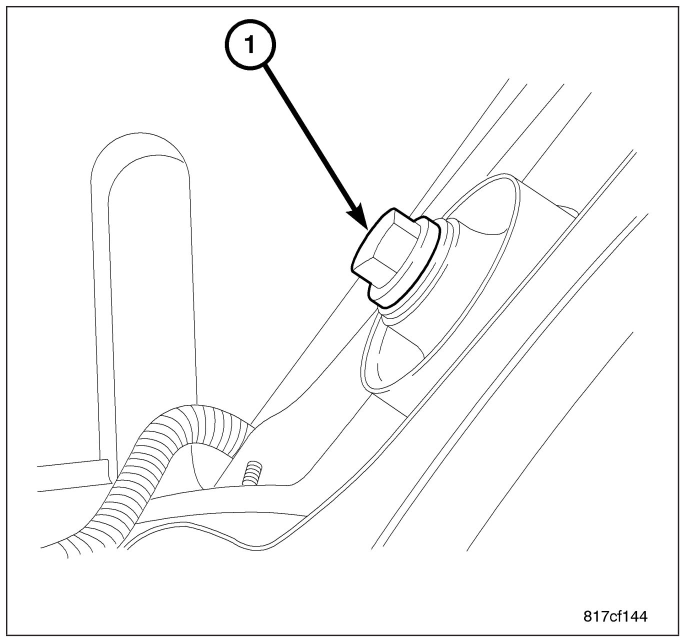
12. Lower driveline module enough gain access to the electrical connector and bracket.
13. Remove the routing bracket bolt.
14. Unplug the electrical connector (1).



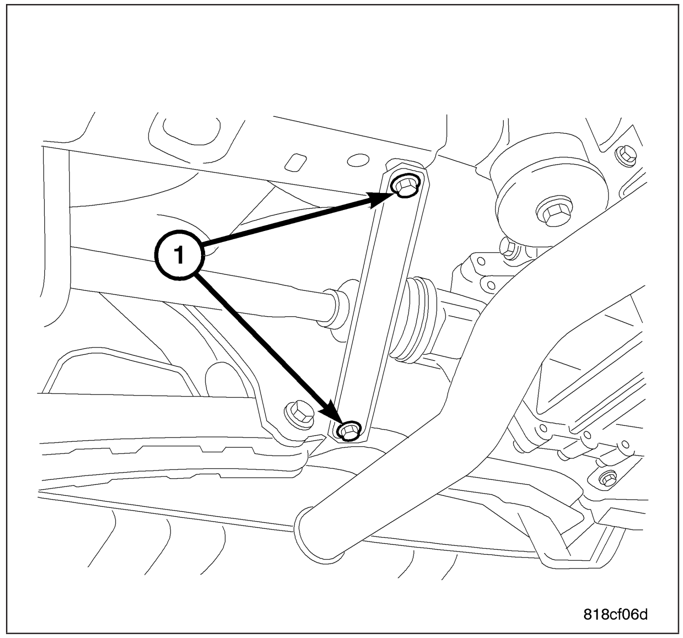
15. Remove the four ECC mounting bolts.
16. Slide ECC from rear axle and lower.



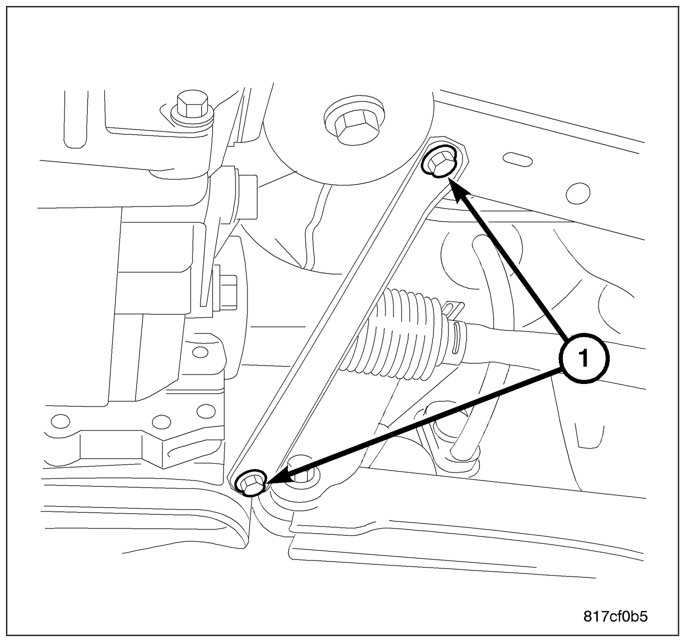
INSTALLATION



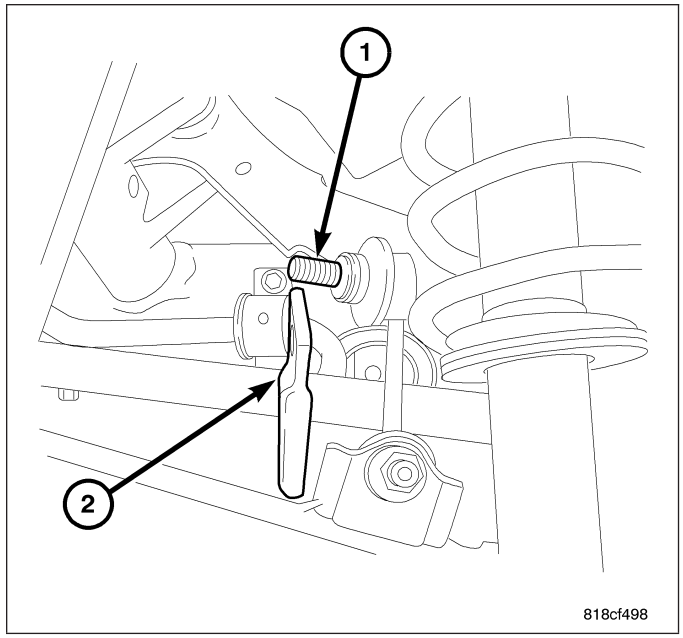
1. Slide ECC into rear axle.
2. Install the four ECC mounting bolts and torque to 68 N·m (50 ft. lbs.).
3. Plug the electrical connector (1) in.
4. Install the routing bracket bolt and torque to 14 N·m (124 in. lbs.).
5. Raise ECC and RDA into place.



6. Install the two side bolts (1) at driveline module (3) and torque to 153 N·m (113 ft. lbs.).



7. Install the rear bolt (1) at the driveline module and torque to 217 N·m (160 ft. lbs.).



8. Remove the transmission jack.
9. Install the right side stay bracket bolts (1) and torque to 48 N·m (35 ft. lbs.).

10. Install the left side stay bracket bolts and torque to 48 N·m (35 ft. lbs.).

11. Roll sway bar (2) up into place and install the nuts (if equipped).
12. Install the rear propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).
13. Install the exhaust system.

VEHICLE QUICK REFERENCE

TABLE OF CONTENTS

FLUID - CAPACITIES & RECOMMENDED

SPECIFICATIONS

FLUIDS, LUBRICANTS AND GENUINE PARTS

ENGINE

Component	**Fluids, Lubricants and Genuine Parts**
Engine Coolant	Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology) or equivalent.
Engine Oil	Use API Certified SAE 5W-20 Engine Oil. Refer to your engine oil filler cap for correct SAE grade meeting DaimlerChrysler Material Standard MS-6395.
Engine Oil Filter	Mopar® 04884900AB or equivalent.
Spark Plugs	Refer to the Vehicle Emission Control Information label in the engine compartment.
Fuel Selection	87 Octane (R + M)/2

CHASSIS

Component	**Fluids, Lubricants and Genuine Parts.**
Automatic Transaxle Fluid	Mopar®CVTF + 4
Manual Transaxle Fluid	Mopar®CVT+4
Rear Drive Assembly (RDA)	Mopar®80W-90 MS9020
Power Transfer Unit (PTU)	Mopar®80W-90 MS9020
Brake Master Cylinder	Mopar® DOT 3, SAE J1703 should be used. If DOT 3, SAE J1703 brake fluid is not available, then DOT 4 is acceptable. Use only recommended brake fluids or equivalent.
Power Steering Reservoir	Mopar® Power Steering Fluid +4 or Mopar® ATF+4 Automatic Transmission Fluid.

CAPACITIES

DESCRIPTION	**U.S.**	**Metric**
Fuel (Approximate)	13.5 Gallons	51.0 Liters
Engine Oil-With Filter		
All Gasoline Engines (Use API Certified SAE 5W-20 Engine Oil.)	4.5 Quarts	4.26 Liters
Cooling System *		
Mopar® Antifreeze/Coolant 5 Year/100,000 Miles Formula), or equivalent.	7.2 Quarts	6.8 Liters
Automatic Transmission Fluid with filter and fluid only	14.8 Pints	7.0 Liters
Automatic Transmission Fluid with transmission overhaul	17.1 Pints	8.1 Liters
Rear Drive Assembly (RDA)	500 ml or fill to bottom of fill plug	16.9 ml or fill to bottom of fill plug
Power Transfer Unit (PTU)	450 ml or fill to bottom of fill plug	15.2 ml or fill to bottom of fill plug
Manual Transaxle Fluid	2.5-2.8 Quarts	2.4-2.7 Liters
* Includes heater and coolant recovery bottle filled to MAX level.		

FUSE LOCATIONS & TYPES

SPECIFICATIONS

INTEGRATED POWER MODULE (IPM)

An Integrated Power Module is located in the engine compartment near the air cleaner assembly. This center contains cartridge fuses and mini fuses. A label that identifies each component may be printed on the inside of the cover.

Cavity	Cartridge Fuse	Mini Fuse	Description
1	40 Amp Green		Power Top Feed
2		20 Amp Yellow	AWD ECU Feed
3		10 Amp Red	CHMSL Brake Switch Feed
4		10 Amp Red	Ignition Switch Feed
5		20 Amp Yellow	Trailer Tow
6		10 Amp Red	IOD Sw/Pwr Mir/Ocm Steering Cntrl Sdar/Hfm
7		30 Amp Green	IOD Sense1
8		30 Amp Green	IOD Sense2
9	40 Amp Green		Power Seats
10		20 Amp Yellow	CCN Power Locks
11		15 Amp Lt Blue	Power Outlet
12		20 Amp Yellow	Ign Run/Acc Inverter
13		20 Amp Yellow	Pwr run/Acc Outlet RR
14		10 Amp Red	IOD CCN/ Interior Lighting
15	40 Amp Green		RAD Fan Relay Battery Feed
16		15 Amp Lt. Blue	IGN Run/Acc Cigar Ltr/Sunroof
17		10 Amp Red	IOD Feed Mod-Wcm
18	40 Amp Green		ASD Relay Contact PWR Feed
19		20 Amp Yellow	PWR Amp 1 & Amp 2 Feed
20		15 Amp Lt. Blue	IOD Feed Radio
21		10 Amp Red	IOD Feed Intrus Mod/Siren
22		10 Amp Red	IGN RUN Hvac/Compass Sensor
23		15 Amp Lt. Blue	ENG ASD Relay Feed 3
24		25 Amp Natural	PWR Sunroof Feed
25		10 Amp Red	Heated Mirror
26		15 Amp Lt. Blue	ENG ASD Relay Feed 2
27		10 Amp Red	IGN RUN Only ORC Feed
28		10 Amp Red	IGN RUN ORC/OCM Feed
29			Hot Car (No Fuse Required)
30		20 Amp Yellow	Heated Seats
31		10 Amp Red	Headlamp Washer Relay Control
32	30 Amp Pink		ENG ASD Control Feed 1
33		10 Amp Red	ABS MOD/J1962 Conn/PCM
34	30 Amp Pink		ABS Valve Feed
35	40 Amp Green		ABS Pump Feed

Cavity	Cartridge Fuse	Mini Fuse	Description
36	30 Amp Pink		Headlamp Washer Control / Smart Glass
37		25 Amp Natural	110 Inverter

CAUTION: When installing the Integrated Power Module cover, it is important to ensure the cover is properly positioned and fully latched. Failure to do so may allow water to get into the Integrated Power Module, and possibly result in an electrical system failure.

CAUTION: When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.

MAINTENANCE SCHEDULES

DESCRIPTION

MAINTENANCE SCHEDULE

There are three maintenance schedules that show **required** service for your vehicle.

First is Schedule **“B”- ALL ENGINES**. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.
- Heavy Loading

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 102,000 miles (170 000 km) or 60 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: Most vehicles are operated under the conditions listed for Schedule ″B″ - ALL ENGINES.

Second is Schedule **“A”**. It is for vehicles that are not operated under any of the conditions listed under Schedule ″B″.

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

Under no circumstances should oil change intervals exceed 6000 miles (10 000 km) or 6 months whichever comes first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add, if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.

- Inspect the brake hoses.
- Inspect the CV joints (if equipped) and front suspension components.
- Check the manual transmission fluid level (if equipped).
- Check the coolant level, hoses, and clamps.

CAUTION: Do not check the automatic transaxle fluid. It must be check by a trained service technician every 15,000 miles and if required only the recommended fluid be added. Refer to the section “Fluids, Lubricants And Genuine Parts” for the proper fluid.

SCHEDULE B

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.
- Heavy Loading

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 102,000 miles (170 000 km) or 60 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

Inspect brake linings.		X		
Replace engine air cleaner filter.				X
Replace make-up air filter.				X
Replace spark plugs.				X
Inspect PCV valve, replace as necessary.**				X

** This maintenance is recommended by the manufacturer to the owner, but not required to maintain the emissions warranty.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

WARNING:
You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

MAINTENANCE SCHEDULES - GASOLINE ENGINES - EXPORT

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **"A"**. It lists all the scheduled maintenance to be performed under "normal" (if none of the conditions in Schedule **"B"** apply to you) operating conditions.

Second is Schedule **"B."** It is a schedule for vehicles that are operated under the conditions listed below.

Follow Schedule **"B"**if you usually operated you vehicle under one or more of the following conditions.

- Day or night temperatures are below 0° C (32° F).

- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32° C (90° F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

NOTE: If ANY of these apply to you then change your engine oil every 5 000 km (3,000 miles) or 3 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 163 000 km (102,000 miles) or 60 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: Most vehicles are operated under the conditions listed for Schedule ″B″.

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect the brake hoses.
- Inspect the CV joints (if equipped) and front suspension components.
- Check the automatic transmission fluid level.
- Check the coolant level, hoses, and clamps.

SCHEDULE A

Kilometers (Miles) [Months]	**12 000 (7,500) [6]**	**24 000 (15,000) [12]**	**36 000 (22,500) [18]**	**48 000 (30,000) [24]**	**60 000 (37,500) [30]**
Change engine oil and engine oil filter.	X	X	X	X	X
Rotate tires.	X	X	X	X	X
Check spare tire for proper pressure and correct stowage.	X	X	X	X	X
Inspect brake linings.			X		

Kilometers **(Miles)** **[Months]**	**12 000** **(7,500)** **[6]**	**24 000** **(15,000)** **[12]**	**36 000** **(22,500)** **[18]**	**48 000** **(30,000)** **[24]**	**60 000** **(37,500)** **[30]**
Replace engine air cleaner filter.				X	
Replace make-up air filter.				X	
Replace spark plugs.				X	

Kilometers **(Miles)** **[Months]**	**72 000** **(45,000)** **[36]**	**84 000** **(52,500)** **[42]**	**96 000** **(60,000)** **[48]**	**108 000** **(67,500)** **[54]**	**120 000** **(75,000)** **[60]**	**132 000** **(82,500)** **[66]**
Change engine oil and engine oil filter.	X	X	X	X	X	X
Rotate tires.	X	X	X	X	X	X
Check spare tire for proper pressure and correct stowage.	X	X	X	X	X	X
Flush and replace engine coolant at 60 months, regardless of mileage.					X	
Inspect brake linings.	X			X		
Replace engine air cleaner filter.			X			
Replace make-up air filter.			X			
Replace spark plugs.			X			
Inspect PCV valve, replace as necessary.			X			
Inspect auto tension drive belt and replace if required.			X			

Kilometers **(Miles)** **[Months]**	**144 000** **(90,000)** **[72]**	**156 000** **(97,500)** **[78]**	**160 000** **(100,000)**	**168 000** **(105,000)** **[84]**	**181 000** **(112,500)** **[90]**	**192 000** **(120,000)** **[96]**
Change engine oil and engine oil filter.	X	X		X	X	X
Rotate tires.	X	X	X	X	X	X
Check spare tire for proper pressure and correct stowage.	X	X		X	X	X
Flush and replace engine coolant, if not done at 60 mos.			X			
Inspect brake linings.	X				X	
Replace engine air cleaner filter.	X					X
Replace make-up air filter.	X					X
Replace spark plugs.	X					X
Inspect PCV valve, replace as necessary.	X					X
Inspect auto tension drive belt and replace if required.	X					

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

SCHEDULE B

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0° C (32° F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32° C (90° F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 102,000 miles (163 000 km) or 60 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

Kilometers (Miles)	**5 000 (3,000)**	**10 000 (6,000)**	**14 000 (9,000)**	**19 000 (12,000)**	**24 000 (15,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Rotate tires.		X		X	
Check spare tire for proper pressure and correct stowage.		X		X	
Inspect engine air cleaner filter, replace if necessary.					X
Inspect and replace make-up air filter, if required.					X

Kilometers (Miles)	**29 000 (18,000)**	**34 000 (21,000)**	**38 000 (24,000)**	**43 000 (27,000)**	**48 000 (30,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Rotate tires.	X		X		X
Check spare tire for proper pressure and correct stowage.	X		X		X
Inspect brake linings.	X				
Replace engine air cleaner filter.					X
Replace make-up air filter.					X
Replace spark plugs.					X
Inspect PCV valve, replace as necessary.					X

Kilometers (Miles)	**53 000 (33,000)**	**58 000 (36,000)**	**62 000 (39, 000)**	**67 000 (42,000)**	**72 000 (45,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Rotate tires.		X		X	

Kilometers (Miles)	**53 000 (33,000)**	**58 000 (36,000)**	**62 000 (39, 000)**	**67 000 (42,000)**	**72 000 (45,000)**
Check spare tire for proper pressure and correct stowage.		X		X	
Inspect brake linings.		X			
Inspect engine air cleaner filter, replace if necessary.					X
Inspect and replace make-up air filter, if required.					X

Kilometers (Miles)	**77 000 (48,000)**	**82 000 (51,000)**	**86 000 (54,000)**	**91 000 (57,000)**	**96 000 (60,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Change Automatic Transaxle (CVT) Fluid and Filter.					X
Rotate tires.	X		X		X
Check spare tire for proper pressure and correct stowage.	X		X		X
Inspect brake linings.			X		
Replace engine air cleaner filter, replace if necessary.					X
Replace make-up air filter.					X
Replace spark plugs.					X
Inspect PCV valve, replace as necessary.					X
Inspect auto tension drive belt and replace if required.					X
Flush and replace engine coolant at 60 months, or 102,000 miles (163, 000 km) whichever comes first.					

Kilometers (Miles)	**101 000 (63,000)**	**106 000 (66,000)**	**110 000 (69,000)**	**115 000 (72,000)**	**120 000 (75,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Rotate tires.		X		X	
Check spare tire for proper pressure and correct stowage.		X		X	
Inspect brake linings.				X	
Inspect engine air cleaner filter, replace if necessary.					X
Inspect and replace make-up air filter, if required.					X
Inspect auto tension drive belt and replace if required.					X

Kilometers (Miles)	**125 000 (78,000)**	**130 000 (81,000)**	**134 000 (84,000)**	**139 000 (87,000)**	**144 000 (90,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X
Change Rear Drive Assembly (RDA) fluid.		X			
Change Power Transfer Unit (PTU)		X			
Rotate tires.	X		X		X

Kilometers **(Miles)**	**125 000** **(78,000)**	**130 000** **(81,000)**	**134 000** **(84,000)**	**139 000** **(87,000)**	**144 000** **(90,000)**
Check spare tire for proper pressure and correct stowage.	X		X		X
Inspect brake linings.					X
Replace engine air cleaner filter.					X
Replace make-up air filter.					X
Replace spark plugs.					X
Inspect PCV valve, replace as necessary.					X
Inspect auto tension drive belt and replace if required.					X

Kilometers **(Miles)**	**149 000** **(93,000)**	**154 000** **(96,000)**	**158 000** **(99,000)**	**160 000** **(100,000)**	**163 000** **(102,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X		X
Rotate tires.		X			X
Check spare tire for proper pressure and correct stowage.		X			X
Flush and replace engine coolant, if not done at 60 months.					X

Kilometers **(Miles)**	**168 000** **(105,000)**	**173 000** **(108,000)**	**178 000** **(111,000)**	**182 000** **(114,000)**	**187 000** **(117,000)**	**192 000** **(120,000)**
Change engine oil and engine oil filter, or at 3 months whichever comes first.	X	X	X	X	X	X
Change Automatic Transaxle (CVT) fluid and filter.						X
Rotate tires.		X		X		X
Check spare tire for proper pressure and correct stowage.		X		X		X
Inspect brake linings.		X				
Replace engine air cleaner filter.	X					X
Inspect and replace make-up air filter, if required.	X					
Replace make-up air filter.						X
Replace spark plugs.						X
Inspect PCV valve, replace as necessary.						X
Inspect auto tension drive belt and replace if required.	X					X

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

WARNING:
You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

REPLACEMENT BULBS

SPECIFICATIONS

REPLACEMENT LIGHT BULBS - INTERIOR

LIGHT BULBS - INTERIOR	BULB NUMBER

Backup Light	W16W (921)
License Light	W5W

TRAILER TOWING

SPECIFICATIONS

TRAILER TOWING

In this section you will find safety tips and information on limits to the type of towing you can reasonably do with your vehicle. Before towing a trailer carefully review this information to tow your load as efficiently and safely as possible.

To maintain warranty coverage, follow the requirements and recommendations in this manual concerning vehicles used for trailer towing.

Common Towing Definitions

The following trailer towing related definitions will assist you in understanding the following information:

Gross Vehicle Weight Rating (GVWR)

The GVWR is the total allowable weight of your vehicle. This includes driver, passengers, cargo and tongue weight. The total load must be limited so that you do not exceed the GVWR.

Gross Trailer Weight (GTW)

The gross trailer weight (GTW) is the weight of the trailer plus the weight of all cargo, consumables and equipment (permanent or temporary) loaded in or on the trailer in its ″loaded and ready for operation″ condition. The recommended way to measure GTW is to put your fully loaded trailer on a vehicle scale. The entire weight of the trailer must be supported by the scale.

Gross Combination Weight Rating (GCWR)

The gross combination weight rating (GCWR) is the total permissible weight of your vehicle and trailer when weighed in combination. (Note that GCWR ratings include a 68 kg (150 lbs) allowance for the presence of a driver).

Gross Axle Weight Rating (GAWR)

The GAWR is the maximum capacity of the front and rear axles. Distribute the load over the front and rear axles evenly. Make sure that you do not exceed either front or rear GAWR.

WARNING:
It is important that you do not exceed the maximum front or rear GAWR. A dangerous driving condition can result if either rating is exceeded. You could lose control of the vehicle and have an accident.

Tongue Weight (TW)

The downward force exerted on the hitch ball by the trailer. In most cases it should not be less than 10% or more than 15% of the trailer load. You must consider this as part of the load on your vehicle.

Frontal Area

The maximum height and maximum width of the front of a trailer.

Trailer Sway Control

The trailer sway control is a telescoping link that can be installed between the hitch receiver and the trailer tongue that typically provides adjustable friction associated with the telescoping motion to dampen any unwanted trailer swaying motions while traveling.

Weight-Carrying Hitch

A weight-carrying hitch supports the trailer tongue weight, just as if it were luggage located at a hitch ball or some other connecting point of the vehicle. These kind of hitches are the most popular on the market today and they're commonly used to tow small- and medium-sized trailers.

Weight-Distributing Hitch

A weight-distributing hitch includes a receiver attached to the tow vehicle, plus a removable hitch head and spring bar assembly that fits into the receiver opening and hook up brackets that connect the spring bars to the trailer frame.

Trailer Hitch Classification

The following chart provides the industry standard for the maximum trailer weight a given trailer hitch class can tow and should be used to assist you in selecting the correct trailer hitch for your intended towing condition. Refer to the Trailer Towing Weights (Maximum Trailer Weight Ratings) chart for the Max. GTW towable for your given drivetrain.

Trailer Hitch Classification	
Class	**Max. GTW (Gross Trailer Wt.)**
Class I - Light Duty	2,000 lbs (907 kg)
Class II - Medium Duty	3,500 lbs (1587 kg)
Class III - Heavy Duty	5,000 lbs (2268 kg)
Class IV - Extra Heavy Duty	10,000 lbs (4540 kg)

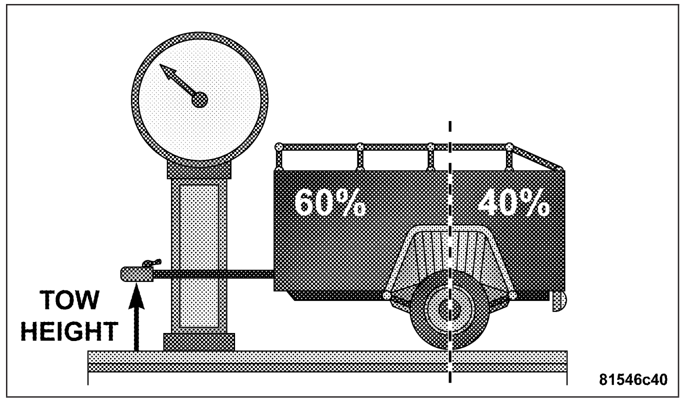
All trailer hitches should be professionally installed on your vehicle.

Trailer Towing Weights (Maximum Trailer Weight Ratings)

The following chart provides the maximum trailer weight ratings towable for your given drivetrain.

Engine/Transmission	Frontal Area	Max. GTW (Gross Trailer Wt.)	Max. Tongue Wt. (See Note 1)
2.0L Auto	22 Sq. Ft. (2.4 sq. m)	1000 lbs (450 kg)	150 lbs (50 kg)
2.4L Auto	22 Sq. Ft. (2.4 sq. m)	1000 lbs (450 kg)	150 lbs (50 kg)
1.8L Manual	22 Sq. Ft. (2.4 sq. m)	1000 lbs (450 kg)	150 lbs (50 kg)
2.4L Auto/Man with Trailer Tow Prep Package (AHC)	32 Sq. Ft. (2.4 sq. m)	2000 lbs (450 kg)	150 lbs (50 kg)
Refer to local laws for maximum trailer towing speeds.			

NOTE: The trailer tongue weight must be considered as part of the combined weight of occupants and cargo, and should never exceed the weight referenced on the Tire and Loading Information placard. Refer to the Tire–Safety Information Section in this manual.



Trailer and Tongue Weight

Always load a trailer with 60% to 65% of the weight in the front of the trailer. This places 10% to 15% of the Gross Trailer Weight (GTW) on the tow hitch of your vehicle. Loads balanced over the wheels or heavier in the rear can cause the trailer to sway **severely** side to side which will cause loss of control of the vehicle and trailer. Failure to load trailers heavier in front is the cause of many trailer accidents.

Never exceed the maximum tongue weight stamped on your bumper or trailer hitch.

Consider the following items when computing the weight on the rear axle of the vehicle:

- The tongue weight of the trailer.
- The weight of any other type of cargo or equipment put in or on your vehicle.
- The weight of the driver and all passengers.

NOTE: Remember that everything put into or on the trailer adds to the load on your vehicle. Also, additional factory-installed options, or dealer-installed options, must be considered as part of the total load on your vehicle. Refer to the Tire and Loading Information placard in the Tire Safety Information Section of this manual for the maximum combined weight of occupants and cargo for your vehicle.

Towing Requirements

To promote proper break-in of your new vehicle drivetrain components the following guidelines are recommended:

CAUTION:
- **Avoid towing a trailer for the first 500 miles (805 km) of vehicle operation. Doing so may damage your vehicle.**
- **During the first 500 miles (805 km) of trailer towing, limit your speed to 50 mph (80 km/h).**

When towing a trailer, never exceed the GAWR, or GCWR, ratings.

WARNING:
Improper towing can lead to an injury accident. Follow these guidelines to make your trailer towing as safe as possible:
Make certain that the load is secured in the trailer and will not shift during travel. When trailering cargo that is not fully secured, dynamic load shifts can occur that may be difficult for the driver to control. You could lose control of your vehicle and have an accident.

- When hauling cargo or towing a trailer, do not overload your vehicle or trailer. Overloading can cause a loss of control, poor performance or damage to brakes, axle, engine, transmission, steering, suspension, chassis structure or tires.
- Safety chains must always be used between your vehicle and trailer. Always connect the chains to the frame or hook retainers of the vehicle hitch. Cross the chains under the trailer tongue and allow enough slack for turning corners.
- Vehicles with trailers should not be parked on a grade. When parking, apply the parking brake on the tow vehicle. Put the tow vehicle automatic transmission in P for Park. With a manual transmission, shift the transmission into reverse. Always, block or ″chock″ the trailer wheels.
- GCWR must not be exceeded.
- **Total weight must be distributed between the tow vehicle and the trailer such that the following four ratings are not exceeded:**
  - GVWR
  - GTW
  - GAWR
  - Tongue weight rating for the trailer hitch utilized (This requirement may limit the ability to always achieve the 10% to 15% range of tongue weight as a percentage of total trailer weight).

Towing Requirements — Tires

− Do not attempt to tow a trailer while using a compact spare tire.

− Proper tire inflation pressures are essential to the safe and satisfactory operation of your vehicle. Refer to the Tires–General Information section of this manual on Tire Pressures for proper tire inflation procedures.

− Also, check the trailer tires for proper tire inflation pressures before trailer usage.

− Check for signs of tire wear or visible tire damage before towing a trailer. Refer to the Tires–General Information section of this manual on Tread Wear Indicators for the proper inspection procedure.

− When replacing tires refer to the Tires–General Information section of this manual on Replacement Tires for proper tire replacement procedures. Replacing tires with a higher load carrying capacity will not increase the vehicle's GVWR and GAWR limits.

Towing Requirements — Trailer Brakes

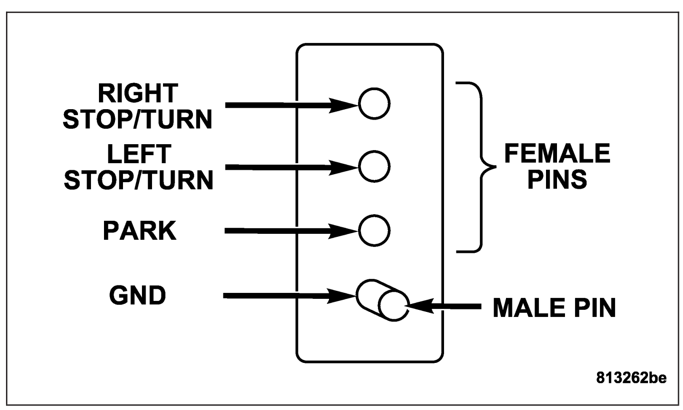
− Do **not** interconnect the hydraulic brake system or vacuum system of your vehicle with that of the trailer. This could cause inadequate braking and possible personal injury.

− An electronically actuated trailer brake controller is required when towing a trailer with electronically actuated brakes. When towing a trailer equipped with a hydraulic surge actuated brake system, an electronic brake controller is not required.

− Trailer brakes are recommended for trailers over 1,000 lbs (450 kg) and required for trailers in excess of 2,000 lbs (907 kg).

CAUTION:
If the trailer weighs more than 1,000 lbs (450 kg) loaded, it should have its own brakes and they should be of adequate capacity. Failure to do this could lead to accelerated brake lining wear, higher brake pedal effort, and longer stopping distances.

WARNING:
Do not connect trailer brakes to your vehicle's hydraulic brake lines. It can overload your brake system and cause it to fail. You might not have brakes when you need them and could have an accident.
Towing any trailer will increase your stopping distance. When towing you should allow for additional space between your vehicle and the vehicle in front of you. Failure to do so could result in an accident.

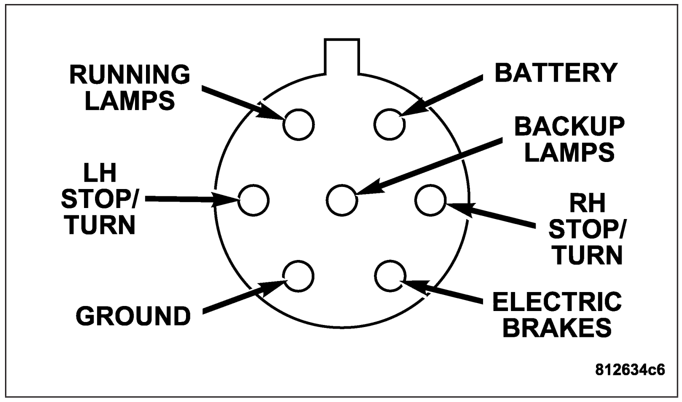


Towing Requirements — Trailer Lights & Wiring

Whenever you pull a trailer, regardless of the trailer size, stop lights and turn signals on the trailer are required for motoring safety.

The Trailer Tow Package may include a 4 and 7 pin wiring harness. Use a factory approved trailer harness and connector.

NOTE: Do not cut or splice wiring into the vehicles wiring harness.



The electrical connections are all complete to the vehicle but you must mate the harness to a trailer connector. Refer to the following illustrations.

Towing Tips

Before setting out on a trip, practice turning, stopping and backing the trailer in an area away from heavy traffic.

If using a manual transmission vehicle for trailer towing, all starts must be in FIRST gear to avoid excessive clutch slippage.

Towing Tips — Electronic Speed Control (If Equipped)

− Don't use in hilly terrain or with heavy loads.

− When using the speed control, if you experience speed drops greater than 10 mph (16 km/h), disengage until you can get back to cruising speed.

− Use speed control in flat terrain and with light loads to maximize fuel efficiency.

Towing Tips — Cooling System

To reduce potential for engine and transmission overheating, take the following actions:

- City Driving - When stopped for short periods of time, put transmission in neutral and increase engine idle speed.
- Highway Driving - Reduce speed.
- Air Conditioning - Turn off temporarily.
- Refer to Cooling System Operating information in the Maintenance section of this manual for more information.

BRAKES

TABLE OF CONTENTS

BRAKES - BASE

TABLE OF CONTENTS

BRAKES - BASE

DESCRIPTION - BASE BRAKE SYSTEM

The base brake system consists of the following components:

- Brake pedal
- Power brake booster
- Master cylinder
- Proportioning valves (2) (non-ABS vehicles only)
- Brake tubes and hoses
- Disc brakes (front)
- Disc brakes (rear) (optional)
- Drum brakes (rear) (standard)
- Parking brake

The hydraulic brake system is diagonally split for both the non-antilock and antilock braking systems. That means the left front and right rear brakes are on one hydraulic circuit and the right front and left rear are on the other.

Front disc brakes control the braking of the front wheels; rear braking is controlled by rear drum brakes as standard equipment. Rear disc brakes and antilock brakes with or without traction control are optional.

Vehicles equipped with the optional antilock brake system (ABS) use a system that shares most base brake hardware used on vehicles without ABS. For more information on ABS (Refer to 5 - BRAKES - ABS - DESCRIPTION).

The parking brake system consists of a hand-operated lever mounted between the front seats that actuates parking brake cables connecting to the rear brakes. For more information on Parking Brakes, (Refer to 5 - BRAKES/PARKING BRAKE - DESCRIPTION).

For information on the Stop Lamp Switch, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - DESCRIPTION).

WARNING

WARNING: Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from production or aftermarket brake linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not sand or grind brake lining unless equipment used is designed to contain the dust residue. Do not clean brake parts with compressed air or by dry brushing. Cleaning should be done by dampening the brake components with a fine mist of water, then wiping the brake components clean with a dampened cloth. Dispose of cloth and all residue containing asbestos fibers in an impermeable container with the appropriate label. Follow practices prescribed by the Occupational Safety And Health Administration (OSHA) and the Environmental Protection Agency (EPA) for the handling, processing, and disposing of dust or debris that may contain asbestos fibers.

CAUTION

CAUTION: Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container. Do not use petroleum-based fluid because seal damage in the brake system will result. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID - SPECIFICATIONS)

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean system components. These fluids damage rubber cups and seals.

CAUTION: During service procedures, grease or any other foreign material must be kept off the caliper assembly, brake linings, brake rotor and external surfaces of the hub.

CAUTION: When handling the brake rotor and caliper, be careful to avoid damaging the brake rotor and caliper, and scratching or nicking the brake shoe lining.

DIAGNOSIS AND TESTING

BASE BRAKE SYSTEM DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover the RED BRAKE WARNING INDICATOR, BRAKE NOISE and OTHER BRAKE CONDITIONS.

RED BRAKE WARNING INDICATOR

CONDITION	POSSIBLE CAUSES	CORRECTION
RED BRAKE WARNING INDICATOR ON	1. Parking brake lever not fully released.	1. Release parking brake lever.
	2. Parking brake warning switch on parking brake lever.	2. Inspect and replace switch as necessary.
	3. Brake fluid level low in reservoir.	3. Fill reservoir. Check entire system for leaks. Repair or replace as required.
	4. Brake fluid level switch.	4. Disconnect switch wiring connector. If lamp goes out, replace switch.
	5. Mechanical instrument cluster (MIC) problem.	5. Refer to Appropriate Diagnostic Information.
	6. ABS EVBP malfunction.	6. Refer to ABS section and Appropriate Diagnostic Information.

BRAKE NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
DISC BRAKE CHIRP	1. Excessive brake rotor runout.	1. Refer to brake rotor - diagnosis and testing. Correct as necessary.
DISC BRAKE RATTLE OR CLUNK	1. Broken or missing spring clips.	1. Replace brake shoes.
	2. Caliper guide pin bolts loose.	2. Tighten guide pin bolts.
	3. Missing abutment shims.	3. Replace missing abutment shims.
DISC BRAKE SQUEAK AT LOW SPEED (WHILE APPLYING LIGHT BRAKE PEDAL EFFORT)	1. Brake shoe linings.	1. Replace brake shoes.
DRUM BRAKE CHIRP	1. Lack of lubricant on brake shoe support plate where shoes ride.	1. Lubricate shoe contact areas on brake shoe support plates.
	2. Wheel cylinder out of alignment.	2. Loosen wheel cylinder mounting bolts, realign wheel cylinder with brake shoes and tighten mounting bolts.
DRUM BRAKE CLUNK	1. Drum(s) have threaded machined braking surface.	1. Reface or replace drake drums as necessary.
DRUM BRAKE HOWL OR MOAN	1. Lack of lubricant on brake shoe support plate where shoes ride and at the anchor.	1. Lubricate shoe contact areas on brake shoe support plates and at the anchor.
	2. Rear brake shoes.	2. Replace rear brake shoes.

CONDITION	POSSIBLE CAUSES	CORRECTION
SCRAPING (METAL-TO-METAL).	1. Foreign object interference with brakes. 2. Brake shoes worn out.	1. Inspect brakes and remove foreign object. 2. Replace brake shoes. Inspect rotors and drums. Reface or replace as necessary.
SCRAPING OR WHIRRING	1. ABS wheel speed sensor hitting tone wheel.	1. Inspect, correct or replace faulty component(s).

OTHER BRAKE CONDITIONS

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKES CHATTER	1. Rear brake drum out of round or disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake drums or rotors as necessary.
BRAKES DRAG (FRONT OR ALL)	1. Contaminated brake fluid. 2. Binding caliper pins or bushings. 3. Misadjusted brake lamp switch. 4. Master cylinder not fully returning. 5. Binding brake pedal.	1. Check for swollen seals. Replace all system components containing rubber. 2. Replace pins and bushings 3. Replace brake lamp switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL) 4. Inspect master cylinder and replace as necessary. 5. Replace brake pedal/bushings.
BRAKES DRAG (REAR ONLY)	1. Parking brake cables binding or froze up. 2. Parking brake cable return spring not returning shoes. 3. Service brakes not adjusted properly (rear drum brakes only). 4. Obstruction inside the center console preventing full return of the parking brake cables.	1. Check cable routing. Replace cables as necessary. 2. Replace cables as necessary. 3. Adjust rear brake shoes. Refer to Brake Pads/Shoes - Drum Brake. 4. Remove console and remove obstruction.
BRAKES GRAB	1. Contaminated brake shoe linings. 2. Improper power brake booster assist.	1. Inspect and clean, or replace shoes. Repair source of contamination. 2. Refer to Power Brake Booster in this section.
EXCESSIVE PEDAL EFFORT	1. Obstruction of brake pedal. 2. Low power brake booster assist. 3. Glazed brake linings. 4. Brake shoe lining transfer to brake rotor.	1. Inspect, remove or move obstruction. 2. Refer to Power Brake Booster in this section. 3. Reface or replace brake rotors as necessary. Replace brake shoes. 4. Reface or replace brake rotors as necessary. Replace brake shoes.
EXCESSIVE PEDAL EFFORT (HARD PEDAL - CAN'T SKID WHEELS)	1. Power brake booster runout (vacuum assist).	1. Check booster vacuum hose and engine tune for adequate vacuum supply. Refer to Power Brake Booster.

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE PEDAL TRAVEL (VEHICLE STOPS OK)	1. Air in brake lines.	1. Bleed brakes.
	2. Rear drum brake auto-adjuster malfunctioning.	2. Inspect and replace drum brake components as necessary. Adjust rear brakes.
EXCESSIVE PEDAL TRAVEL (ONE FRONT WHEEL LOCKS UP DURING HARD BRAKING)	1. One of the two hydraulic circuits is malfunctioning.	1. Inspect system for leaks. Check master cylinder for internal malfunction.
PEDAL PULSATES/ SURGES DURING BRAKING	1. Rear brake drum out of round or disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake drums or rotors as necessary.
PEDAL IS SPONGY	1. Air in brake lines.	1. Bleed brakes.
PREMATURE REAR WHEEL LOCKUP	1. Contaminated brake shoe linings.	1. Inspect and clean, or replace shoes. Repair source of contamination.
	2. Inoperative proportioning valve (non-ABS vehicles only).	2. Test proportioning valves following diagnosis and testing procedure. Refer to Proportioning Valve. Replace valves as necessary.
	3. ABS EVBP not functioning.	3. Refer to the ABS section and Appropriate Diagnostic Information.
STOP LAMPS STAY ON	1. Brake lamp switch out of adjustment.	1. Replace brake lamp switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL)
	2. Brake pedal binding.	2. Inspect and replace as necessary.
	3. Power brake booster not allowing pedal to return completely.	3. Replace power brake booster.
VEHICLE PULLS TO RIGHT OR LEFT ON BRAKING	1. Frozen brake caliper piston.	1. Replace frozen piston or caliper. Bleed brakes.
	2. Contaminated brake shoe lining (most likely front lining).	2. Inspect and clean, or replace shoes. Repair source of contamination.
	3. Pinched brake lines.	3. Replace pinched line.
	4. Leaking piston seal.	4. Replace piston seal or brake caliper.
	5. Suspension problem.	5. Refer to the Suspension section.
PARKING BRAKE - EXCESSIVE HANDLE TRAVEL	1. Rear brakes out of adjustment.	1. Adjust rear drum brake shoes, or rear parking brake shoes on vehicles with rear disc brakes.

STANDARD PROCEDURE

BASE BRAKE BLEEDING

NOTE: For bleeding the ABS hydraulic system, refer to Antilock Brake System Bleeding in the Antilock Brake System section.

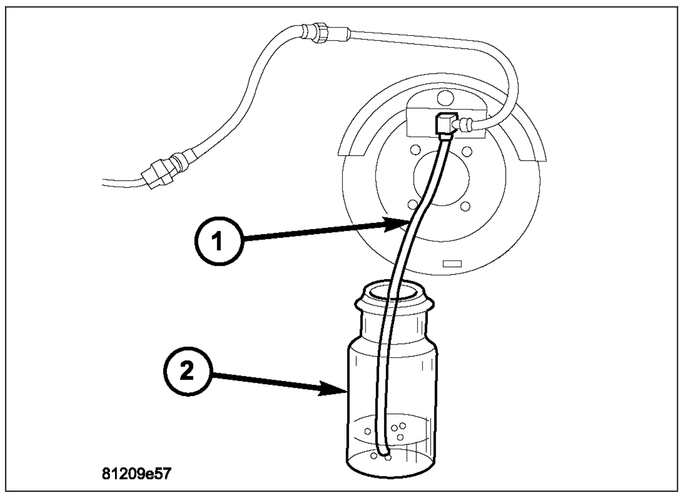
CAUTION: Before removing the master cylinder cap, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder reservoir.

CAUTION: Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

NOTE: For bleeding of the Antilock Brake System, (Refer to 5 - BRAKES - ABS - STANDARD PROCEDURE).

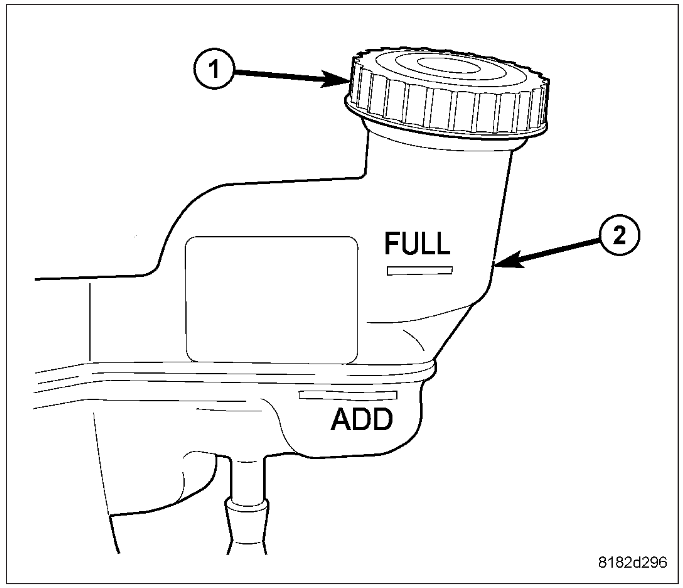
Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.

Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.



The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the hydraulic system.

- Left rear wheel
- Right front wheel
- Right rear wheel
- Left front wheel

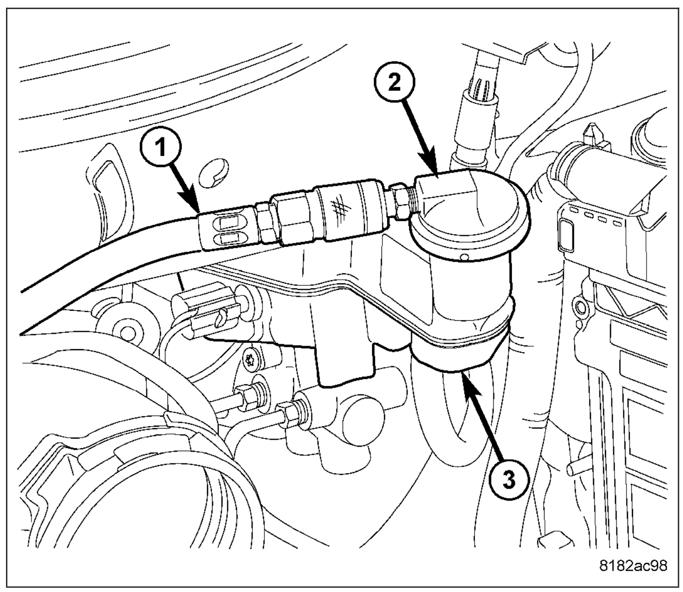


MANUAL BLEEDING

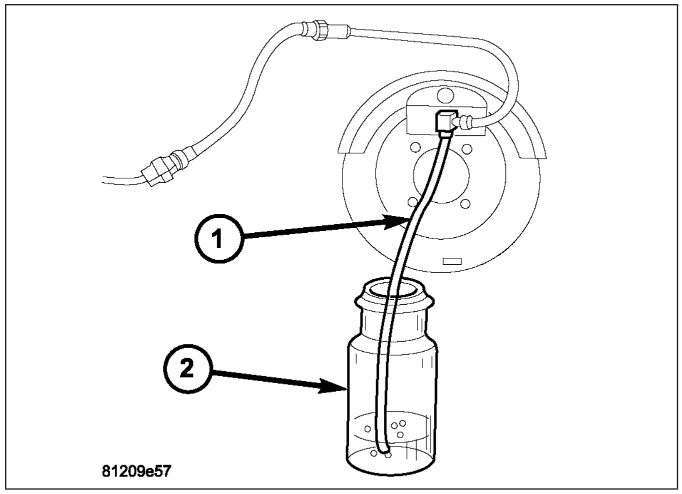
NOTE: To bleed the brakes manually, the aid of a helper will be required.

1. Attach a clear plastic hose (1) to the bleeder screw and feed the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
2. Have a helper pump the brake pedal three or four times and hold it in the down position.
3. With the pedal in the down position, open the bleeder screw at least one full turn.
4. Once the brake pedal has dropped, close the bleeder screw. After the bleeder screw is closed, release the brake pedal.
5. Repeat the above steps until all trapped air is removed from that wheel circuit (usually four or five times).

6. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake system. Monitor the fluid level in the master cylinder reservoir (2) to make sure it does not go dry.
7. Check and adjust brake fluid level to the FULL mark.
8. Check the brake pedal travel. If pedal travel is excessive or has not been improved, some air may still be trapped in the system. Re-bleed the brakes as necessary.
9. Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

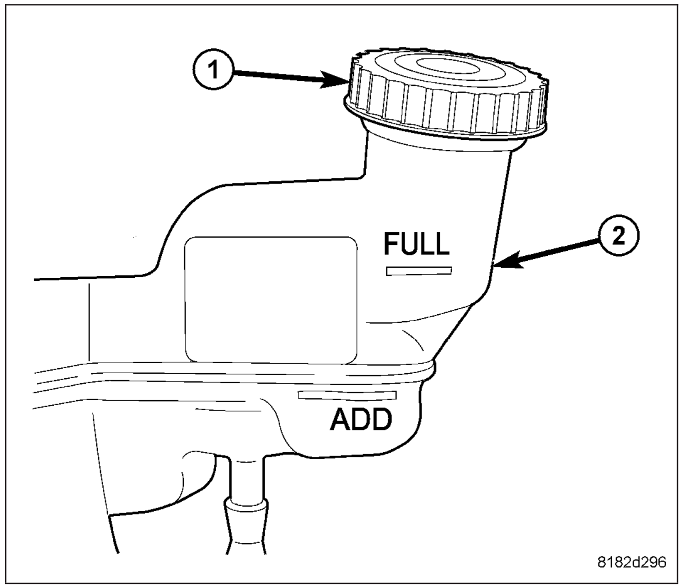


PRESSURE BLEEDING



NOTE: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

Following the same wheel circuit sequence as prescribed for manual bleeding.



1. Attach Master Cylinder Cap (2), Special Tool 6921, in place of the filler cap on the master cylinder reservoir (3).
2. Attach Bleeder Tank (1), Special Tool C-3496-B, or an equivalent, to the Master Cylinder Cap 6921.

3. Attach a clear plastic hose (1) to the bleeder screw and feed the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
4. Open the bleeder screw at least one full turn or more to obtain a steady stream of brake fluid.
5. After approximately 4–8 ounces of fluid have been bled through the brake circuit and an air-free flow is maintained in the clear plastic hose and jar, close the bleeder screw.
6. Repeat this procedure at all the remaining bleeder screws.

7. Check and adjust brake fluid level to the FULL mark on the reservoir (2).
8. Check the brake pedal travel. If pedal travel is excessive or has not been improved, some air may still be trapped in the system. Re-bleed the brakes as necessary.
9. Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

SPECIFICATIONS

BRAKE ACTUATION

ACTUATION:	
Vacuum Operated Power Brakes	Standard
Hydraulic System	Dual-Diagonally Split
BRAKE PEDAL:	
Pedal Ratio	3.3:1
POWER BRAKE BOOSTER:	
Type	Vacuum Assist
Mounting Studs	M8 x 1.25
Diaphragm Size/Type	250 mm /Single Diaphragm
MASTER CYLINDER ASSEMBLY:	
Type	Compact
Body Material	Anodized Aluminum
Reservoir Material	Polypropelene
Bore and Stroke	20.6 mm x 42 mm (0.812 in. x 1.654 in.)
Displacement Split	50 / 50
MASTER CYLINDER FLUID OUTLET PORTS:	
Tube Fitting Type	ISO Flare
Primary Tube Nut Thread - With ABS	M12 x 1
Primary Tube Nut Thread - Without ABS	M10 x 1
Secondary Tube Nut Thread - All	M12 x 1
PROPORTIONING VALVE:	
Material	Aluminum/Steel
Function	Fixed Pressure Proportioning
Outlet Tube Fitting Type	ISO Flare
Outlet Tube Nut Threads - Primary	M12 x 1
Outlet Tube Nut Threads - Secondary	M10 x 1
ABS HYDRAULIC CONTROL UNIT PORTS:	
Tube Fitting Type	ISO Flare
Inlet Port Threads (Both)	M12 x 1
Outlet Port Threads-Left Front and Left Rear	M12 x 1
Outlet Port Threads-Right Front and Right Rear	M10 x 1

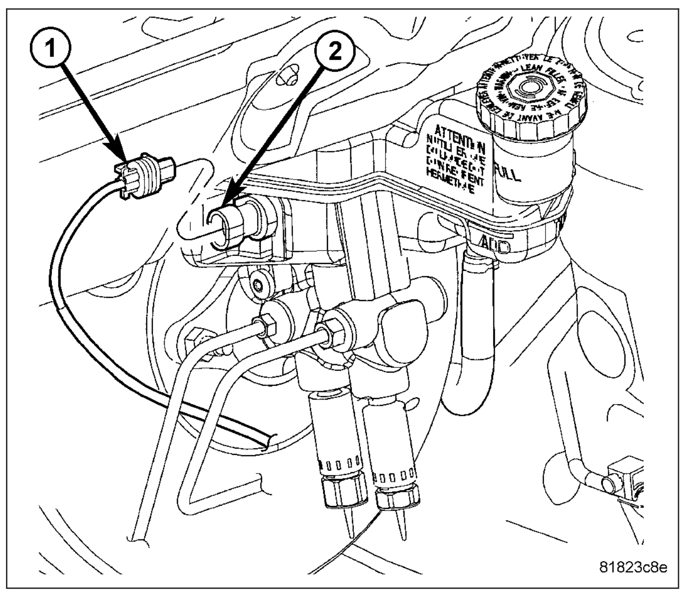
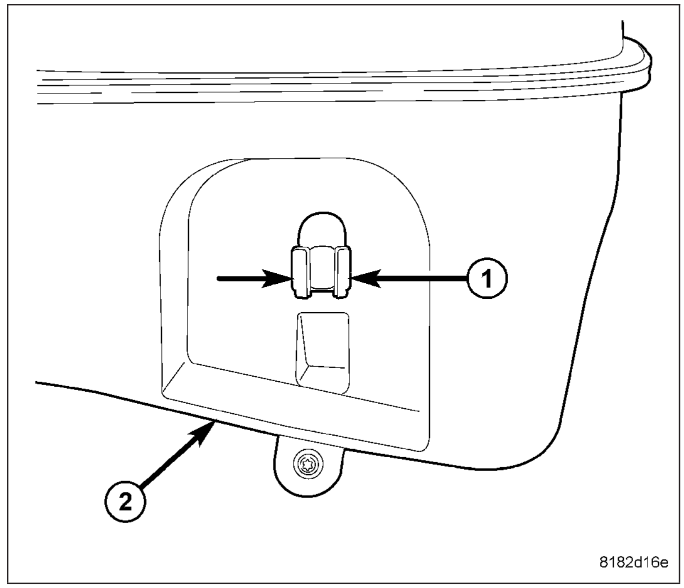
SWITCH-BRAKE FLUID LEVEL

DESCRIPTION



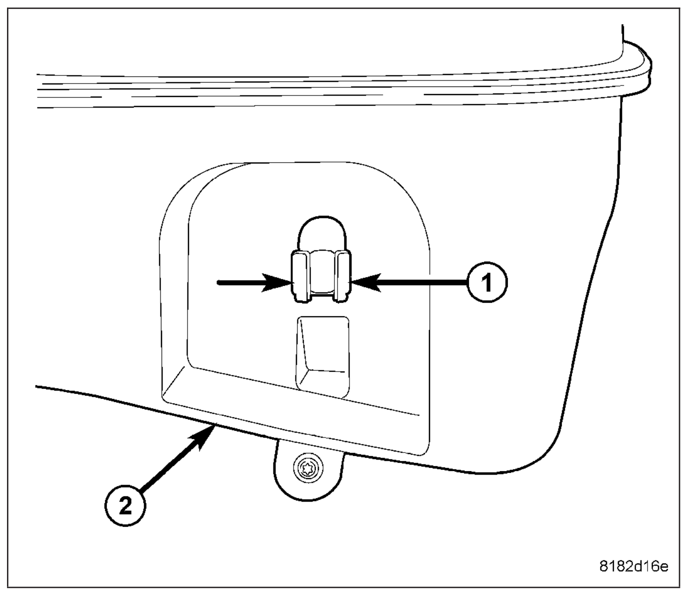
The brake fluid level switch (2) is mounted through the center of the fluid reservoir (1). The switch can be serviced separately from the master cylinder fluid reservoir.



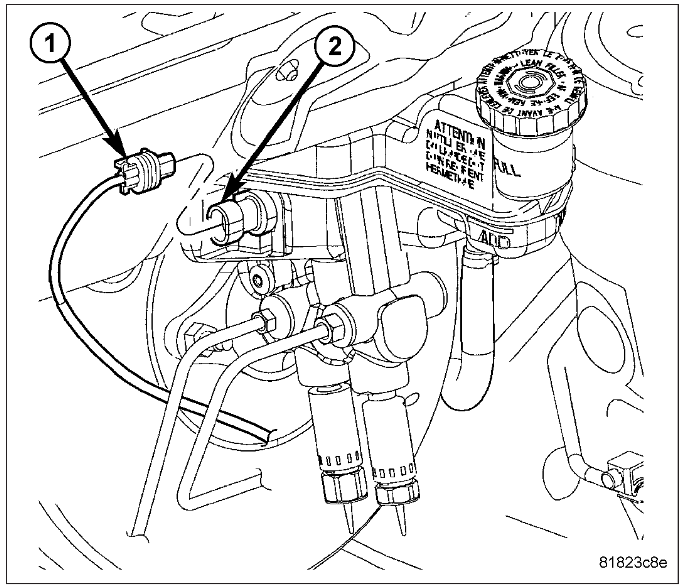
REMOVAL

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

1. Remove the wiring harness connector (1) from the brake fluid level switch (2) in the master cylinder brake fluid reservoir.



2. Push together the retaining tabs (1) holding the brake fluid level switch in place in the brake fluid reservoir (2).
3. Pull the brake fluid level switch out the right side of the reservoir.



INSTALLATION

1. Align the brake fluid level switch with its mounting hole on the right side of the master cylinder brake fluid reservoir. Push the switch into the fluid reservoir until the switch retaining tabs (1) are expanded on the opposite side of the reservoir (2), locking it in place.

2. Connect the wiring harness connector (1) to the switch (2).

HYDRAULIC/MECHANICAL

DESCRIPTION

DISC BRAKES

There are several brake packages available featuring either a disc/drum combination or a disc/disc combination.

- “15-inch” vented front disc/9-inch rear drum (BRA)
- “15-inch” vented front disc/9-inch rear drum with ABS (BRK)
- “16-inch” vented front disc/9-inch rear drum with ABS (BRJ)
- “16-inch” vented front disc/”14-inch” solid rear disc with ABS (BRF)
- “16-inch” vented front disc/”14-inch” solid rear disc with ESP (BRF)

Only one package is available on Export vehicles, that is a “16-inch” vented front disc/”14-inch” (BR1) solid rear disc with ABS. It is like the BRF brake package, except the front brake linings are different.

“15-INCH” FRONT DISCS

“15-inch” front disc brakes (so called because they are designed to fit inside 15-inch or larger wheels) feature 2.2 inch (57 mm) single-piston floating calipers acting on 10.8 x 1.0 in. (276 x 26 mm) vented disc rotors.

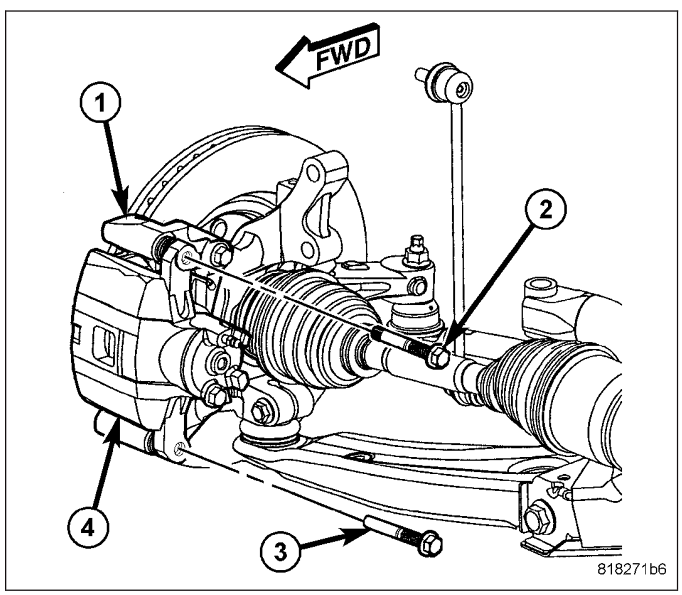
“16-INCH” FRONT DISCS

“16-inch” front disc brakes (so called because they are designed to fit inside 16-inch or larger wheels) feature 2.2 inch (57 mm) single-piston floating calipers acting on 11.5 x 1.0 in. (294 x 26 mm) vented disc rotors.

“14-INCH” REAR DISCS

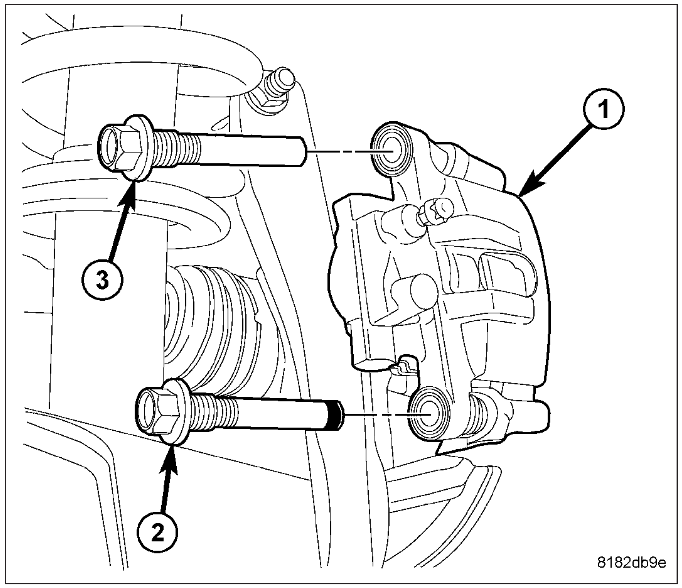
“14-inch” rear disc brakes feature 1.4 inch (35 mm) single-piston floating calipers acting on 10.3 x 0.39 in. (262 x 10 mm) solid disc rotors.

Each disc brake assembly consists of the following major components:



- Caliper
- Caliper adapter bracket
- Pads (Shoe and lining assemblies)
- Rotor

All calipers are the low-drag type. New technology caliper construction allows minimal drag of the pads on the discs with low clearance to the rotors to maintain maximum pedal feel and responsiveness.



All calipers are coated, giving them a bright appearance. This coating offers corrosion protection and a long-term neat appearance. Steel pistons are used in all calipers.

The main difference between the two front disc brakes packages are rotor size (diameter) and caliper adapter bracket (1) length.

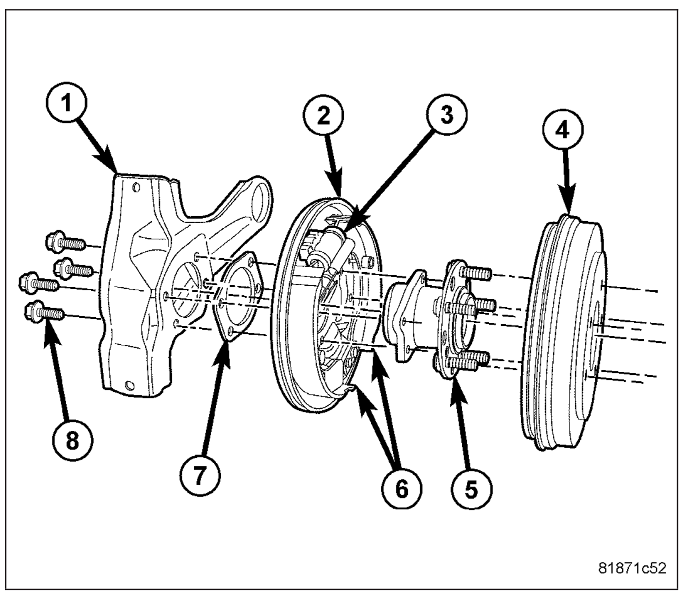
The caliper guide pin bolts are of special interest. There are two different caliper guide pin bolts used at each brake caliper, one of which has a special sleeve at the tip of the guide pin. It is there for anti-rattle and noise suppression issues and must be placed correctly to work properly. At each front brake caliper (4) this bolt (2) is placed at the upper location.

At each rear brake caliper (1) this bolt (2) is placed at the lower location.

Front disc brakes are equipped with an audible wear indicator on the right side inboard brake pad only. The left side pads do not include an audible wear indicator.

Rear disc brakes are equipped with audible wear indicators on both left side and right side inboard brake pads.

When the brake pads are replaced, only brake pads meeting the Original Equipment Manufacturer (OEM) formulation (such as Mopar® replacement parts) should be used.



All brake rotors are fully coated with zinc dust, water-soluble, environmentally friendly corrosion preventive. Both the friction surfaces and the vents are coated. During initial brake applications of a new rotor, the brake pads scrub the coating off the friction surfaces, ensuring that the remainder will be rust free. Coating the vents also ensures that there will not be a loss of heat capacity over time.

REAR DRUM BRAKES

All rear drum brake equipped vehicles feature 9 inch (229 mm) rear drum brakes. The drum brakes are all two-shoe (7), internal-expanding type with an automatic adjuster screw.

Each rear drum brake consists of these major components as well as the attaching hardware:

- Adjuster
- Drum (4)
- Shoes (6)
- Support Plate (2)
- Wheel Cylinder (3)

The rear drum brakes also serve as part of the parking brake system. (Refer to 5 - BRAKES/PARKING BRAKE - DESCRIPTION)

DIAGNOSIS AND TESTING

DRUM BRAKE AUTOMATIC ADJUSTER

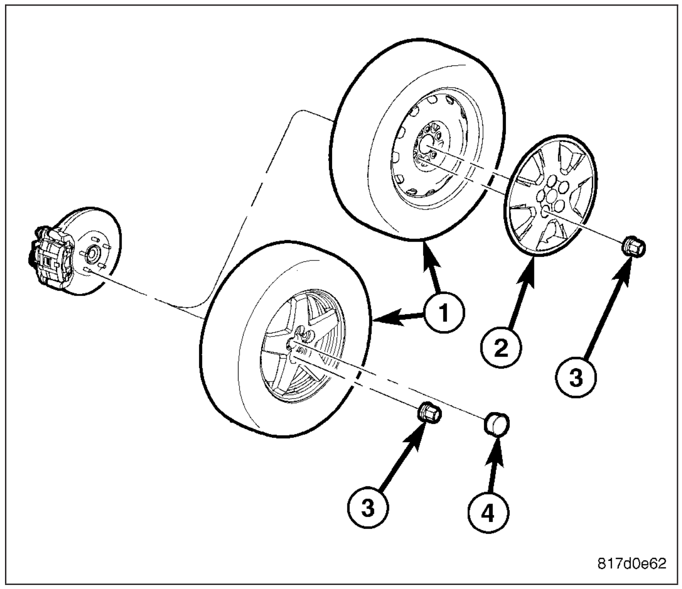
To properly test the drum brake automatic adjuster, the aide of a helper inside the vehicle to apply the brakes will be necessary.

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
2. Remove the access plug from the rear adjustment slot in each brake support plate.
3. Insert a thin screwdriver in the adjustment slot and push back the adjustment lever. With the lever in this position, back the star wheel adjustment off approximately 10 notches. This will eliminate the possibility that the brake is at full adjustment, and can be adjusted no further.
4. Remove the screwdriver from the adjustment slot.
5. Watch the star wheel through the adjustment slot, while a helper applies the brake pedal. As the brake shoes apply, the adjustment lever should move downward, turning the star wheel. A definite rotation of the adjuster star wheel can be observed if the automatic adjuster is working properly.

If the star wheel does not move as indicated, the brake drum needs to be removed and further inspection of the rear brakes is necessary.

6. If the star wheel is operating properly, readjust the brakes. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - ADJUSTMENTS).
7. Reinstall the adjustment slot access plug.
8. Lower the vehicle.

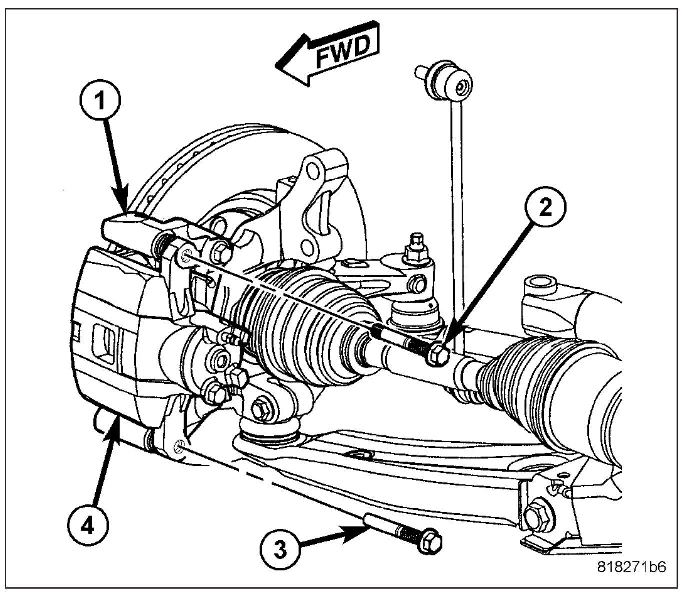
PADS-FRONT BRAKE



REMOVAL

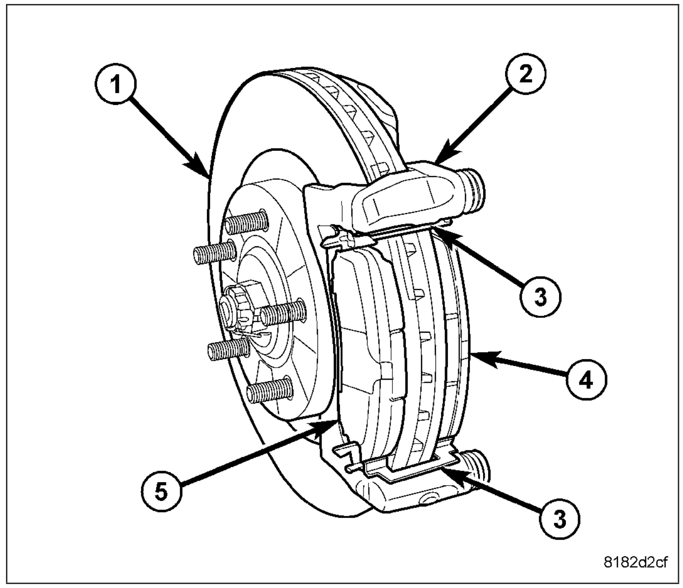
NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)



NOTE: Perform Step 2 through Step 5 on each side of the vehicle to complete pad set removal.

2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).



CAUTION: When removing the caliper guide pin bolts (2, 3) note that one (upper) has a special sleeve on the end. It important that his bolt be installed in the upper mounting hole when the caliper is installed.

3. Remove the two brake caliper guide pin bolts (2, 3).
4. Remove the disc brake caliper (4) from the disc brake adapter bracket (1) and hang it out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.

5. Remove the brake pads (4, 5) from the caliper adapter bracket (2).

CLEANING

WARNING: Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from production or aftermarket brake linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not sand or grind brake lining unless equipment used is designed to contain the dust residue. Do not clean brake parts with compressed air or by dry brushing. Cleaning should be done by dampening the brake components with a fine mist of water, then wiping the brake components clean with a dampened cloth. Dispose of cloth and all residue containing asbestos fibers in an impermeable container with the appropriate label. Follow practices prescribed by the Occupational Safety And Health Administration (OSHA) and the Environmental Protection Agency (EPA) for the handling, processing, and disposing of dust or debris that may contain asbestos fibers.

INSPECTION

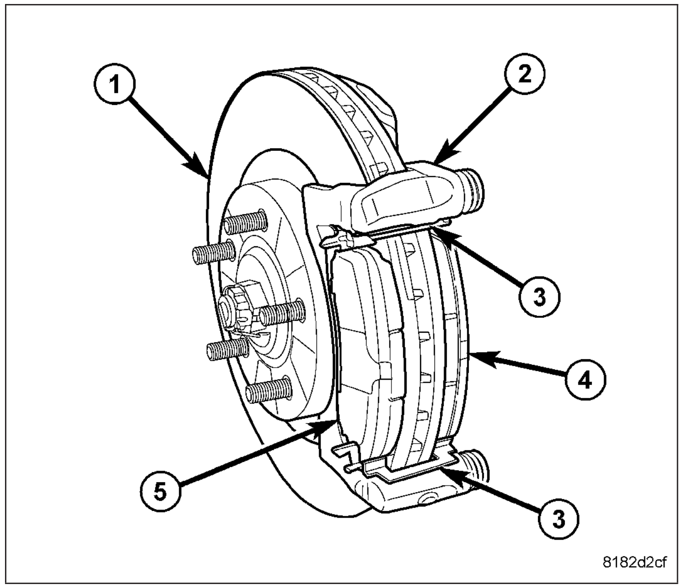
Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

Measure brake pad minimum thickness. Brake pads must be replaced when usable material on a brake pad lining measured at its thinnest point measures one millimeter (0.04 inches) or less.

NOTE: It is important to inspect both front and rear brake pads during the same inspection. Typically, front and rear brake pads wear out at the same time.

Replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.



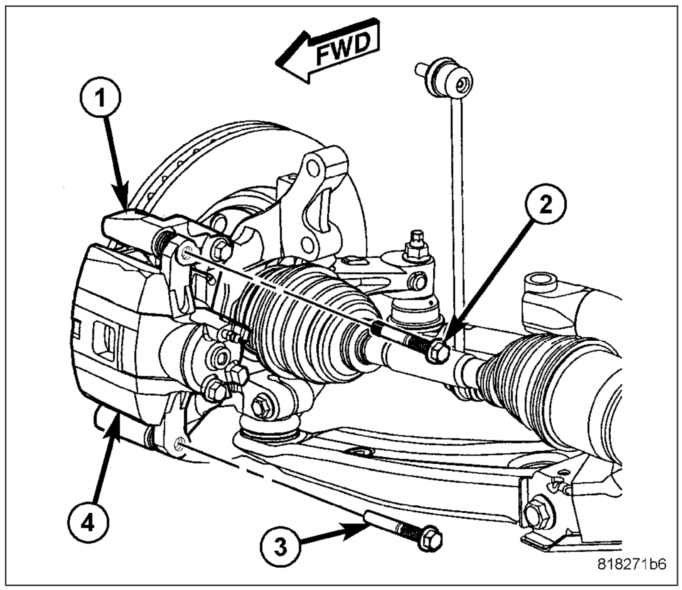
If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

INSTALLATION

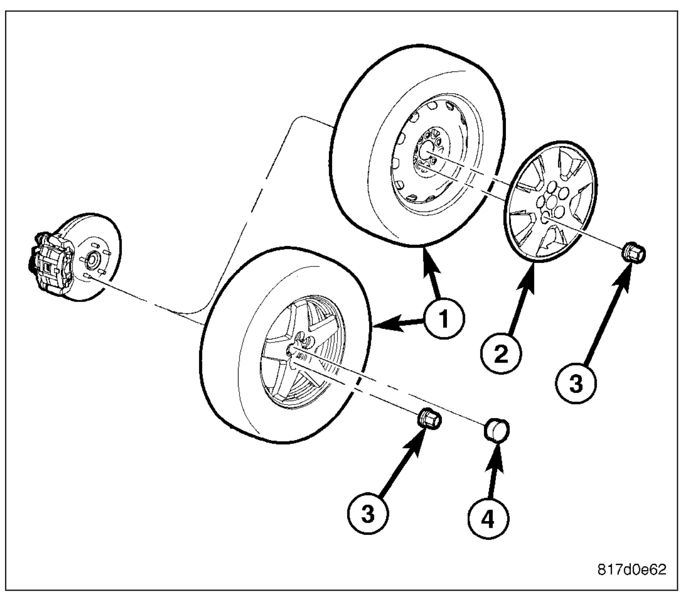
NOTE: Perform Step 1 through Step 5 on each side of the vehicle to complete pad set installation, then proceed to Step 6.

NOTE: Make sure that the audible wear indicators (if equipped) are placed toward the top when the inboard brake pads are installed on each side of the vehicle.

1. Place the brake pads (4, 5) in the abutment shims (3) clipped into the disc brake caliper adapter bracket (2) as shown. Place the pad with the wear indicator attached on the inboard side (2).
2. Completely retract the caliper piston back into the bore of the caliper.

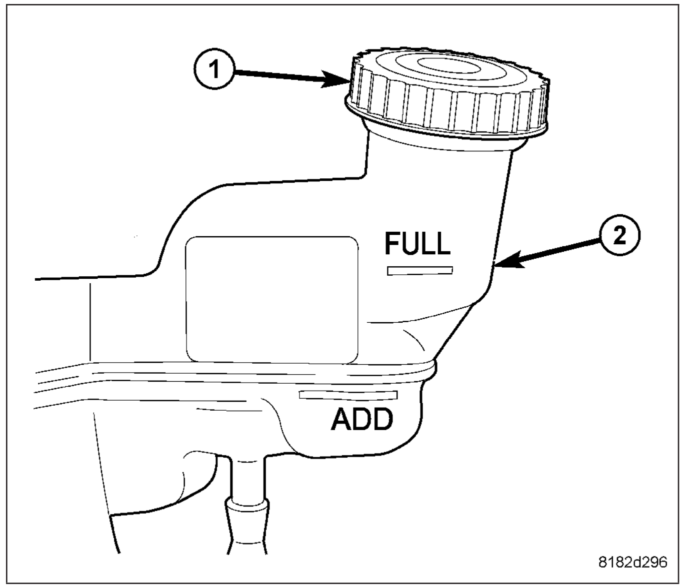


CAUTION: Use care when installing the caliper (4) onto the adapter bracket (1) to avoid damaging the boots.



3. Install the disc brake caliper over the brake pads on the brake caliper adapter bracket.

CAUTION: When installing the caliper guide pin bolts (2, 3) make sure that the one that has a special sleeve on the end is installed in the upper mounting hole.

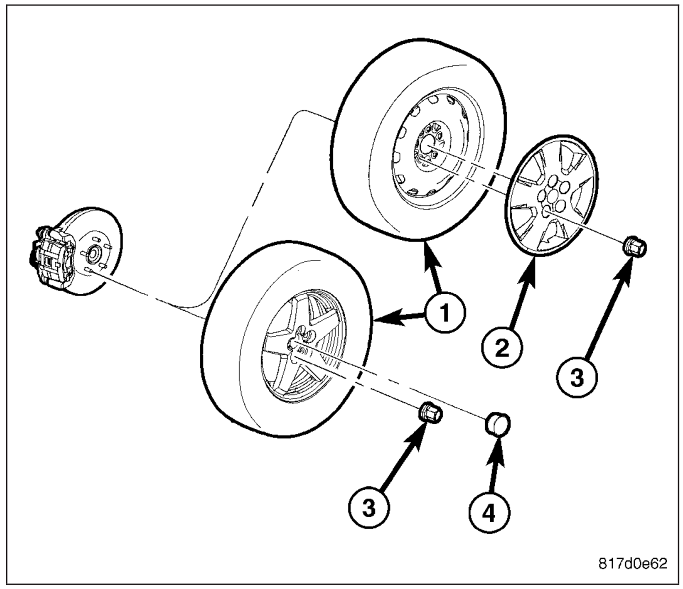


4. Align the caliper guide pin bolt holes with the adapter bracket. Install the upper (with special sleeve) (2) and lower (3) caliper guide pin bolts. Tighten the guide pin bolts to 43 N·m (32 ft. lbs.).

5. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
6. Lower the vehicle.

7. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
8. Check and adjust the brake fluid level in the reservoir (2) as necessary.
9. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

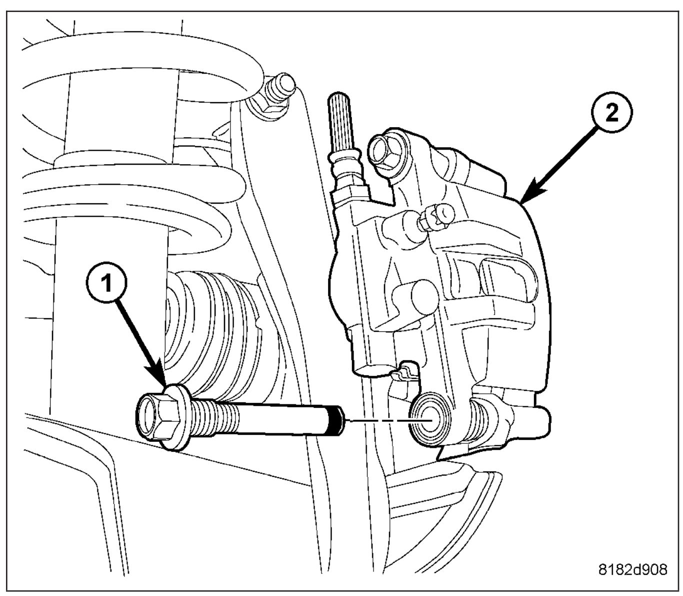
PADS-REAR BRAKE



REMOVAL

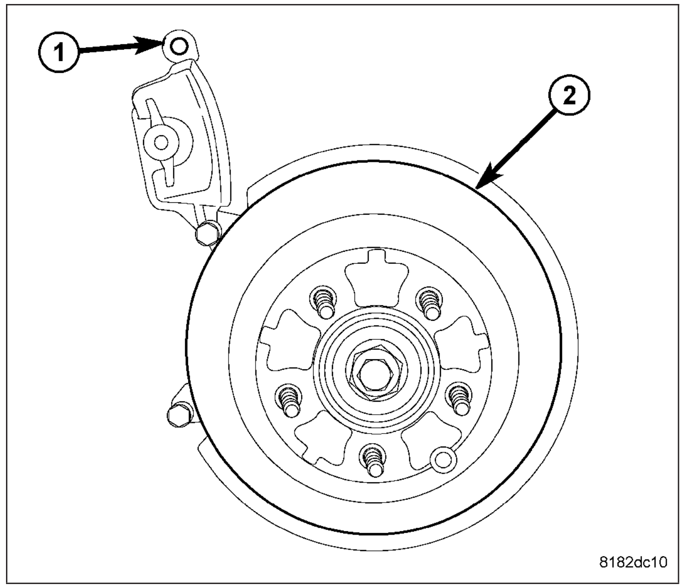
NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)



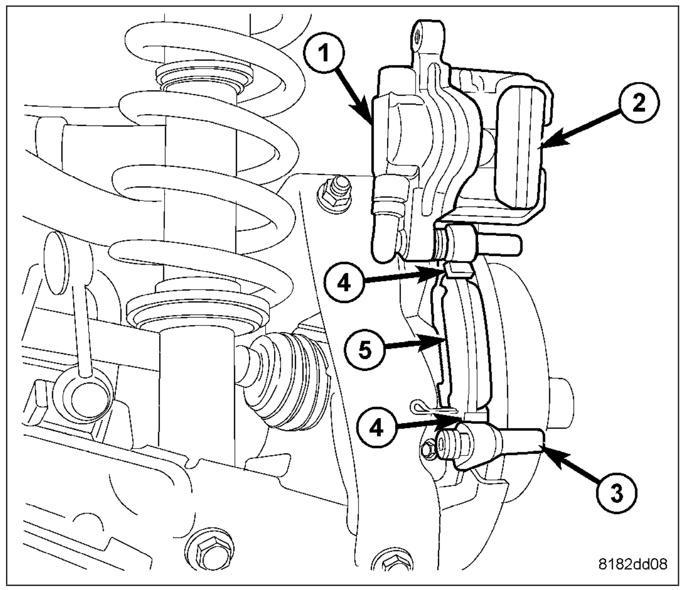
NOTE: Perform Step 2 through Step 6 on each side of the vehicle to complete pad set removal.

2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).



NOTE: In some cases, it may be necessary to retract the caliper piston in its bore a small amount in order to provide sufficient clearance between the pads and the rotor to easily remove the caliper from the knuckle. This can usually be accomplished before the guide pin bolts are removed, by grasping the rear of the caliper and pulling outward working with the guide pins, thus retracting the piston. Never push on the piston directly as it may get damaged.

3. Remove the disc brake caliper (2) lower guide pin bolt (1).



CAUTION: When moving rear brake caliper upward, use extreme care not to damage or over-extend the flex hose. Damage may occur.

4. Rotate the caliper (1) upward hinging off the upper guide pin bolt. Rotate the caliper upward just enough to allow brake pad removal. Hang the caliper assembly in this position using wire or a bungee cord.

5. Remove the inboard brake pad (5) from the caliper adapter bracket (3).
6. Remove the outboard brake pad (2) from the caliper (1) by prying the brake pad retaining clip over the raised area on the caliper. Slide the brake pad off of the brake caliper.

CLEANING

WARNING: Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from production or aftermarket brake linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not sand or grind brake lining unless equipment used is designed to contain the dust residue. Do not clean brake parts with compressed air or by dry brushing. Cleaning should be done by dampening the brake components with a fine mist of water, then wiping the brake components clean with a dampened cloth. Dispose of cloth and all residue containing asbestos fibers in an impermeable container with the appropriate label. Follow practices prescribed by the Occupational Safety And Health Administration (OSHA) and the Environmental Protection Agency (EPA) for the handling, processing, and disposing of dust or debris that may contain asbestos fibers.

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

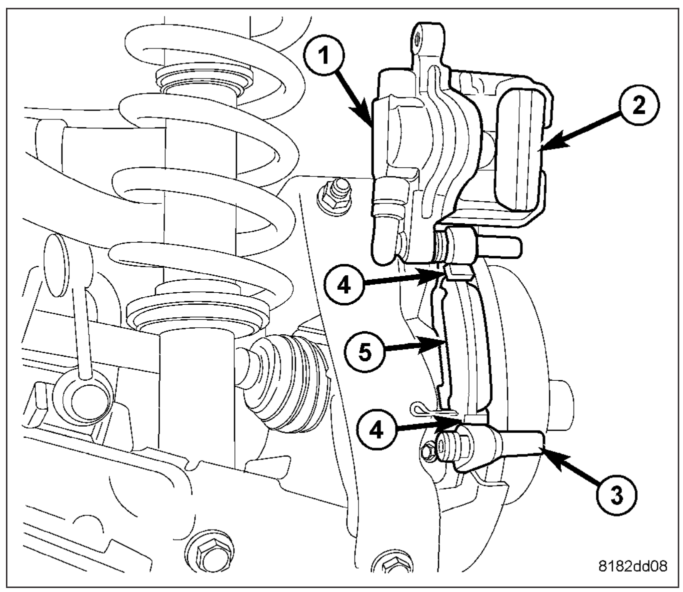
If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

Measure brake pad minimum thickness. Brake pads must be replaced when usable material on a brake pad lining measured at its thinnest point measures one millimeter (0.04 inches) or less.

NOTE: It is important to inspect both front and rear brake pads during the same inspection. Typically, front and rear brake pads wear out at the same time.

Replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

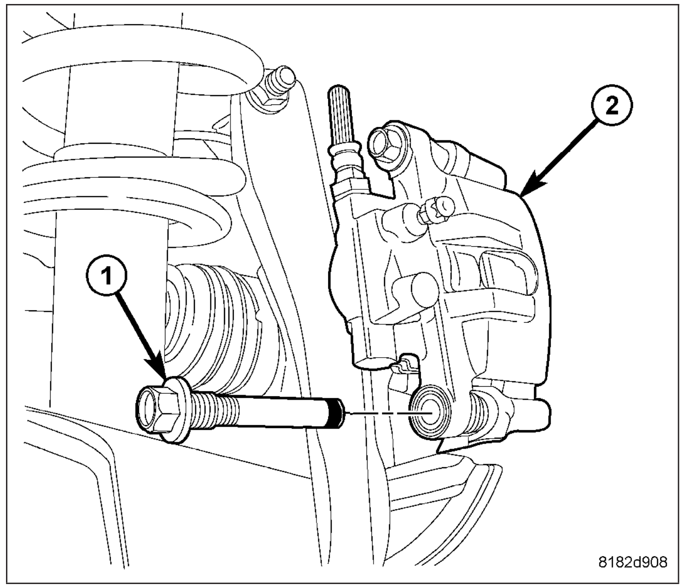


INSTALLATION

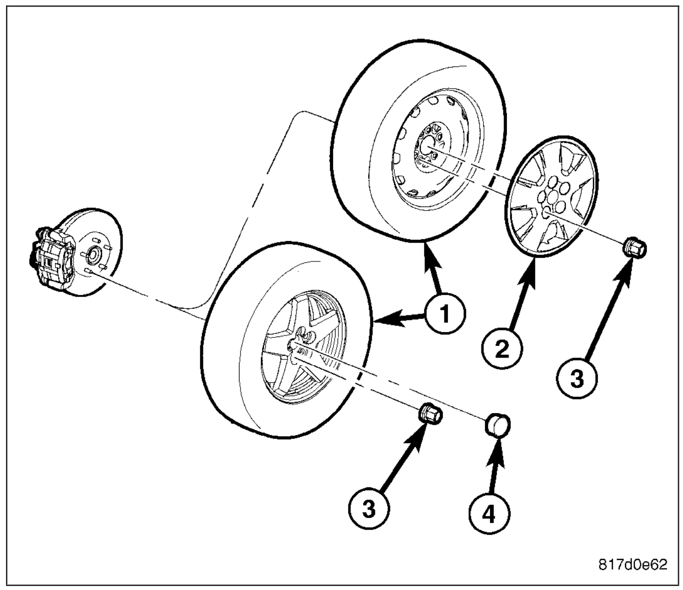
NOTE: Perform Step 1 through Step 6 on each side of the vehicle to complete pad set installation, then proceed to Step 7.

1. Completely retract the caliper piston back into the piston bore of the caliper. This is required to gain the necessary pad-to-rotor clearance for the caliper installation onto the steering knuckle.

NOTE: Place the brake pad with the audible wear indicator attached on the inboard side. The audible wear indicator should be positioned at the bottom when installed.



2. Slide the outboard brake pad (2) onto the caliper (1). Be sure the retaining clip is squarely seated in the depressed areas on the caliper beyond the raised retaining bead.
3. Place the inboard brake pad (5) in the abutment shims (4) clipped into the disc brake caliper adapter bracket (3) as shown (see preceding note).



CAUTION: Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boot.

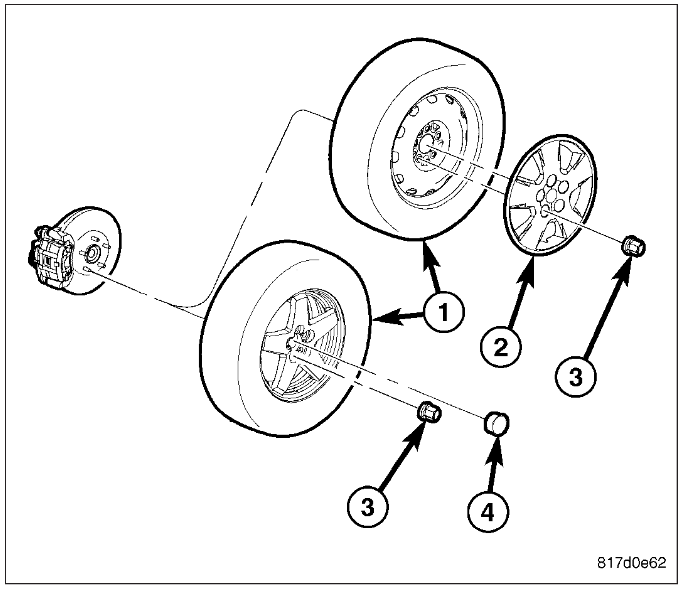
NOTE: The lubricant used on the guide pin portion of the guide pin bolt is Niglube RM. Use the appropriate lubricant when necessary.

4. Rotate the disc brake caliper downward over the brake rotor and lower part of caliper adapter.
5. Install the disc brake caliper (2) lower guide pin bolt (1). Tighten the guide pin bolt to 43 N·m (32 ft. lbs.).

6. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
7. Lower the vehicle.
8. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving the vehicle.
9. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

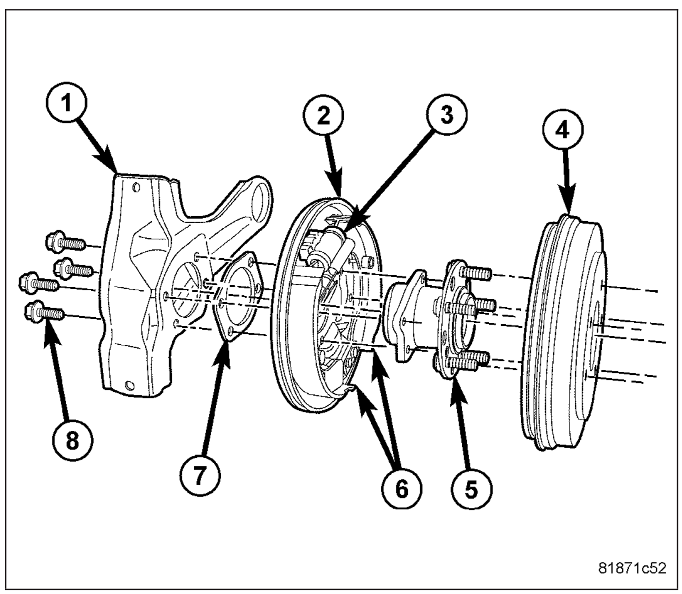
SHOE AND LININGS-REAR DRUM BRAKE

REMOVAL



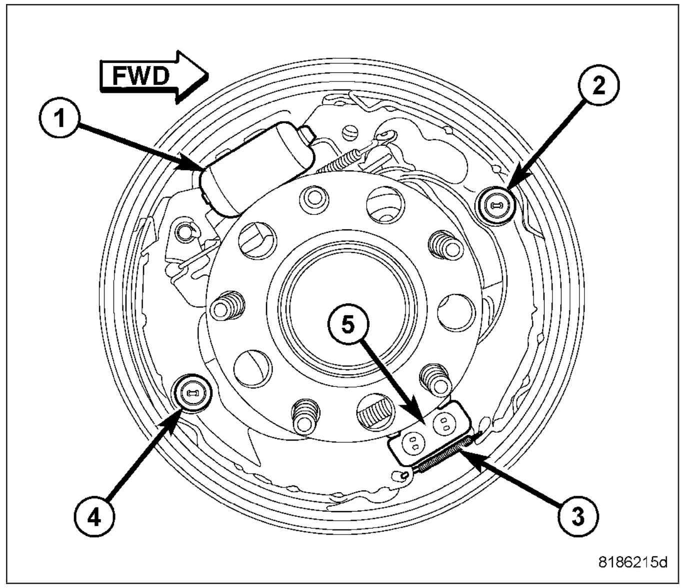
NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

NOTE: Make sure parking brake is in "released" position before raising vehicle.

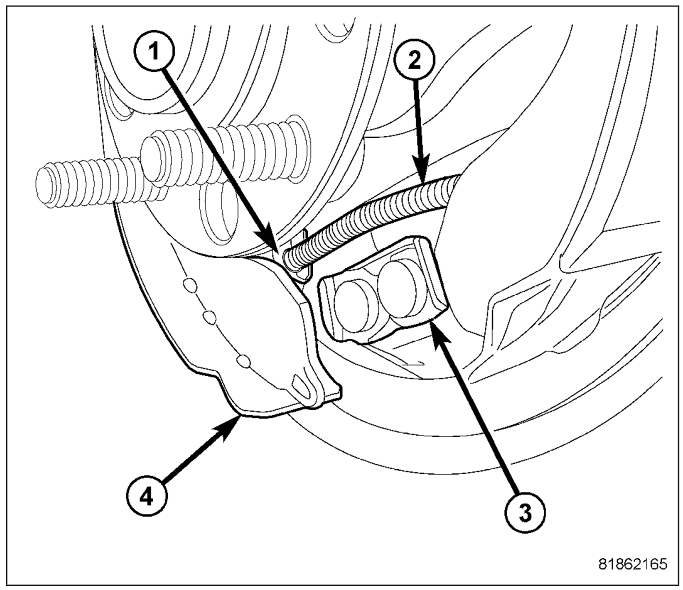


1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

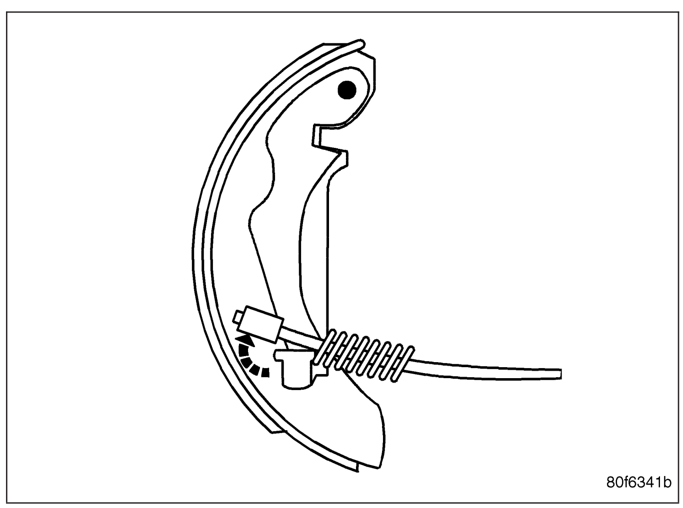
NOTE: Perform Step 2 through Step 16 on each side of the vehicle to complete shoe set removal. It may be easier to install the new components on the first side of the vehicle before disassembling the opposite side so it may be used as a reference guide for proper installation.



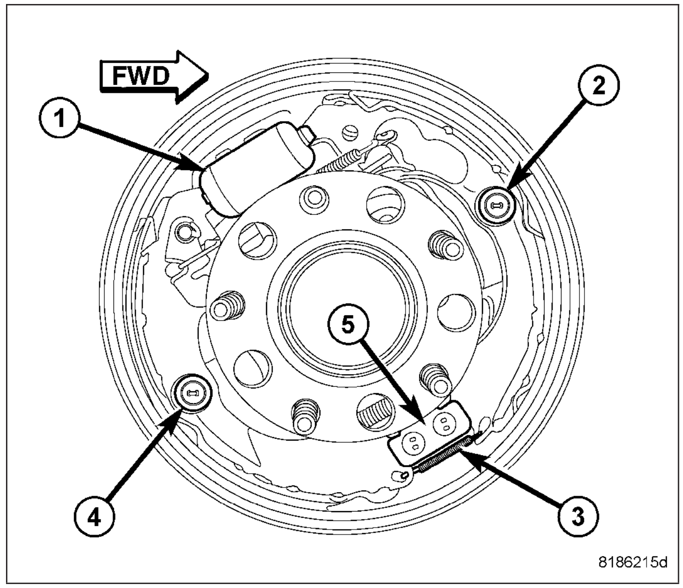
2. Remove the wheel mounting nuts (3), then the rear tire and wheel assembly.



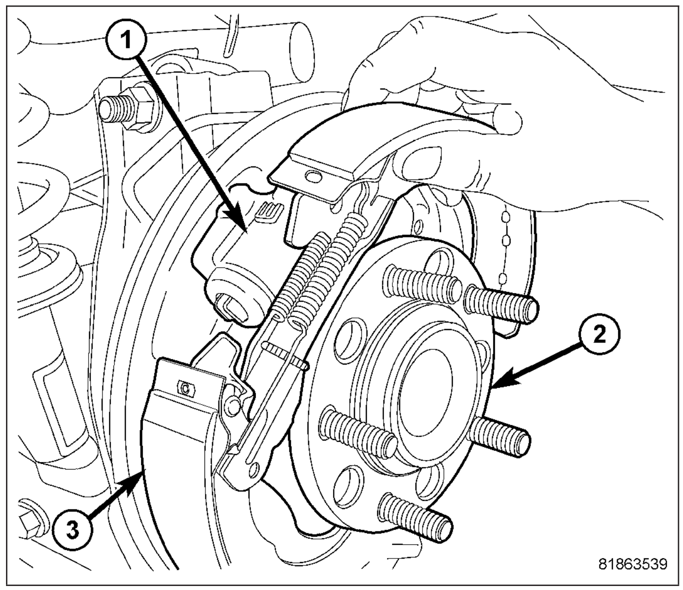
3. Remove the brake drum (4). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DRUM - REMOVAL)



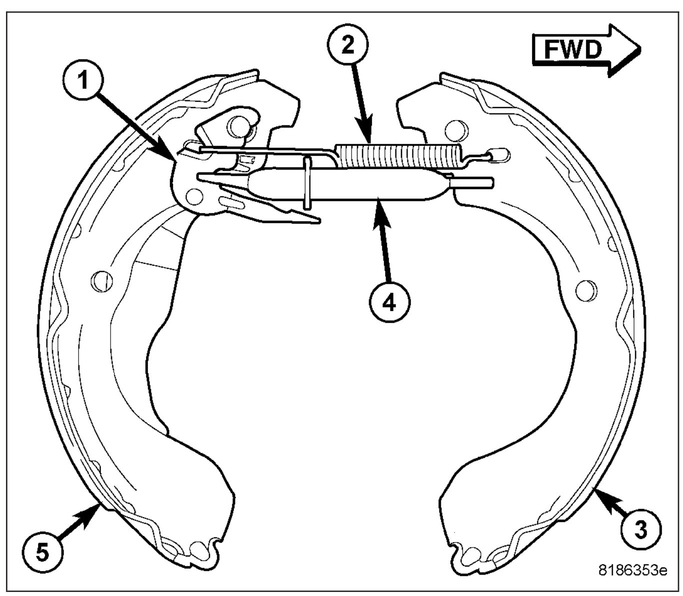
4. Remove the lower shoe spring (3).
5. Compress and remove the hold-down spring (4) retaining the rear shoe to the support plate.



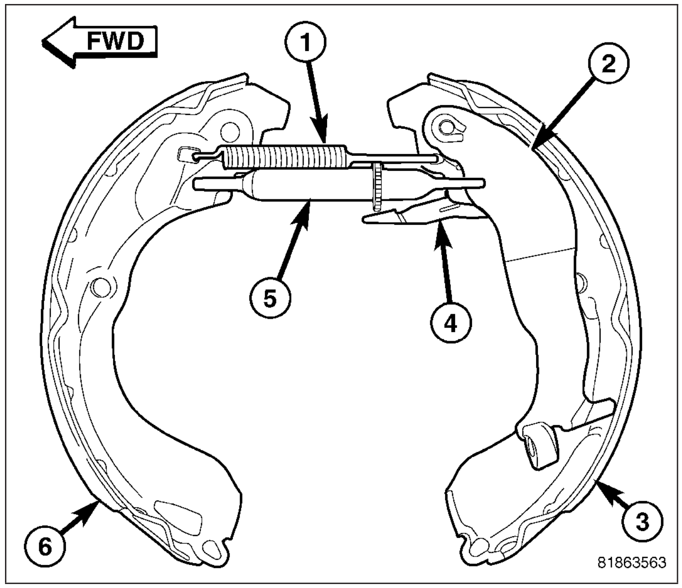
6. Pull the rear shoe (4) away from the anchor (3) allowing better access to the parking brake cable (2) connection at the lever (1).



7. Compress the cable return spring, then remove the parking brake cable from the parking brake lever.



8. Compress and remove the hold-down spring (2) retaining the front shoe to the support plate.



9. Remove both brake shoes from the wheel cylinder.
10. Remove both shoes and remaining parts as an assembly (3) through the opening between the wheel cylinder (1) and support plate hub and bearing.

11. Place the shoe assembly outboard-side-up on a flat surface.
12. Remove the adjuster spring (2) from the leading shoe (3) and the lever pawl (1).
13. Remove the lever pawl (1) from the pivot on the rear shoe (5).

14. Flip the shoe assembly over to show the inboard side.
15. Remove the upper shoe return spring (1).
16. Remove the adjuster (5) from the shoes and parking brake lever (2).

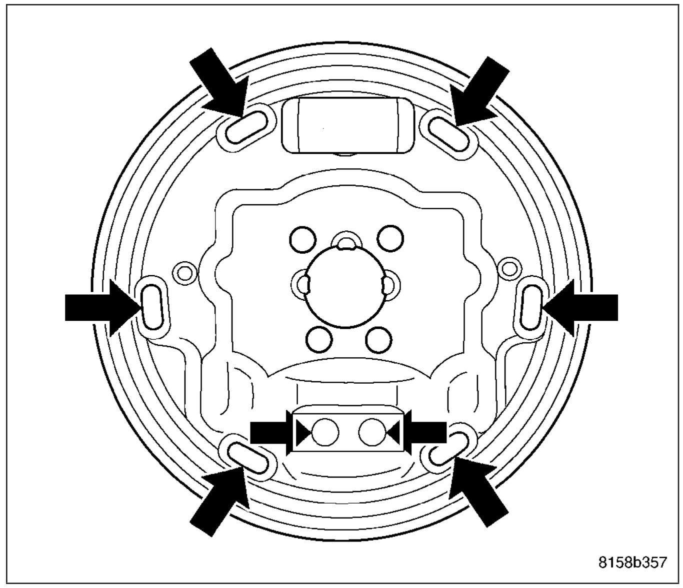
CLEANING

WARNING: Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from production or aftermarket brake linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not sand or grind brake lining unless equipment used is designed to contain the dust residue. Do not clean brake parts with compressed air or by dry brushing. Cleaning should be done by dampening the brake components with a fine mist of water, then wiping the brake components clean with a dampened cloth. Dispose of cloth and all residue containing asbestos fibers in an impermeable container with the appropriate label. Follow practices prescribed by the Occupational Safety And Health Administration (OSHA) and the Environmental Protection Agency (EPA) for the handling, processing, and disposing of dust or debris that may contain asbestos fibers.

INSPECTION

Inspect the shoe linings. Rear brake shoe linings should show contact across the entire width of the lining and also from the heel to the toe of the lining. Replace the shoes if noted otherwise. Brake shoes with lack of contact at the toe or heel of the brake shoe lining may be improperly ground.

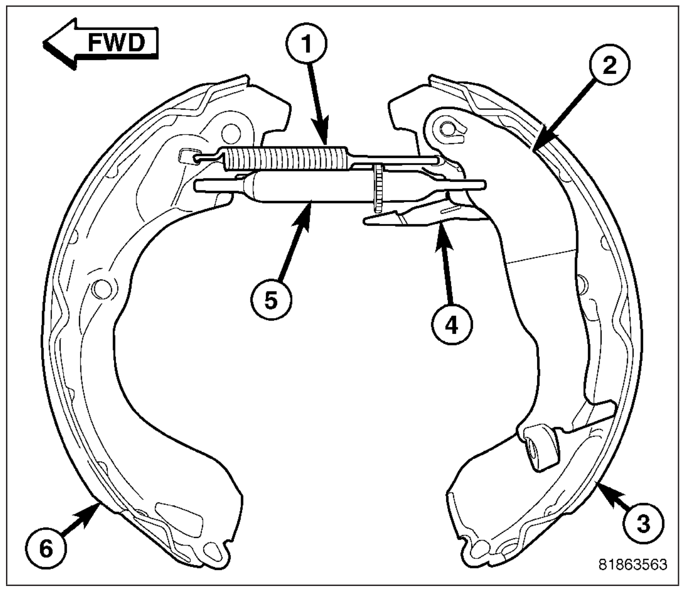
Clean and inspect the brake support plate and shoe adjuster screw. Apply a thin coat of Mopar® Multi-Purpose Grease or equivalent to the threads of the self-adjuster. Replace the adjuster screw if it is corroded.



NOTE: Adjuster screws are different side-to-side. Left side adjuster screws have left-hand threads and right side adjuster screws have right-hand threads.

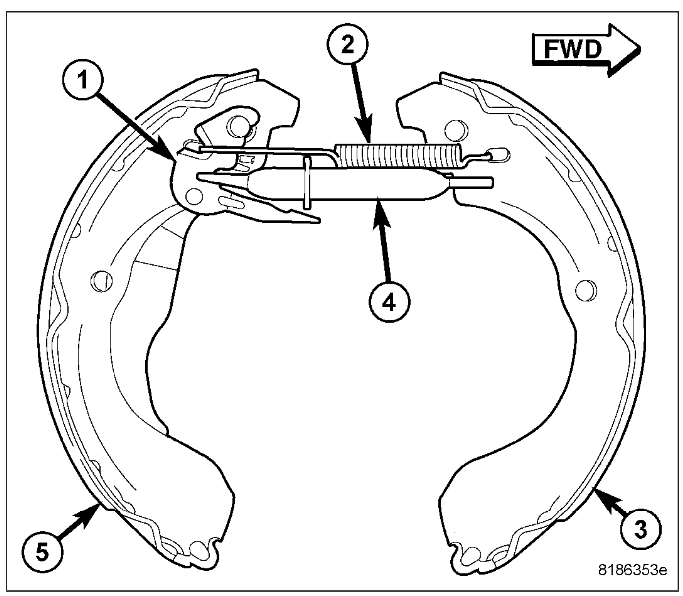
Inspect the return springs and hold-down spring clips. If the existing brake shoe return springs or hold-down spring clips have been overheated or damaged, replace them. Overheating indications are paint discoloration or distorted end coils.

INSTALLATION

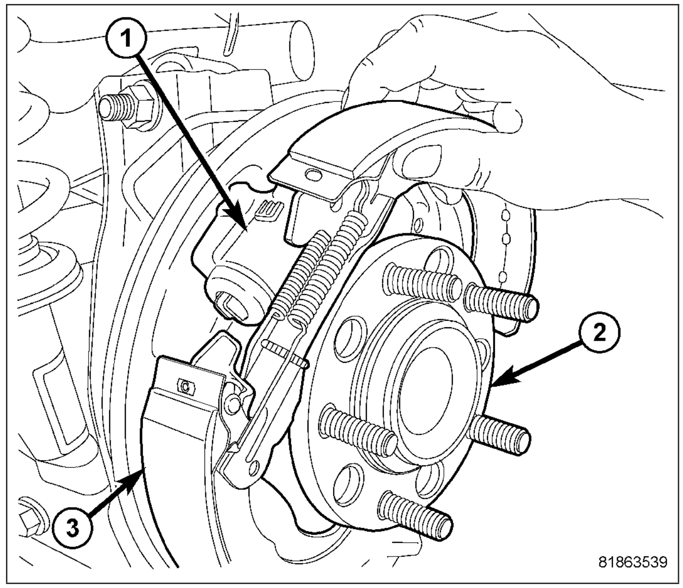


NOTE: Perform Step 1 through Step 21 on each side of vehicle to complete shoe set installation, then proceed to Step 22.

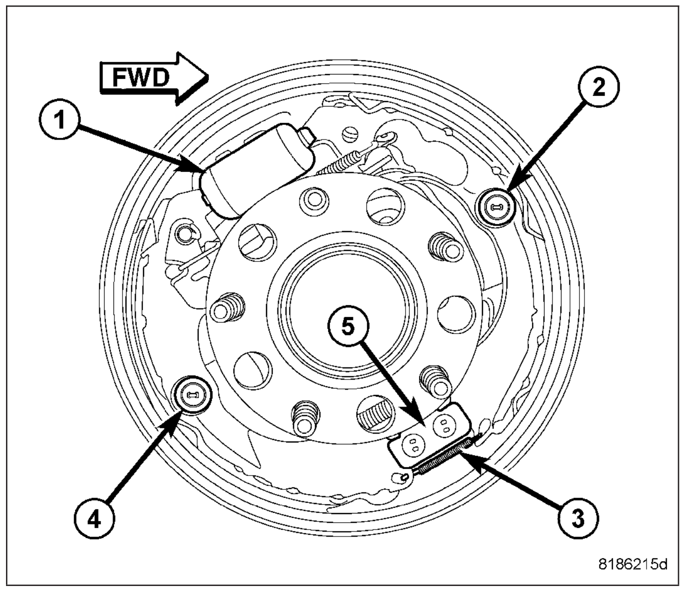
1. Lubricate shoe contact areas on support plate and anchor using Mopar® Brake Lubricant or equivalent.
2. Lubricate the adjuster screw threads with Mopar® Brake Lubricant or equivalent. Turn adjuster wheel in until it is completely seated.



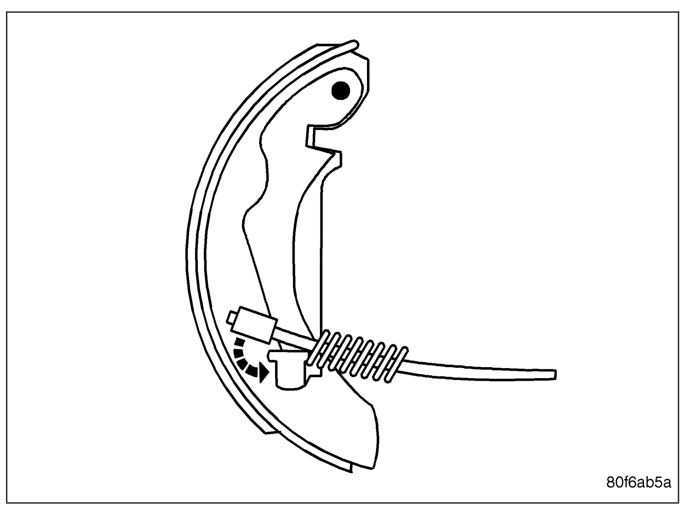
NOTE: Right side drum brake shown. Left side is typical.



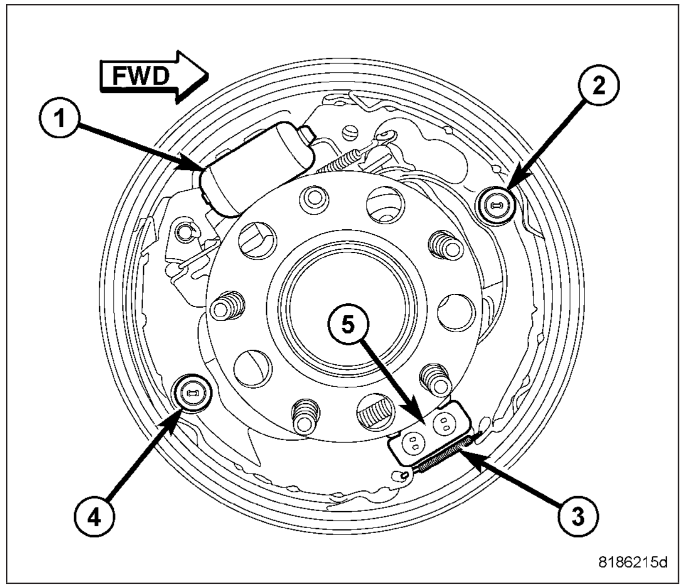
3. Place one front shoe (6) and one rear shoe (3) inboard-side-up on a flat surface. (rear shoe has parking brake lever attached to it).
4. Install the adjuster (5), adjuster wheel toward the rear, between the two brake shoes. Make sure the wide notch in the rear fork aligns with the parking brake lever (2).
5. Install the upper return spring (1) as shown.



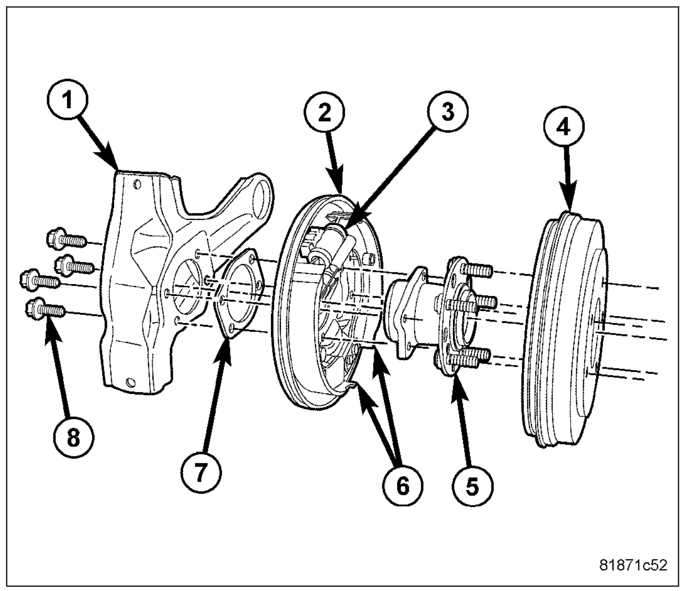
6. Flip the shoe assembly over to show the outboard side.
7. Install the lever pawl (1) onto the pivot located on the rear shoe (5).
8. Install the adjuster spring (2) between the front shoe (3) and the lever pawl (1).



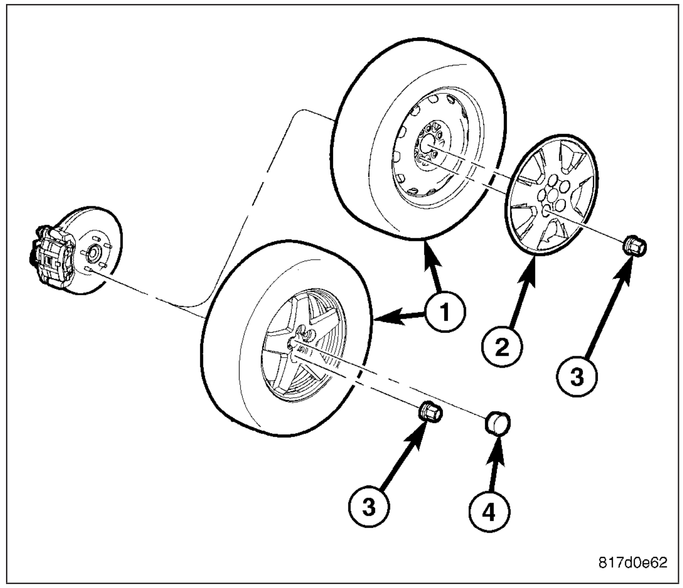
9. Install the pre-assembled brake shoe assembly (3) through the opening between the wheel cylinder (1) and support plate hub and bearing.



10. Insert the upper tips of the brake shoes into the grooves of the wheel cylinder (1) pistons.
11. Position the bottom of the front shoe against the anchor pin (5).
12. Install a shoe hold-down pin from the rear, through the support plate and the front shoe.
13. Compress and install the hold-down spring (2) retaining the front shoe to the support plate.



14. Compress the parking brake cable return spring, then carefully install the cable onto the parking brake lever. Release the spring guiding it beneath the retaining tab on the lever.

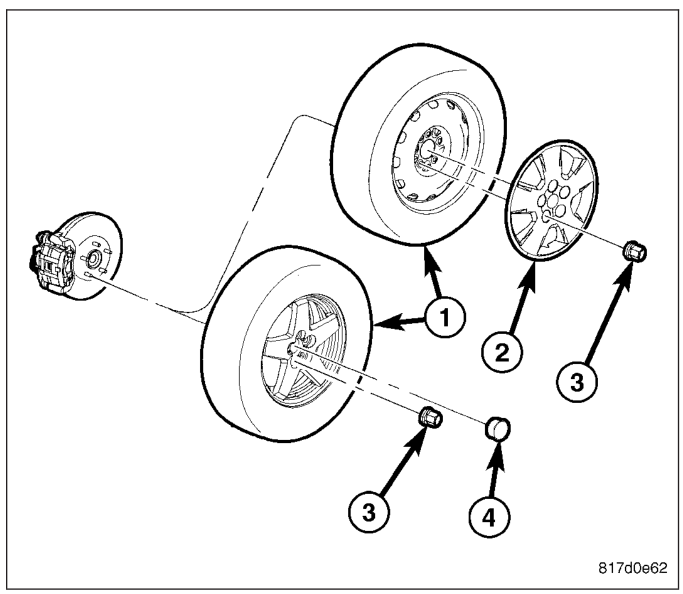


15. Position the bottom of the rear shoe against the anchor pin (5).
16. Install a shoe hold-down pin from the rear, through the support plate and the rear shoe.
17. Compress and install the hold-down spring (4) retaining the rear shoe to the support plate.
18. Install the lower shoe spring (3).

19. Adjust the brake shoes to the drum diameter using a brake shoe gauge. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - ADJUSTMENTS)
20. Install the brake drum (4). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DRUM - INSTALLATION)

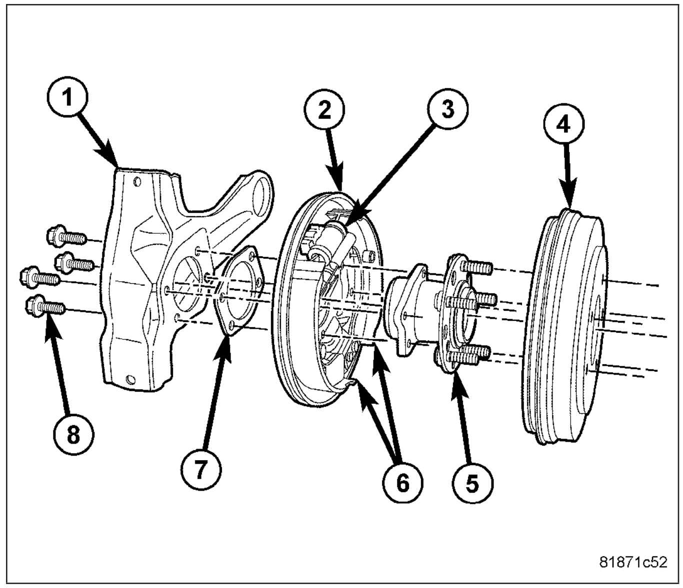
21. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
22. Slowly rotate both rear wheels and verify that the brake drums **lightly** drag on the shoes. Further adjustments may be done using the adjustment procedure as necessary. (Refer to 5 - BRAKES/ HYDRAULIC/MECHANICAL/BRAKE PADS/ SHOES - ADJUSTMENTS)
23. Lower the vehicle.
24. Road test vehicle stopping in both forward and reverse directions. The automatic-adjuster will continue to adjust brakes as necessary during road test.

ADJUSTMENTS



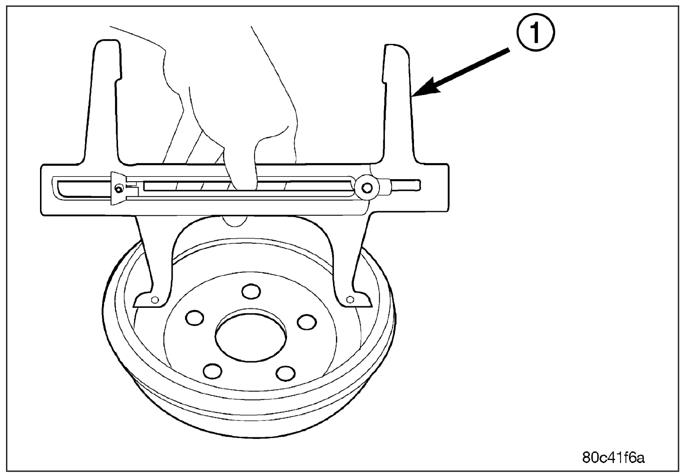
DRUM BRAKE SHOE ADJUSTMENT

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

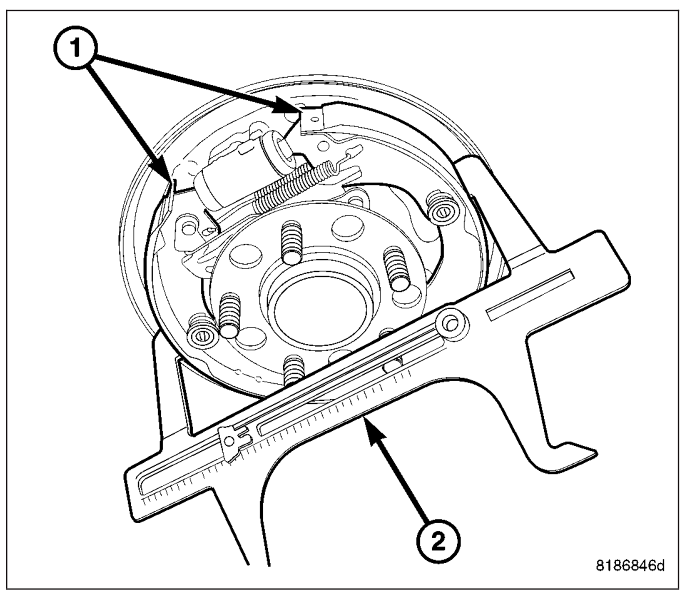


1. Verify the parking brake lever is in the fully released position.
2. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

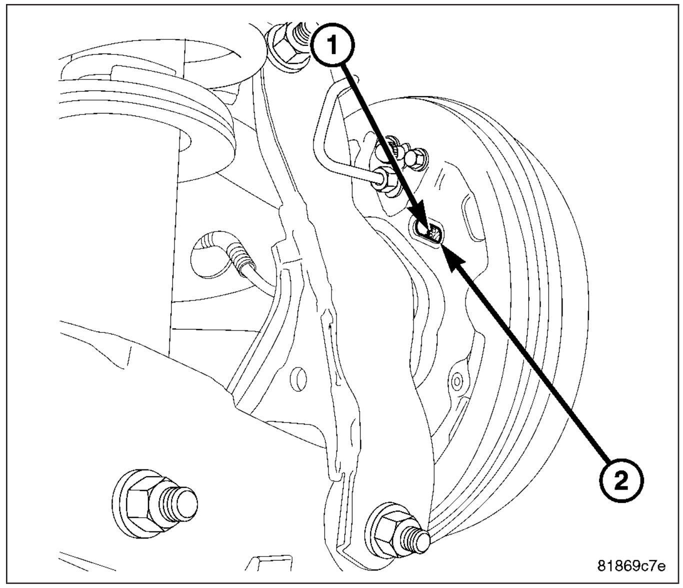
NOTE: Perform the following steps on each rear drum brake assembly as necessary.



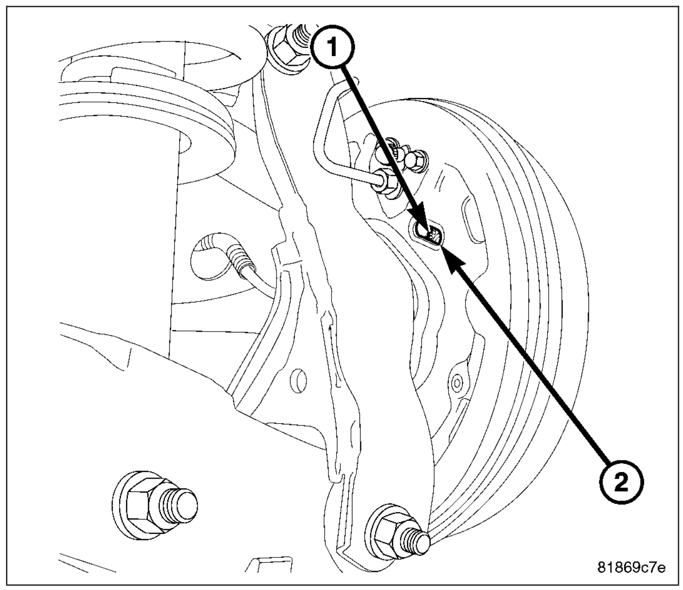
3. Remove the wheel mounting nuts (3), then the rear tire and wheel assembly.



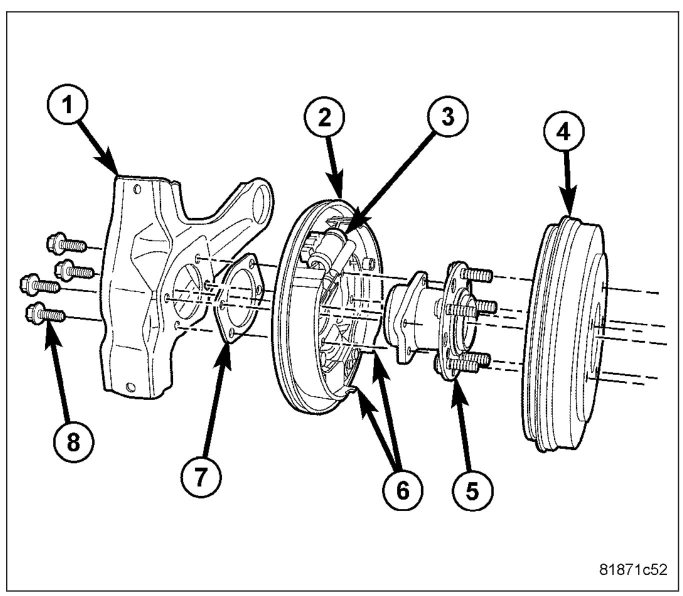
4. Remove the brake drum (4). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DRUM - REMOVAL)



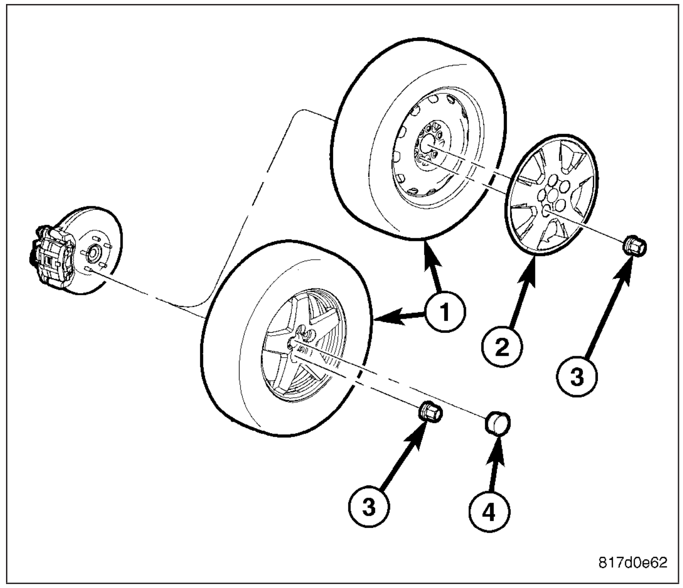
5. Using a Brake Shoe Gauge (1), Special Tool C-3919 or equivalent, measure the inside diameter of the brake drum at the center of the shoe contact area. Tighten the Gauge setscrew at this measurement.



6. Place the opposite side of the brake shoe gauge (2) over the brake shoes (1) as shown.



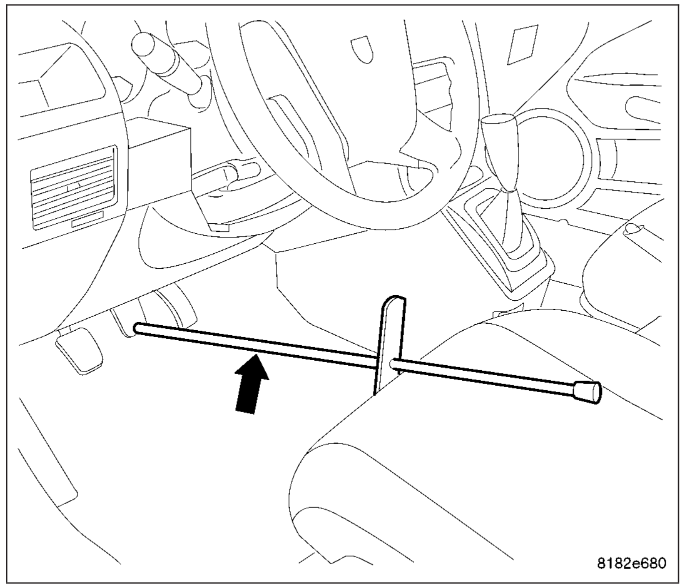
7. Adjust the shoe diameter to the setting on the gauge. To adjust the shoe diameter, turn the adjuster wheel using a screwdriver inserted through the adjusting hole in the rear of the shoe support plate. Once the tip of the screwdriver contacts the adjuster wheel teeth, move the handle of tool upward using the support plate as a pivot to adjust the shoes outward.



8. If at any time the adjustment needs to be backed off, perform the following:
   a. Remove the plug from the rear of the support plate below the wheel cylinder.
   b. Insert a small screwdriver through the access hole (2) in the support plate, under the adjuster, against the lever pawl. The pawl is attached to and pivots from the rear brake shoe.
   c. While pushing on the pawl with the screwdriver to disengage it from the adjuster wheel teeth, rotate the wheel (1) upward to back off the adjustment using another screwdriver or a brake adjuster tool.

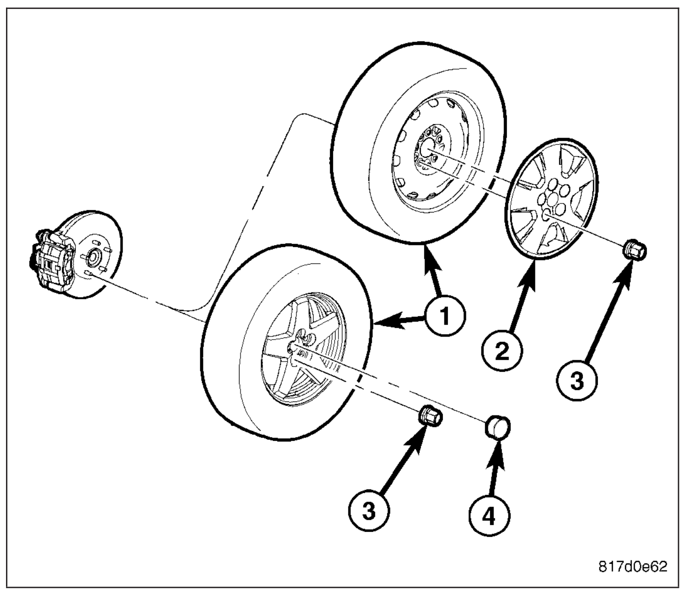
9. Once the shoe diameter is set, remove the tool and install the brake drum (4). (Refer to 5 - BRAKES/ HYDRAULIC/MECHANICAL/DRUM - INSTALLATION)
10. Turn the brake drum. A **slight** drag should be felt while rotating the drum. If not, repeat the above procedure.

11. Install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
12. After adjusting both rear drum brakes as necessary, lower the vehicle.



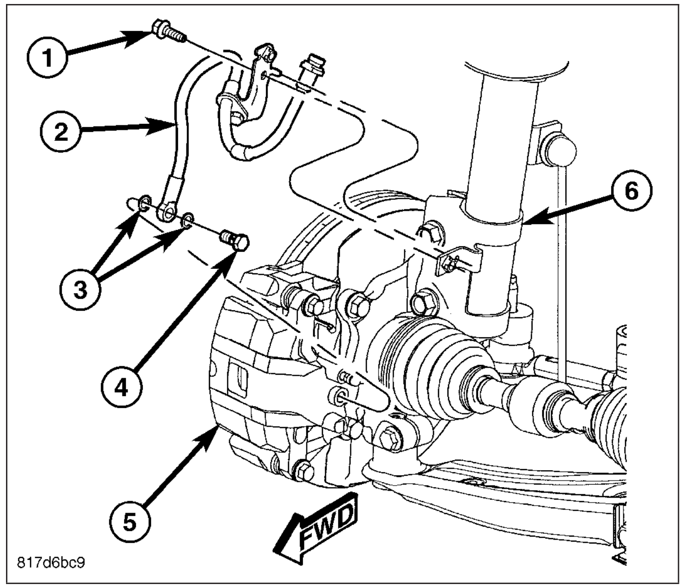
13. Apply and release the parking brake lever one time after the adjustment process is completed checking parking brake operation.
14. Road test the vehicle stopping in both forward and reverse directions. The automatic-adjuster will continue to adjust the brakes as necessary during the road test.

CALIPER-FRONT DISC BRAKE



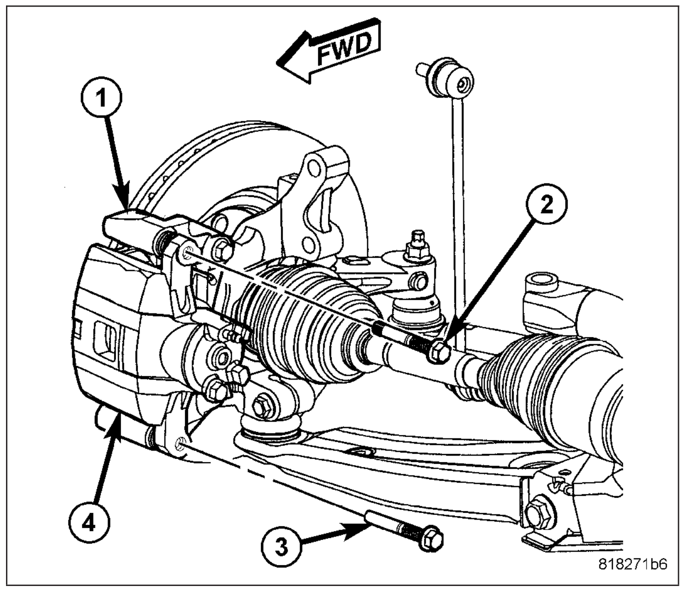
REMOVAL

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



1. Using a brake pedal holding tool as shown, depress the brake pedal past its first one inch of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir when the lines are opened.
2. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

3. Remove the wheel mounting nuts (3), then the tire and wheel assembly.



4. Remove the banjo bolt (4) connecting the brake flex hose (2) to the brake caliper (5). There are two washers (3) that will come off with the banjo bolt. Discard the washers.

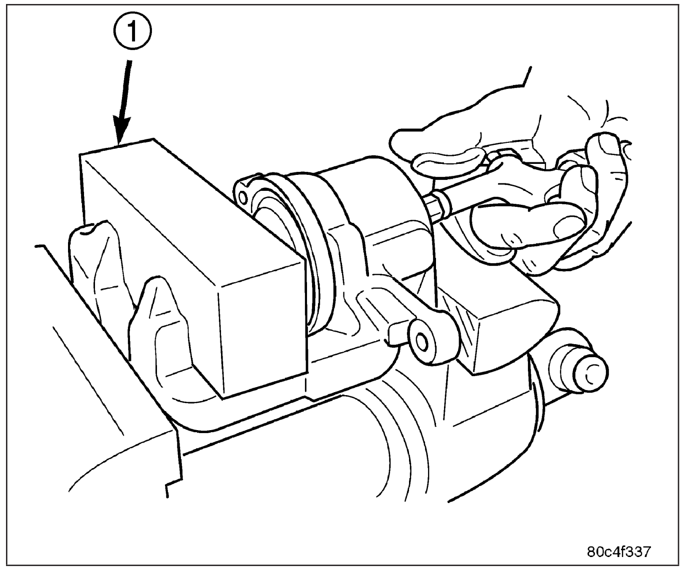
CAUTION: When removing the caliper guide pin bolts (2, 3) note that one (upper) has a special sleeve on the end. It important that his bolt be installed in the upper mounting hole when the caliper is installed.

5. Remove the two brake caliper guide pin bolts (2, 3).
6. Slide the disc brake caliper (4) from the disc brake adapter bracket (1) and brake pads and remove.

DISASSEMBLY

NOTE: Before disassembling the brake caliper, remove it from the vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - REMOVAL)

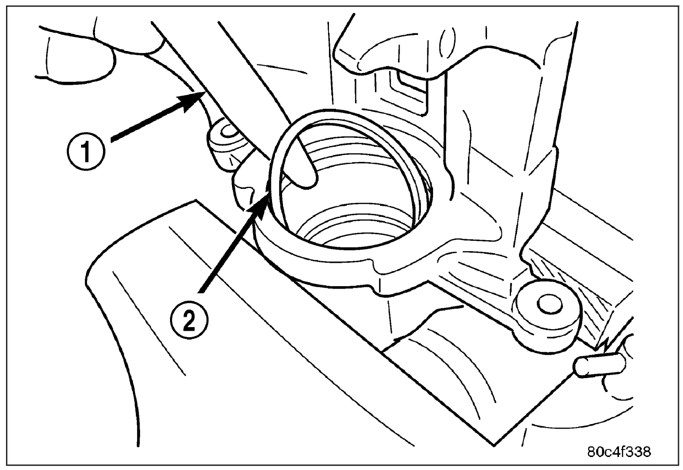
NOTE: Before disassembling the brake caliper, clean and inspect it. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - CLEANING) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSPECTION)



WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

1. Mount the caliper in a vise equipped with protective jaws.



WARNING: Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.

2. Place a wooden block (1) in the caliper as shown.
3. If necessary, apply low pressure compressed air to the caliper fluid inlet in short spurts to force the piston out.
4. Remove the piston from the caliper.
5. Remove the dust boot from the piston and discard it.

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

6. Using a soft tool such as a plastic trim stick (1), work the piston seal (2) out of its groove in caliper piston bore. Discard the used seal.
7. Clean the piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
8. Inspect both the piston and bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth.

CLEANING

WARNING: Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from production or aftermarket brake linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not sand or grind brake lining unless equipment used is designed to contain the dust residue. Do not clean brake parts with compressed air or by dry brushing. Cleaning should be done by dampening the brake components with a fine mist of water, then wiping the brake components clean with a dampened cloth. Dispose of cloth and all residue containing asbestos fibers in an impermeable container with the appropriate label. Follow practices prescribed by the Occupational Safety And Health Administration (OSHA) and the Environmental Protection Agency (EPA) for the handling, processing, and disposing of dust or debris that may contain asbestos fibers.

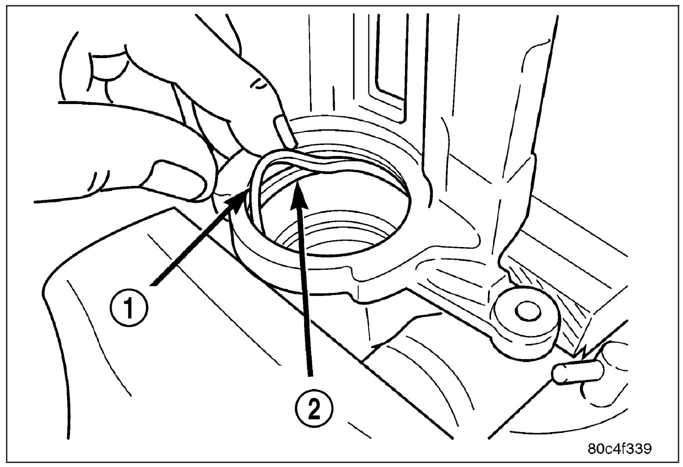
To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION

Inspect the disc brake caliper for the following:

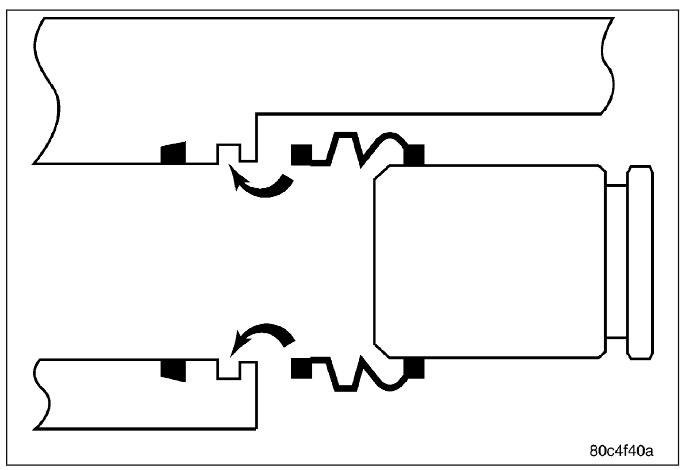
- Brake fluid leaks in and around piston boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.



ASSEMBLY

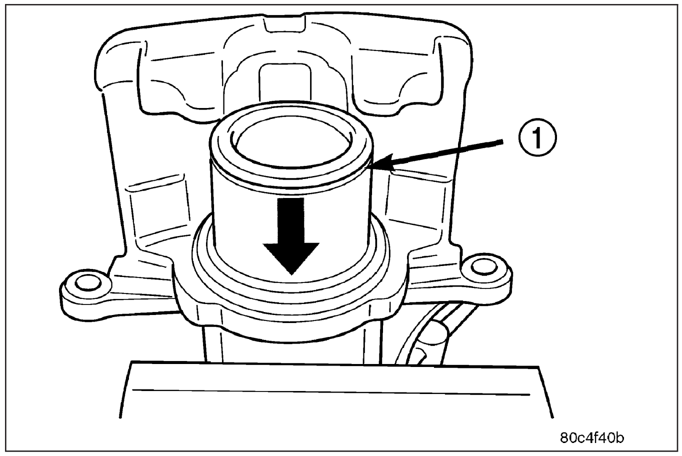
NOTE: Always have clean hands when assembling a brake caliper.



NOTE: Always use fresh, clean brake fluid when assembling a brake caliper.

NOTE: Never use an old piston seal.

1. Dip the NEW piston seal in clean brake fluid and install it in the groove (2) of the caliper bore. The seal (1) should be started at one area of the groove and gently worked around into the groove using only your clean fingers to seat it.

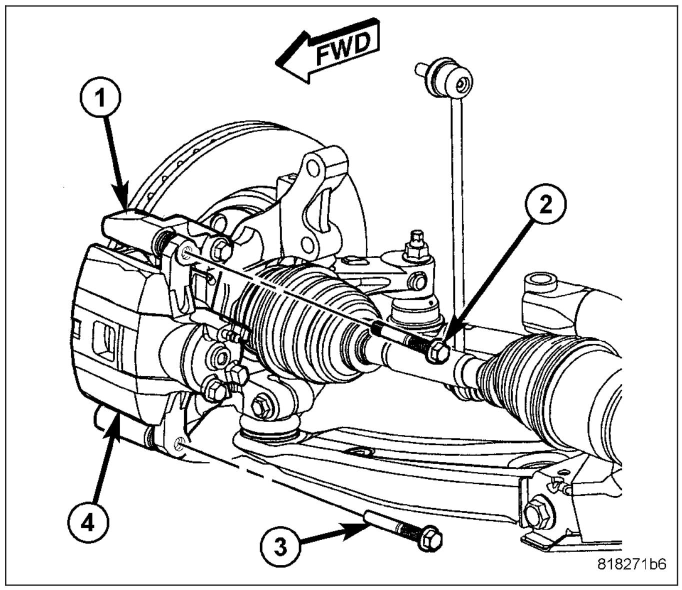


2. Coat the NEW piston with clean brake fluid.
3. Coat the NEW piston boot with clean brake fluid leaving a generous amount inside the boot.
4. Position the dust boot over the lower section of the piston.
5. Extend the dust boot below the bottom of the piston and guide the lip seal into the groove in the caliper piston bore.

CAUTION: Force applied to the piston (1) to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

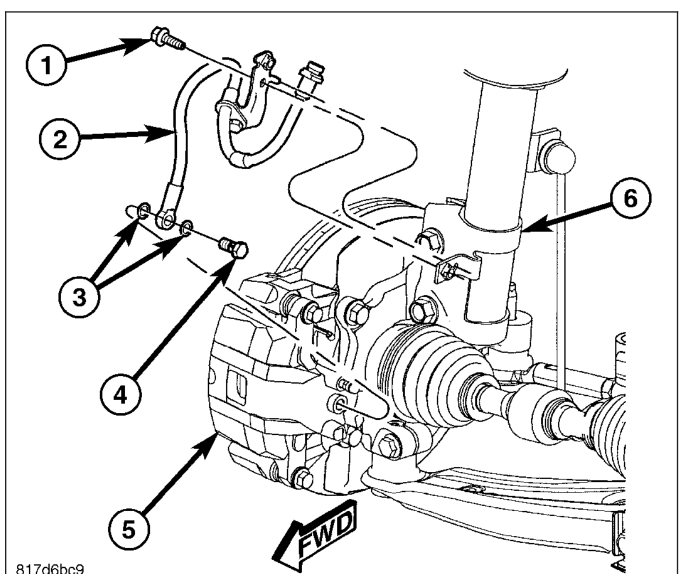
6. Install the piston (1) into the bore, carefully pushing it past the piston seal using **hand pressure**. Push the piston in until it bottoms in the caliper bore and the dust boot lip seal falls into the groove near the top of the piston.
7. Install the caliper on the vehicle and bleed the brakes as necessary. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSTALLATION)

INSTALLATION



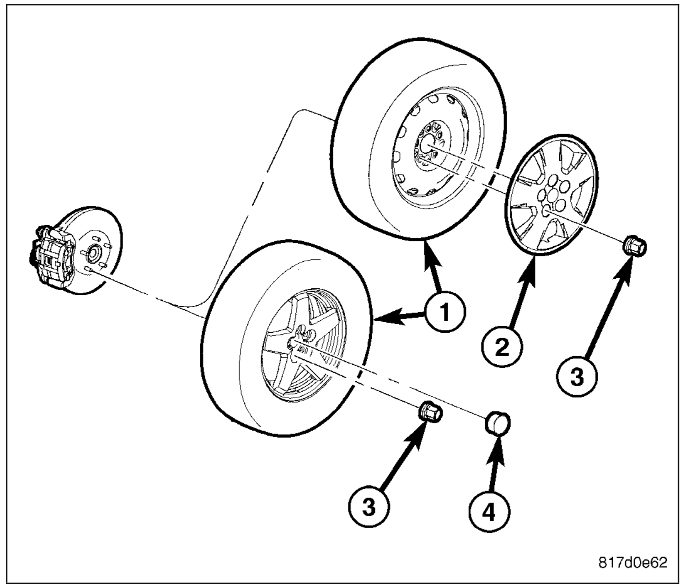
1. Completely retract the caliper piston back into the bore of the caliper. Use a C-clamp to retract the piston. Place a wood block over the piston before installing the C-clamp to avoid damaging the piston.

CAUTION: Use care when installing the caliper (4) onto the adapter bracket (1) to avoid damaging the guide pin boots.

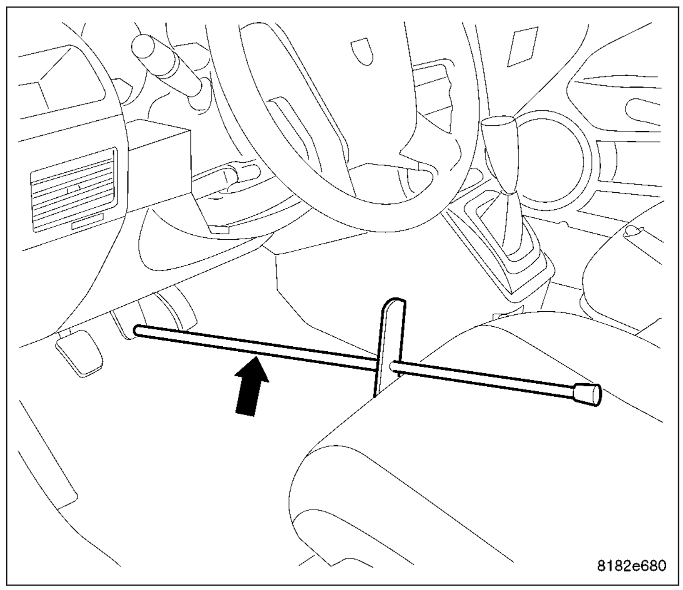


2. Install the disc brake caliper over the brake pads on the brake caliper adapter bracket.

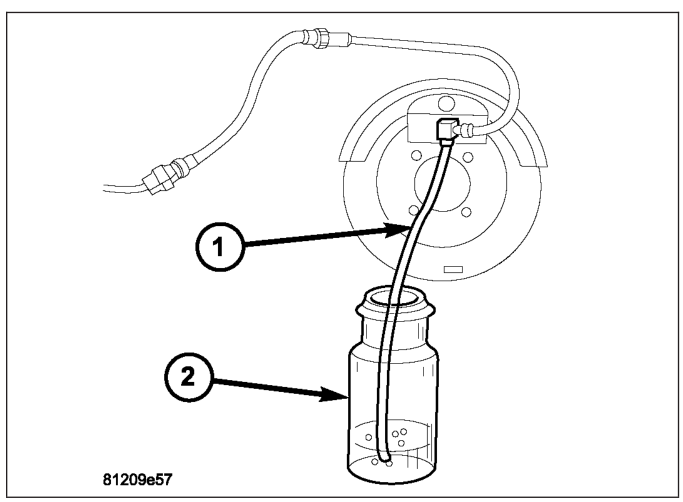
CAUTION: When installing the caliper guide pin bolts (2, 3) make sure that the one that has a special sleeve on the end is installed in the upper mounting hole.



3. Align the caliper guide pin bolt holes with the adapter bracket. Install the upper (with special sleeve) (2) and lower (3) caliper guide pin bolts. Tighten the guide pin bolts to 43 N·m (32 ft. lbs.).



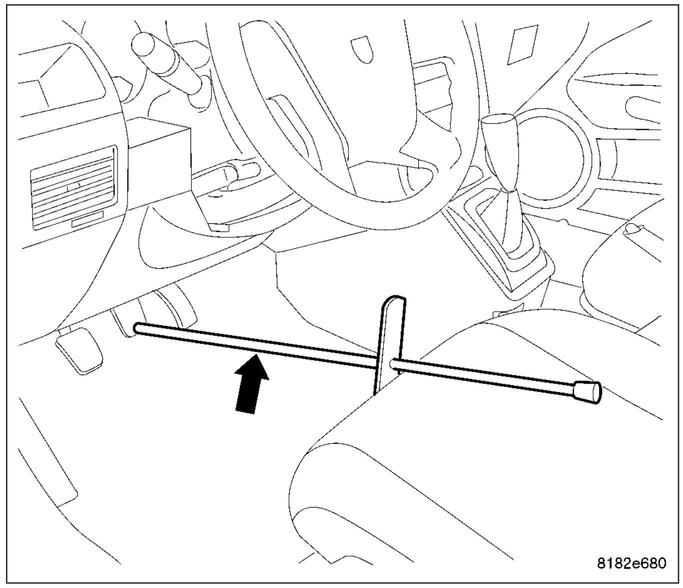
4. Install the banjo bolt (4) connecting the brake flex hose (2) to the brake caliper (5). Install NEW washers (3) on each side of the hose fitting as the banjo bolt is guided through the fitting. Thread the banjo bolt into the caliper and tighten it to 24 N·m (18 ft. lbs.).



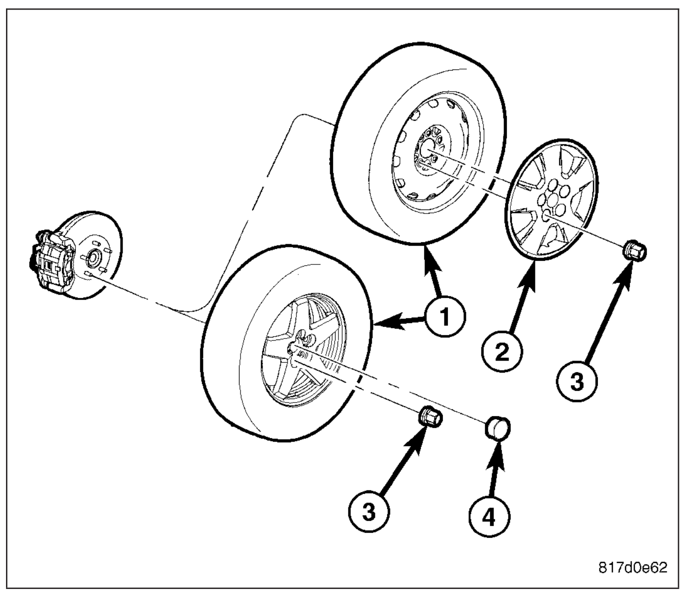
5. Install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
6. Lower the vehicle.

7. Remove the brake pedal holding tool.

8. Bleed the caliper as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
9. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoes.

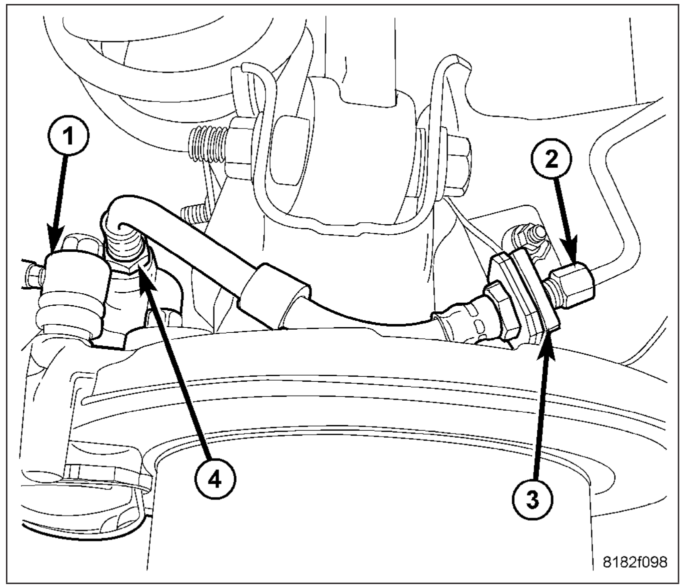


CALIPER-REAR DISC BRAKE



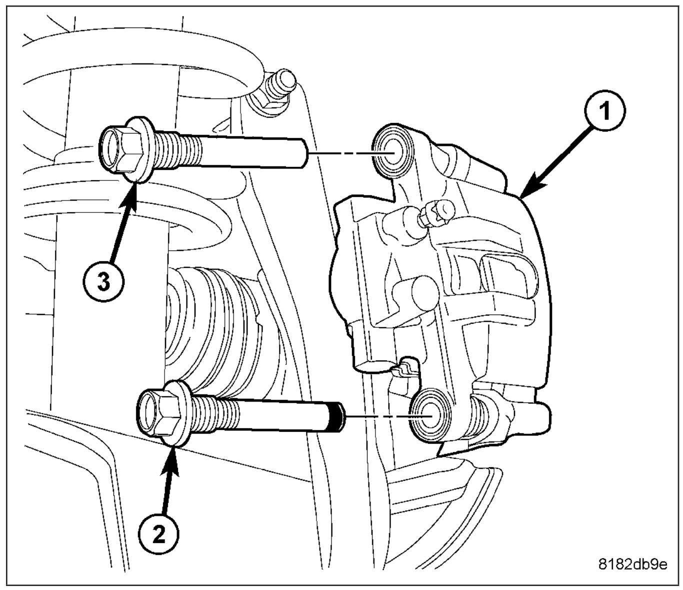
REMOVAL

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



1. Using a brake pedal holding tool as shown, depress the brake pedal past its first one inch of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir while the lines are disconnected.

2. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
3. Remove the wheel mounting nuts (3), then the rear tire and wheel assembly.



4. Unthread the brake tube nut (2) at the rear flex hose.
5. Remove the clip (3) securing the rear flex hose to the trailing link mounted bracket. Remove the flex hose from the bracket.
6. Unthread and remove the brake flex hose (4) from the brake caliper (1).

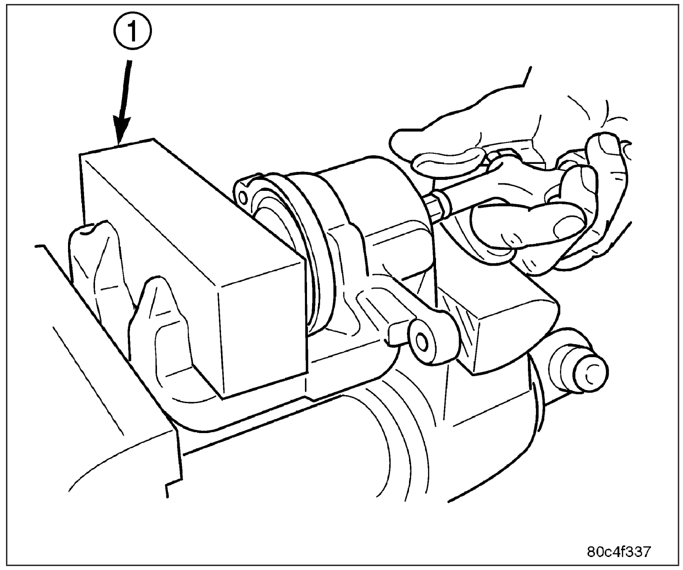
CAUTION: When removing the caliper guide pin bolts (2, 3) note that one (lower) has a special sleeve on the end. It important that his bolt be installed in the lower mounting hole when the caliper is installed.

7. Remove the two brake caliper guide pin bolts (2, 3).
8. Slide and remove the disc brake caliper (1) with outboard brake pad attached from the disc brake adapter bracket, inboard brake pad and rotor.
9. Remove the outboard brake pad from the caliper by prying the brake pad retaining clip over the raised area on the caliper. Slide the brake pad off of the brake caliper.

DISASSEMBLY

NOTE: Before disassembling the brake caliper, remove it from the vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - REMOVAL)

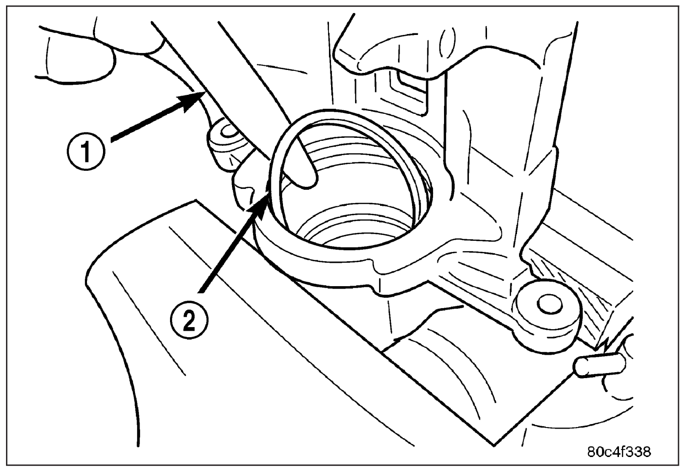
NOTE: Before disassembling the brake caliper, clean and inspect it. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - CLEANING) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSPECTION)



WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

1. Mount the caliper in a vise equipped with protective jaws.



WARNING: Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.

2. Place a wooden block (1) in the caliper as shown.
3. If necessary, apply low pressure compressed air to the caliper fluid inlet in short spurts to force the piston out.
4. Remove the piston from the caliper.
5. Remove the dust boot from the piston and discard it.

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

6. Using a soft tool such as a plastic trim stick (1), work the piston seal (2) out of its groove in caliper piston bore. Discard the used seal.
7. Clean the piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
8. Inspect both the piston and bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth.

CLEANING

WARNING: Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from production or aftermarket brake linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not sand or grind brake lining unless equipment used is designed to contain the dust residue. Do not clean brake parts with compressed air or by dry brushing. Cleaning should be done by dampening the brake components with a fine mist of water, then wiping the brake components clean with a dampened cloth. Dispose of cloth and all residue containing asbestos fibers in an impermeable container with the appropriate label. Follow practices prescribed by the Occupational Safety And Health Administration (OSHA) and the Environmental Protection Agency (EPA) for the handling, processing, and disposing of dust or debris that may contain asbestos fibers.

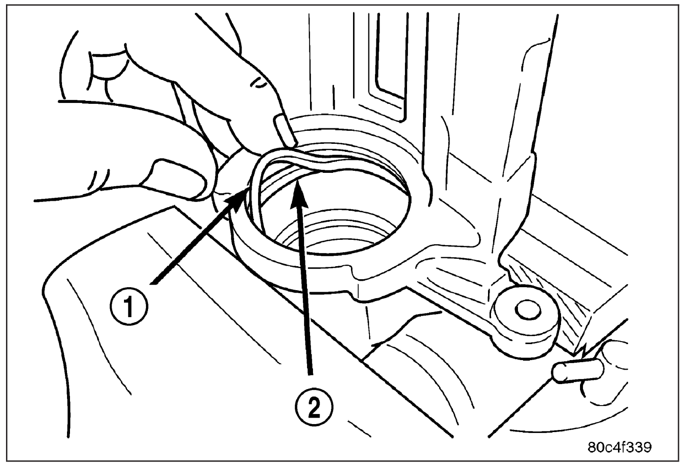
To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION

Inspect the disc brake caliper for the following:

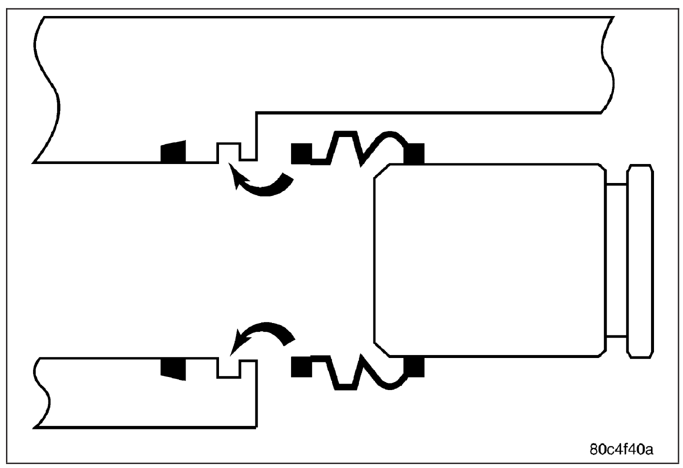
- Brake fluid leaks in and around boot area and inboard lining
- Ruptures, brittleness or damage to the piston dust boot
- Damaged, dry or brittle guide pin dust boots

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.



ASSEMBLY

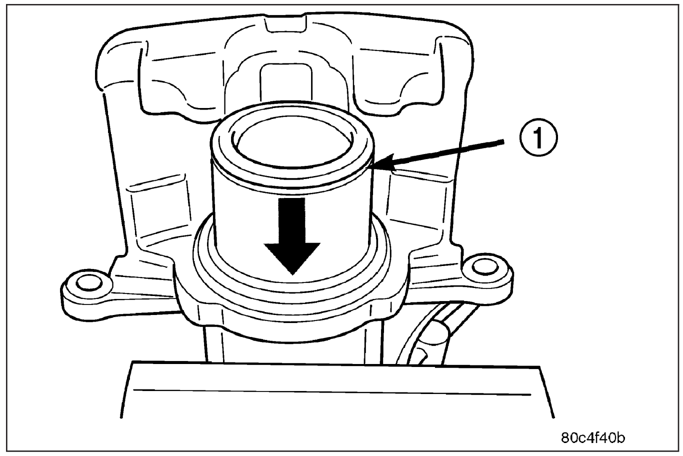
NOTE: Always have clean hands when assembling a brake caliper.



NOTE: Always use fresh, clean brake fluid when assembling a brake caliper.

NOTE: Never use an old piston seal.

1. Dip the NEW piston seal in clean brake fluid and install it in the groove (2) of the caliper bore. The seal (1) should be started at one area of the groove and gently worked around into the groove using only your clean fingers to seat it.

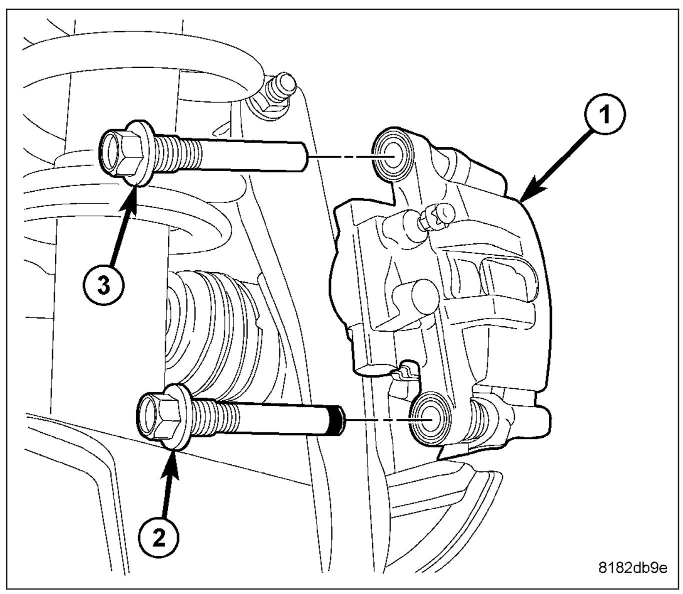


2. Coat the NEW piston with clean brake fluid.
3. Coat the NEW piston boot with clean brake fluid leaving a generous amount inside the boot.
4. Position the dust boot over the lower section of the piston.
5. Extend the dust boot below the bottom of the piston and guide the lip seal into the groove in the caliper piston bore.

CAUTION: Force applied to the piston (1) to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

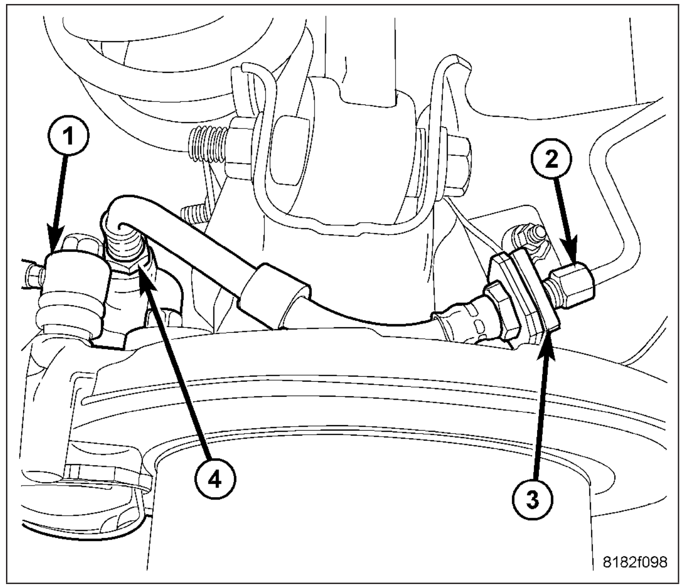
6. Install the piston (1) into the bore, carefully pushing it past the piston seal using **hand pressure**. Push the piston in until it bottoms in the caliper bore and the dust boot lip seal falls into the groove near the top of the piston.
7. Install the caliper on the vehicle and bleed the brakes as necessary. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSTALLATION)

INSTALLATION



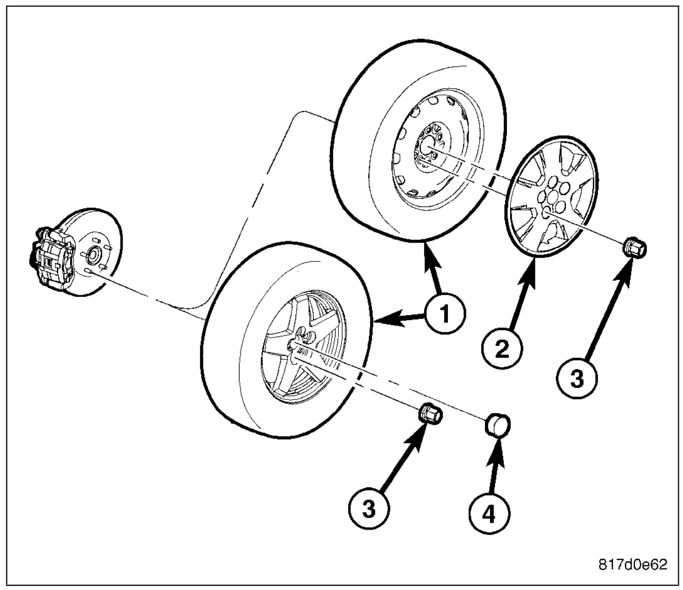
1. If not already performed, completely retract the caliper piston back into the piston bore of the caliper. Use a C-clamp to retract the piston. Place a wood block over the piston before installing the C-clamp to avoid damaging the piston.
2. Slide the outboard brake pad onto the caliper. Be sure the retaining clip is squarely seated in the depressed areas on the caliper beyond the raised retaining bead.

CAUTION: Use care when installing the caliper onto the disc brake adapter to avoid damaging the guide pin boots.

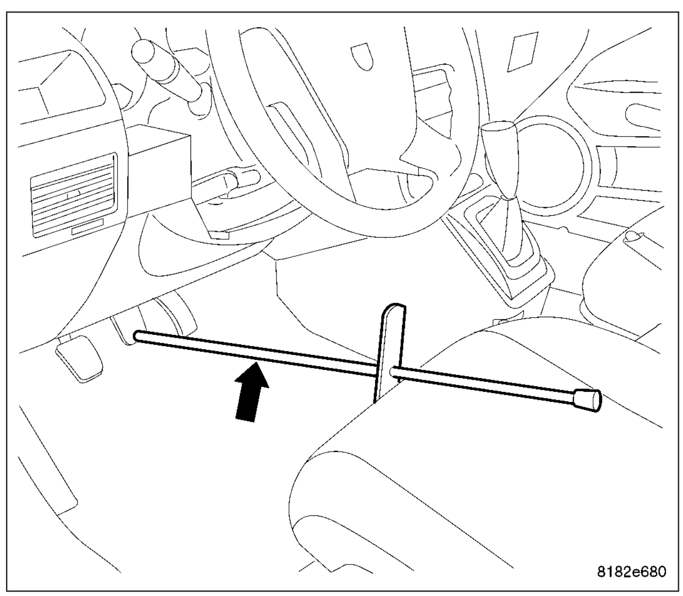


3. Install the disc brake caliper with outboard brake pad attached over the inboard brake pad and rotor, onto the brake caliper adapter bracket.

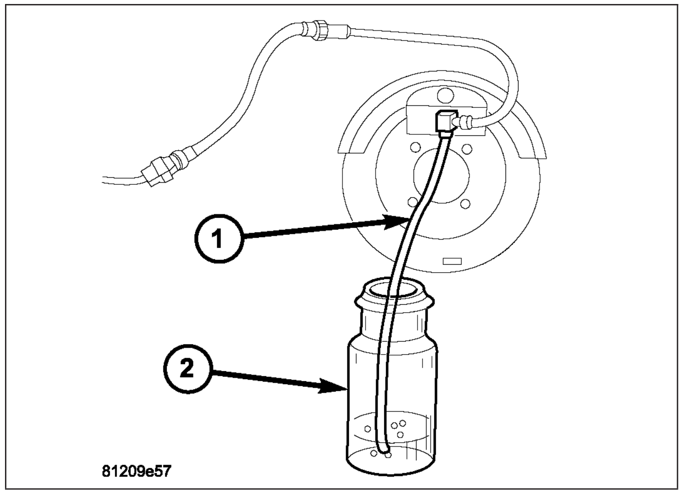
CAUTION: When installing the caliper guide pin bolts (2, 3) make sure that the one that has a special sleeve on the end is installed in the lower mounting hole.



4. Align the caliper guide pin bolt holes with the adapter bracket. Install the lower (with special sleeve) (2) and upper (3) caliper guide pin bolts. Tighten the guide pin bolts to 43 N·m (32 ft. lbs.).



5. Thread the rear brake flex hose (4) into the brake caliper (1). Tighten the flex hose fitting at the caliper to 15 N·m (133 in. lbs.).
6. Route and install the brake flex hose into the trailing link mounted bracket. Install the clip (3) securing the flex hose to the bracket.
7. Thread the brake tube nut (2) into brake flex hose. Tighten the brake tube nut to 17 N·m (150 in. lbs.).



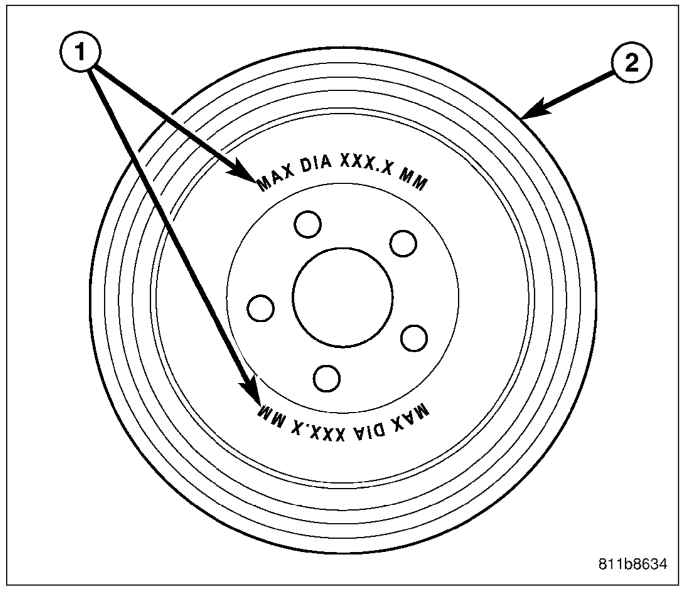
8. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
9. Lower the vehicle.

10. Remove the brake pedal holding tool.

11. Bleed the caliper as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
12. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoes.

DRUM

DIAGNOSIS AND TESTING



BRAKE DRUM

With the drum off the vehicle, measure the drum for diameter variation (oval shape). The diameter variation of the drum braking surface must not exceed specifications listed in the following table.

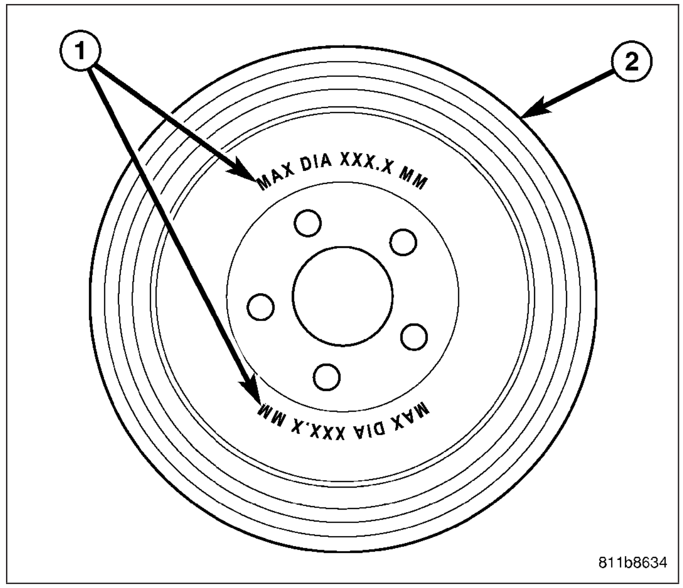
Measure brake drum runout. Brake drum runout should be checked with the drum mounted on a brake lathe. Brake drum runout should not exceed specifications listed in the following table.

If either of these measurements are not within specification, reface or replace the drum. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DRUM - STANDARD PROCEDURE).

Always replace the drum if machining will cause the diameter to exceed drum maximum diameter. All brake drums (2) are marked on the inside with the maximum allowable brake drum diameter (1). Maximum brake drum diameter can also be found in the following table.

BRAKE DRUM LIMITS

SALES CODE	DIAMETER VARIATION	RUNOUT	MAXIMUM DIAMETER
ALL	0.20 mm 0.008 in.	0.06 mm 0.002 in.	230.60 mm 9.079 in.



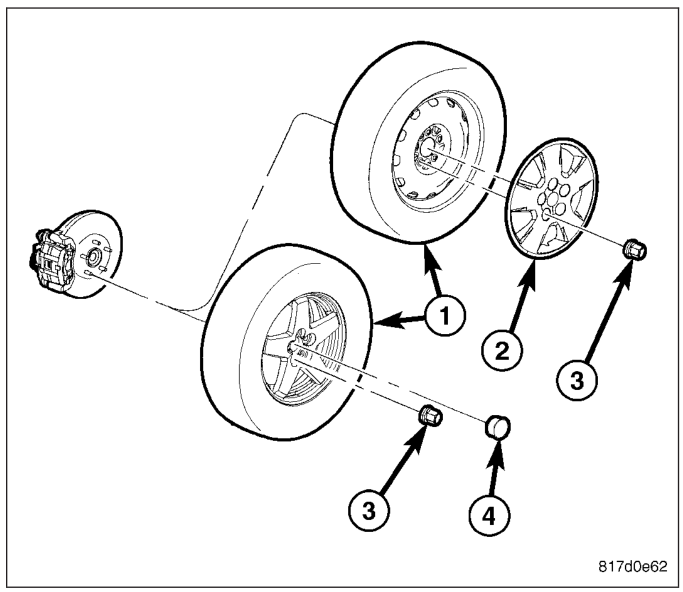
STANDARD PROCEDURE

BRAKE DRUM MACHINING

If a brake drum is deeply scored or warped, it can be machined on a brake lathe equipped to machine brake drums. Follow the manufacturers instructions on the machining procedure.

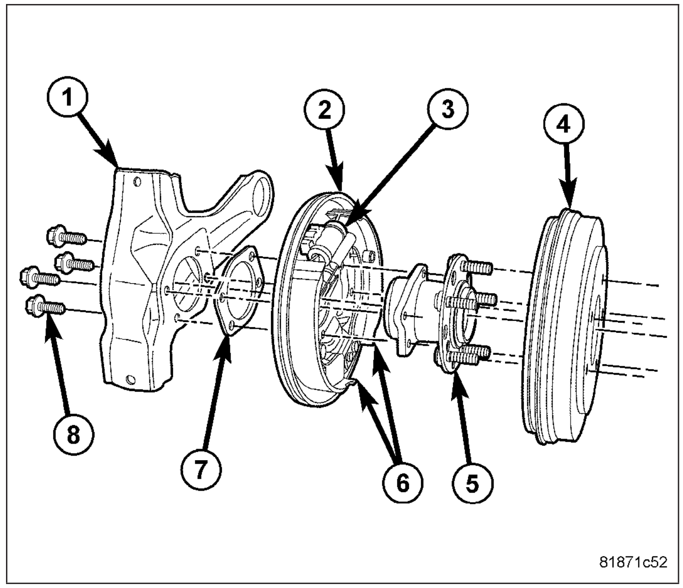
Measure the brake drum diameter before machining. If machining the drum will cause the drum to exceed maximum allowable diameter, do not machine the brake drum. It needs to be replaced.

CAUTION: Do not machine the brake drum if it will cause the drum to exceed maximum allowable diameter.



All brake drums (2) are marked with the maximum allowable brake drum diameter. All vehicles have it marked on the inside of the drum (1).

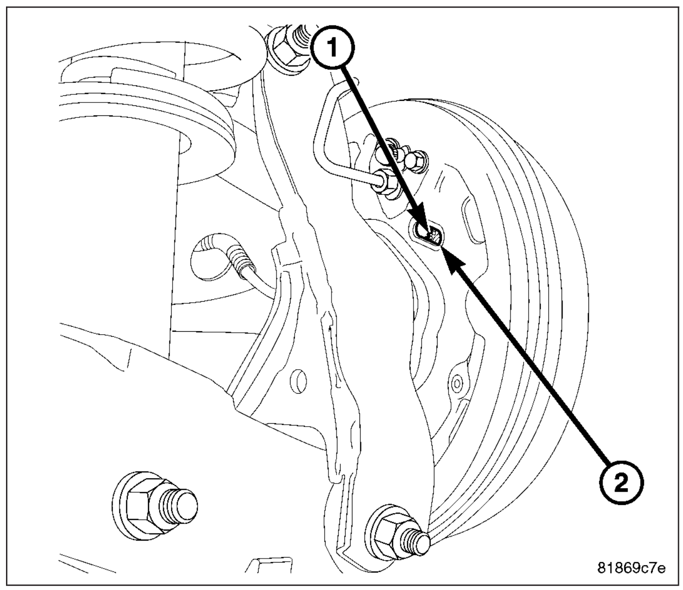
When machining, make sure the feed rate for the final cut is set to deliver a fine finish. A fine finish helps to avoid a screw effect on the brake shoes when the brakes are applied. This final feed cut specification varies from lathe manufacturer to lathe manufacturer.



REMOVAL

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

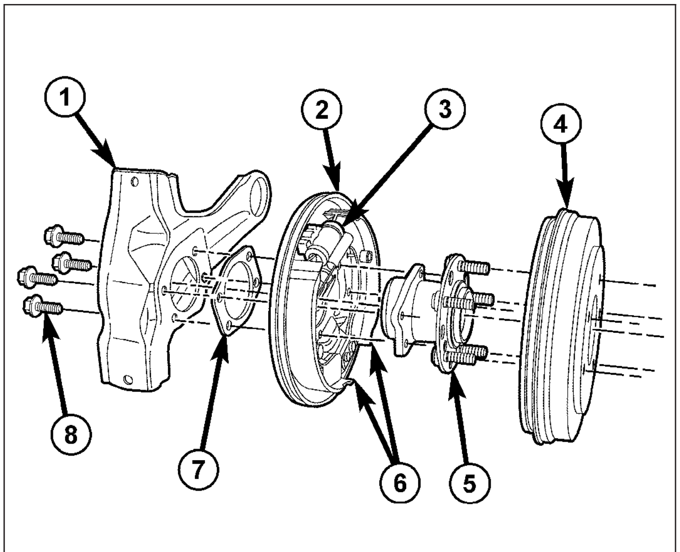
1. Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel mounting nuts (3), then the tire and wheel assembly.



3. Slide the brake drum (4) off the wheel mounting studs of the hub and bearing (5) and remove it from the vehicle. If the drum does not come off, further brake clearance can be obtained by backing off the brake adjuster screw. To do so, perform the following procedure.

BACKING OFF SHOE ADJUSTMENT

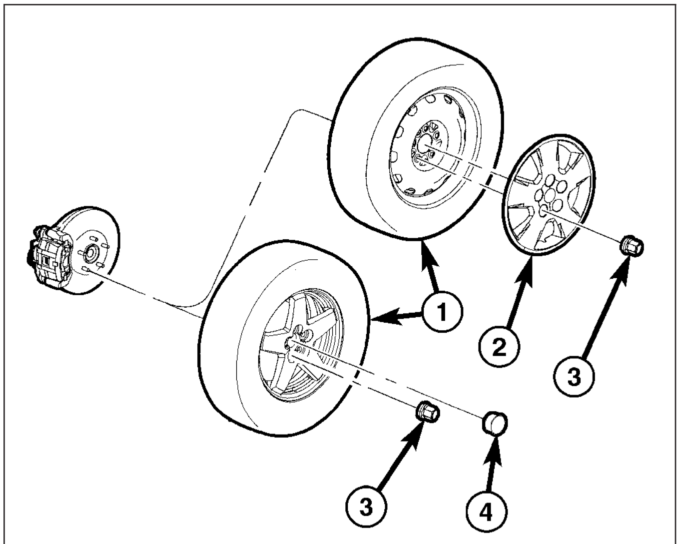
1. Remove the plug from the rear of the support plate below the wheel cylinder.
2. Insert a small screwdriver through the access hole (2) in the support plate, under the adjuster, against the lever pawl. The pawl is attached to and pivots from the rear brake shoe.
3. While pushing on the pawl with the screwdriver to disengage it from the adjuster wheel teeth, rotate the wheel (1) upward to back off the adjustment using another screwdriver or a brake adjuster tool.
4. Once the adjuster screw is backed off a sufficient amount, slide the drum off the wheel mounting studs.



INSTALLATION

NOTE: Before installing drum, inspect brake shoe linings for wear, alignment, and contamination. Repair or replace as necessary.

NOTE: If rust or any foreign material is present on hub, drum or wheel mating surfaces, wet wire brush these areas to remove prior to assembly of parts.



1. Properly remove any buildup formed along outer edge of drum's machined braking surface.
2. Adjust the brake shoes-to-drum diameter using a brake shoe gauge. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - ADJUSTMENTS)

3. Slide the brake drum (4) onto the wheel mounting studs on the hub and bearing (5).

81871c52

4. Install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
5. Lower the vehicle.
6. Road test the vehicle stopping in both forward and reverse directions. The automatic-adjuster will continue to adjust the brakes as necessary during the road test.

817d0e62

FLUID

DIAGNOSIS AND TESTING

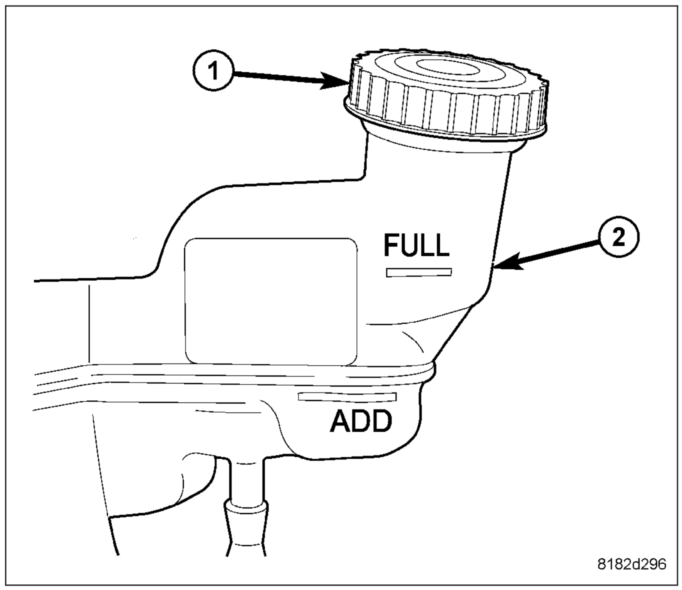
BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts. Swelling indicates the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If the fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If the brake fluid is contaminated, drain and thoroughly flush the brake system. Replace all the rubber parts or components containing rubber coming into contact with the brake fluid including: the master cylinder and reservoir; proportioning valves (non-ABS); caliper seals; wheel cylinder seals; ABS hydraulic control unit; and all hydraulic fluid hoses.

STANDARD PROCEDURE



BRAKE FLUID LEVEL CHECKING

NOTE: Brake fluid level should be checked a minimum of twice a year.

Master cylinder reservoirs (2) are marked, FULL and ADD, indicating the allowable brake fluid level range in the master cylinder fluid reservoir.

CAUTION: Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container. Do not use petroleum-based fluid because seal damage in the brake system will result. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID - SPECIFICATIONS)

NOTE: Although there is a range, the preferred level is FULL.

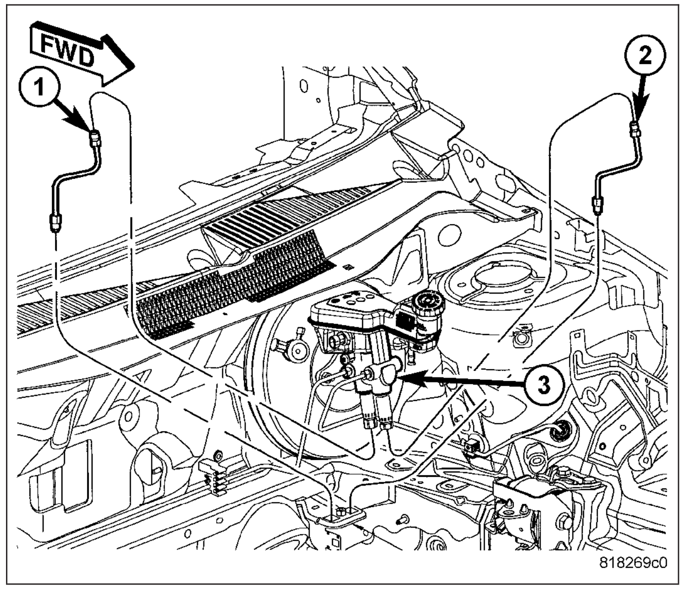
1. Remove the cap (1).
2. Adjust the brake fluid level to the FULL mark listed on the side of the master cylinder fluid reservoir (2) as necessary. Do not overfill the system.
3. Install the cap (1).

SPECIFICATIONS

BRAKE FLUID

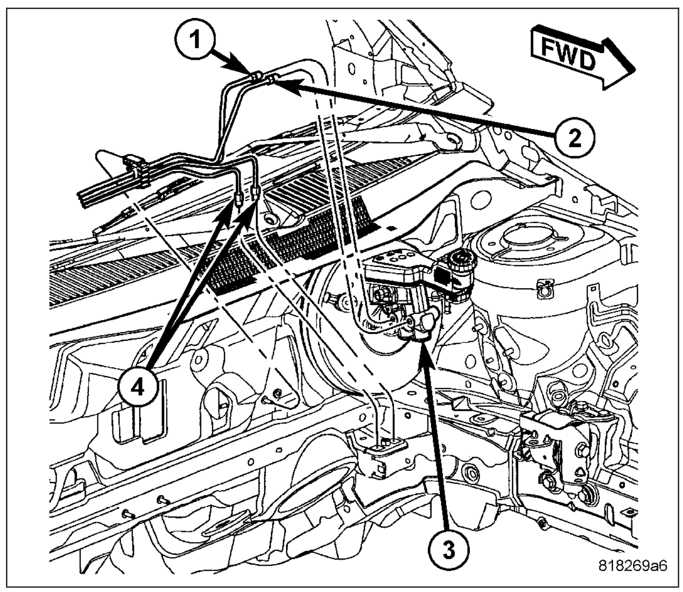
The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container will absorb moisture from the air and contaminate the fluid.



CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

MASTER CYLINDER



DESCRIPTION

The master cylinder used on this vehicle is a Plunger II design supplied by Continental Teves. The bore diameter for all applications is 20.6 mm (0.812 in.).

The non-ABS master cylinder (3) is a four-outlet design (one for each wheel brake). There are two ports at each piston. One feeds a front wheel brake while the other feeds the opposite side rear wheel brake. The rear wheel brake ports are drilled and threaded to accept screw-in proportioning valves. Both valves are threaded into the bottom of the master cylinder housing.

All ABS master cylinders (3) are a two-outlet design and the brake tubes from these primary and secondary outlet ports lead directly to the Integrated Control Unit (ICU) before going to each wheel brake.

All master cylinders mount to the power brake booster in the same manner.

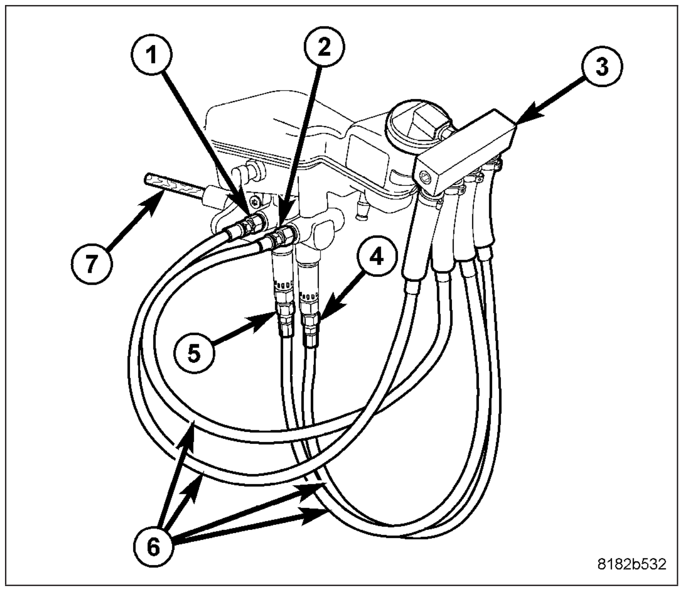
The master cylinder body is an anodized aluminum casting. It has a machined bore to accept the master cylinder pistons and also has threaded ports with seats for hydraulic brake tube connections.

The master cylinder has the brake fluid reservoir mounted on top of it which gravity feeds brake fluid to the master cylinder when it is required. On manual transmission model vehicles the brake fluid reservoir also feeds the clutch hydraulic circuit. The reservoir is made of see-through plastic and it houses the brake fluid level switch. A removable brake fluid level switch is mounted in the right side.

OPERATION

When the brake pedal is pressed, the master cylinder primary and secondary pistons apply brake pressure through the proportioning valves (on non-ABS vehicles) and chassis brake tubes to each brake assembly. The brake fluid reservoir supplies the brake hydraulic system with the necessary fluid to operate properly.

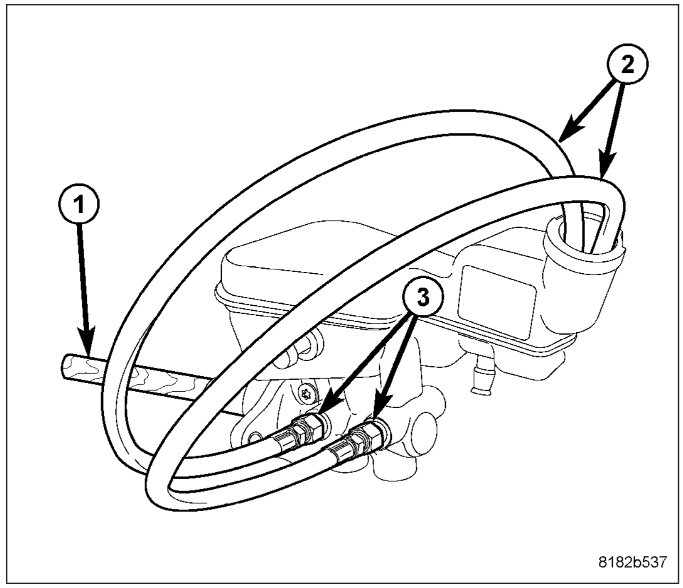
The non-ABS master cylinder's primary outlet ports supply hydraulic pressure to the right front and left rear brakes while the secondary outlet ports supply hydraulic pressure to the left front and right rear brakes. ABS equipped master cylinder outlet ports supply hydraulic pressure to the ABS Integrated Control Unit (ICU) where it is distributed to the individual wheel brakes.



The master cylinder reservoir cap diaphragm is slit to allow atmospheric pressure to equalize on both sides of the diaphragm.

STANDARD PROCEDURE

MASTER CYLINDER BLEEDING



NOTE: On vehicles without ABS this procedure is designed to be performed with the proportioning valves installed in the master cylinder.

1. Clamp the master cylinder in a vise with soft-jaw caps.
2. Master Cylinder without ABS – Attach the special tools for bleeding the master cylinder in the following fashion:
   a. Thread Bleeder Tube Adapter (1), Special Tool 8822-1, into the primary outlet port of the master cylinder without a proportioning valve. Tighten Adapter to 17 N·m (150 in. lbs.).
   b. Thread Bleeder Tube Adapter (2), Special Tool 8822-2, into the secondary outlet port of the master cylinder without a proportioning valve. Tighten Adapter to 17 N·m (150 in. lbs.).
   c. Thread Bleeder Tube Adapter (4), Special Tool 8822-1, into the proportioning valve in the lower secondary outlet port of the master cylinder. Tighten Adapter to 17 N·m (150 in. lbs.).
   d. Thread Bleeder Tube Adapter (5), Special Tool 8822-2, into the proportioning valve in the lower primary outlet port of the master cylinder. Tighten Adapter to 17 N·m (150 in. lbs.).

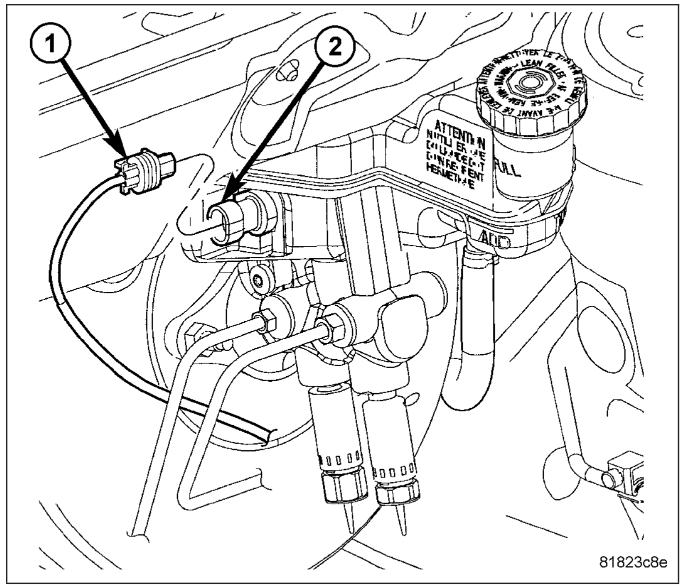
   e. Thread a Bleeder Tube (6), Special Tool 8358-1, into each Adapter. Tighten tube nuts to 17 N·m (150 in. lbs.).
   f. Install Bleeder Tubes Adapter (3), Special Tool 9705, in place of the fill cap as shown.
   g. Flex and place the open ends of the Bleeder Tubes into open hose tips on Adapter 9705. Be sure Bleeder Tubes are inserted into Adapter 9705 far enough not to come loose during bleed procedure.

3. Master Cylinder with ABS – Attach the special tools for bleeding the master cylinder in the following fashion:
   a. Thread Bleeder Tube Adapters (3), Special Tool 8822-2, into the primary and secondary outlet ports of the master cylinder. Tighten Adapters to 17 N·m (150 in. lbs.).
   b. Thread a Bleeder Tube (2), Special Tool 8358-1, into each Adapter. Tighten tube nuts to 17 N·m (150 in. lbs.).
   c. Flex each Bleeder Tube and place the open ends into the neck of the master cylinder reservoir. Position the open ends of the tubes into the reservoir so their outlets are below the surface of the brake fluid in the reservoir when filled.

NOTE: Make sure the ends of the Bleeder Tubes stay below the surface of the brake fluid in the reservoir at all times during the bleeding procedure.

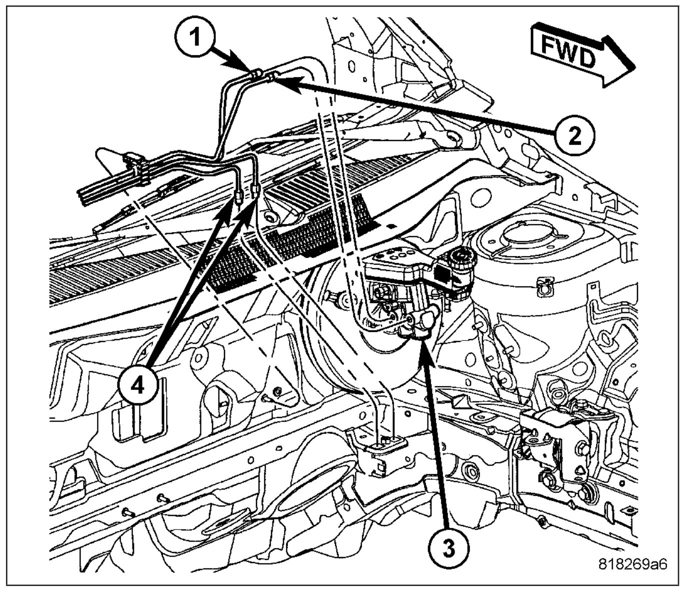
4. Fill the brake fluid reservoir with fresh Mopar® Brake Fluid DOT 3 Motor Vehicle, or equivalent. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID - SPECIFICATIONS)
5. Using an appropriately sized wooden dowel as a pushrod, slowly press the pistons inward discharging brake fluid through the Bleeder Tubes, then release the pressure, allowing the pistons to return to the released position. Repeat this several times until all air bubbles are expelled from the master cylinder bore and Bleeder Tubes.
6. Remove the Bleeder Tubes and Adapters from the master cylinder and plug the master cylinder outlet ports.
7. Install the fill cap on the reservoir.
8. Remove the master cylinder from the vise.
9. Install the master cylinder on the vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)

REMOVAL



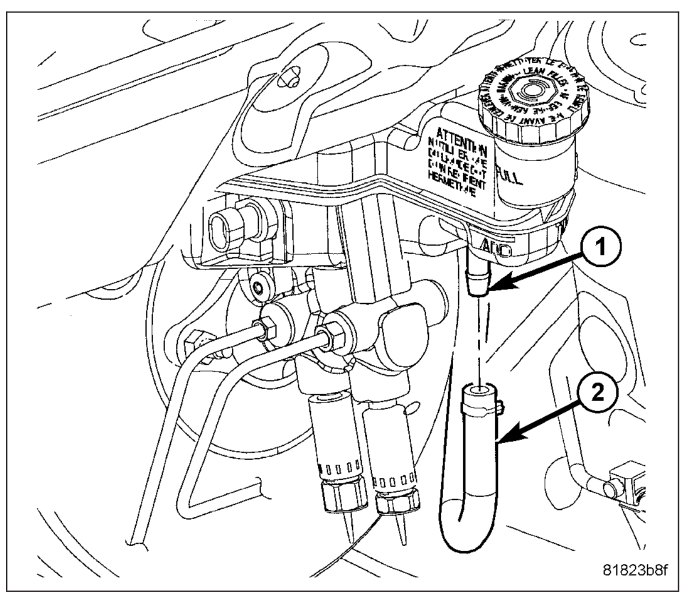
LEFT-HAND-DRIVE WITH ABS

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

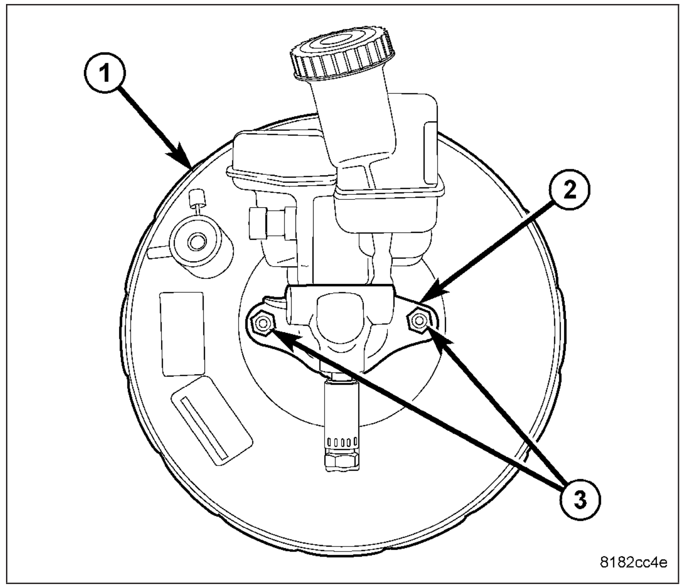


CAUTION: The vacuum in the power brake booster must be pumped down before removing the master cylinder to prevent the booster from sucking in any contamination. This can be done by pumping the brake pedal while the engine is not running until a firm brake pedal is achieved.

1. With the engine not running, pump the brake pedal 4-5 strokes until the pedal feel is firm.
2. Disconnect the negative (ground) cable from the battery and isolate the cable.



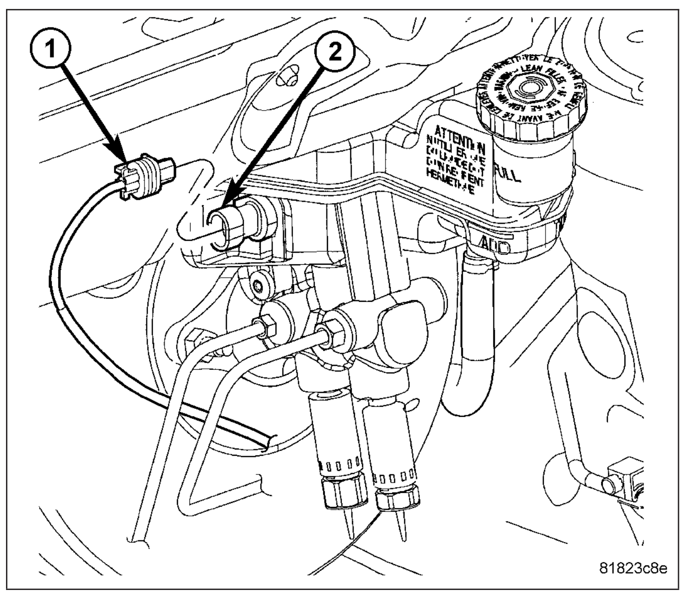
3. Disconnect the wiring harness connector (1) from the brake fluid level switch (2) in the master cylinder brake fluid reservoir.



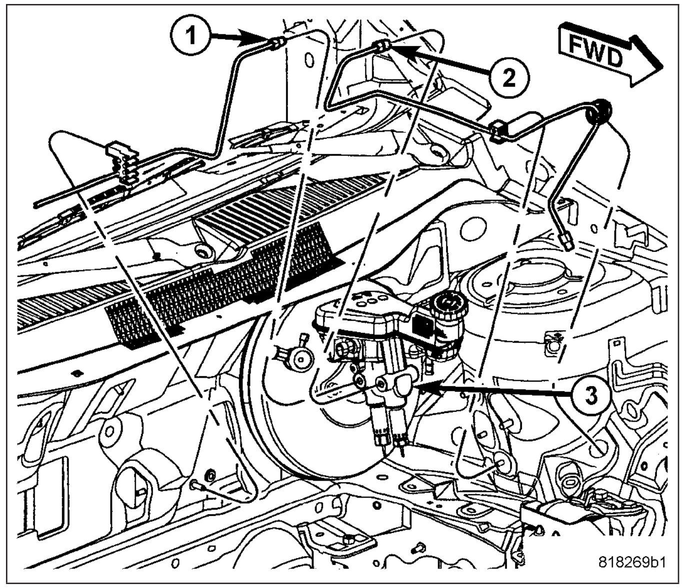
4. Disconnect the primary (1) and secondary (2) brake tubes at the master cylinder outlet ports. Install plugs at all of the open brake tube outlets on the master cylinder.

5. If equipped with a manual transaxle, remove the clamp and slide the clutch actuator hose (2) off the reservoir port (1).

6. Clean the area around where the master cylinder (2) attaches to the power brake booster (1) using a suitable brake cleaner such as Mopar® Brake Parts Cleaner or an equivalent.
7. Remove the two nuts (3) attaching the master cylinder (2) to the power brake booster (1).
8. Slide the master cylinder straight out of the power brake booster.

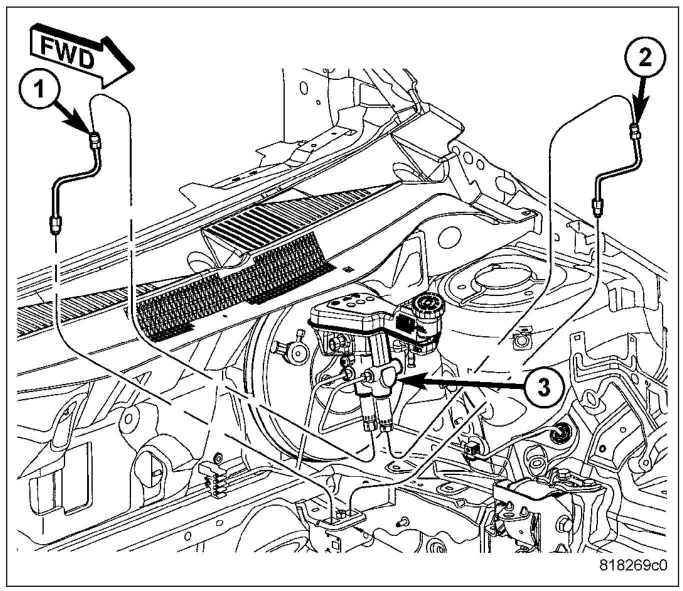


LEFT-HAND-DRIVE WITHOUT ABS

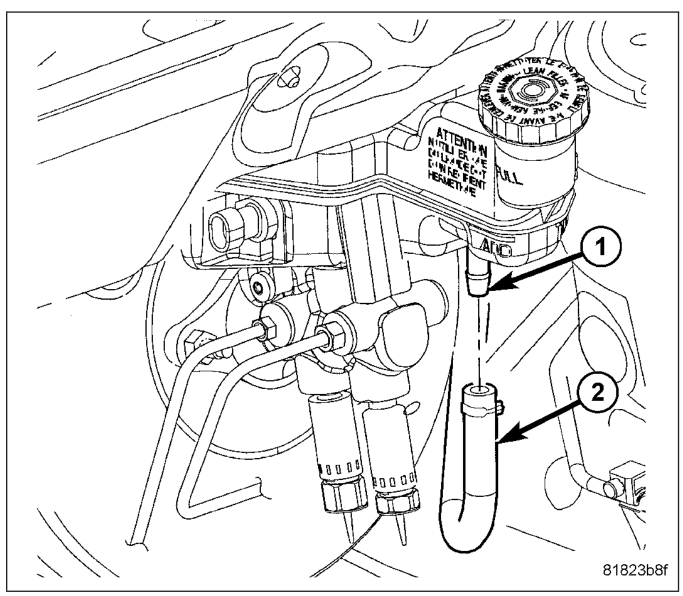


NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

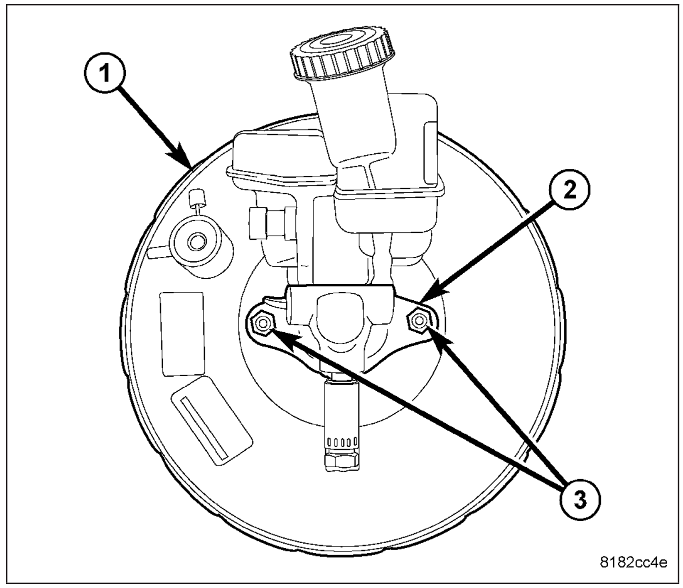
CAUTION: The vacuum in the power brake booster must be pumped down before removing the master cylinder to prevent the booster from sucking in any contamination. This can be done by pumping the brake pedal while the engine is not running until a firm brake pedal is achieved.



1. With the engine not running, pump the brake pedal 4-5 strokes until the pedal feel is firm.
2. Disconnect the negative (ground) cable from the battery and isolate the cable.
3. Remove the wiring harness connector (1) from the brake fluid level switch (2) in the master cylinder brake fluid reservoir.

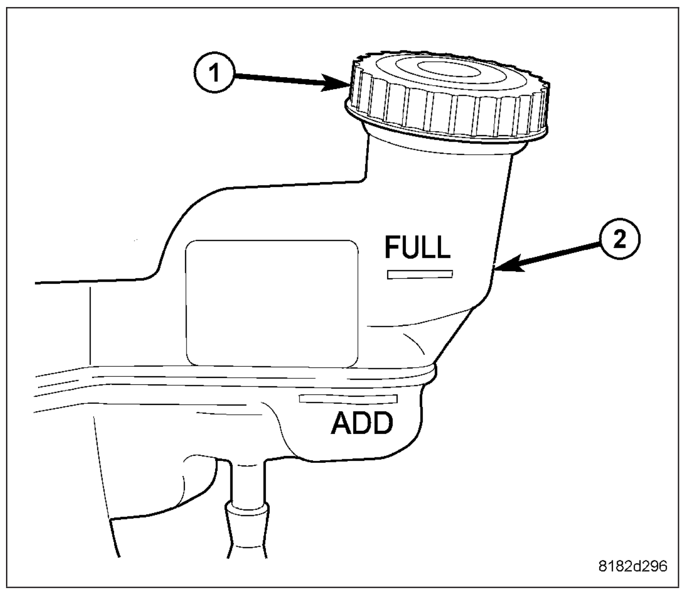


4. Disconnect the two front brake tubes (1, 2) from the master cylinder. Install plugs at the open brake tube outlets on the master cylinder.

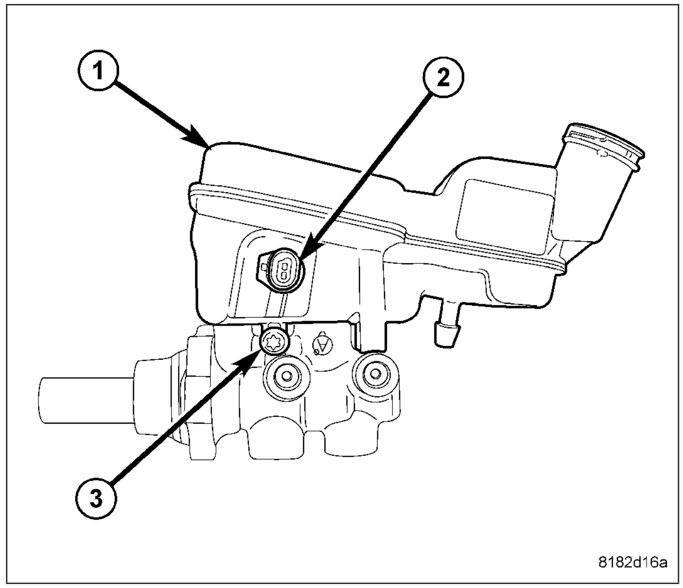


5. Disconnect the two rear brake tubes (1, 2) from the proportioning valves on the master cylinder (3). Install plugs at the open brake tube outlets on the proportioning valves.

6. If equipped with a manual transaxle, remove the clamp and slide the clutch actuator hose (2) off the reservoir port (1).

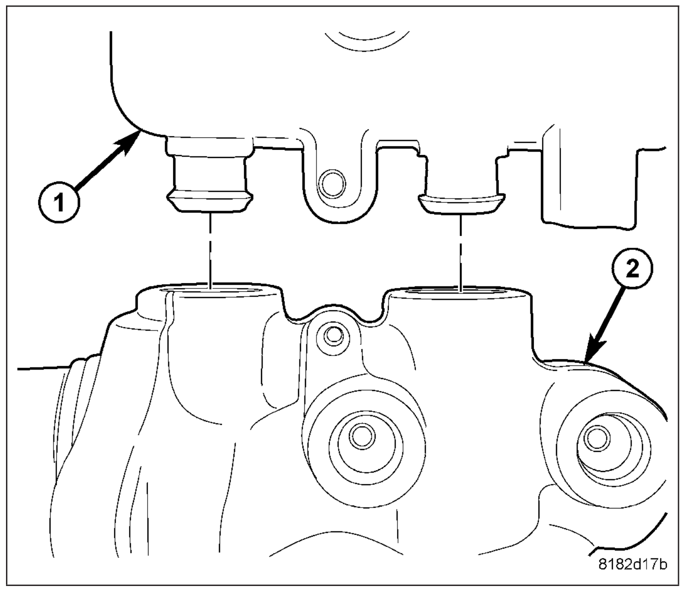


7. Clean the area around where the master cylinder (2) attaches to the power brake booster (1) using a suitable brake cleaner such as Mopar® Brake Parts Cleaner or an equivalent.
8. Remove the two nuts (3) attaching the master cylinder (2) to the power brake booster (1).
9. Slide the master cylinder straight out of the power brake booster.
10. To remove the proportioning valves, unthread each from the master cylinder.

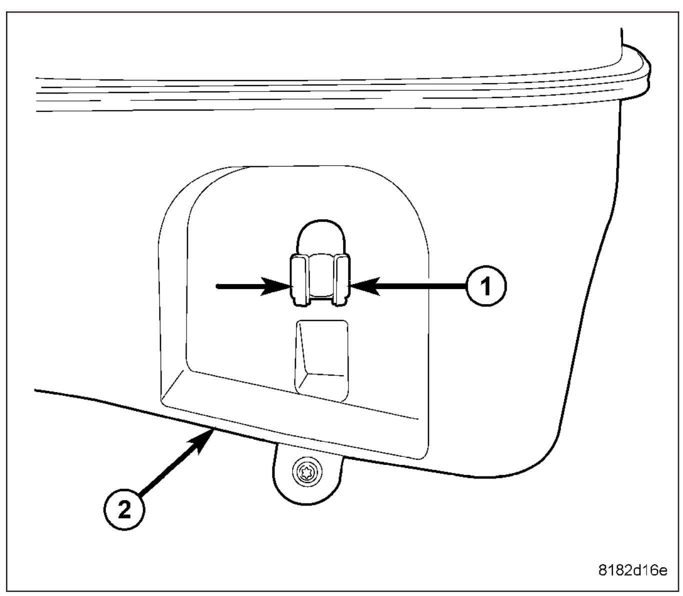


DISASSEMBLY

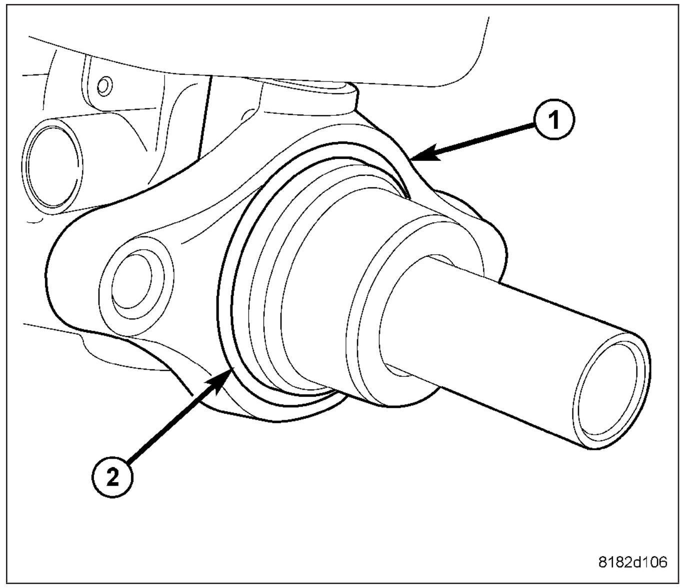
1. Clean the master cylinder housing and brake fluid reservoir. Use only Mopar® Brake Parts Cleaner or equivalent.
2. Remove the brake fluid reservoir cap (1). Using a syringe or equivalent type tool, empty as much brake fluid as possible from the reservoir.



CAUTION: When removing the fluid reservoir (1) from the master cylinder, do not attempt to pry it off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

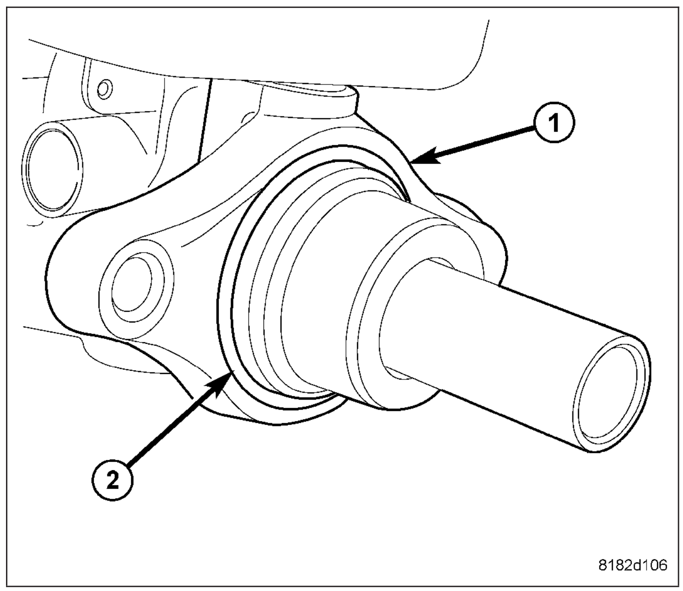


3. Remove the screw (3) fastening the fluid reservoir (1) to the master cylinder housing.

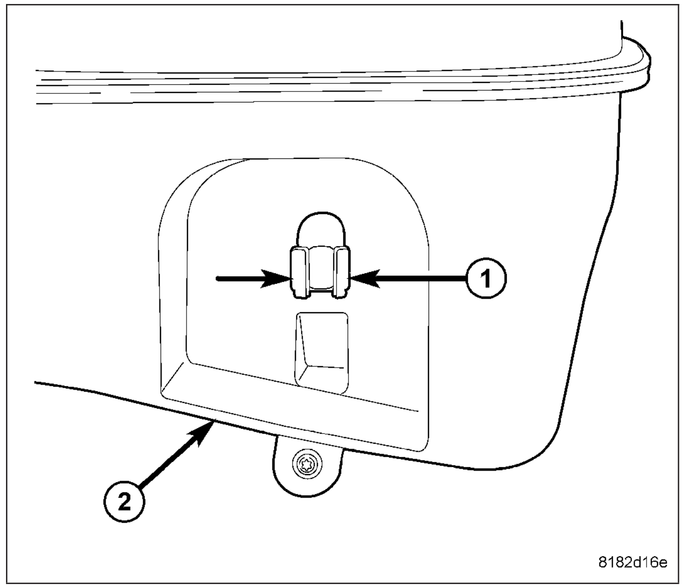


4. Pull the reservoir (1) straight up and remove it from the grommet seals in master cylinder housing (2).

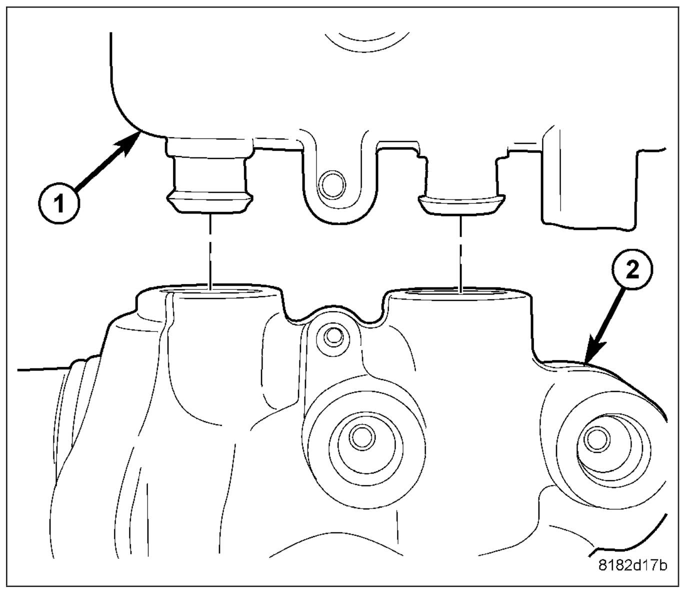
5. If the reservoir is being replaced, remove the fluid level switch. Push together the retaining tabs (1) holding the brake fluid level switch in place in the brake fluid reservoir (2), then pull the brake fluid level switch out the opposite side of the reservoir.



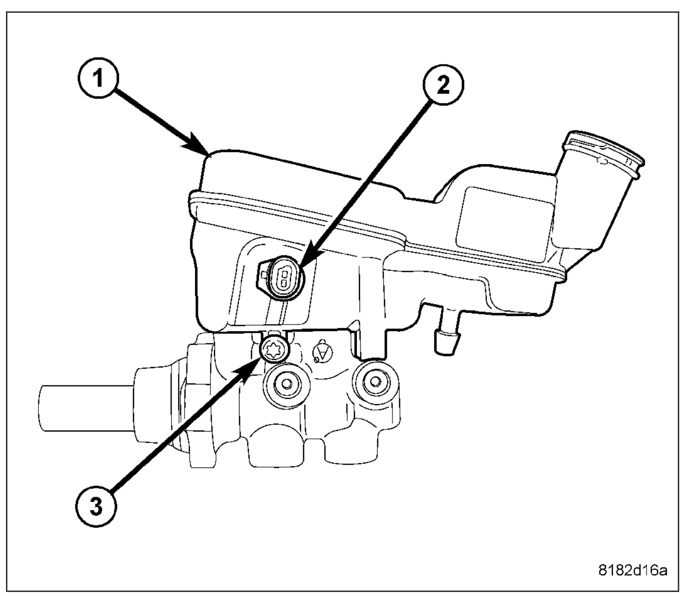
6. Remove the vacuum seal (2) from the master cylinder mounting flange (1).



ASSEMBLY



1. Install a NEW vacuum seal (2) on the master cylinder mounting flange (1) making sure the seal fits squarely in its groove.

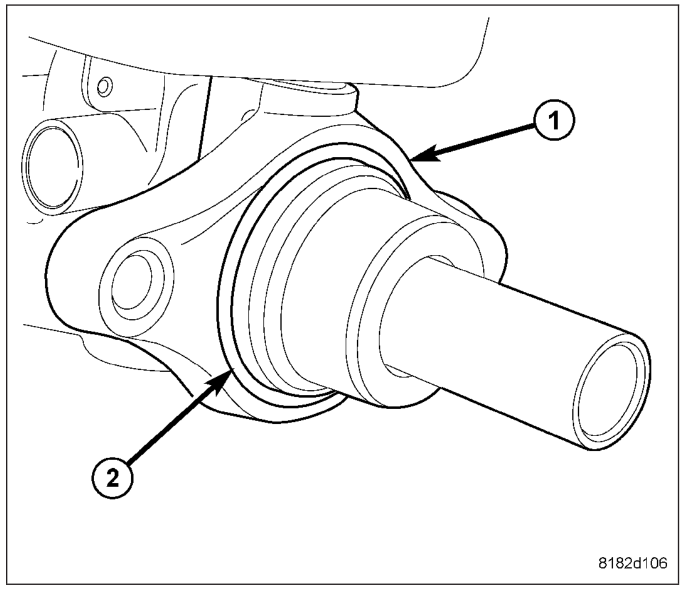


2. If the reservoir is being replaced, align the brake fluid level switch with its mounting hole on the left side of the master cylinder brake fluid reservoir. Push the switch into the fluid reservoir until the switch retaining tabs (1) are expanded on the other side of the reservoir (2), locking it in place.

3. Lubricate the reservoir mounting area with fresh clean brake fluid. Place the reservoir (1) in position over the grommet seals in the master cylinder (2). Slide the reservoir into the grommet seals by firmly pressing down on the fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both grommet seals.

4. Install the fluid reservoir mounting screw (3). Tighten the screw to 5.5 N·m (48 in. lbs.).
5. Thoroughly bleed the master cylinder before installing it. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - STANDARD PROCEDURE)
6. Install the master cylinder. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)

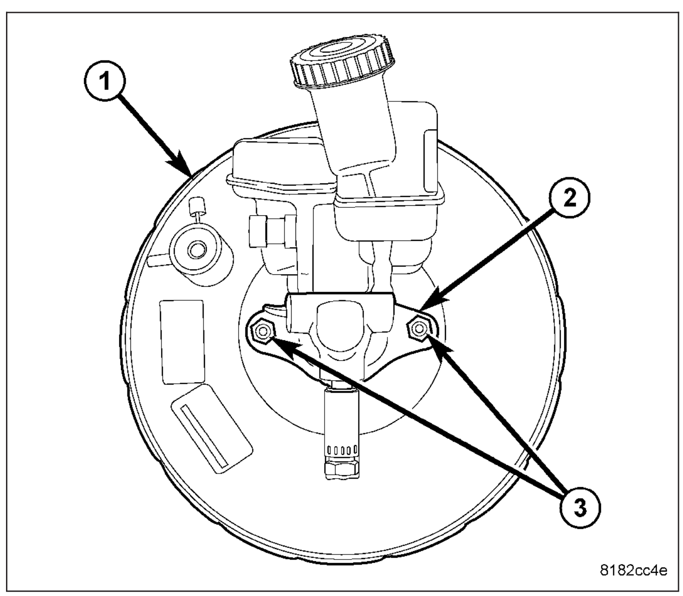
INSTALLATION



LEFT-HAND-DRIVE WITH ABS

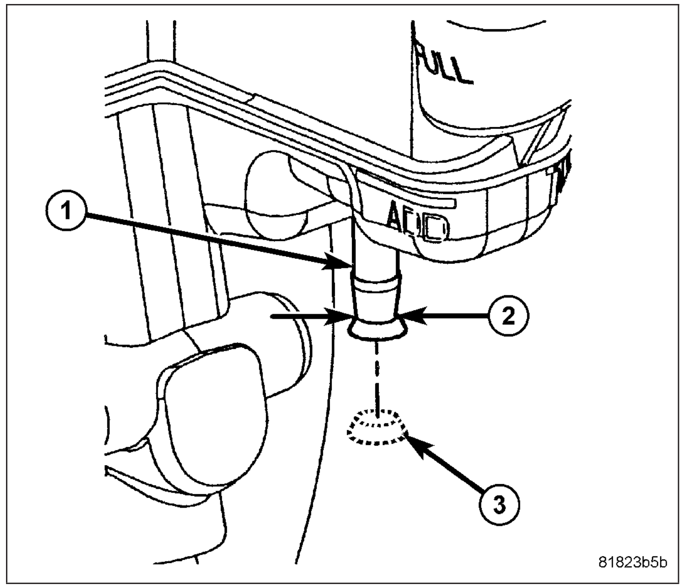
NOTE: The master cylinder must be bled before installing it on the vehicle.

1. Bench bleed the master cylinder. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - STANDARD PROCEDURE)
2. Wipe the face of the power brake booster clean where the vacuum seal on the rear of the master cylinder comes in contact when it's installed. Do not get any cleaner or debris inside the booster.

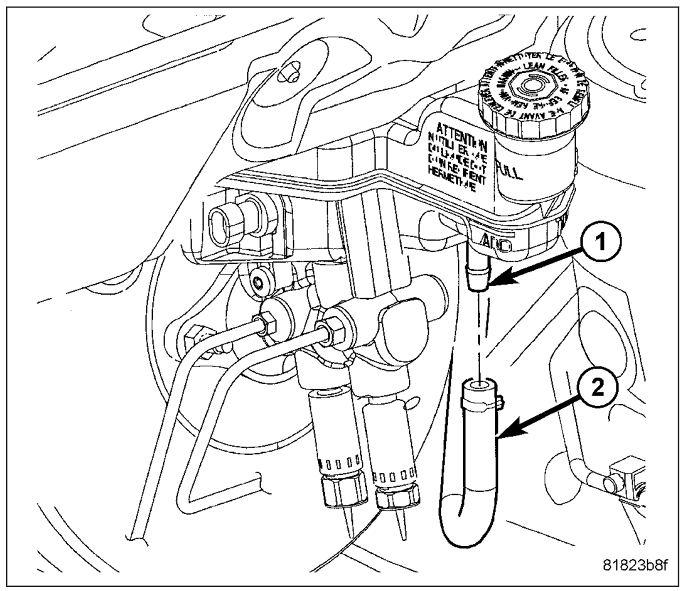


CAUTION: When installing a master cylinder on the vehicle, a NEW vacuum seal (2) MUST be installed on the master cylinder mounting flange (1).

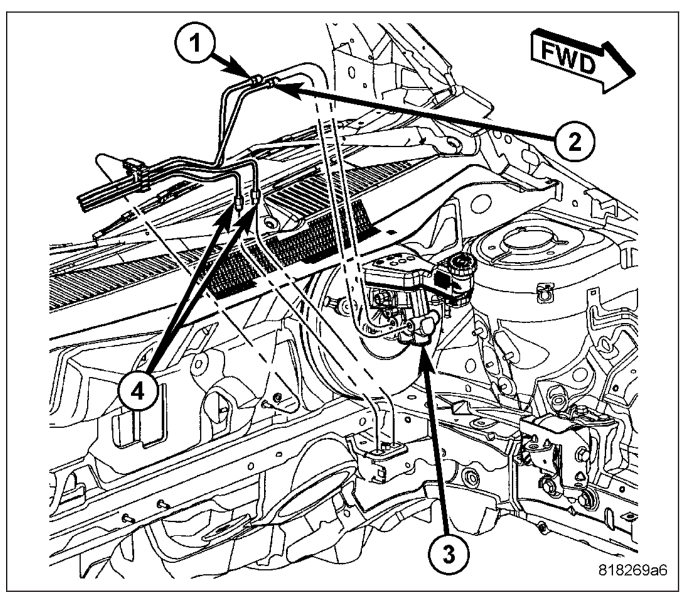
3. If the master cylinder does not have a new vacuum seal (2) on the mounting flange (1), remove it. Install a NEW vacuum seal on the master cylinder mounting flange making sure the seal fits squarely in its groove.



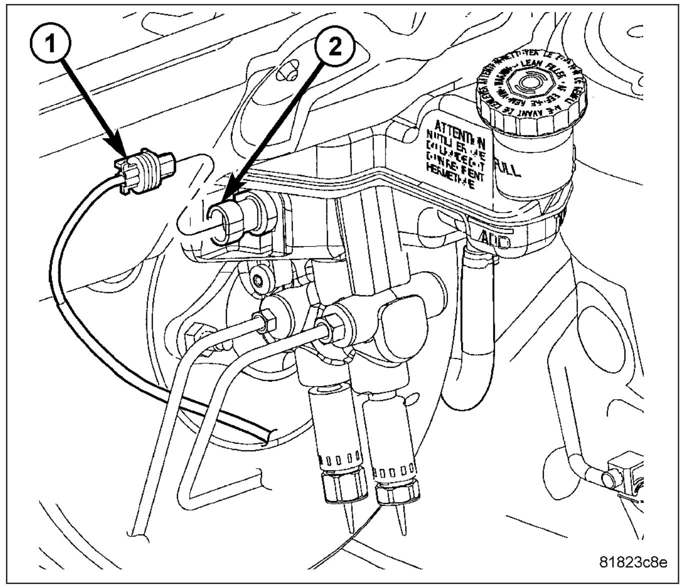
CAUTION: If resistance is met during master cylinder insertion into power brake booster, the master cylinder push rod may not be lined up with the booster push rod. Remove the master cylinder, realign and insert it again.



4. Line the master cylinder mounting holes up with the mounting studs on the power brake booster. Ensure the master cylinder piston push rod lines up with the booster push rod, then carefully slide the master cylinder into the power brake booster until it contacts the face of the booster.
5. Install two NEW master cylinder mounting nuts (3). Tighten each nut to 25 N·m (18 ft. lbs.).



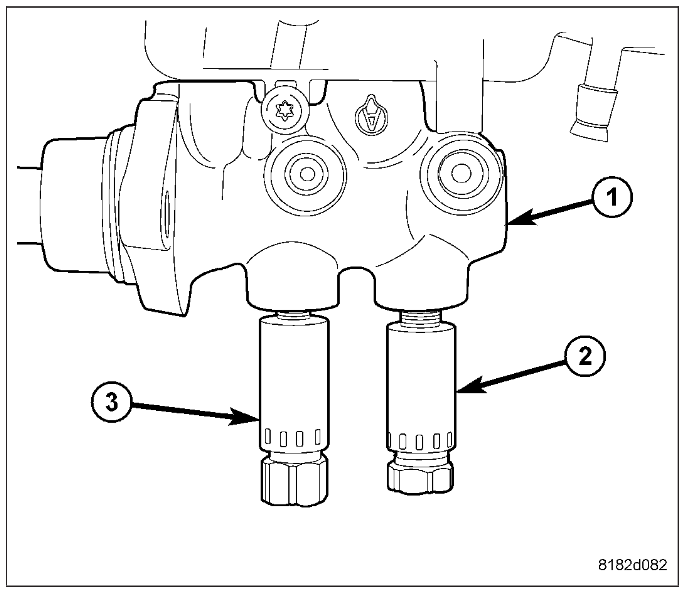
6. If equipped with a manual transaxle and a new reservoir is being installed, using an appropriate cutting tool, cut the clutch actuator port at the center of the “V” groove (2) opening the hydraulic clutch port (1). Discard the severed plug (3).



7. If equipped with a manual transaxle, slide the clutch actuator hose (2) onto the reservoir port (1). Install the hose clamp just past the upset bead on the port.

8. Connect the primary (1) and secondary (2) brake tubes to the master cylinder outlet ports. Tighten the tube nuts to 17 N·m (150 in. lbs.).

9. Connect the wiring harness connector (1) to the brake fluid level switch (2).
10. Connect the negative (ground) cable on the battery.
11. Fill the master cylinder reservoir to the proper level. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID - STANDARD PROCEDURE)



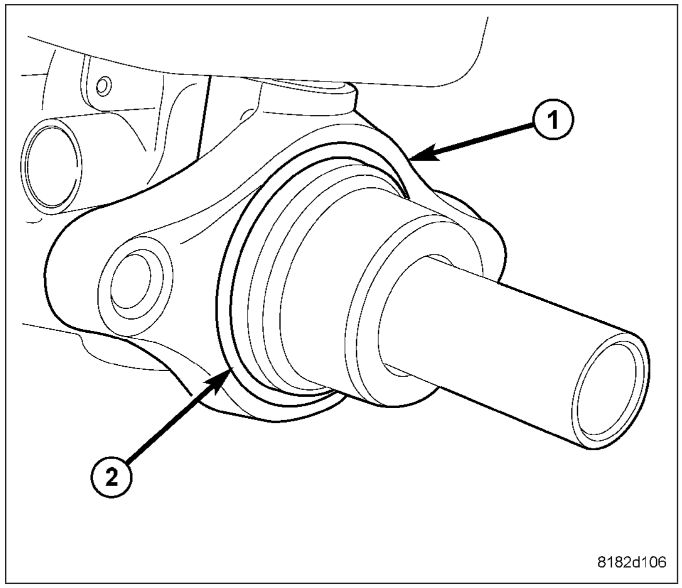
WARNING: Be certain a firm brake pedal is achieved prior to attempting to operate the vehicle. If a firm brake pedal cannot be achieved, bleed the brake hydraulic system and check for leaks. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

12. Road test the vehicle to ensure proper operation of the brakes.

LEFT-HAND-DRIVE WITHOUT ABS

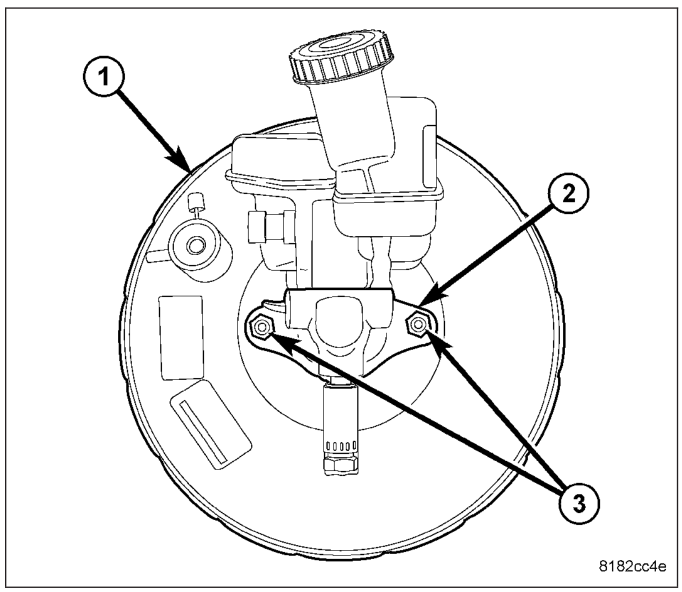
NOTE: The proportioning valves are not identical and cannot be interchanged. The proportioning valve that threads into the primary port (3) has M10 x 1 threads going into the master cylinder (1). The proportioning valve that threads into the secondary port (2) has M12 x 1 threads going into the master cylinder (1).

1. If removed, install the proportioning valves (2, 3) in their master cylinder ports. Tighten the proportioning valves to 30 N·m (22 ft. lbs.).



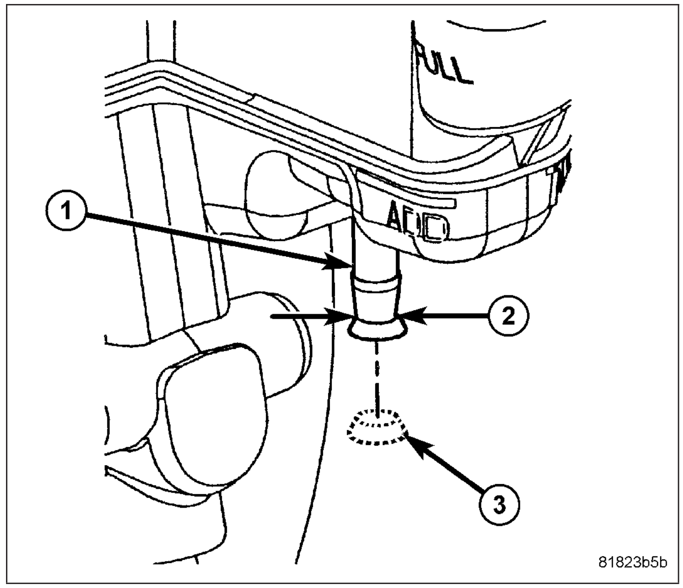
NOTE: The master cylinder must be bled before installing it on the vehicle.

2. Bench bleed the master cylinder. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - STANDARD PROCEDURE)
3. Wipe the face of the power brake booster clean where the master cylinder seal comes in contact when it's installed. Do not get any cleaner or debris inside the booster.

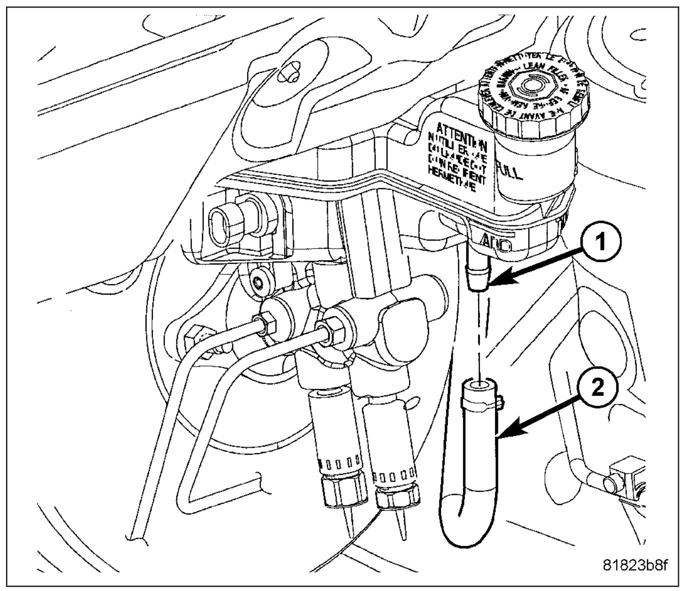


CAUTION: When installing a master cylinder on the vehicle, a NEW vacuum seal (2) MUST be installed on the master cylinder mounting flange (1).

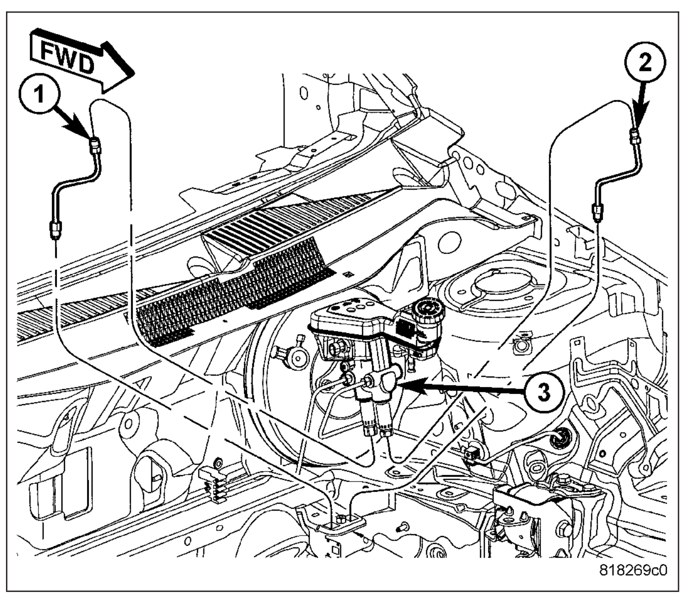
4. If the master cylinder does not have a new vacuum seal (2) on the mounting flange (1), remove it. Install a NEW vacuum seal on the master cylinder mounting flange making sure the seal fits squarely in its groove.



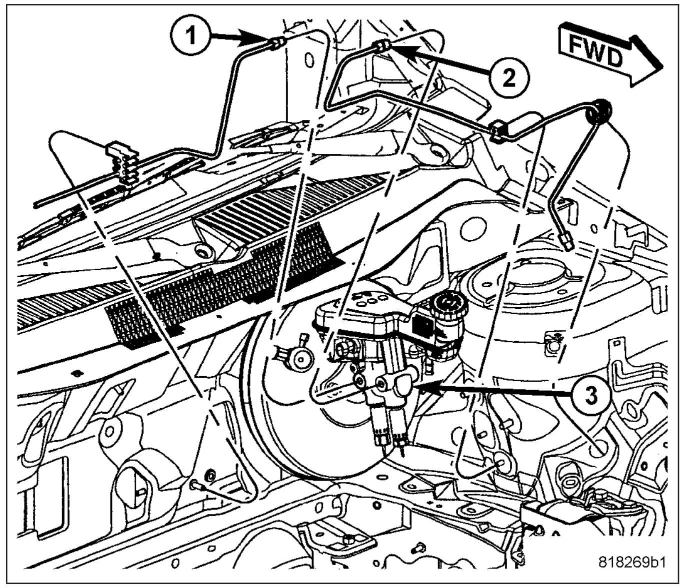
CAUTION: If resistance is met during master cylinder insertion into power brake booster, the master cylinder push rod may not be lined up with the booster push rod. Remove the master cylinder, realign and insert it again.



5. Line the master cylinder mounting holes up with the mounting studs on the power brake booster. Ensure the master cylinder piston push rod lines up with the booster push rod, then carefully slide the master cylinder into the power brake booster until it contacts the face of the booster.
6. Install two NEW master cylinder mounting nuts (3). Tighten each nut to 25 N·m (18 ft. lbs.).

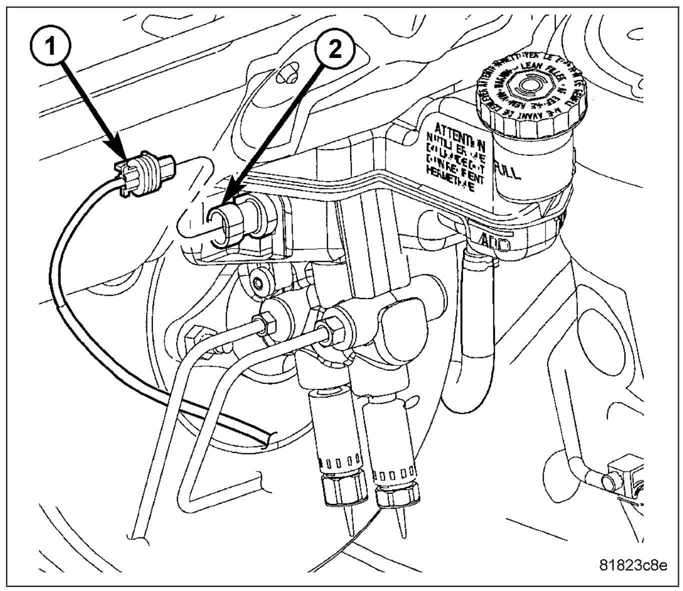


7. If equipped with a manual transaxle and a new reservoir is being installed, using an appropriate cutting tool, cut the clutch actuator port at the center of the "V" groove (2) opening the hydraulic clutch port (1). Discard the severed plug (3).



8. If equipped with a manual transaxle, slide the clutch actuator hose (2) onto the reservoir port (1). Install the hose clamp just past the upset bead on the port.

9. Connect the two rear brake tubes (1, 2) to the proportioning valves on the master cylinder (3). Tighten the tube nuts to 17 N·m (150 in. lbs.).

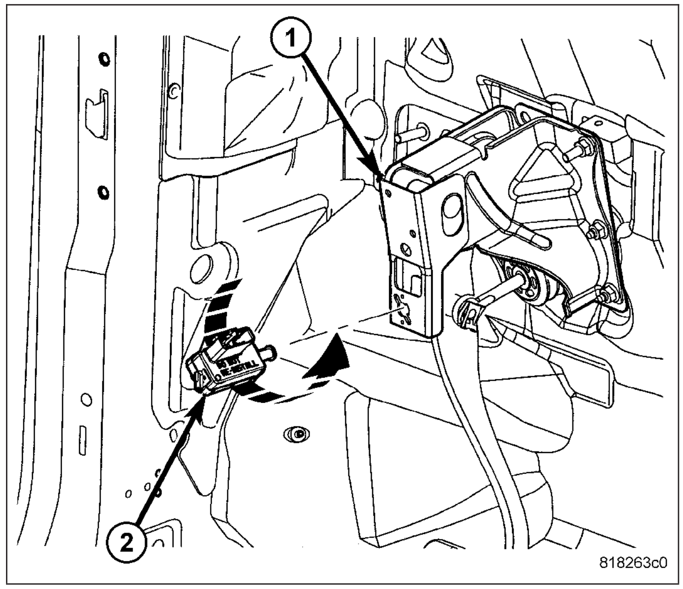


10. Connect the two front brake tubes (1, 2) to the master cylinder. Tighten the tube nuts to 17 N·m (150 in. lbs.).

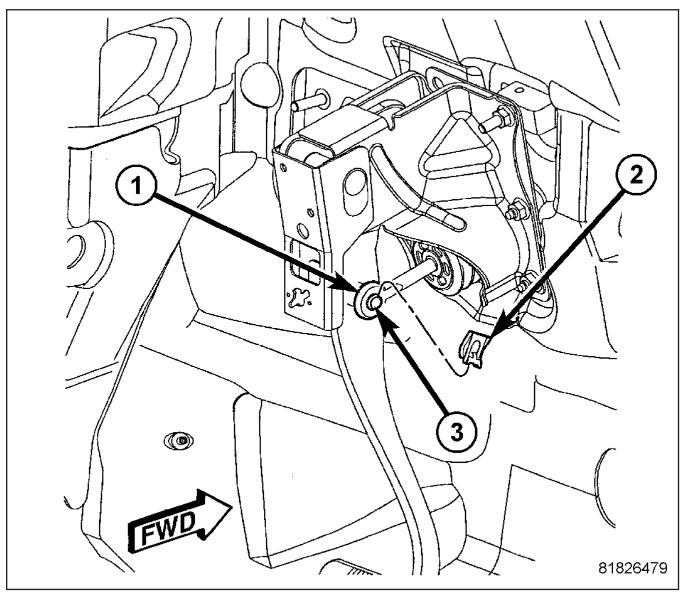
11. Connect the wiring harness connector (1) to the brake fluid level switch (2).
12. Connect the negative (ground) cable on the battery.
13. Fill the master cylinder reservoir to the proper level. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID - STANDARD PROCEDURE)

WARNING: Be certain a firm brake pedal is achieved prior to attempting to operate the vehicle. If a firm brake pedal cannot be achieved, bleed the brake hydraulic system and check for leaks. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

14. Road test the vehicle to ensure proper operation of the brakes.

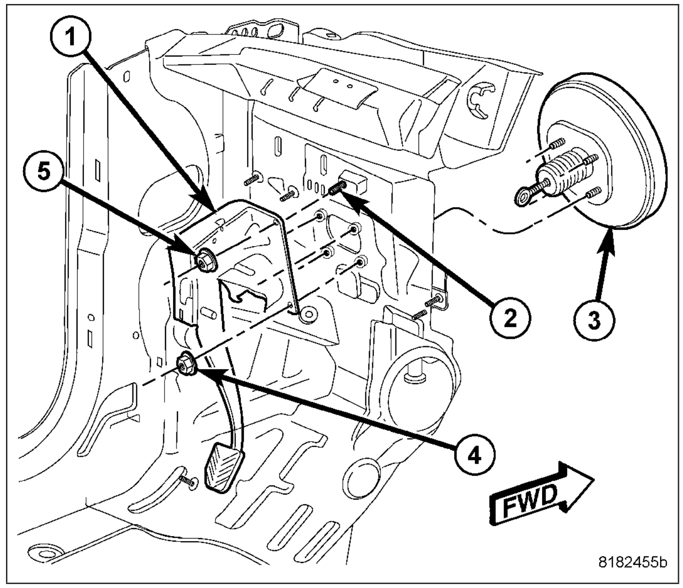


PEDAL



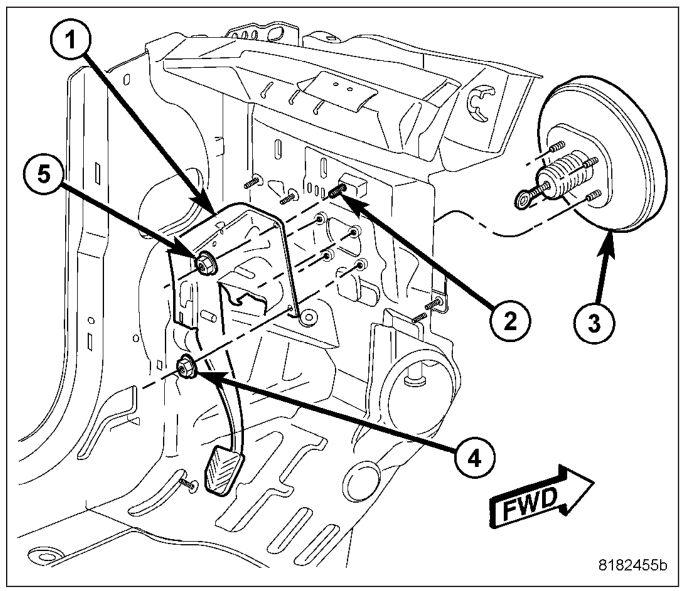
REMOVAL

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

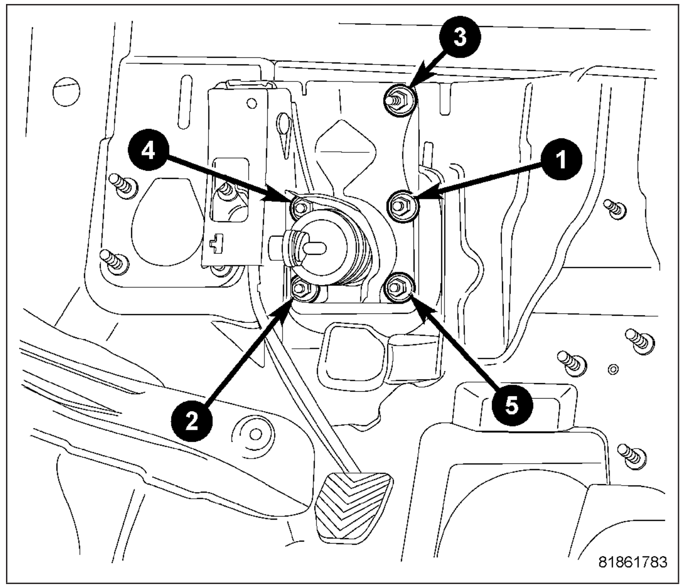


1. Disconnect and isolate the battery negative cable from its post on the battery.
2. If equipped, remove the silencer pad below the steering column opening cover.
3. Remove the steering column opening cover on the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL)
4. Remove the reinforcement behind the steering column opening cover.
5. Remove the stop lamp switch (2) and discard it. **Do not reuse the stop lamp switch.** (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/STOP LAMP SWITCH - REMOVAL)

6. Remove the retaining clip (2) securing the power brake booster push rod (1) to the brake pedal. To do so, position a small screwdriver under the center tang of the retaining clip, then rotate the screwdriver enough to allow the retaining clip tang to pass over the end of the brake pedal pin (3). Remove and discard the clip. **Do not reuse the clip.**
7. Slide the booster push rod (1) off the brake pedal pin (3).

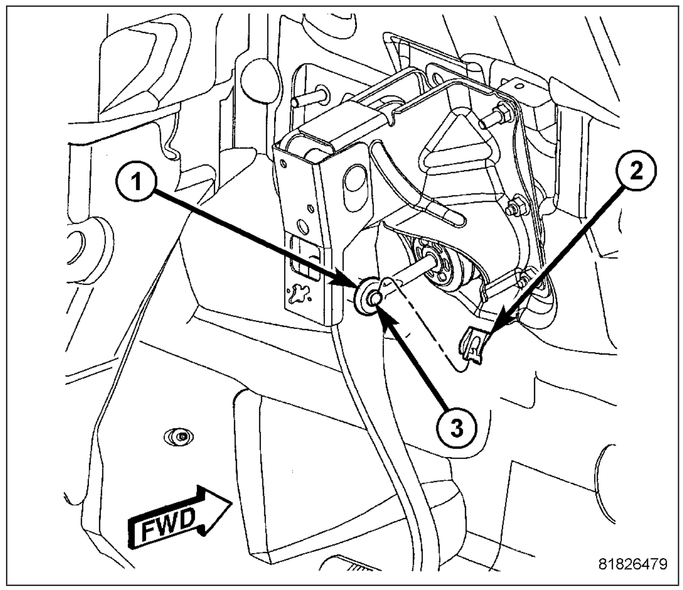


8. Remove the four nuts (4) attaching the brake pedal (1) (and power brake booster) to the dash panel.
9. Remove the remaining nut (5) attaching the brake pedal (1) to the dash panel.
10. Remove the brake pedal (1).



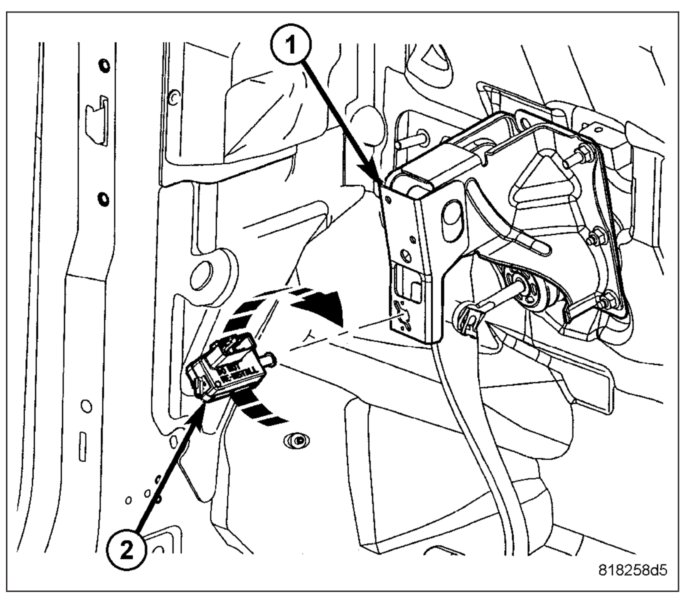
INSTALLATION

1. Carefully install the brake pedal and bracket assembly (1) in the vehicle lining up the bracket with the power brake booster mounting studs and the stud (2) on the dash panel.
2. Install the four nuts (4) attaching the brake pedal (1) (and power brake booster) to the dash panel. **Do not tighten the nuts at this time.**
3. Install the remaining nut (5) attaching the brake pedal (1) to the dash panel. To tighten this nut, refer to the following step.



CAUTION: Because of power brake booster design, it is very important to tighten the mounting nuts in the proper sequence.

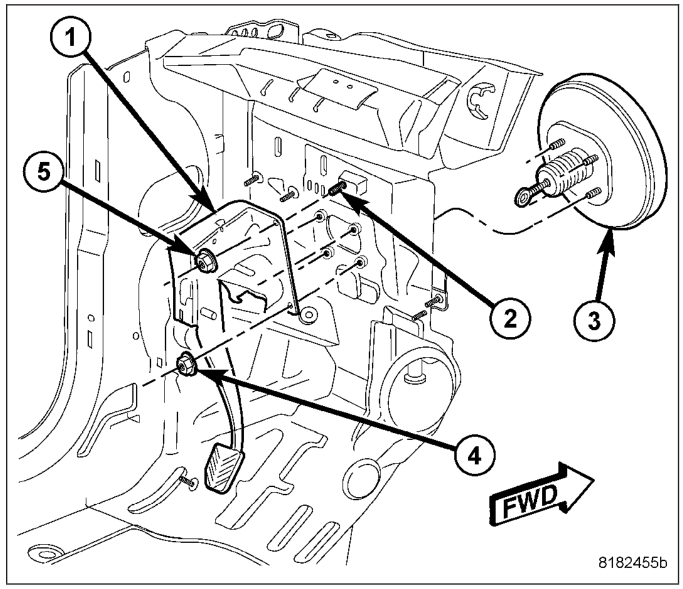
4. Tighten the brake pedal/booster mounting nuts in the proper sequence to 23 N·m (17 ft. lbs.).



5. Using Mopar® Lubriplate, or an equivalent, coat the surface of the brake pedal pin (3) where it contacts the brake booster input rod (1).
6. Install the power brake booster push rod (1) on the pin (3) mounted on the side of the brake pedal. Install a NEW retaining clip (2) on the end of the pin. **Do not reuse the old clip.**

CAUTION: Do not reuse the original stop lamp switch. The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.

7. Install and adjust a NEW stop lamp switch (2) in the brake pedal bracket (1). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/STOP LAMP SWITCH - INSTALLATION)
8. Install the steering column opening cover reinforcement in the steering column opening.
9. Install the steering column opening cover on the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION)
10. If equipped, install the silencer pad below the instrument panel.



11. Connect the battery negative cable to its post on the battery.
12. Check the stop lamps to verify they are operating properly and not staying on when the pedal is in the released position.
13. Road test the vehicle to ensure proper operation of the brakes.

BOOSTER-POWER BRAKE

DESCRIPTION

The power brake booster (3) is mounted to the engine side of the dash panel. The master cylinder is bolted to the front of the booster. A vacuum check valve is also mounted on the front of the booster. A vacuum line connects the check valve to engine source vacuum. The booster input rod extends through the dash panel and connects to the brake pedal.

This vehicle uses a 254 mm single diaphragm power brake booster. Power brake boosters are internally tuned differently depending on whether the vehicle is equipped with ABS or without ABS. If the power brake booster requires replacement, be sure it is replaced with the correct part.

The power brake booster can be identified by the tag attached to the body of the booster. This tag contains the following information:

- The production part number
- The date it was built, and
- The booster manufacturer.

DIAGNOSIS AND TESTING

POWER BRAKE BOOSTER

BASIC TEST

1. With engine off, depress and release the brake pedal several times to purge all vacuum from the power brake booster.
2. Depress and hold the pedal with light effort (15 to 25 lbs. pressure), then start the engine.

The pedal should fall slightly, then hold. Less effort should be needed to apply the pedal at this time. If the pedal fell as indicated, perform the VACUUM LEAK TEST listed after the BASIC TEST. If the pedal did not fall, continue on with this BASIC TEST.

3. Disconnect the vacuum hose at the vacuum check and tee-in a vacuum gauge.
4. Start the engine.
5. When the engine is at warm operating temperature, allow it to idle and check the vacuum at the gauge.

If the vacuum supply is 12 inches Hg (40.5 kPa) or more, the power brake booster is defective and must be replaced. If the vacuum supply is below 12 inches, continue on with this BASIC TEST.

6. Shut off the engine.
7. Connect the vacuum gauge to the vacuum reference port on the engine intake manifold.
8. Start the engine and observe the vacuum gauge.

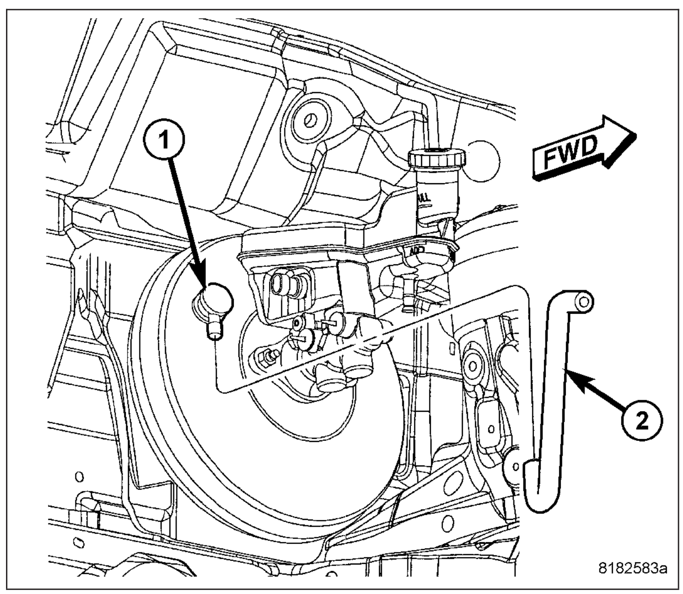
If the vacuum is still low, check the engine tune and repair as necessary. If the vacuum is above 12 inches, the hose or check to the booster has a restriction or leak.

Once an adequate vacuum supply is obtained, repeat the BASIC TEST.

VACUUM LEAK TEST

1. Disconnect the vacuum hose at the vacuum check and tee-in a vacuum gauge.
2. Start the engine.
3. Allow the engine to warm up to normal operating temperature and engine idle.
4. Using vacuum line pliers, close off the vacuum supply hose near the booster and observe the vacuum gauge.

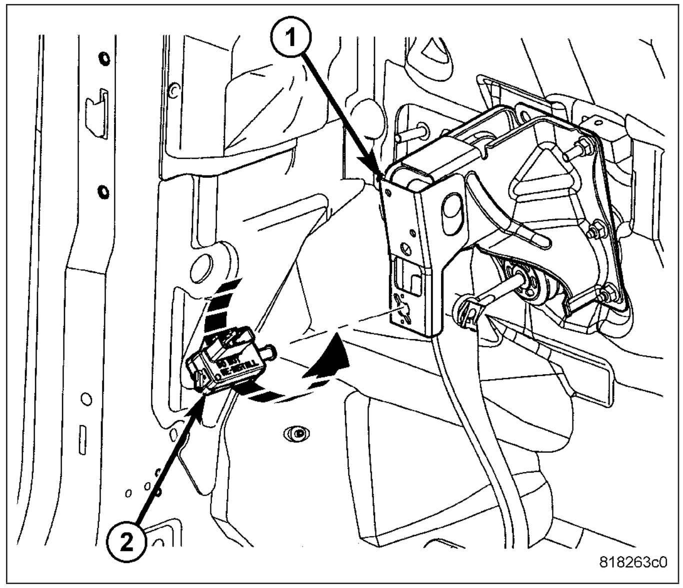
If the vacuum drop exceeds 1.0 inch Hg (3.3 kPa) in one minute, repeat the above steps to confirm the reading. The vacuum loss should be less than 1.0 inch Hg in one minute time span. If the loss is more than 1.0 inch Hg, replace the power brake booster. If it is not, continue on with this test.



5. Remove the pliers from the hose temporarily.
6. Apply light effort (approximately 15 lbs. of force) to the brake pedal and hold the pedal steady. Do not move the pedal once the pressure is applied or the test results may vary.
7. Have an assistant reattach the pliers to the vacuum supply hose.
8. Allow 5 seconds for stabilization, then observe the vacuum gauge.

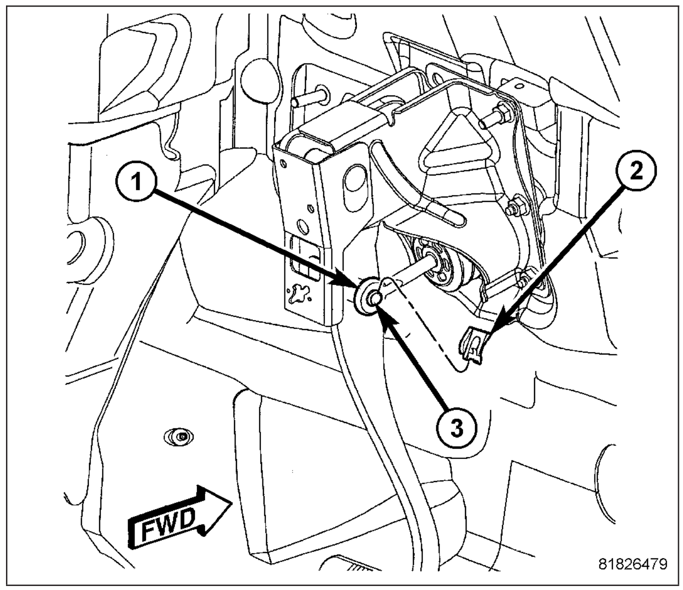
If the vacuum drop exceeds 3.0 inches Hg (10 kPa) in 15 seconds, repeat the above steps to confirm the reading. The vacuum loss should be less than 3.0 inches Hg in 15 seconds time span. If the loss is more than 3.0 inches Hg, replace the power brake booster. If it is not, the booster is not defective.

REMOVAL

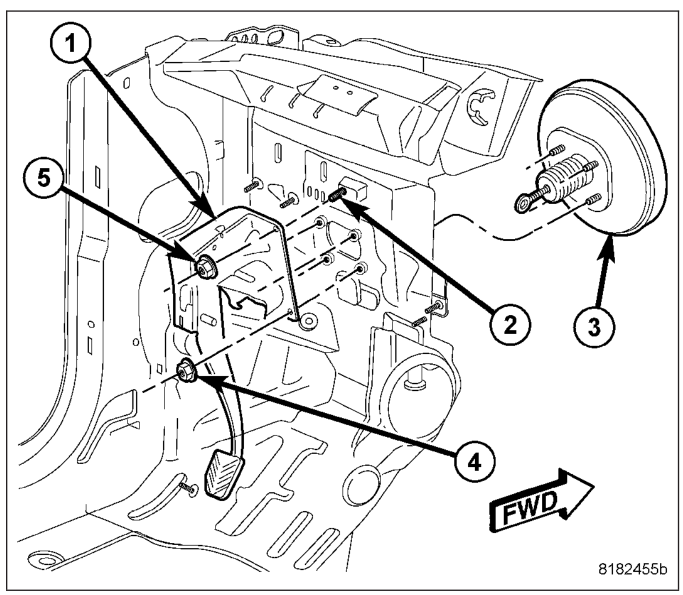


NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

1. Disconnect and isolate the battery negative cable from its post on the battery.
2. Remove the master cylinder. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - REMOVAL)
3. Disconnect the vacuum hose (2) from the check valve (1) on the power brake booster. **Do do not remove the check valve from power brake booster.**

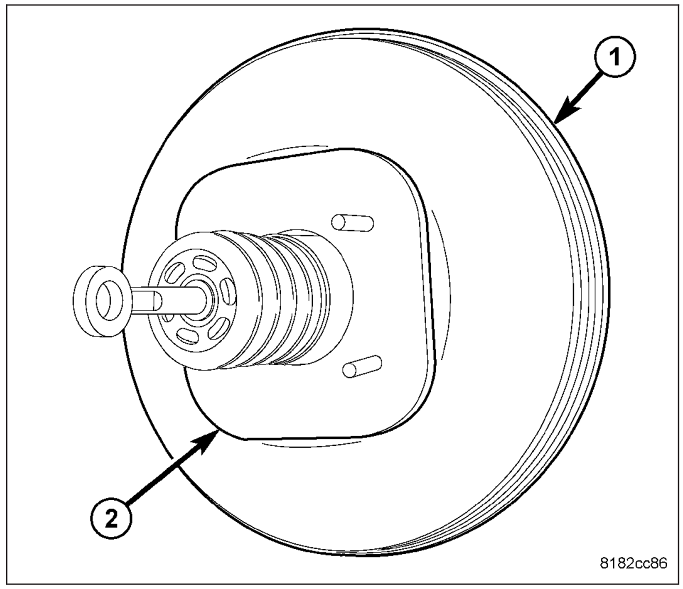


4. If equipped, remove the silencer pad below the steering column opening cover.
5. Remove the steering column opening cover on the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL)
6. Remove the reinforcement behind the steering column opening cover.

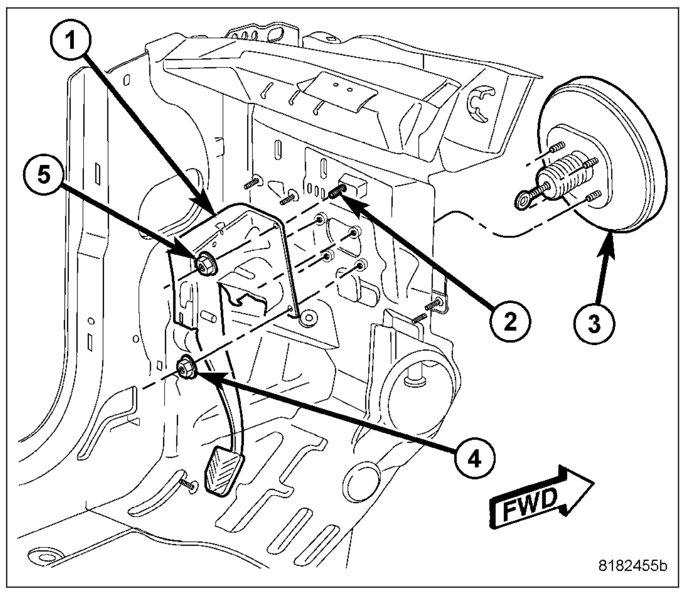


7. Remove the stop lamp switch (2) and discard it. **Do not reuse the stop lamp switch.** (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ STOP LAMP SWITCH - REMOVAL)

8. Remove the retaining clip (2) securing the power brake booster push rod (1) to the brake pedal. To do so, position a small screwdriver under the center tang of the retaining clip, then rotate the screwdriver enough to allow the retaining clip tang to pass over the end of the brake pedal pin (3). Remove and discard the clip. **Do not reuse the clip.**
9. Slide the booster push rod (1) off the brake pedal pin (3).

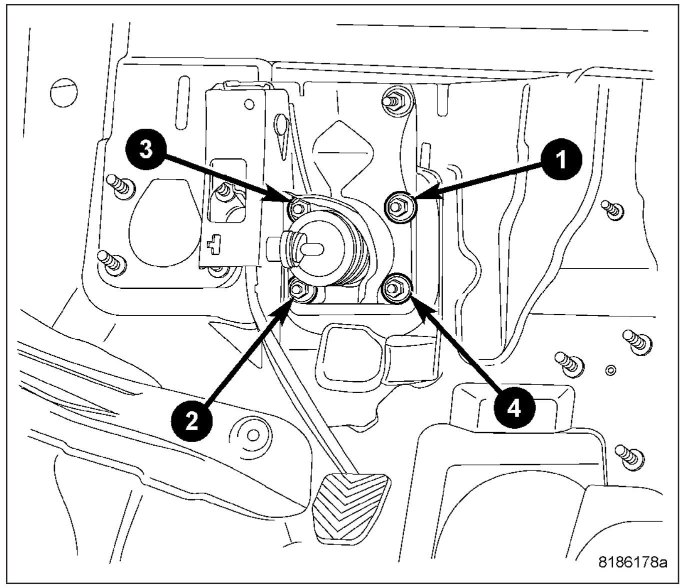


10. Remove the four nuts (4) attaching the power brake booster (3) to the dash panel.
11. Slide the power brake booster (3) forward until its mounting studs clear the dash panel, then remove it through the engine compartment.

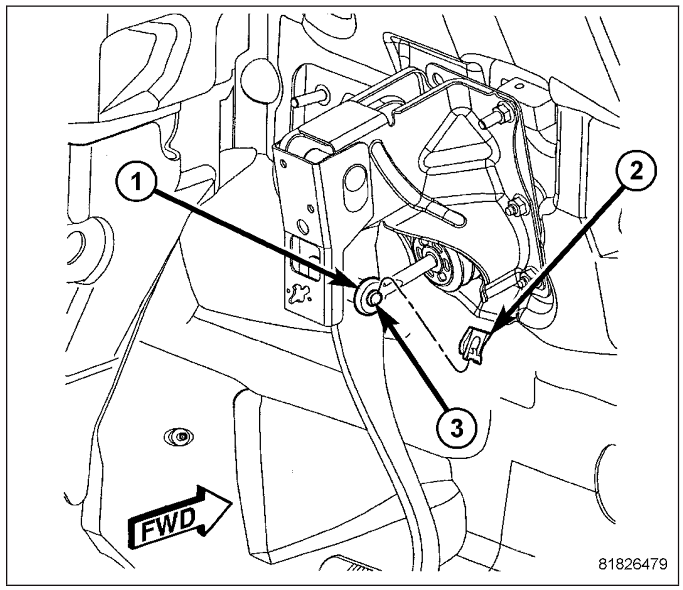


INSTALLATION

NOTE: Before power brake booster (1) installation, be certain a NEW dash seal (2) is installed on the booster mounting studs.

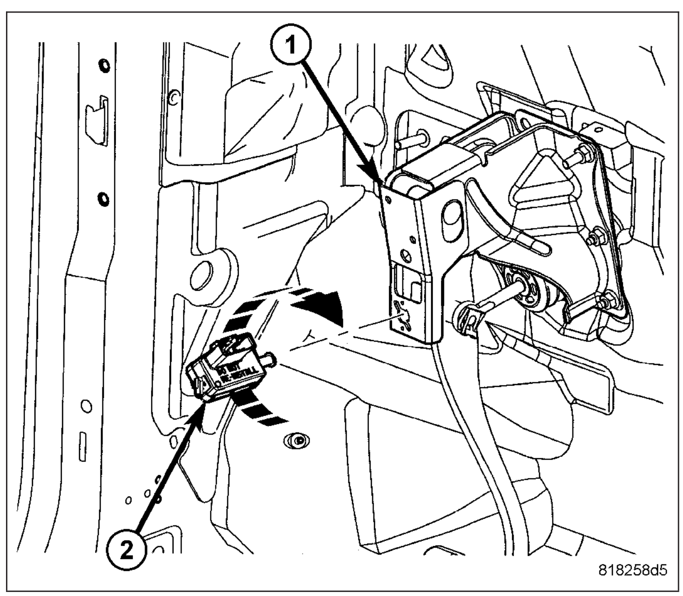


1. Install the power brake booster (3) by sliding the push rod and studs through the dash panel and into mounting position.
2. Under the instrument panel, install the four power brake booster mounting nuts (4). To tighten the nuts, refer to the following step.

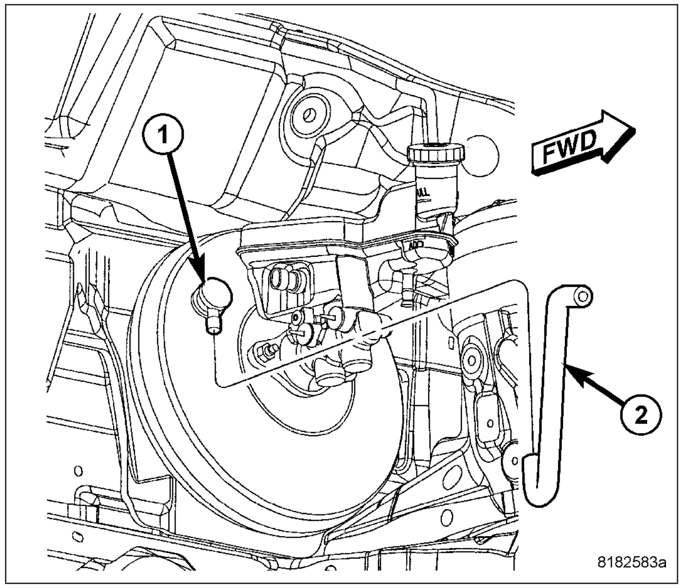


CAUTION: Because of power brake booster design, it is very important to tighten the mounting nuts in the proper sequence.

3. Tighten the brake pedal/booster mounting nuts in the proper sequence to 23 N·m (17 ft. lbs.).



4. Using Mopar® Lubriplate, or an equivalent, coat the surface of the brake pedal pin (3) where it contacts the brake booster input rod (1).
5. Install the power brake booster push rod (1) on the pin (3) mounted on the side of the brake pedal. Install a NEW retaining clip (2) on the end of the pin. **Do not reuse the old clip.**

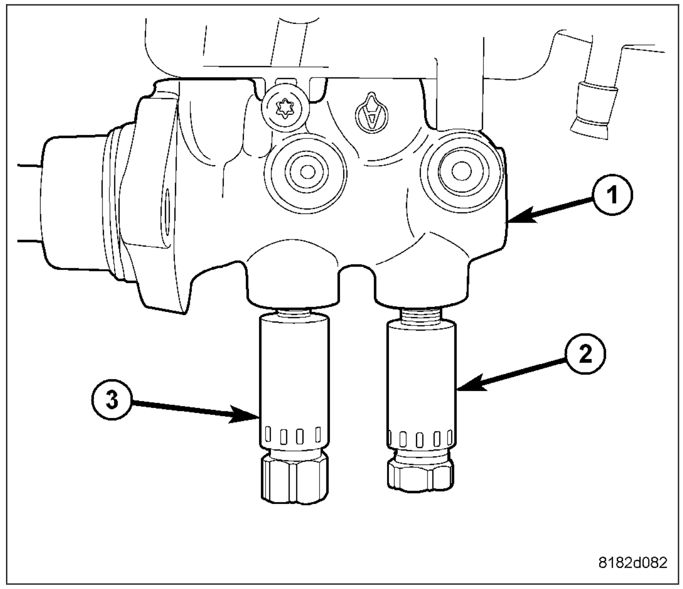


CAUTION: Do not reuse the original stop lamp switch. The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.

6. Install and adjust a NEW stop lamp switch (2) in the brake pedal bracket (1). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/STOP LAMP SWITCH - INSTALLATION)
7. Install the steering column opening cover reinforcement in the steering column opening.
8. Install the steering column opening cover on the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION)
9. If equipped, install the silencer pad below the instrument panel.

CAUTION: When installing the vacuum hose on the check valve (1), make sure the hose is routed properly to avoid possible contact with unfriendly surfaces.

10. Connect the vacuum hose (2) to the vacuum check valve (1).
11. Install the master cylinder. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)
12. Connect the battery negative cable to its post on the battery.
13. Bleed the base brake system if necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
14. Road test the vehicle to ensure proper operation of the brakes.



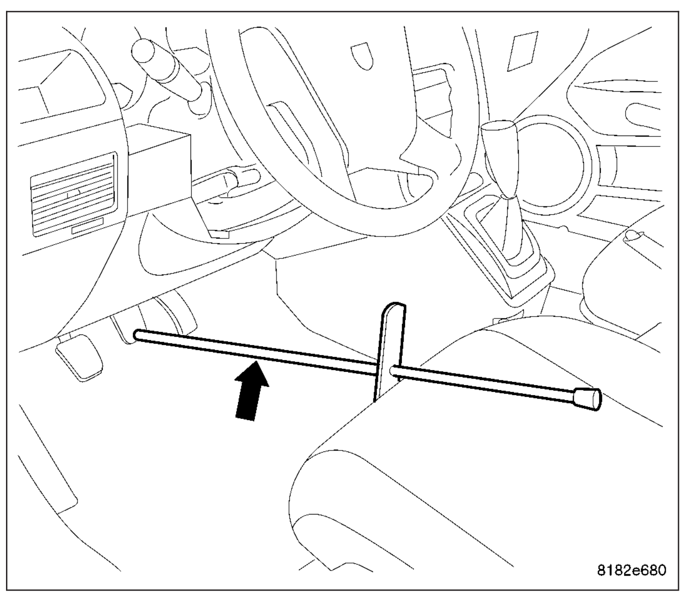
VALVE-PROPORTIONING

DESCRIPTION

NOTE: Only vehicles without antilock brakes have proportioning valves. Vehicles with antilock brakes have Electronic Variable Brake Proportioning (EVBP) that is built into the Integrated Control Unit (ICU).

On the non-antilock master cylinder (1), two screw-in proportioning valves (2, 3) are screwed directly into the rear brake outlet ports. The chassis brake tubes leading to the rear brakes attach to the outlets of the proportioning valves. One proportioning valve controls each rear brake.

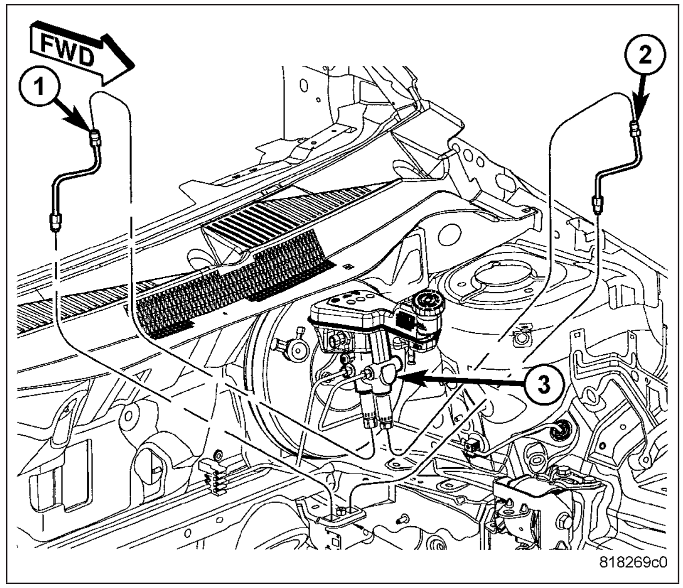
The proportioning valves are not identical and cannot be interchanged. The proportioning valve that threads into the primary port (3) has M10 x 1 threads going into the master cylinder (1). The proportioning valve that threads into the secondary port (2) has M12 x 1 threads going into the master cylinder (1).



OPERATION

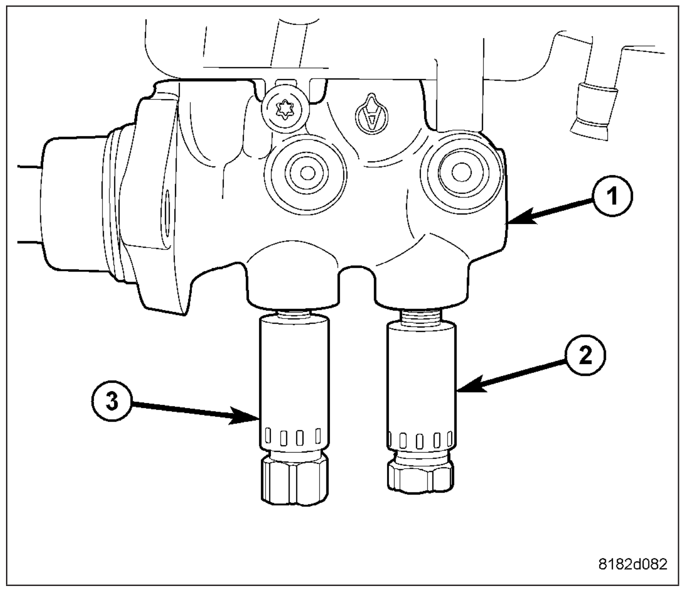
Proportioning valves balance front to rear braking by controlling the brake fluid hydraulic pressure to the rear brakes above a preset level (split point). Under light pedal application, the proportioning valve allows normal fluid flow to the rear brakes. Under higher pedal effort, the valve reduces fluid pressure to the rear brakes. This helps prevent rear wheel skid tendencies.

REMOVAL



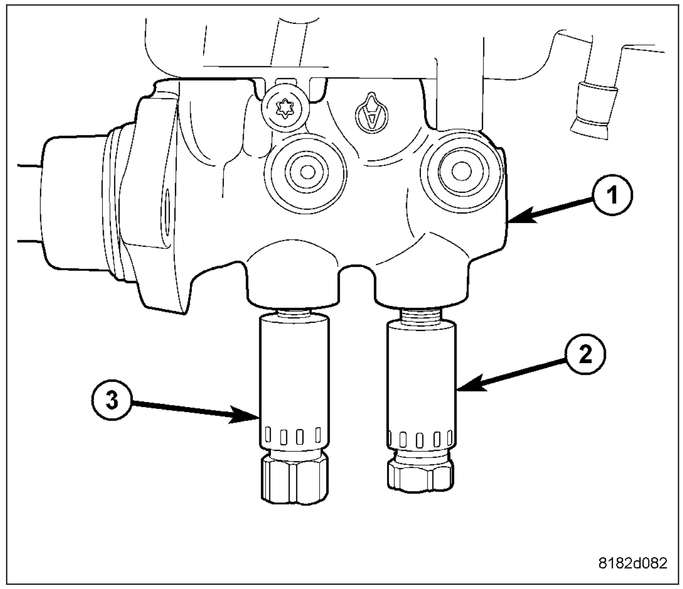
NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

1. Using a brake pedal holder, depress the brake pedal past its first one inch (25 mm) of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir.

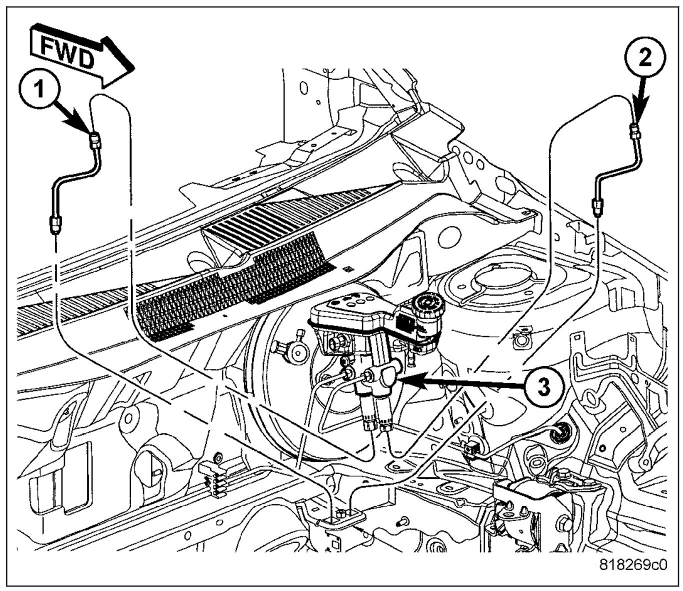


NOTE: To access the lower (left rear) proportioning valve, it may help to remove the air cleaner cover and hose to the throttle body.

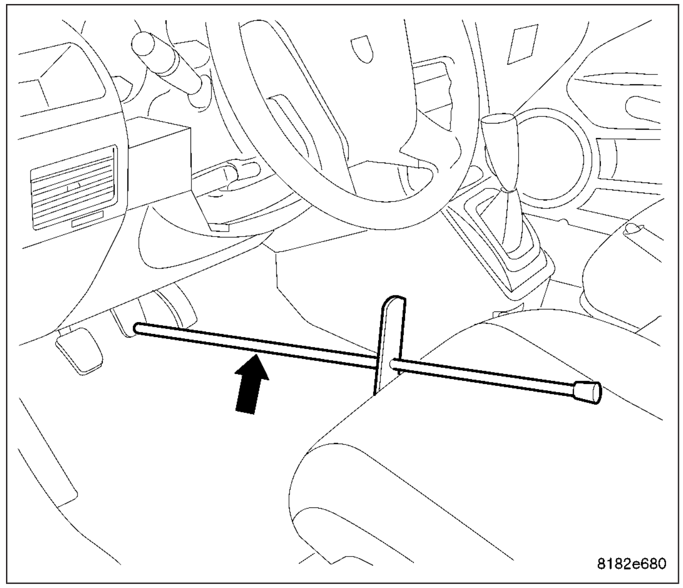
2. Disconnect the brake tube (1 or 2) from the proportioning valve requiring removal.



3. Unscrew the proportioning valve (2 or 3) from the master cylinder (1).



INSTALLATION



1. Install the proportioning valve (2 or 3) in its master cylinder (1) port. Tighten the proportioning valve to 17 N·m (150 in. lbs.).

2. Install the correct brake tube (1 or 2) to the proportioning valve. Tighten the tube nut to 30 N·m (22 ft. lbs.).

3. Remove the brake pedal holder.
4. Bleed the affected brake line(s). (Refer to 5 - BRAKES - STANDARD PROCEDURE)
5. Road test the vehicle to ensure proper operation of the brakes.

ROTOR

DIAGNOSIS AND TESTING

BRAKE ROTOR

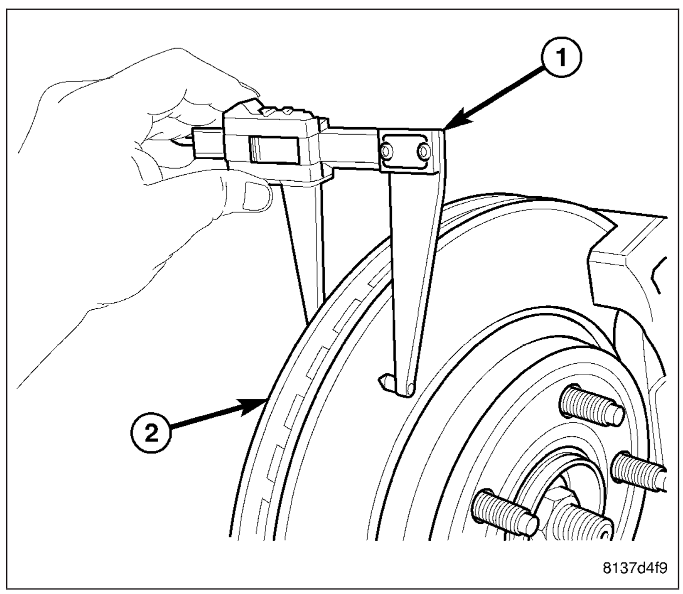
Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be inspected.

BRAKING SURFACE INSPECTION

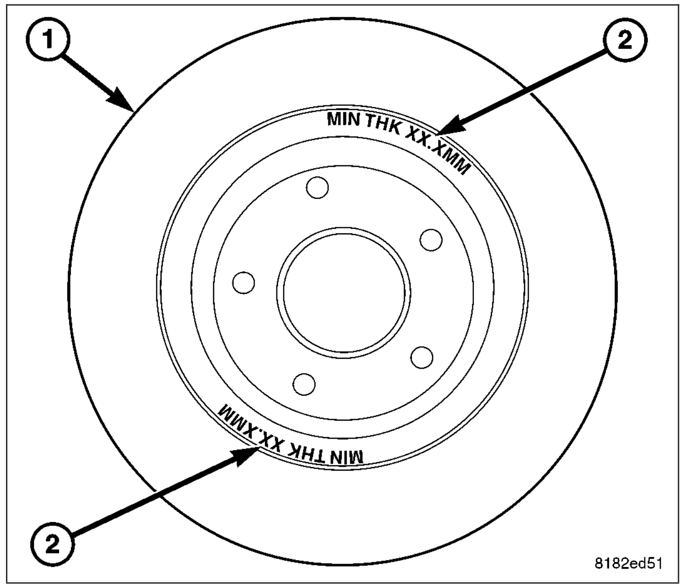
Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be refaced or replaced. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE).



Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

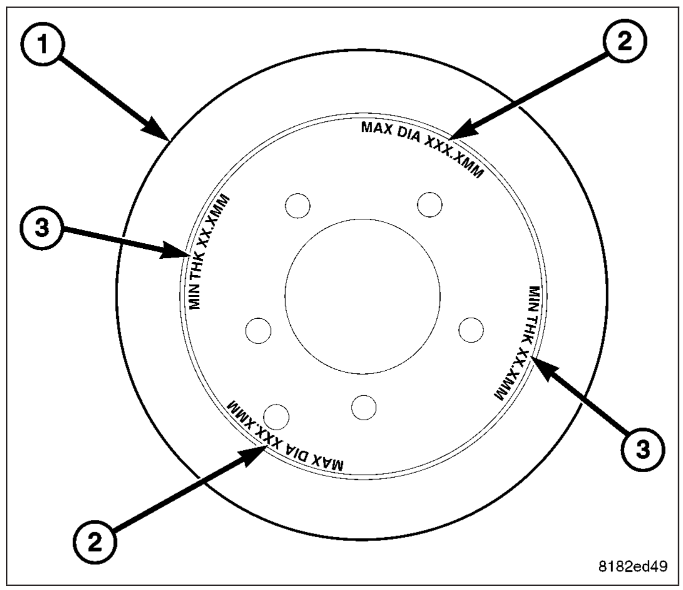
If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.



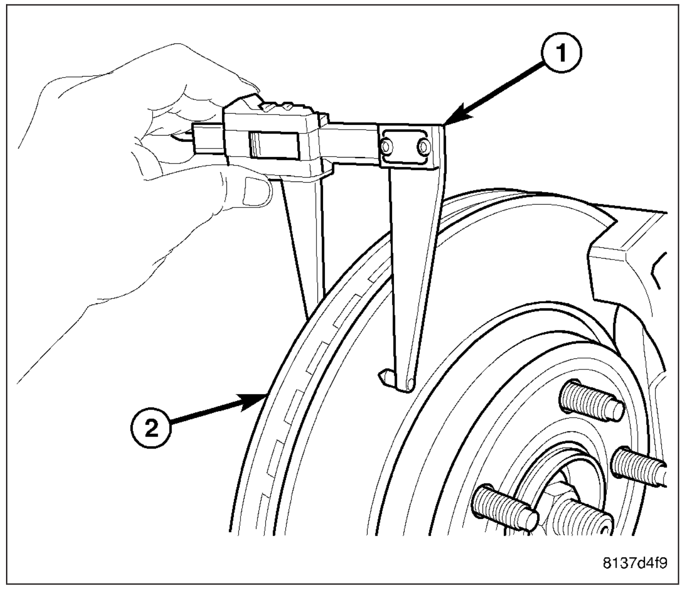
ROTOR MINIMUM THICKNESS

Measure rotor thickness (1) at the center of the brake pad contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.



CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

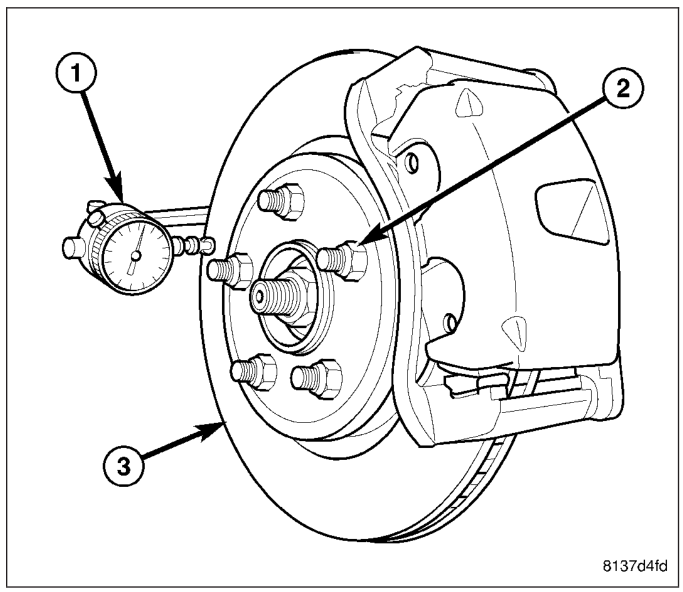
On front rotors, Minimum thickness specifications (2) are cast on the rotor's unmachined surface on the inside of the rotor (1). Limits can also be found in this component's specification table. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)



On rear rotors, Minimum thickness specifications (3) are cast into the rotor's unmachined surface on the outside of the rotor (1). This area also shows the maximum thickness specifications (2) for the hat section of the rotor. Limits can also be found in this component's specification table. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

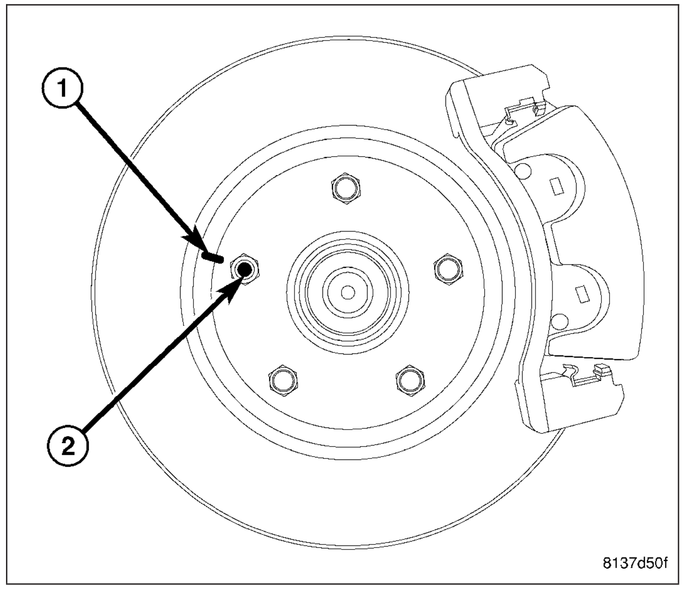
ROTOR THICKNESS VARIATION

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.



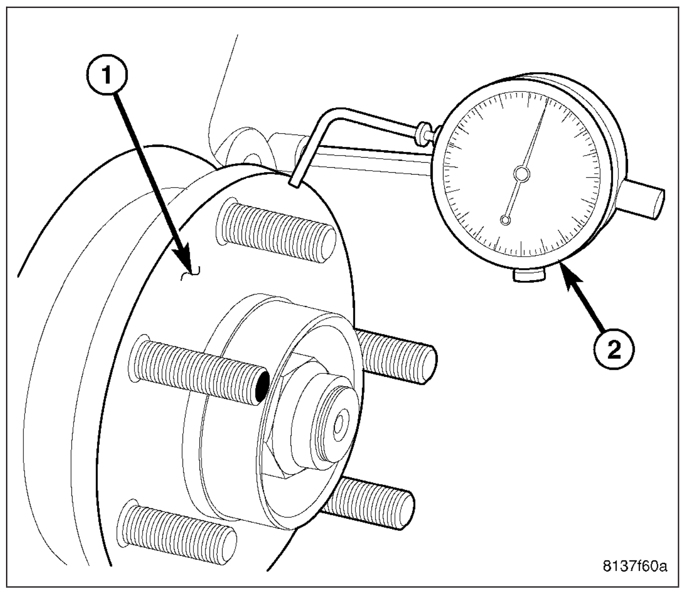
Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor (2) at 12 equal points around the rotor braking surface with a micrometer (1) at a radius approximately 25 mm (1 inch) from edge of rotor. If thickness measurements vary beyond the specification listed in the specification table (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS), the rotor should be refaced or replaced. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - STANDARD PROCEDURE).

ROTOR RUNOUT



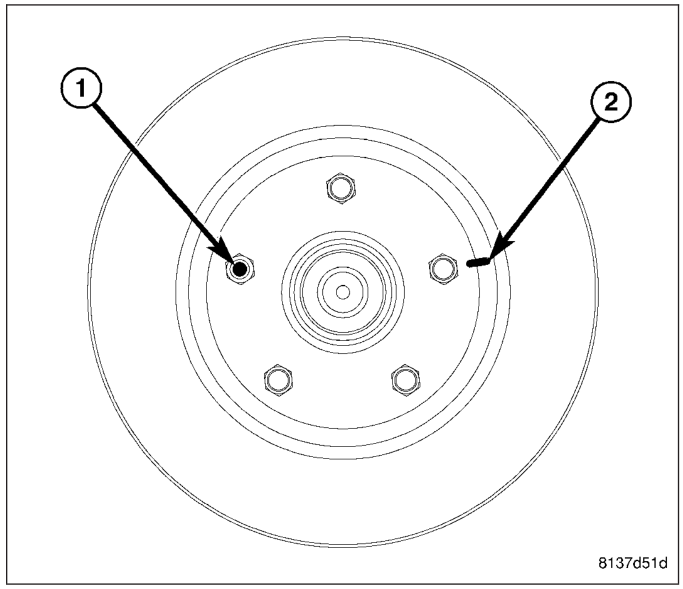
On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the brake rotor (hub runout can be measured separately). To measure rotor runout on the vehicle:

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS - REMOVAL)
3. Install standard wheel mounting nuts, flat side to rotor, on all the wheel studs (2). Progressively tighten the nuts in a crisscross pattern to 135 N·m (100 ft. lbs.).
4. Mount Dial Indicator (1), Special Tool C-3339A, with Wheel, Special Tool 25w, or equivalent, to the knuckle. Position the dial indicator wheel to contact the rotor braking surface approximately 10 millimeters from the outer edge of the rotor (3).



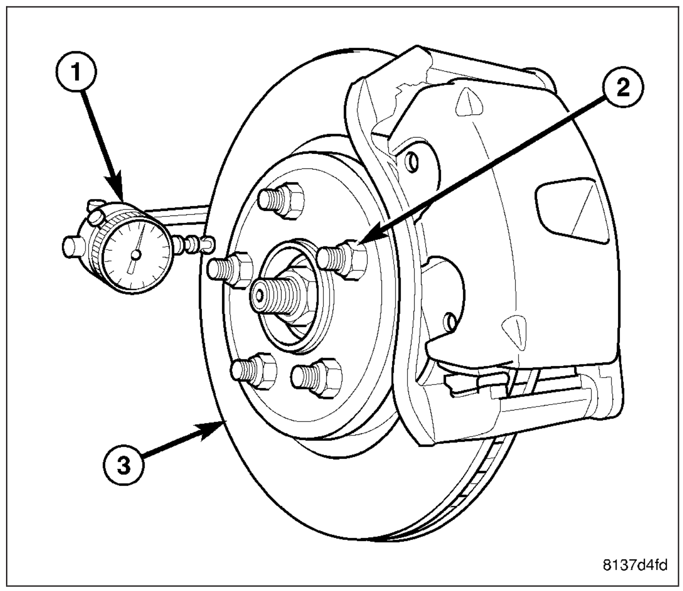
5. Slowly rotate the brake rotor checking lateral runout, marking the low and high spots. Record these measurements.
6. Check and record the runout on the opposite side of the rotor in the same fashion, marking the low and high spots.

7. Compare runout measurement to specifications. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)
8. If runout is in excess of specifications, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor (1) and the one wheel stud (2) closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed.
9. Remove the rotor from the hub. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - REMOVAL)



NOTE: Before measuring hub runout, clean the hub face surface with an appropriate cleaner. This provides a clean surface to get an accurate indicator reading.

10. Mount Dial Indicator (2), Special Tool C-3339A, to the knuckle. Position the dial indicator stem so it contacts the hub face (1) near the outer diameter. Care must be taken to position the stem outside of the stud circle, but inside of the chamfer on the hub rim.
11. Slowly rotate the hub measuring runout. Hub runout should not exceed 0.08 mm (0.003 inch). If runout exceeds this specification, the hub must be replaced. (Refer to 2 - SUSPENSION/FRONT/

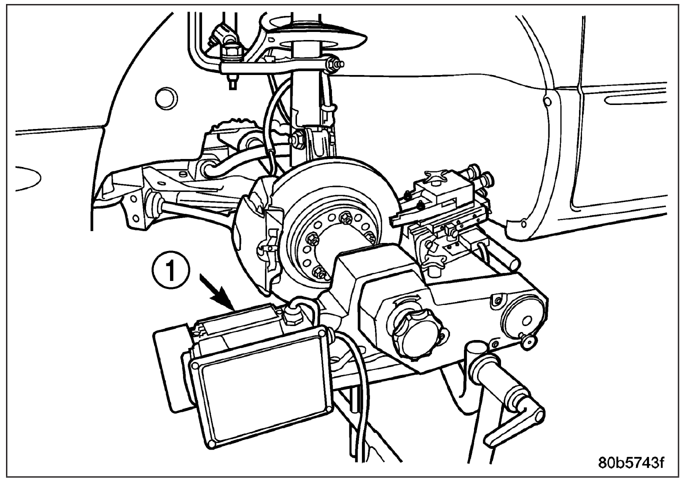


KNUCKLE - REMOVAL) (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)

12. If hub runout does not exceed this specification, install the original rotor back on the hub, aligning the chalk mark on the rotor (2) with a wheel mounting stud, two studs apart from the original stud (1).

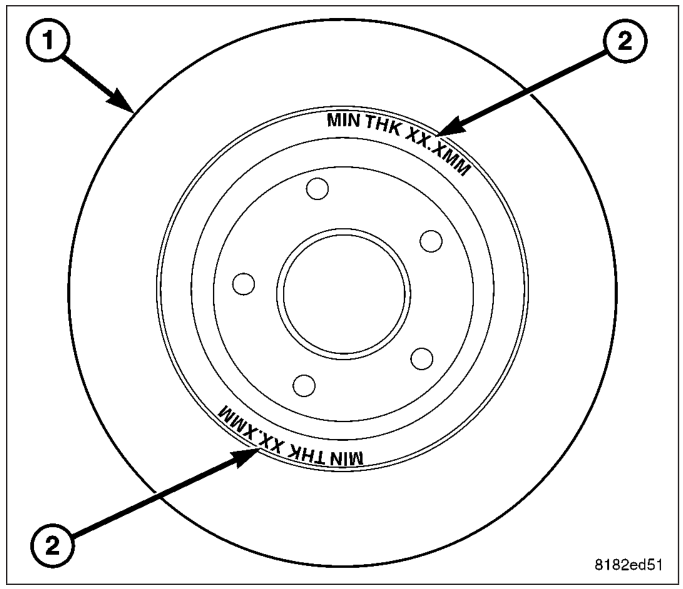
13. Install standard wheel mounting nuts, flat side to rotor, on all the wheel studs (2). Progressively tighten the nuts in a crisscross pattern to 135 N·m (100 ft. lbs.).
14. Mount the Dial Indicator (1), Special Tool C-3339A, and remeasure runout on both sides of the brake rotor as explained in earlier steps to see if runout is now within specifications. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)
15. If runout is still not within specifications, reface or replace brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE)

STANDARD PROCEDURE



BRAKE ROTOR MACHINING

NOTE: Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.



Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (1), or replaced.

The use of a hub-mounted on-car brake lathe (1) is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

NOTE: All brake rotors (1) have markings for minimum allowable thickness cast on an unmachined surface of the rotor (2) or stamped into the hat section. On this vehicle, the minimum thickness specification for the front brake rotor is located on the inside of the rotor. The minimum thickness specification for the rear brake rotor is located on the outside of the rotor. Minimum thickness specifications can also be found in this component's specification table. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

Minimum allowable thickness is the minimum thickness which the brake rotor machined surface may be cut to.

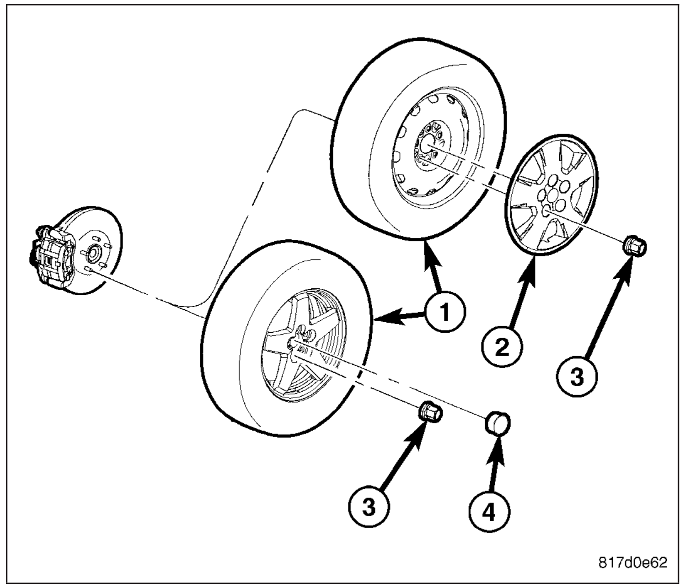
CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Before lathe installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

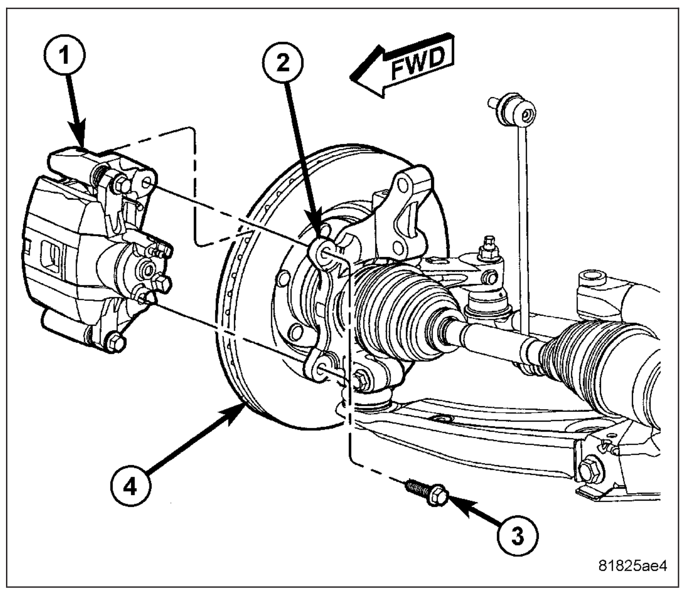
When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED. Extreme care in the operation of rotor turning equipment is required. Specifications for brake rotor machining can be found in this sections specification table. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)



REMOVAL

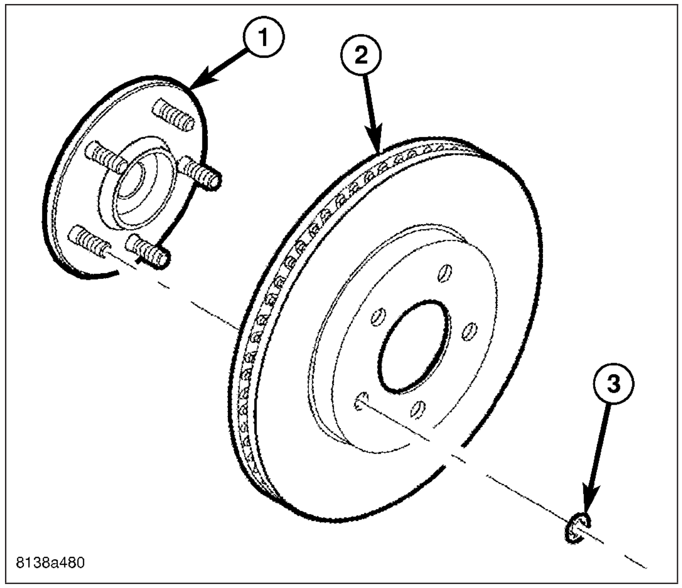
FRONT BRAKE ROTOR

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



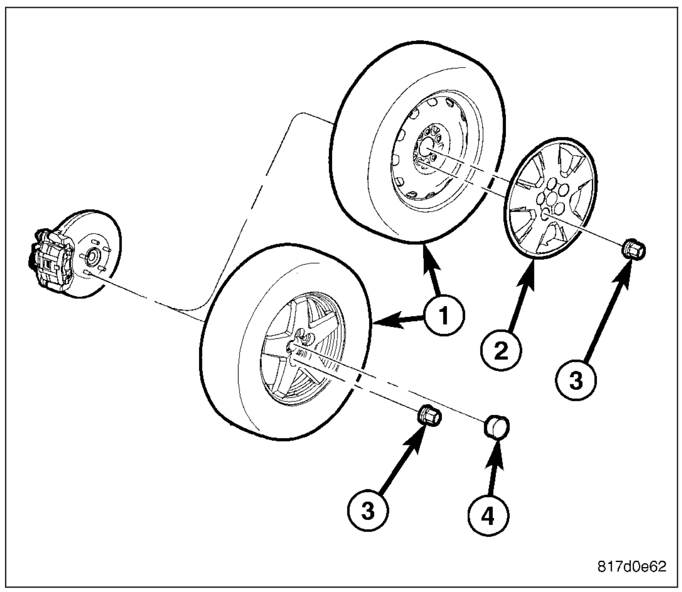
1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

2. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).



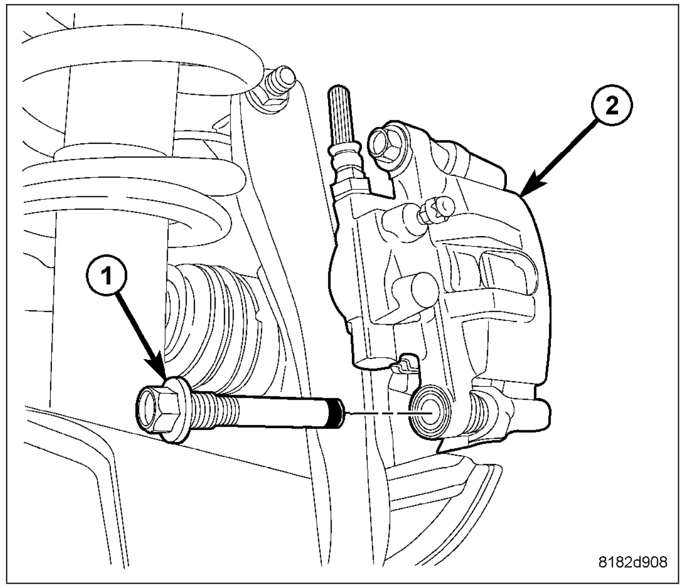
NOTE: In some cases, it may be necessary to retract the caliper piston in its bore a small amount in order to provide sufficient clearance between the pads and the rotor to easily remove the caliper from the knuckle. This can usually be accomplished before the guide pin bolts are removed, by grasping the inboard side of the caliper and pulling outward working with the guide pins, thus retracting the piston. Never push on the piston directly as it may get damaged.

3. Remove the two bolts (3) securing disc brake caliper and adapter bracket (1) to the steering knuckle (2).
4. Remove the disc brake caliper and adapter bracket (1) from the knuckle (2) and rotor (4) as an assembly. Hang the assembly out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.



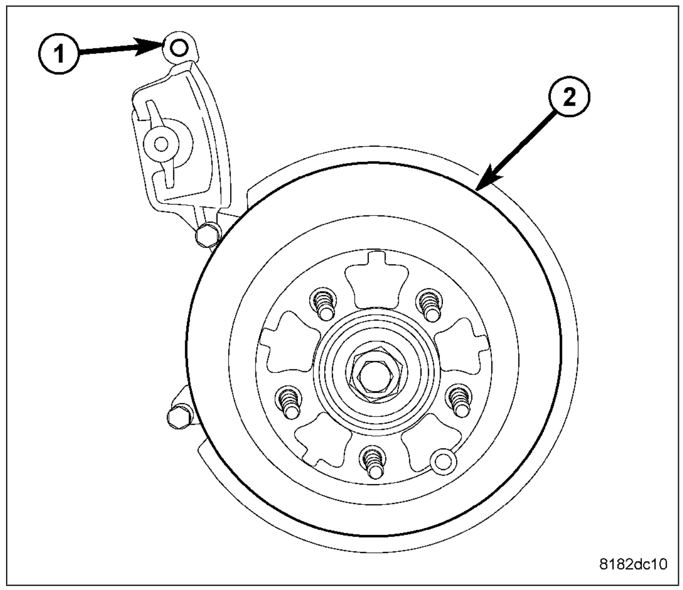
5. Remove any clips (3) retaining the brake rotor (2) to the wheel studs.
6. Slide the brake rotor (2) off the hub and bearing (1).

REAR BRAKE ROTOR



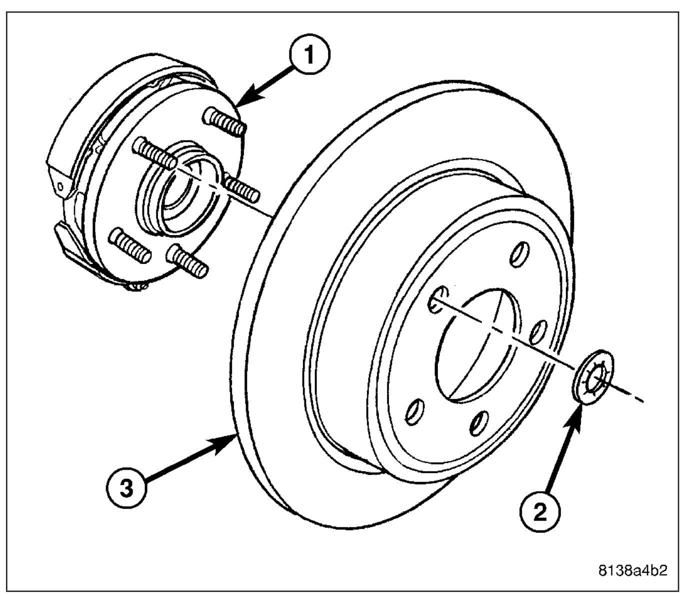
NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel mounting nuts (3), then the tire and wheel assembly.



NOTE: In some cases, it may be necessary to retract the caliper piston in its bore a small amount in order to provide sufficient clearance between the pads and the rotor to easily remove the caliper from the knuckle. This can usually be accomplished before the guide pin bolts are removed, by grasping the inboard side of the caliper and pulling outward working with the guide pins, thus retracting the piston. Never push on the piston directly as it may get damaged.

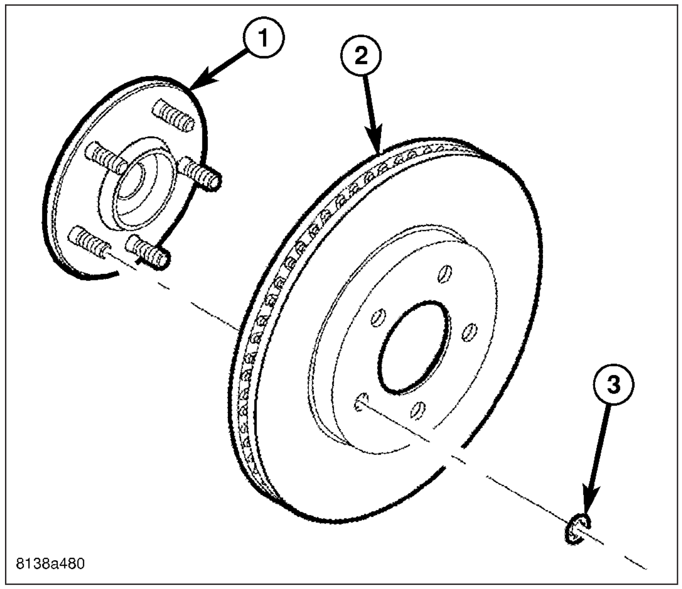
3. Remove the disc brake caliper (2) lower guide pin bolt (1).



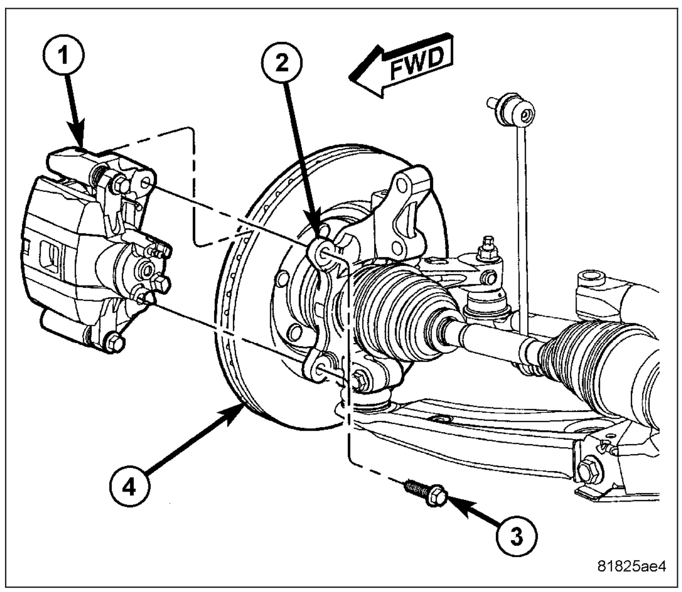
CAUTION: When moving rear brake caliper upward, use extreme care not to damage or over-extend the flex hose. Damage may occur.

4. Rotate the caliper upward hinging off the upper guide pin bolt. Rotate the caliper upward just enough to allow brake rotor removal. Hang the caliper assembly in this position using wire or a bungee cord.

5. Remove any clips (2) retaining the brake rotor (3) to the wheel studs.
6. Slide the brake rotor (3) off the hub and bearing (1) and remove.

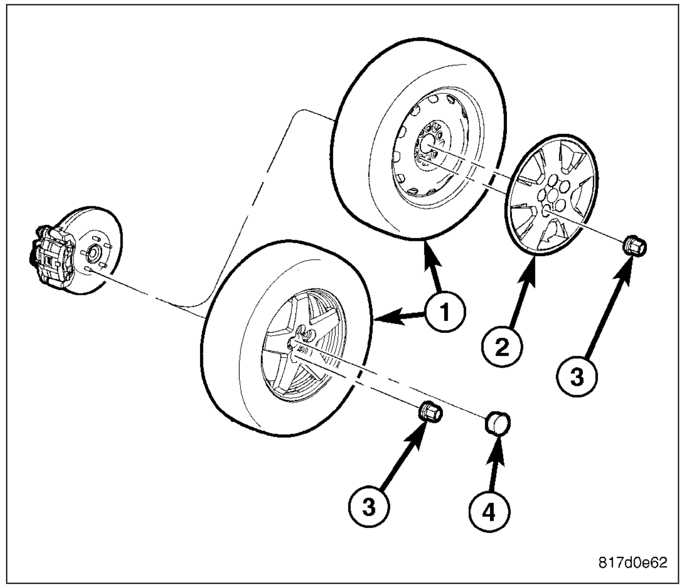


INSTALLATION



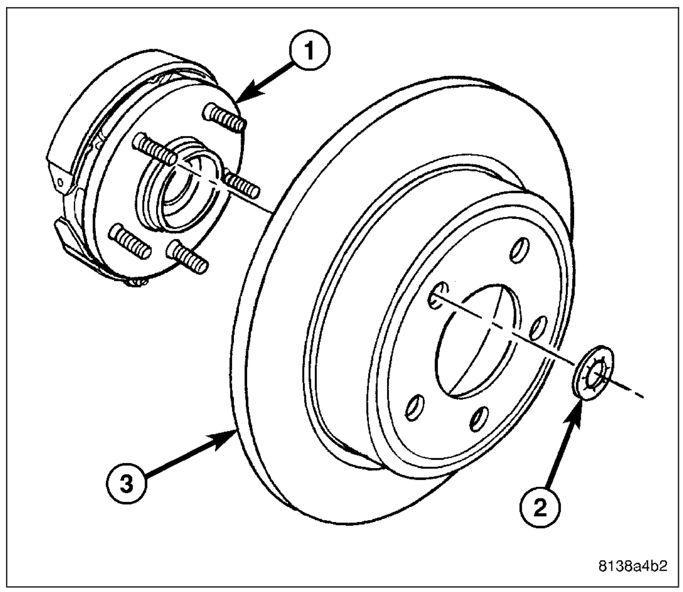
FRONT BRAKE ROTOR

NOTE: Inspect disc brake pads before installation. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSPECTION)



1. Clean the hub face (1) to remove any dirt or corrosion where the rotor mounts.
2. Install the brake rotor (2) over the studs on the hub and bearing.

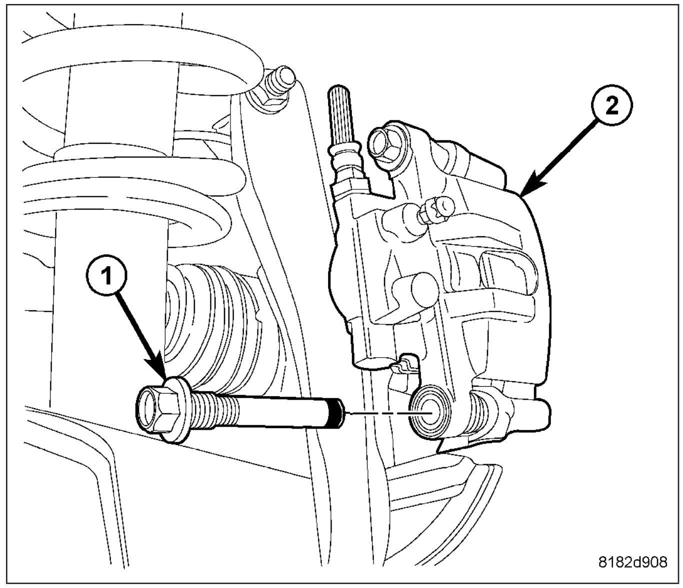
3. Install the disc brake caliper and adapter bracket assembly (1) over the brake rotor (4) and knuckle (2).
4. Install the mounting bolts (3) securing the caliper adapter bracket to the knuckle (2). Tighten the bolts to 108 N·m (80 ft. lbs.).



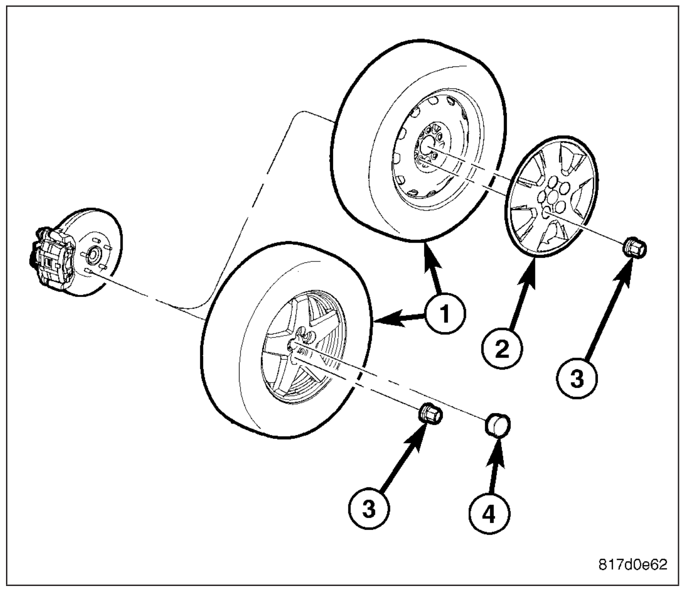
5. Install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
6. Lower the vehicle.
7. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
8. Check and adjust the brake fluid level in the reservoir as necessary.
9. Road test the vehicle and make several stops to seat the brake pads to the rotor.

REAR BRAKE ROTOR

NOTE: Inspect disc brake pads and parking brake shoes before installation. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSPECTION)



1. Clean the hub face (1) to remove any dirt or corrosion where the rotor mounts.
2. Install the brake rotor (3) over the studs on the hub and bearing (1).



CAUTION: Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boot.

NOTE: The lubricant used on the guide pin portion of the guide pin bolt is Niglube RM. Use the appropriate lubricant when necessary.

3. Rotate the disc brake caliper downward over the brake rotor and lower part of caliper adapter.
4. Install the disc brake caliper (2) lower guide pin bolt (1). Tighten the guide pin bolt to 43 N·m (32 ft. lbs.).

5. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
6. Lower the vehicle.
7. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
8. Check and adjust the brake fluid level in the reservoir as necessary.
9. Road test the vehicle and make several stops to seat the brake pads to the rotor.

SPECIFICATIONS

BRAKE ROTOR LIMITS/SPECIFICATIONS

NOTE: When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED.

Braking Rotor	Rotor Thickness	Minimum Rotor Thickness	Rotor Thickness Variation	Rotor Runout*
Front Rotor (15-inch)**	25.90–26.10 mm 1.020–1.028 in.	24.40 mm 0.961 in.	0.005 mm 0.0002 in.	0.05 mm 0.002 in.
Front Rotor (16-inch*)**	25.90–26.10 mm 1.020–1.028 in.	24.40 mm 0.961 in.	0.005 mm 0.0002 in.	0.05 mm 0.002 in.
Rear Rotor	9.80–10.20 mm 0.386–0.402 in.	8.40 mm 0.331 in.	0.015 mm 0.0006 in.	0.06 mm 0.0024 in.

* TIR Total Indicator Reading (Measured On Vehicle)
** Referred to as “15-inch” because they are designed to fit inside 15-inch or larger wheels. Actual rotor diameter is 10.8 in. (276 mm).
*** Referred to as “16-inch” because they are designed to fit inside 16-inch or larger wheels. Actual rotor diameter is 11.5 in. (294 mm).

TUBES/HOSES

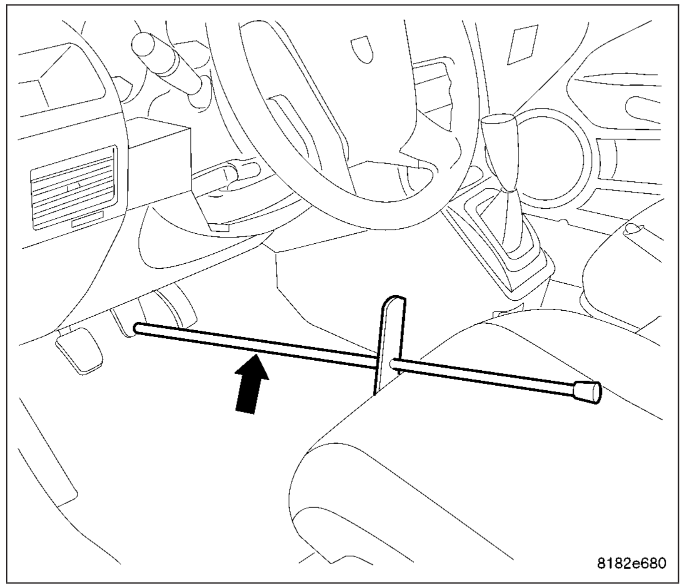
DESCRIPTION

The brake tubes are steel with a corrosion-resistant nylon coating applied to the external surfaces.

The flex hoses used at each wheel brake are made of reinforced rubber with fittings at each end. The fitting at each front brake caliper is the banjo-type and requires a special banjo bolt and copper washers. The fitting at each rear brake caliper is a screw-in type fitting. Rear drum brake vehicles use a standard tube nut fitting at each wheel cylinder.

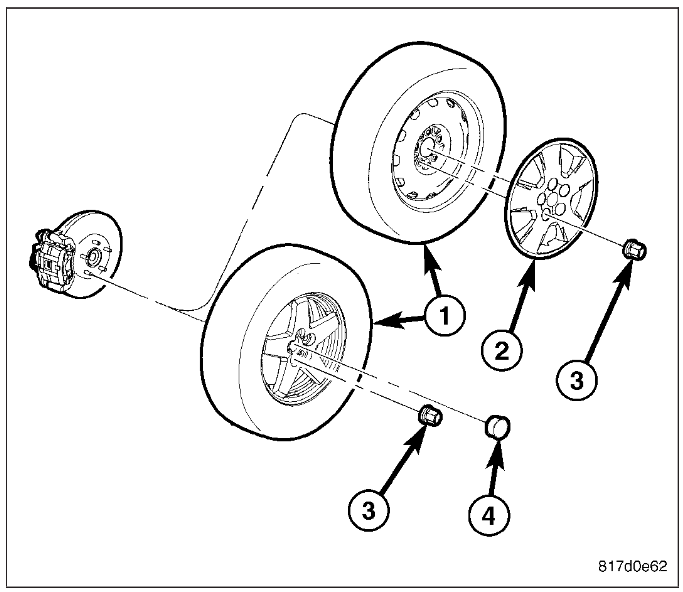
INSPECTION

Brake tubing should be inspected periodically for evidence of physical damage or contact with moving or hot components.



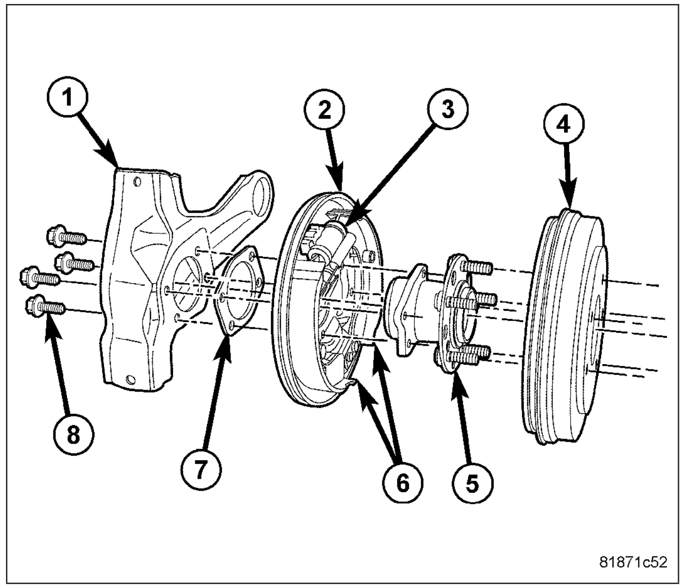
Flexible rubber hose is used at both the front and rear wheel brakes. Inspection of the flexible brake hoses should be performed whenever the brake system is serviced and every 7,500 miles or 12 months, whichever comes first. Inspect hydraulic brake hoses for surface cracking, scuffing, or worn spots. If the fabric casing of the hose becomes exposed due to cracks or abrasions in the hose cover, the hose should be replaced immediately. Eventual deterioration of the hose can take place with possible burst failure. Faulty installation can cause twisting, resulting in wheel, tire, or chassis interference.

PLATE-SUPPORT, BRAKE BACKING

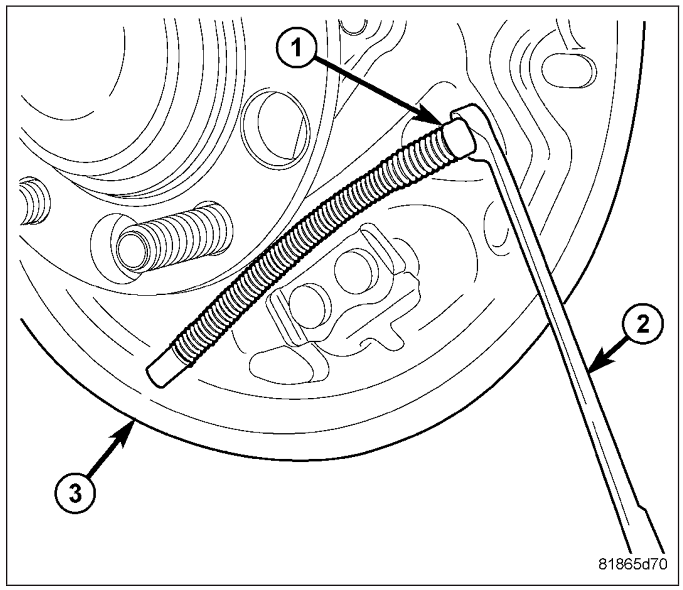


REMOVAL

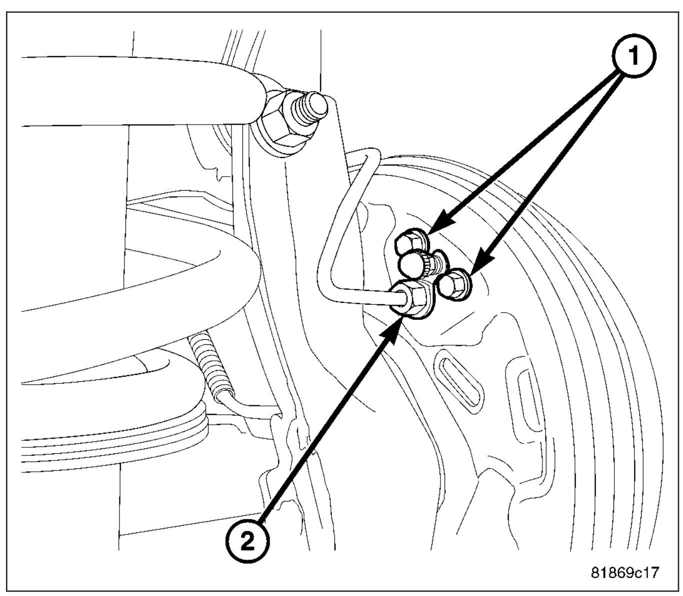
NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



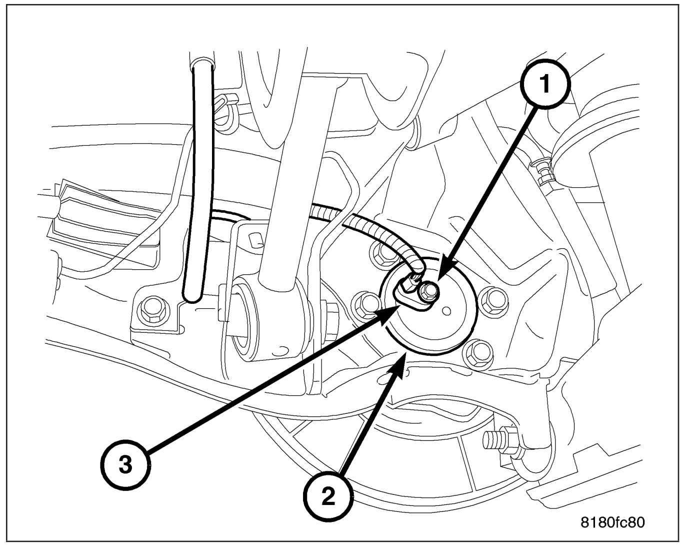
1. Using a brake pedal holding tool as shown, depress the brake pedal past its first one inch of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir.
2. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)



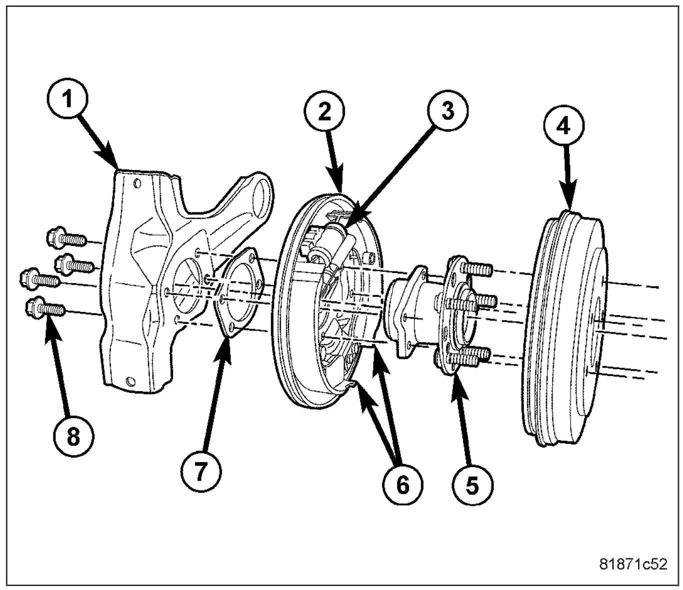
3. Remove the wheel mounting nuts (3), then the tire and wheel assembly.



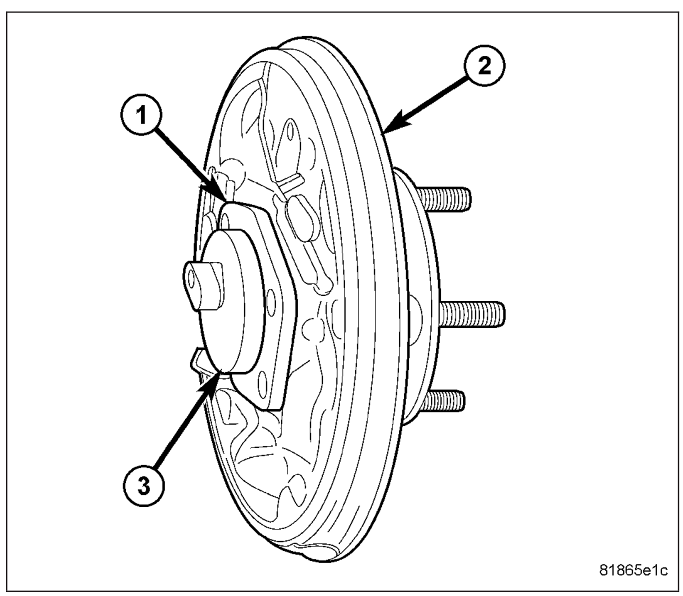
4. Access and remove the drum brake shoes (6) from the support plate (2). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL)



5. Position a 10 mm box wrench (2) over the retainer fingers on the end of the parking brake cable housing (1). Compress the cable housing retaining fingers with the wrench, then pull the cable housing out of the support plate.

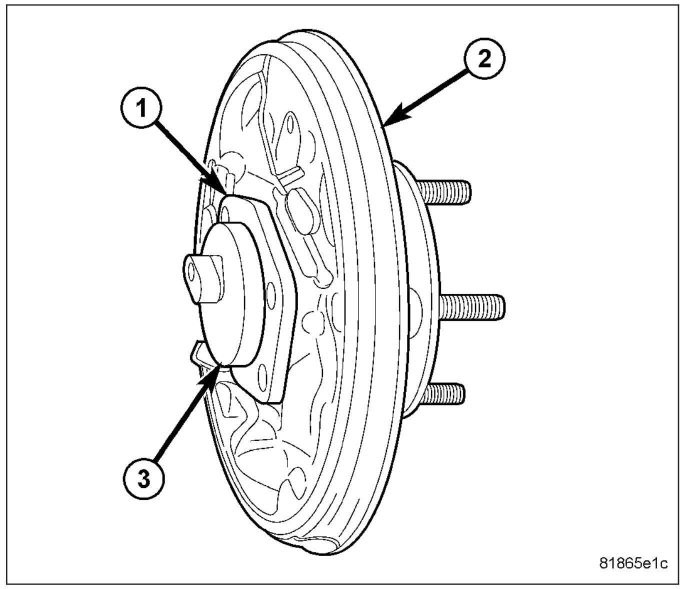


6. Disconnect the brake tube (2) at the wheel cylinder.
7. Remove the wheel cylinder attaching screws (1).
8. Remove the wheel cylinder from the support plate.

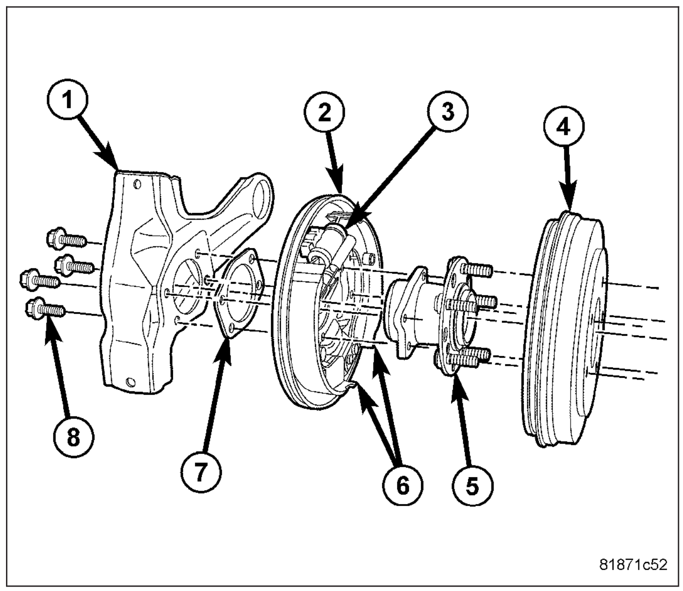


9. If equipped with a wheel speed sensor, remove the screw (1) fastening the wheel speed sensor head (3) in the rear of the hub and bearing (2). Remove the sensor head from the hub and bearing.

10. Remove the four bolts (8) securing the hub and bearing (5), support plate (2), and spacer (7) to the trailing link (1).

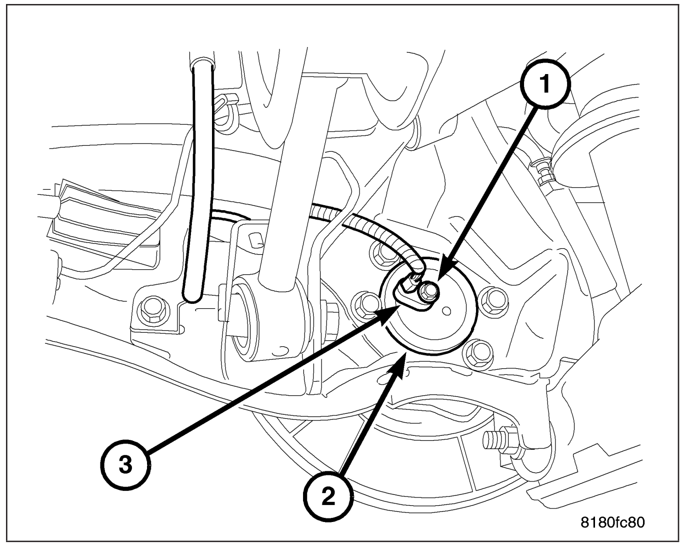


11. Remove the hub and bearing (3), support plate (2), and spacer (1) as an assembly from the trailing link (1). Separate the spacer and hub and bearing from the support plate once removed.



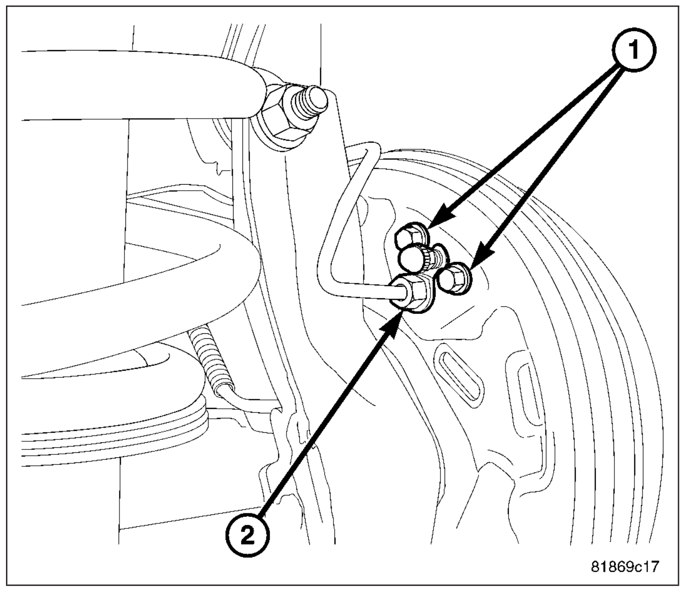
INSTALLATION

1. Assemble the hub and bearing (3) through the support plate (2) and install the spacer (1) on the rear of the assembly.
2. Install the hub and bearing (3), support plate (2), and spacer (1) as an assembly on the trailing link.

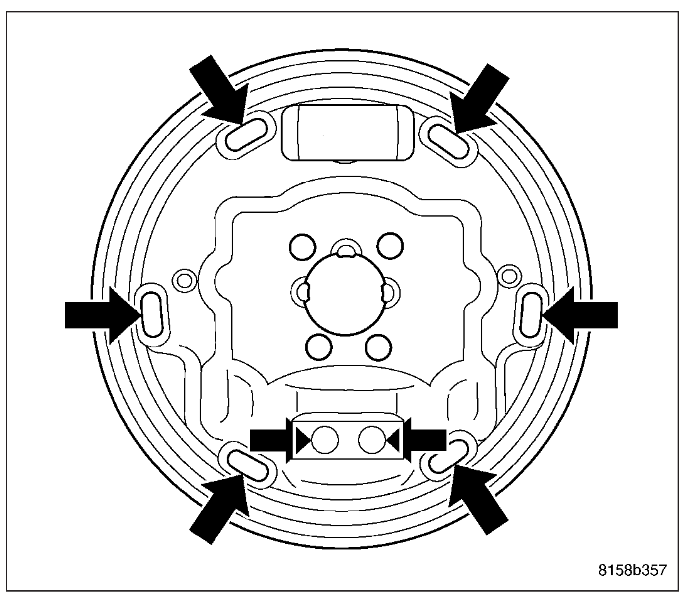


NOTE: When performing the following step, use NEW mounting bolts or clean and apply Mopar® Stud & Bearing Mount Adhesive or equivalent to the original mounting bolt threads before reuse.

3. Install the four bolts (8) securing the hub and bearing (5), support plate (2), and spacer (7) to the trailing link (1). Tighten the mounting bolts to 105 N·m (77 ft. lbs.).

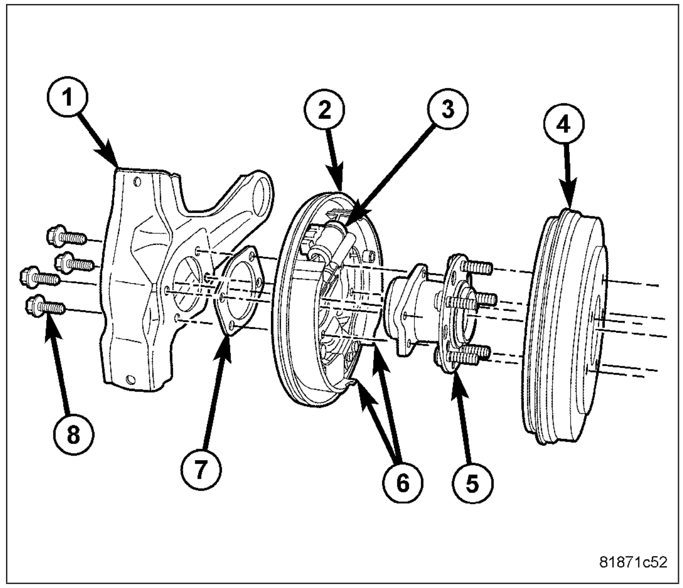


4. Insert the parking brake cable into its mounting hole in the brake support plate. Push the cable housing in until the retainer's fingers lock into place.

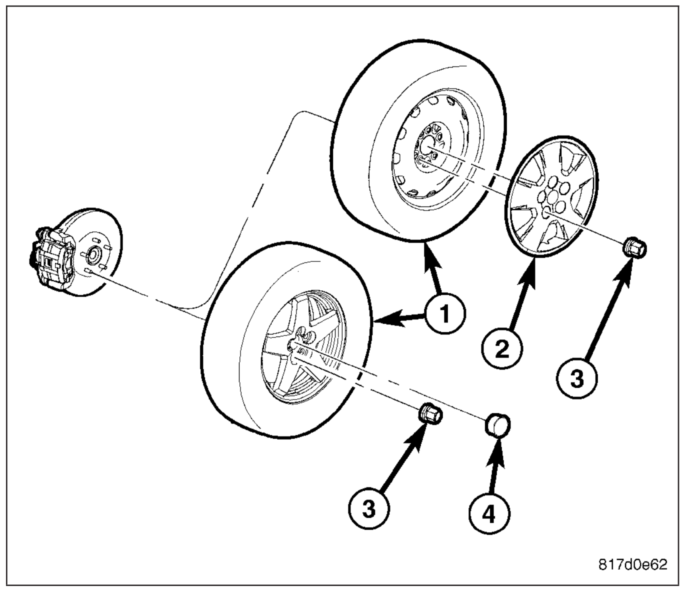


5. If equipped with a wheel speed sensor, Install the wheel speed sensor head (3) into the rear of the hub and bearing (2). Install the wheel speed sensor head mounting screw (1). Tighten the screw to 10 N·m (89 in. lbs.).

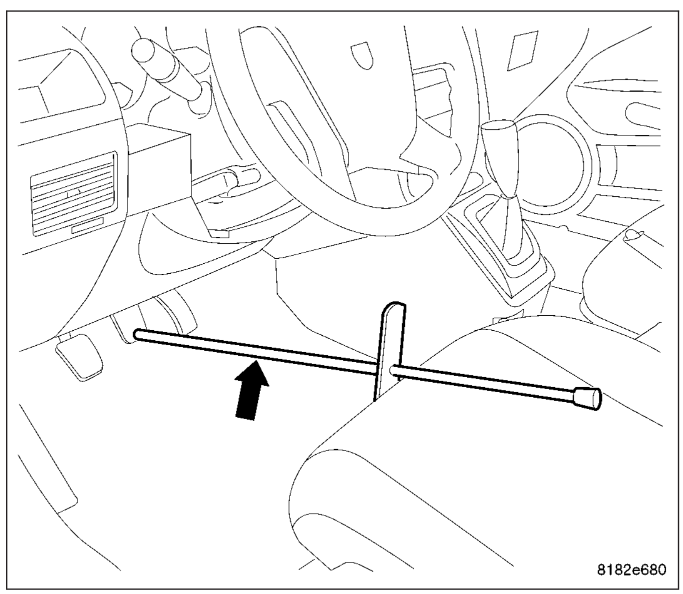
6. Install the wheel cylinder onto the brake support plate. Install and tighten the mounting screws (1) to 13 N·m (115 in. lbs.).
7. Connect the brake tube (2) to the wheel cylinder (1). Tighten the tube nut to 17 N·m (150 in. lbs.).



8. Lubricate shoe contact areas on support plate and anchor using Mopar® Brake Lubricant or equivalent.



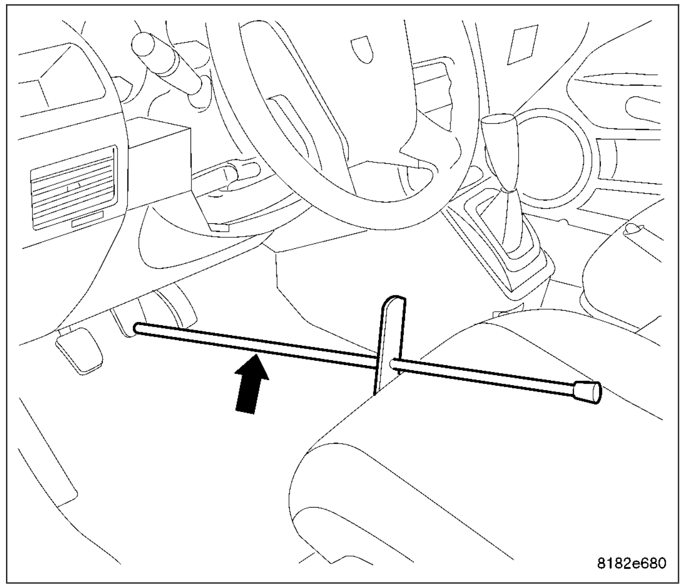
NOTE: Inspect the brake shoes before installation. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ BRAKE PADS/SHOES - INSPECTION)



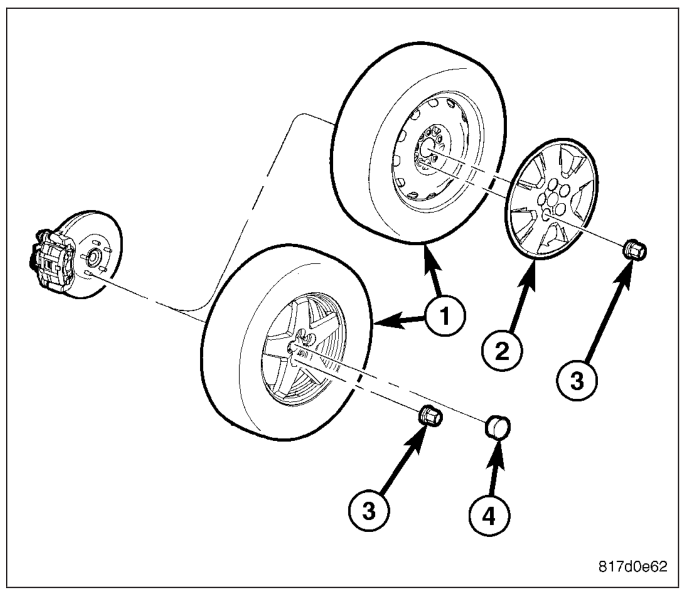
9. Install the drum brake shoes (6) and drum (4). Adjust shoes as necessary. (Refer to 5 - BRAKES/ HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION)

10. Install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
11. Slowly rotate the rear wheel and verify that the brake drum **lightly** drags on the shoes.
12. Lower the vehicle.

13. Remove the brake pedal holding tool.
14. Bleed the affected wheel cylinder as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
15. Road test the vehicle to ensure proper brake operation.

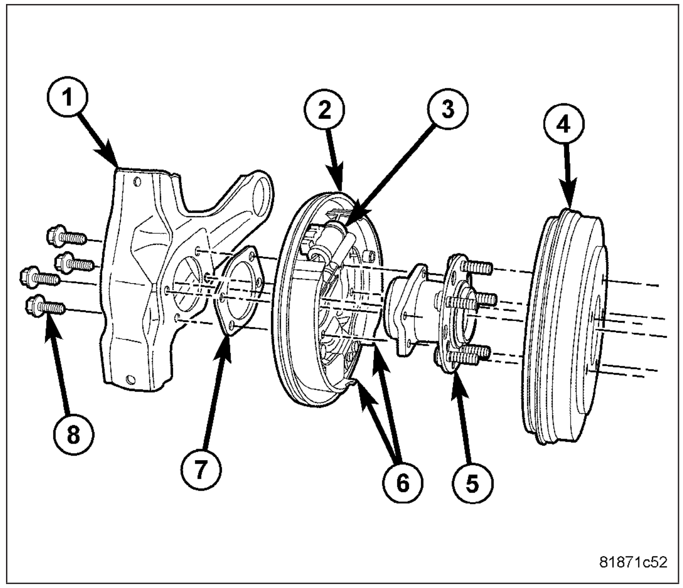


WHEEL CYLINDER - DRUM BRAKE

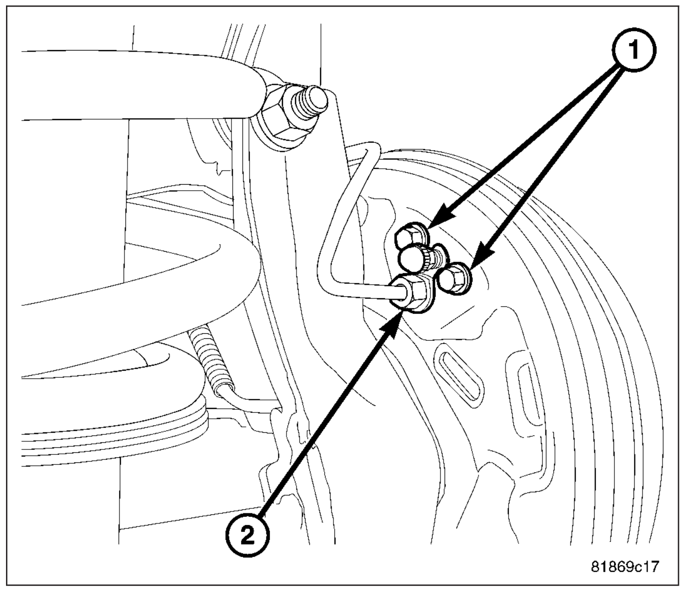


REMOVAL

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



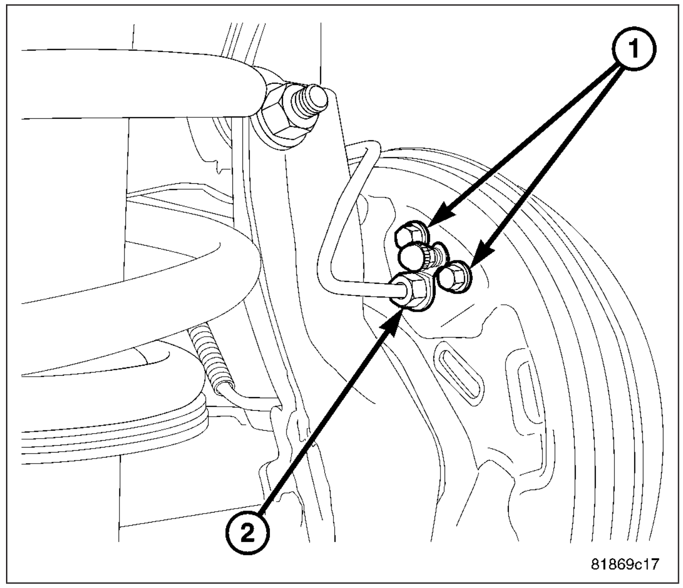
1. Using a brake pedal holder, depress the brake pedal past its first one inch of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir.
2. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)



3. Remove the wheel mounting nuts (3), then the tire and wheel assembly.

4. Access and remove the drum brake shoes (6) from the support plate (2). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL)

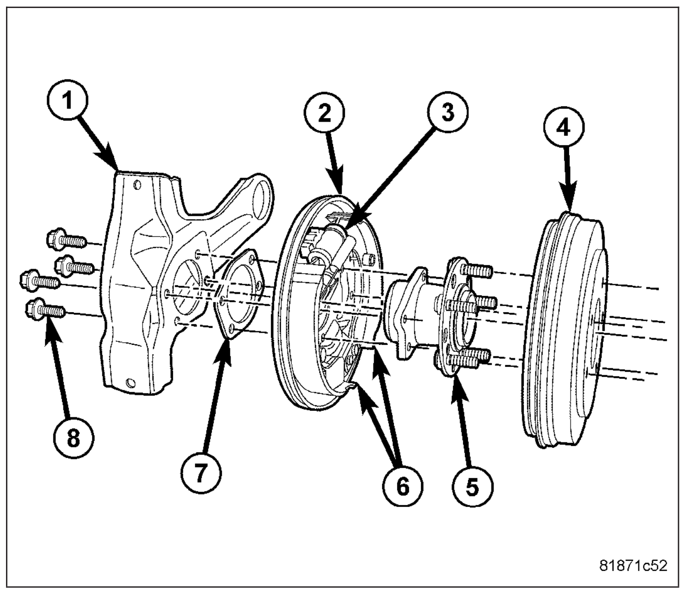
5. Disconnect the brake tube (2) at the wheel cylinder.
6. Remove the wheel cylinder attaching screws (1).
7. Remove the wheel cylinder from the support plate.



INSPECTION

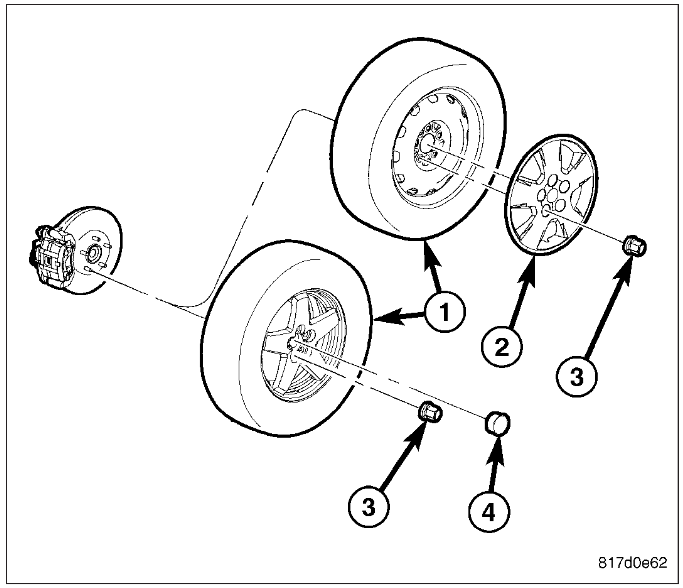
With the brake drum removed, inspect the wheel cylinder boots for evidence of a brake fluid leak. Visually check the boots for cuts, tears, or heat cracks. If any of these conditions exist, the wheel cylinders must be replaced.

If a wheel cylinder is leaking and the brake lining material is saturated with brake fluid, the brake shoes must be replaced.

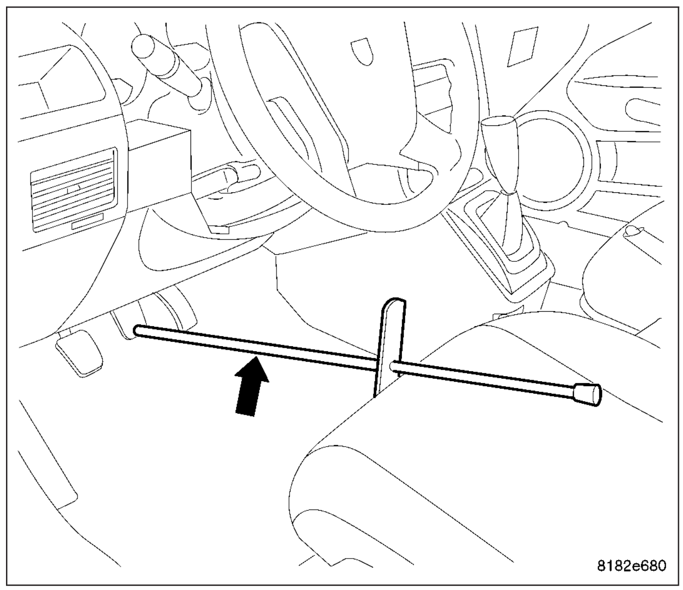


INSTALLATION

1. Install the wheel cylinder onto the brake support plate. Install and tighten the mounting screws (1) to 13 N·m (115 in. lbs.).
2. Hand start the brake tube nut (2) into the wheel cylinder (1). Tighten the tube nut to 17 N·m (150 in. lbs.).



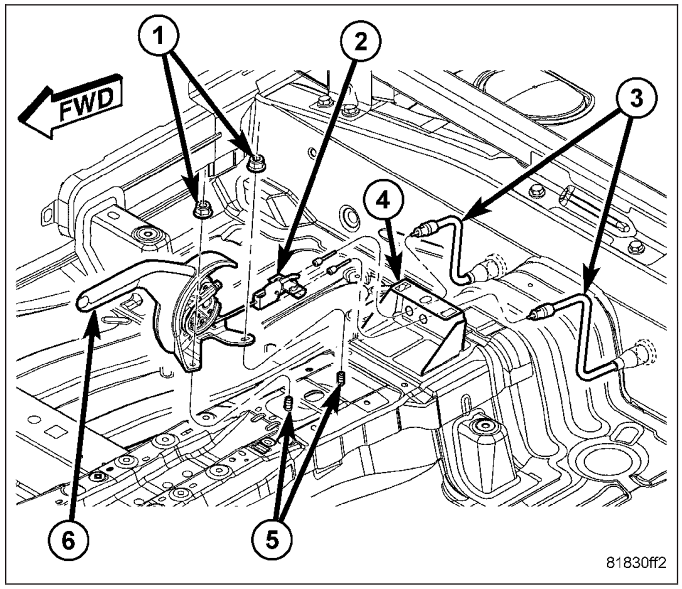
NOTE: Inspect the brake shoes before installation. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ BRAKE PADS/SHOES - INSPECTION)



3. Install the drum brake shoes (6) and drum. Adjust shoes as necessary. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION)

4. Install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
5. Slowly rotate the rear wheel and verify that the brake drum **lightly** drags on the shoes.
6. Lower the vehicle.

7. Remove the brake pedal holder.
8. Bleed the wheel cylinder as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
9. Road test the vehicle to make sure the brakes operate correctly.

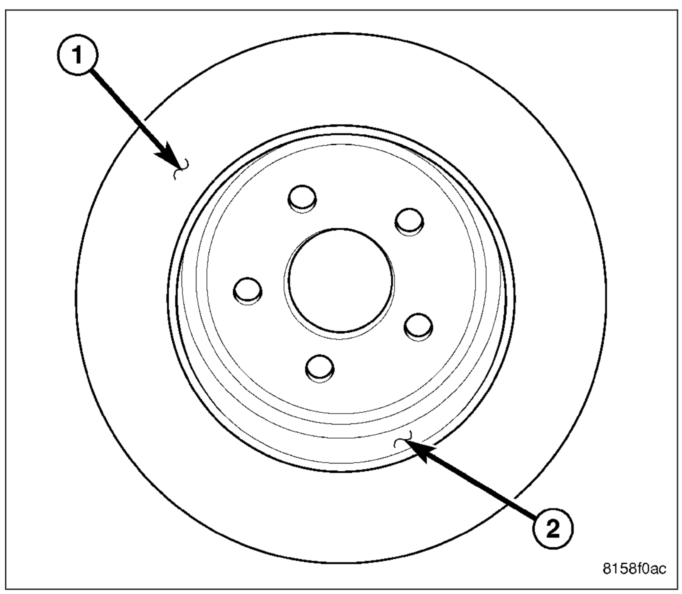


PARKING BRAKE

DESCRIPTION

The parking brakes consist of the following components:

- Hand-operated park brake lever (6)
- Parking brake cables (one each side) (3)
- Actuation levers and struts
- Duo-servo parking brake assembly (rear disc only)



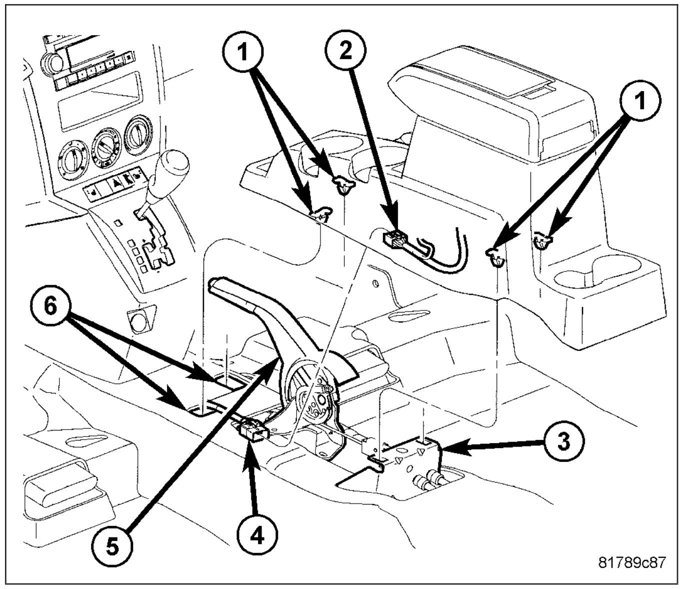
All vehicles are equipped with a center-mounted, hand-operated parking brake lever mounted between the front seats. A bent nail tensioner is built into the equalizer mounted on the end of the lever's output cable.

There is an individual parking brake cable for each rear wheel that joins a parking brake cable equalizer, attached to the parking brake lever, to the rear parking brakes. The parking brake cables are made of flexible steel cable. Both drum rear brakes and disc rear brakes use the same parking brake cable configuration, but the cables are different.

On vehicles equipped with rear drum brakes, the rear wheel service brakes also act as the vehicle's parking brakes. The rear drum brake shoes, when acting as parking brakes, are mechanically operated using an internal actuating lever and strut connected to the flexible steel parking brake cable.

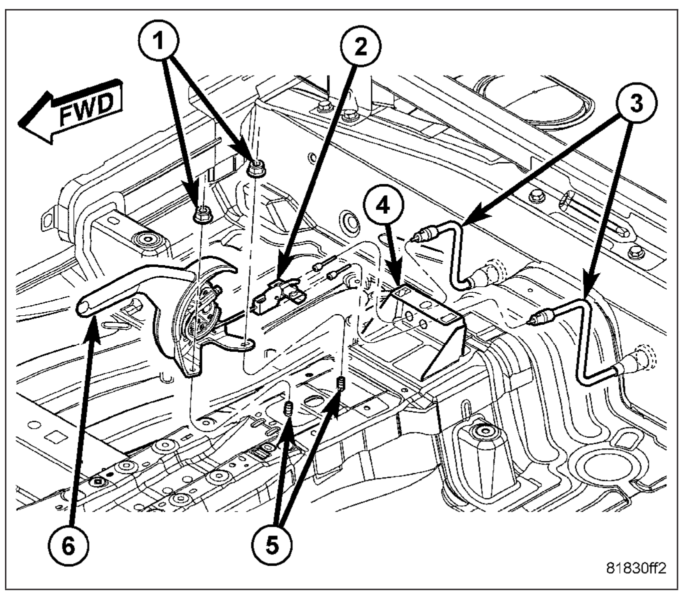
The parking brakes on vehicles equipped with rear disc brakes consist of a small duo-servo brake assembly mounted to the disc brake caliper adapter including two shoes, an actuating lever and strut, as well as the attaching springs and clips. This parking brake application uses the same operating cable configuration as the drum brake equipped vehicles, but uses different cables.

The hat (center) section (2) of each rear disc brake rotor (1) serves as the braking surface (drum) for the parking brakes.



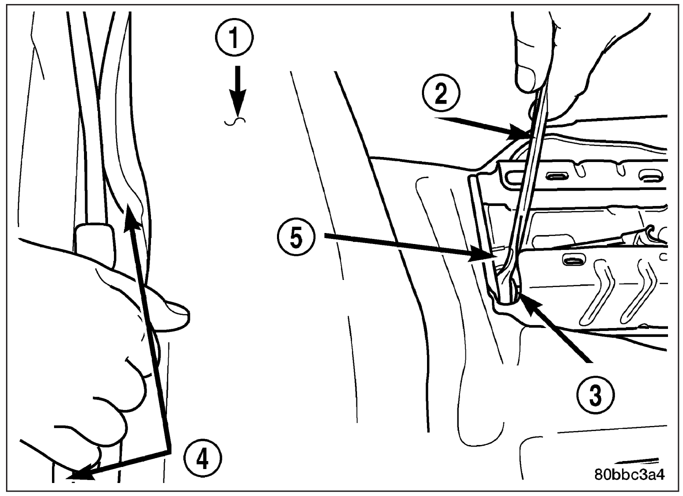
CABLE-PARKING BRAKE

REMOVAL

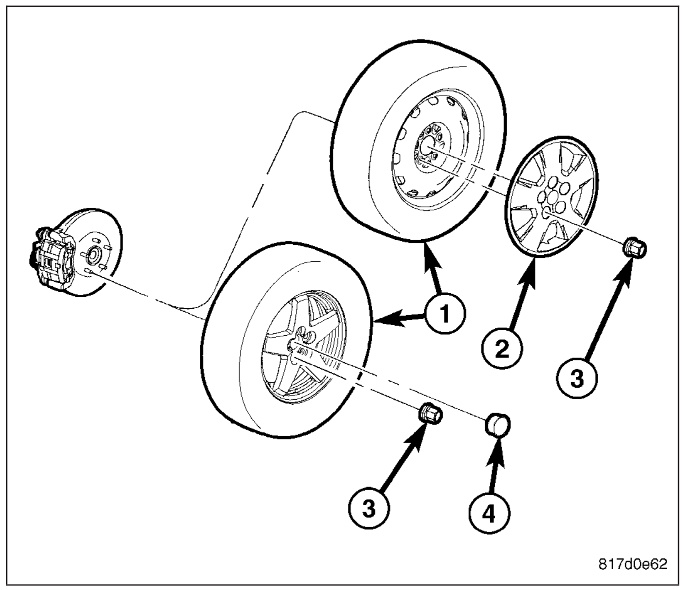


NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

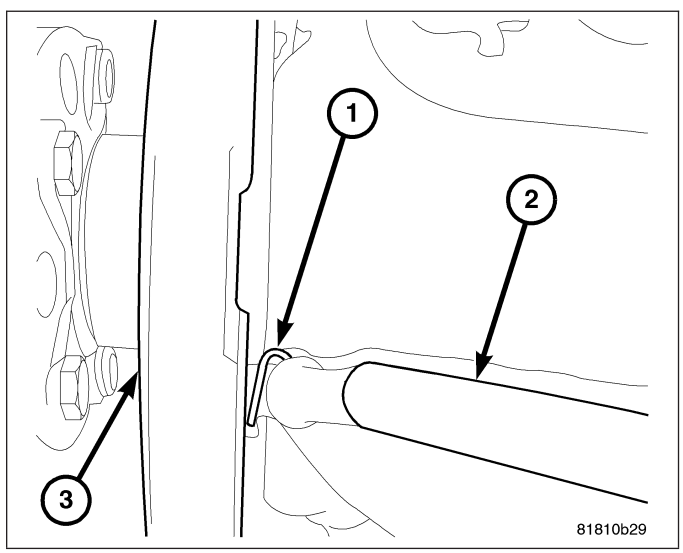
NOTE: The procedure below applies to either of the two rear parking brake cables.



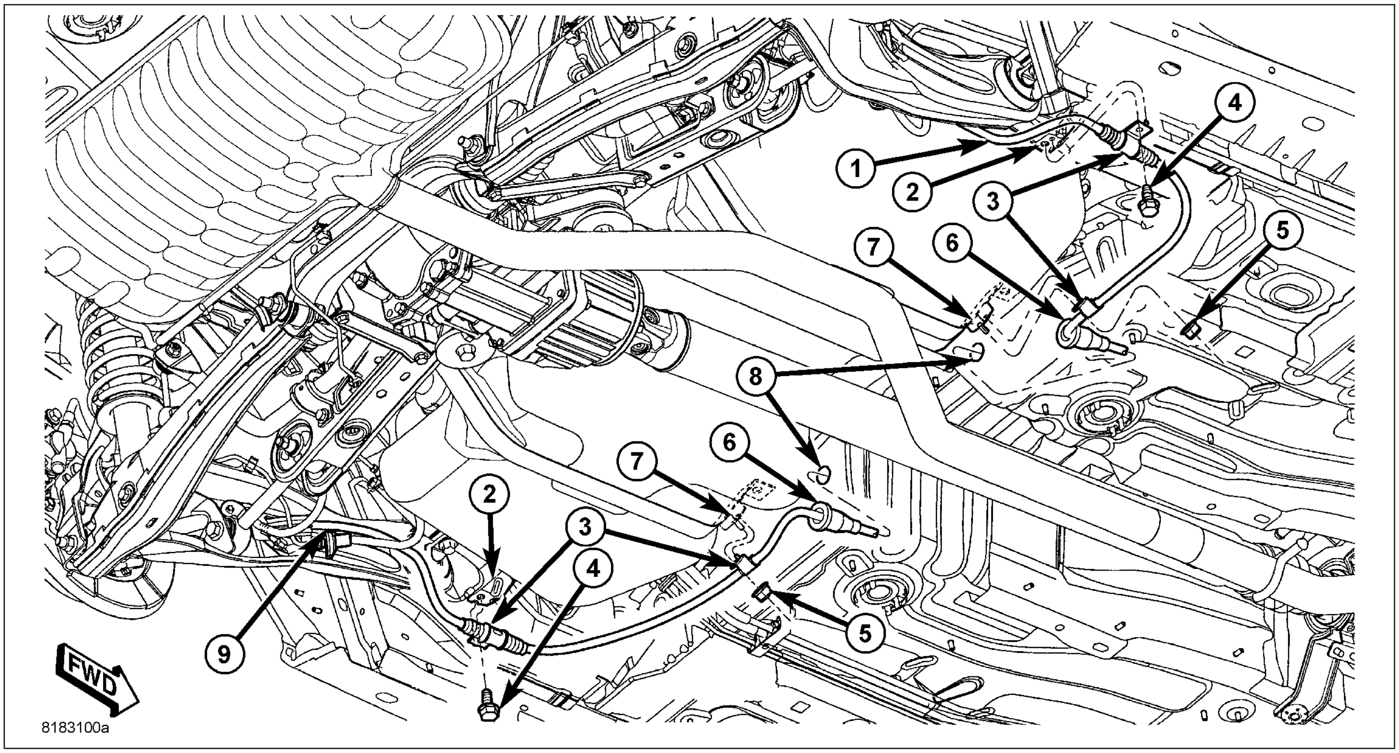
1. Disconnect and isolate the battery negative cable from its post on the battery.
2. Block the tire and wheel assemblies so the vehicle does not move once the vehicle parking brake lever is released.
3. Remove the center console. (Refer to 23 - BODY/ INTERIOR/CENTER CONSOLE - REMOVAL)
4. Release and lower the parking brake lever (5).



5. Loosen the adjusting nut on the lever's output cable taking tension off parking brake cables.
6. Remove the parking brake cables (3) from the parking brake cable equalizer (2).
7. Remove the rear seat cushion.

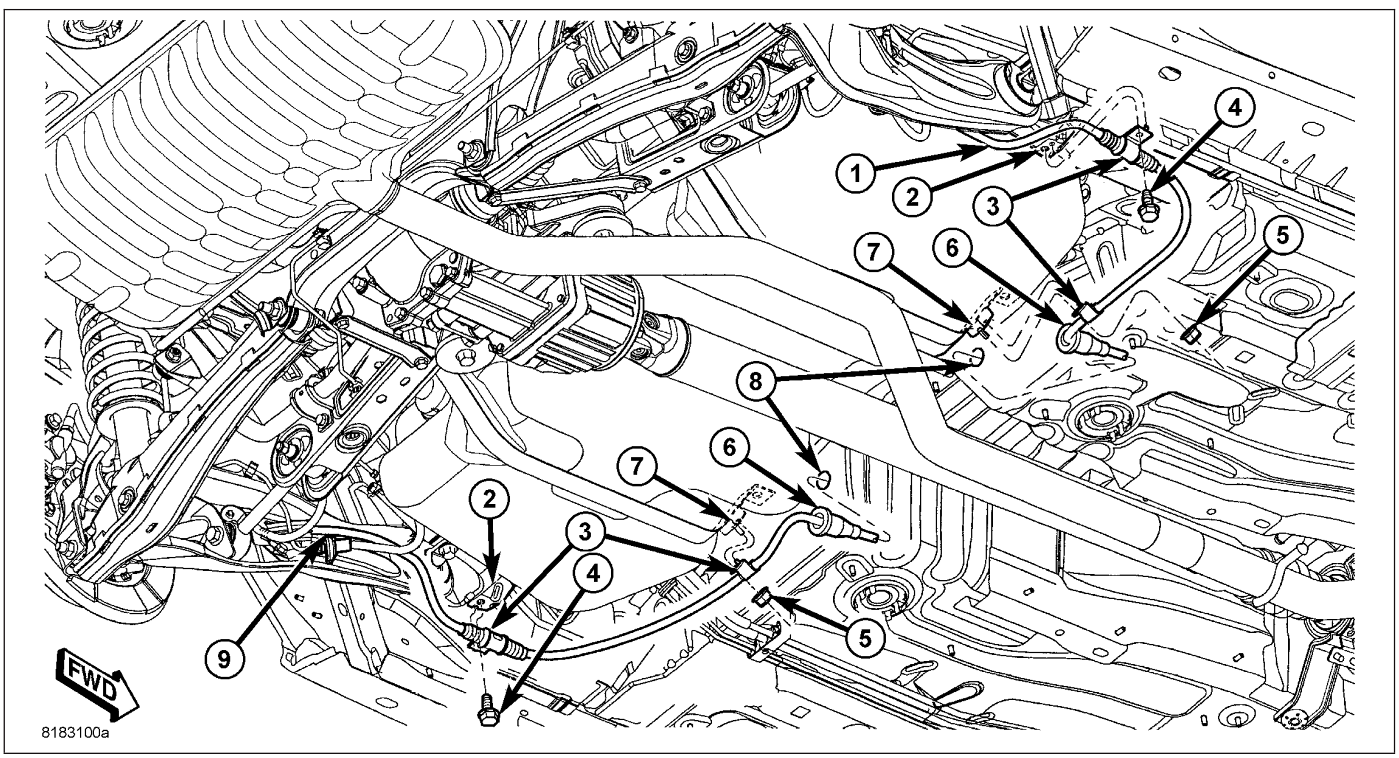


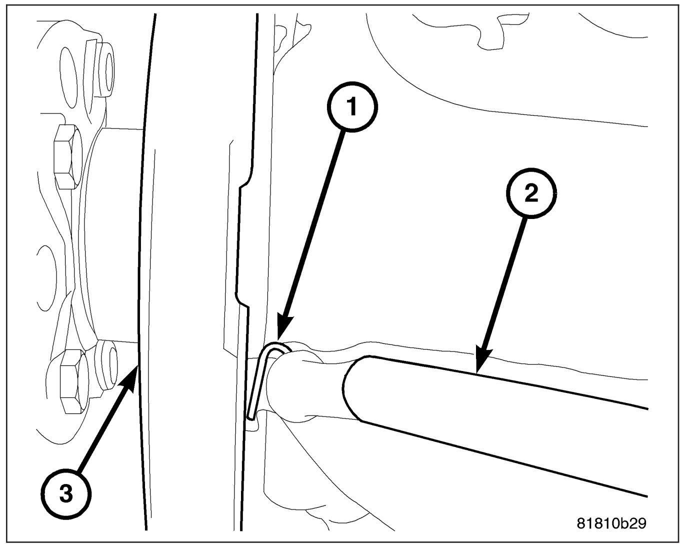
8. Fold the rear carpeting forward (1) to expose the parking brake cables (4) at the end of the rear floor.
9. Install the box end of a ½ inch (13 mm) wrench (2) over the retainer for either the right (3) or left (5) parking brake cable. Push the wrench onto the retainer until the retainer fingers are collapsed. From under the carpeting, grasp the parking brake cable housing and pull the cable straight out of the bracket attached to the floor.



10. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
11. Remove the wheel mounting nuts (3), then the rear tire and wheel assembly (1).
12. Access and remove the parking brake shoes. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - REMOVAL)

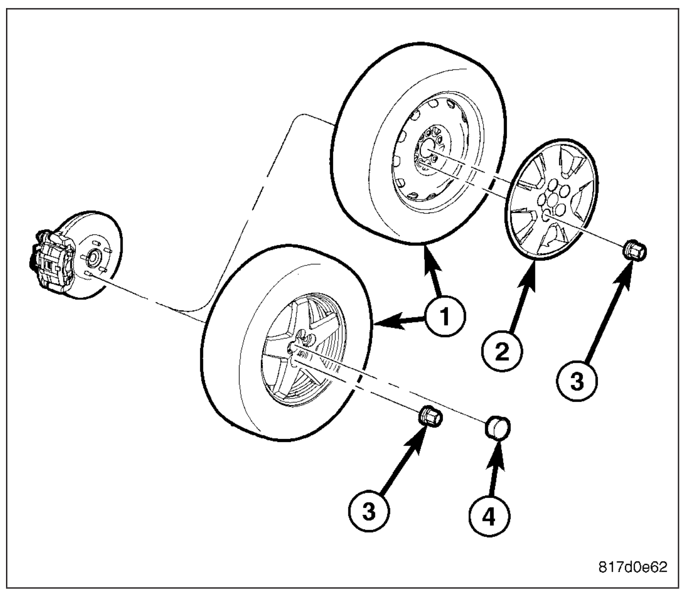
13. Remove the hair pin (1) securing the parking brake cable (2) to the brake support plate (3).
14. Pull the parking brake cable from the support plate and hole in trailing link.



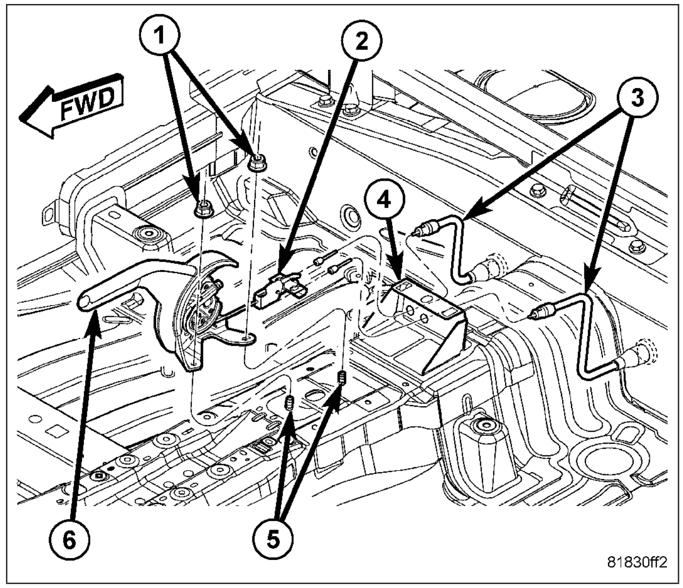


15. Remove the screw (4) securing the cable routing clamp (3) to the body (2).
16. Remove the nut (5) securing the cable routing clamp (3) to the fuel tank strap (7).
17. Remove the parking brake cable (1 - right cable, 9 - left cable) with sealing grommet (6) through the hole (8) in the floor pan of the vehicle.

INSTALLATION

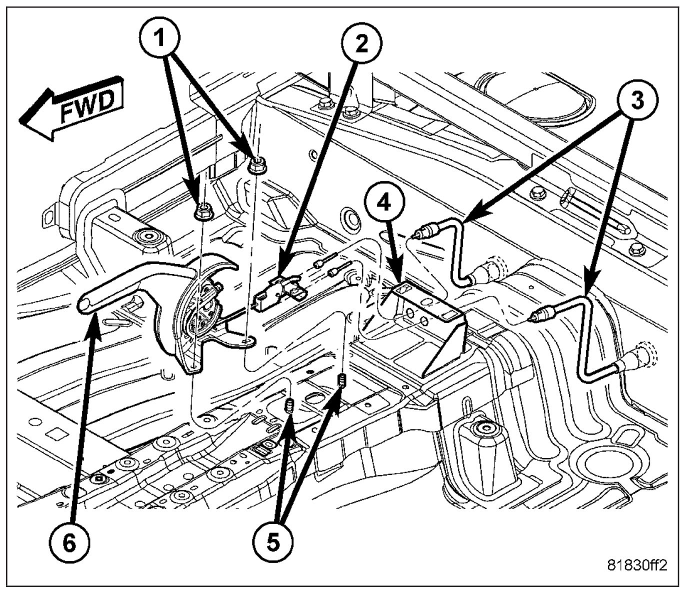


NOTE: The following procedure applies to either of the two rear parking brake cables.

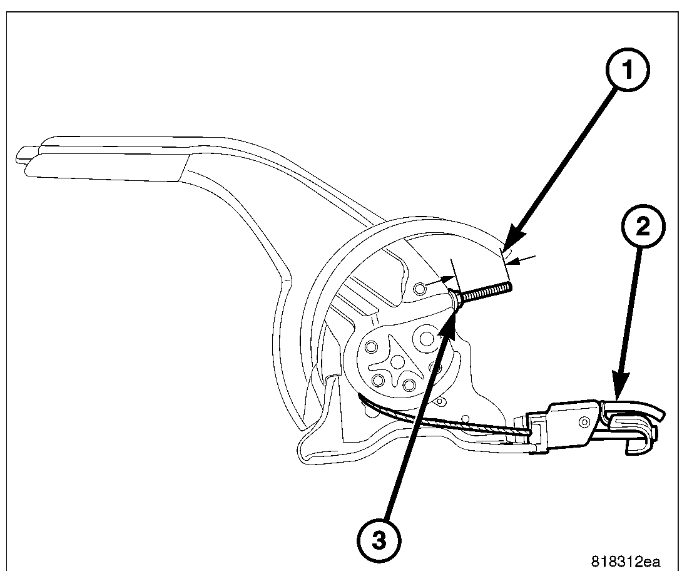


1. From underneath, push the parking brake cable through the hole (8) in the floor pan of the vehicle making sure the cable sealing grommet (6) is installed in the floor pan as far as possible (without going all the way through) to ensure a good seal.
2. Position the cable routing clamp (3) over the stud on the fuel tank strap (7) and install the nut (5).
3. Position the cable routing clamp (3) and install the screw (4) securing the cable (1 - right cable, 9 - left cable) to the body (2).
4. Insert the parking brake cable through the hole in the trailing link and the support plate (3).
5. Install the hair pin (1) securing the parking brake cable (2) to the brake support plate (3).

6. Install the parking brake shoes (and check adjustment) and components removed to access them. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - INSTALLATION)
7. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
8. Lower the vehicle.
9. Block the tire and wheel assemblies so the vehicle does not move with the vehicle parking brake lever released.

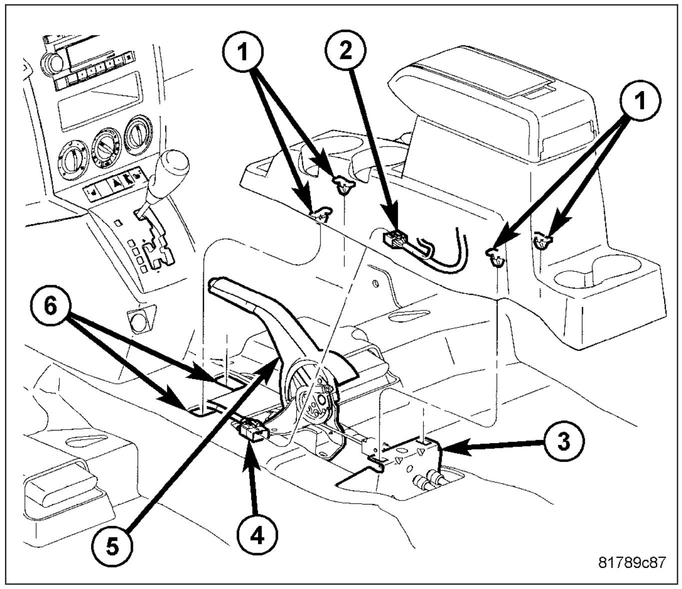


10. Ensure that the seal grommet on the cable installed from underneath is fully seated into the floor pan.
11. Route the parking brake cable under the carpeting, up to the parking brake cable retaining bracket (4) on the floor pan. Insert the parking brake cable (3) through the retaining bracket. Push the cable in until the locking fingers on the cable retainer lock the cable into place.



CAUTION: A NEW parking brake cable equalizer (2) must be installed when servicing the parking brake cables or lever. The equalizer has an integrated bent nail tensioner that needs to be stretched upon installation placing the correct tension on the cables.

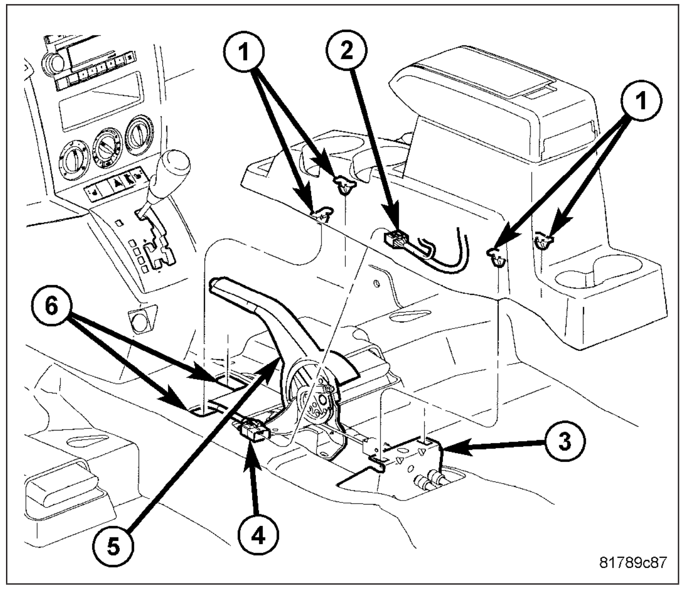
12. Remove and install a NEW parking brake cable equalizer (2) on the parking brake lever output cable.
13. Install the rear parking brake cables (3) into the equalizer (2) on the parking brake lever output cable.
14. Ensure that the parking brake cables are correctly installed on the equalizer and aligned with the cable track on the parking brake lever.



NOTE: Actuating the parking brake lever to its fully applied position one time after tightening the adjustment nut will yield (stretch) the bent nail portion of the equalizer approximately 1/4 inch. This process will correctly set the parking brake cable tension.

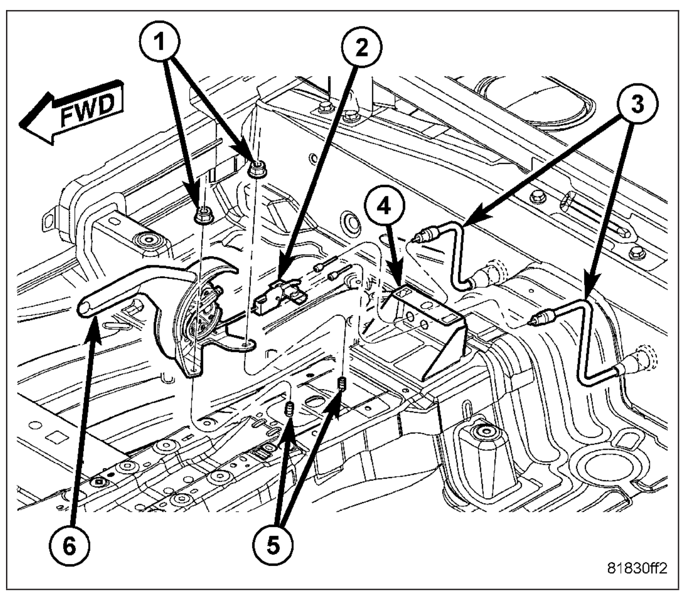
15. Adjust parking brake cable tension using the following steps:
    a. Place the parking brake lever in the fully released (down) position.
    b. Tighten the adjusting nut (3) on the parking brake lever output cable until 31 millimeters of thread is out past the end of the adjustment nut (1).
    c. Actuate the parking brake lever to its fully applied position one time, then reposition it to its fully released (down) position.

16. Raise the vehicle to a point where the rear wheels just clear the floor.
17. Check the rear wheels of the vehicle; they should rotate freely without dragging.
18. Apply the parking brake. Check the rear wheels of the vehicle. They should not rotate.
19. Return the parking brake lever to its fully released (down) position and check the rear wheels. They should rotate freely without dragging.
20. Apply the parking brake.
21. Lower the vehicle.
22. Install the center console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
23. Remove the blocks from the tires and wheel assemblies.
24. Connect the battery negative cable to its post on the battery.



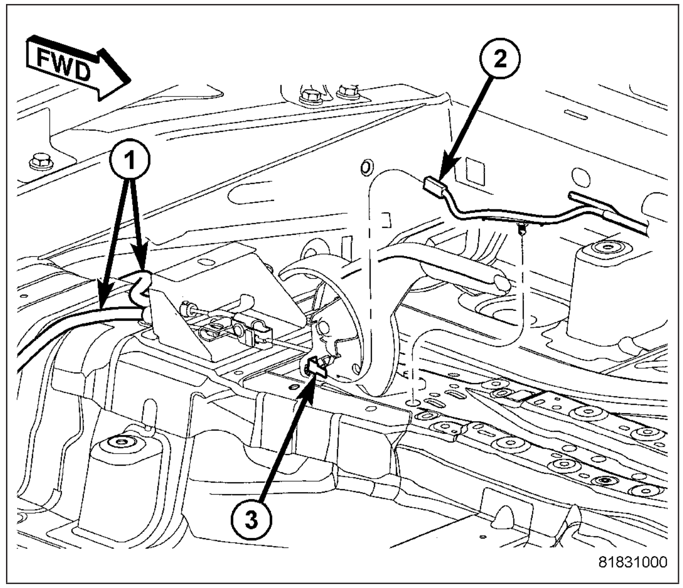
LEVER-PARKING BRAKE

REMOVAL

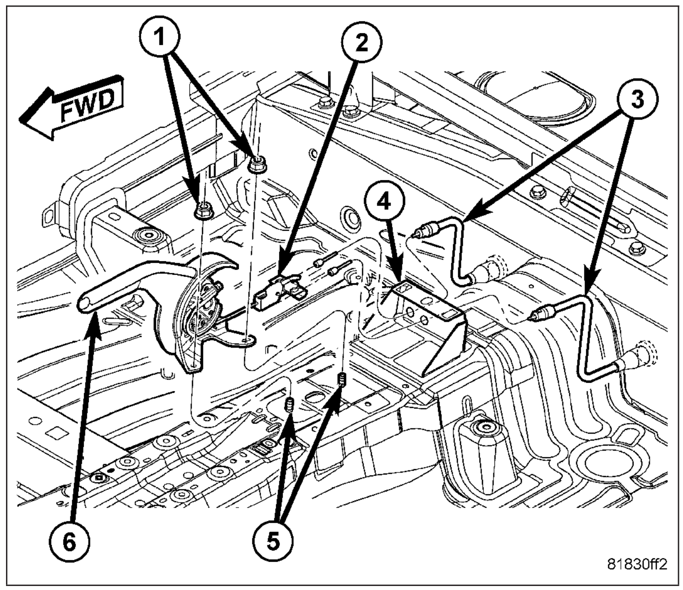


NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

NOTE: The procedure below applies to either of the two rear parking brake cables.

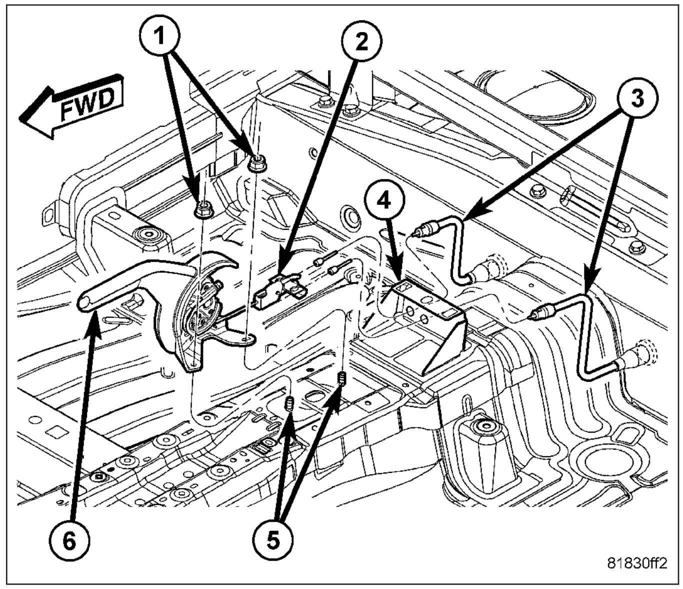


1. Disconnect and isolate the battery negative cable from its post on the battery.
2. Block the tire and wheel assemblies so the vehicle does not move once the vehicle parking brake lever is released.
3. Remove the center console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
4. Release and lower the parking brake lever (5).

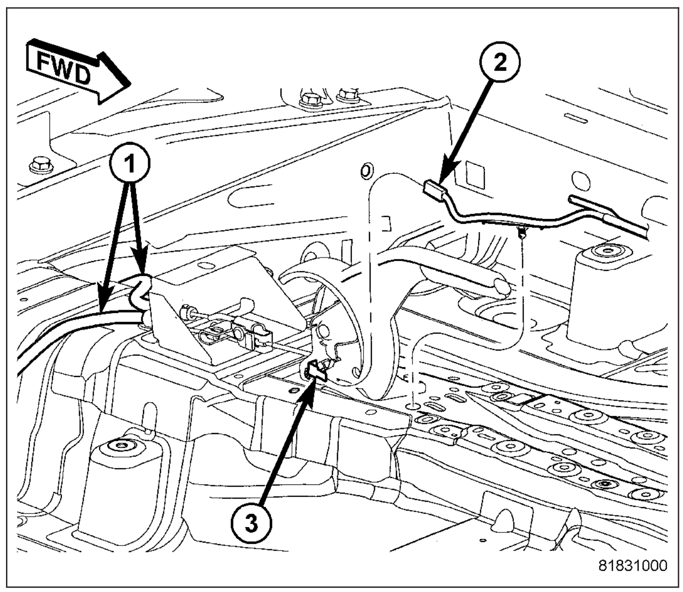


5. Loosen the adjusting nut on the lever's output cable taking tension off parking brake cables. Back the nut off until it is flush with the end of the output cable.
6. Remove the parking brake cables (3) from the parking brake cable equalizer (2).

7. Disconnect the wiring harness connector (2) from the parking brake switch (3).

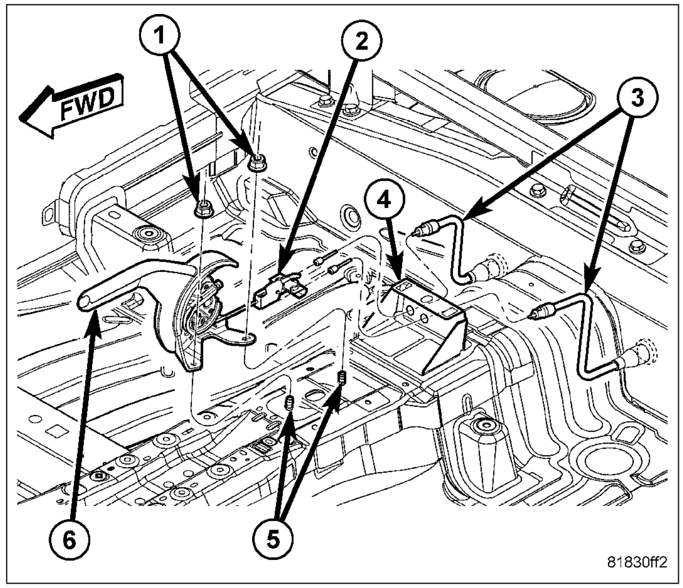


8. Remove the nuts (1) attaching the parking brake lever (6) to the vehicle.
9. Remove the parking brake lever (6).

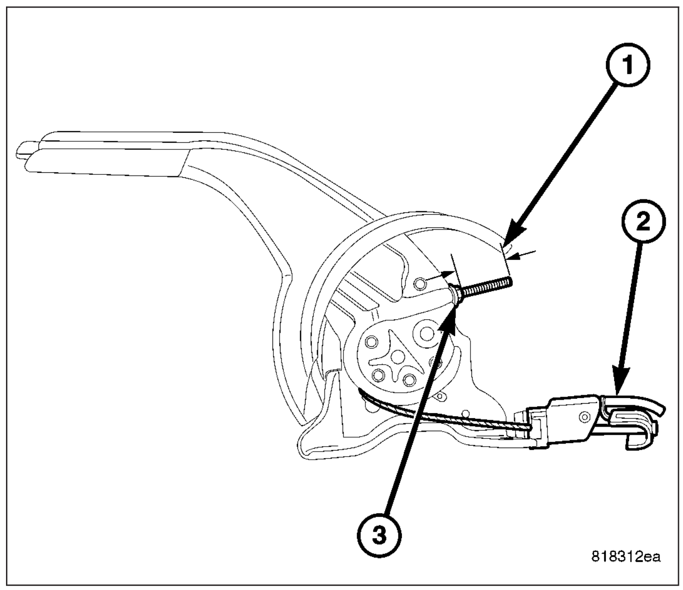


INSTALLATION

1. Place the parking brake lever (6) on the mounting studs (5) affixed to the vehicle floor pan. Install and tighten the nuts to 28 N·m (250 in. lbs.).

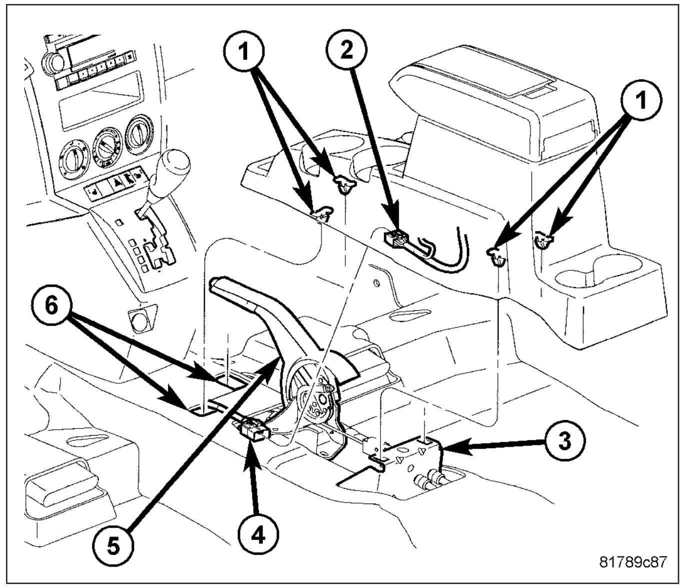


2. Connect the wiring harness connector (2) to the parking brake switch (3).



CAUTION: A NEW parking brake cable equalizer (2) must be installed when servicing the parking brake cables or lever. The equalizer has an integrated bent nail tensioner that needs to be stretched upon installation placing the correct tension on the cables.

3. Remove and install a NEW parking brake cable equalizer (2) on the parking brake lever output cable.
4. Install the rear parking brake cables (3) into the equalizer (2) on the parking brake lever output cable.
5. Ensure that the parking brake cables are correctly installed on the equalizer and aligned with the cable track on the parking brake lever.



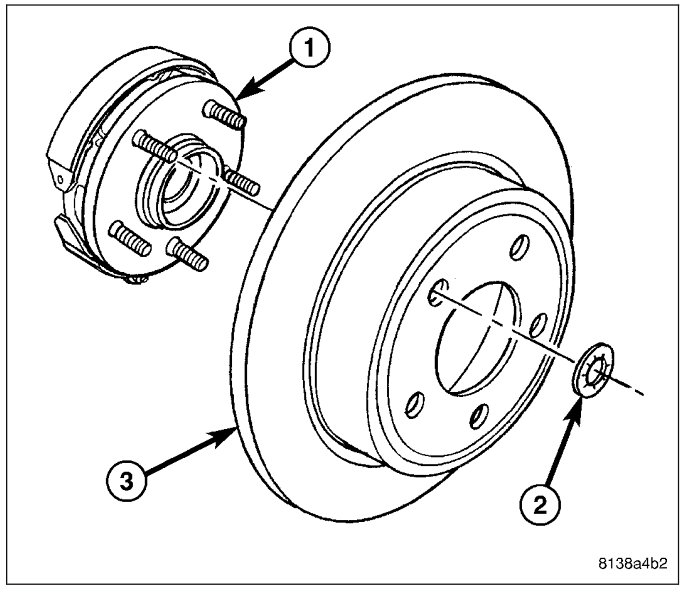
NOTE: Actuating the parking brake lever to its fully applied position one time after tightening the adjustment nut will yield (stretch) the bent nail portion of the equalizer approximately 1/4 inch. This process will correctly set the parking brake cable tension.

6. Adjust parking brake cable tension using the following steps:
   a. Place the parking brake lever in the fully released (down) position.
   b. Tighten the adjusting nut (3) on the parking brake lever output cable until 31 millimeters of thread is out past the end of the adjustment nut (1).
   c. Actuate the parking brake lever to its fully applied position one time, then reposition it to its fully released (down) position.

7. Raise the vehicle to a point where the rear wheels just clear the floor.
8. Check the rear wheels of the vehicle; they should rotate freely without dragging.
9. Apply the parking brake. Check the rear wheels of the vehicle. They should not rotate.
10. Return the parking brake lever to its fully released (down) position and check the rear wheels. They should rotate freely without dragging.
11. Apply the parking brake.
12. Lower the vehicle.

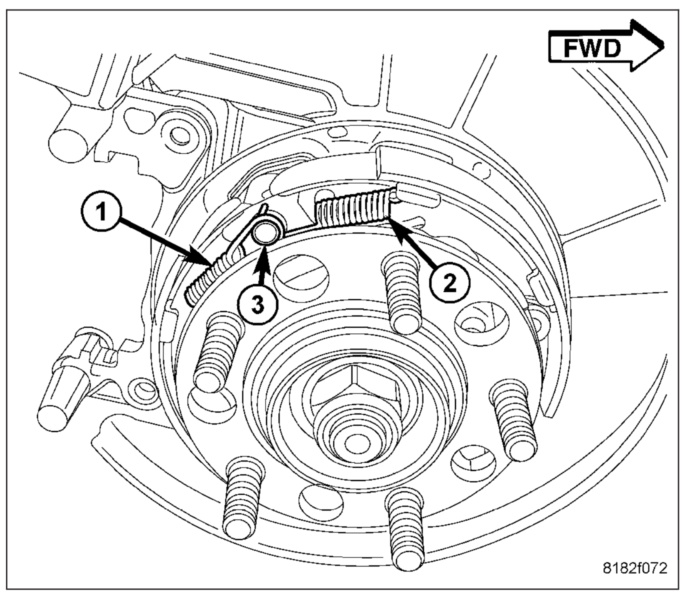
13. Install the center console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
14. Remove the blocks from the tires and wheel assemblies.
15. Connect the battery negative cable to its post on the battery.

SHOE AND LININGS-PARKING BRAKE



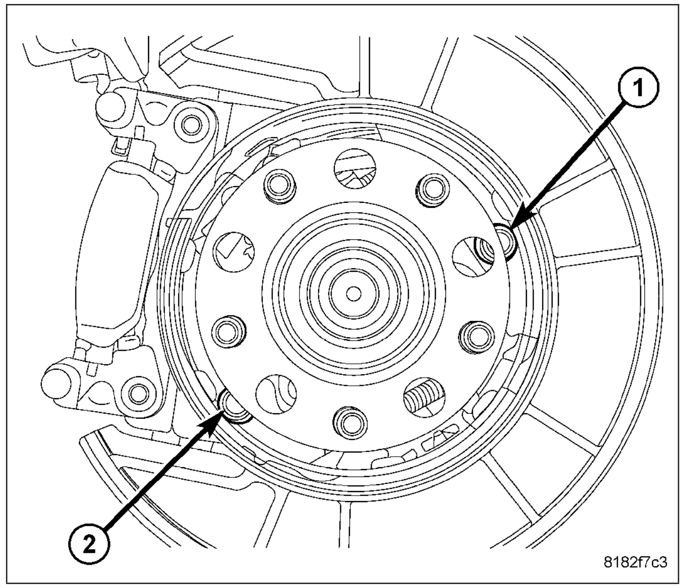
REMOVAL

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

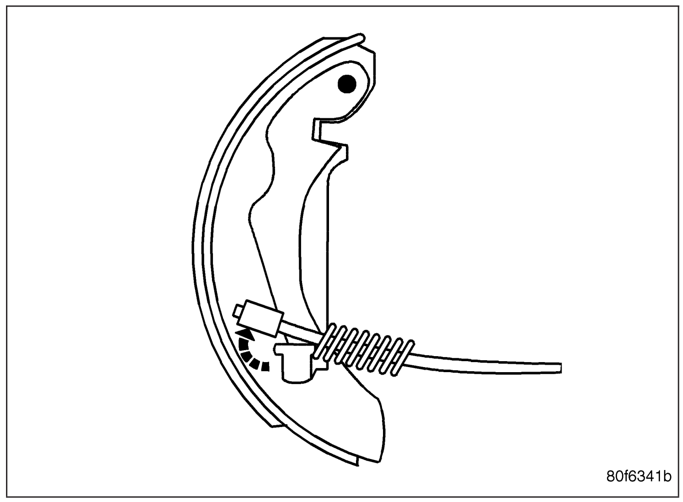


1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

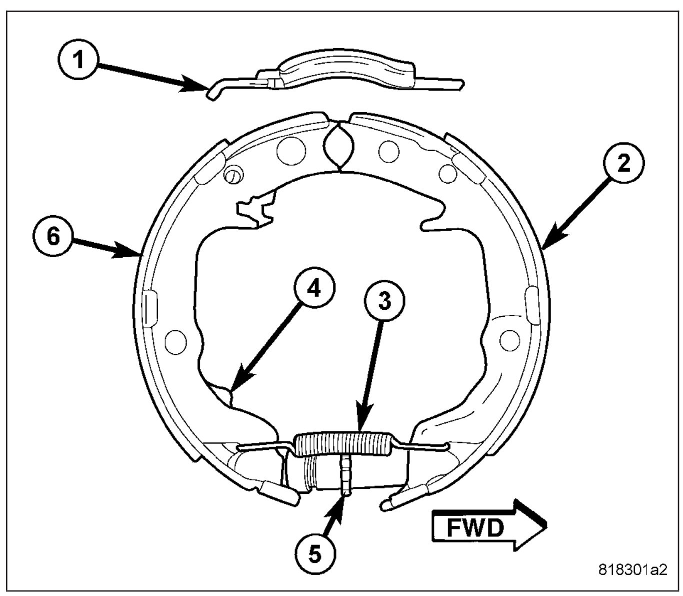
NOTE: If removing parking brake shoes on both sides of vehicle, perform remaining steps on each side of the vehicle.



2. Access and remove the rear brake rotor (3). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL)
3. Turn the brake shoe adjuster wheel until the adjuster is at shortest length.

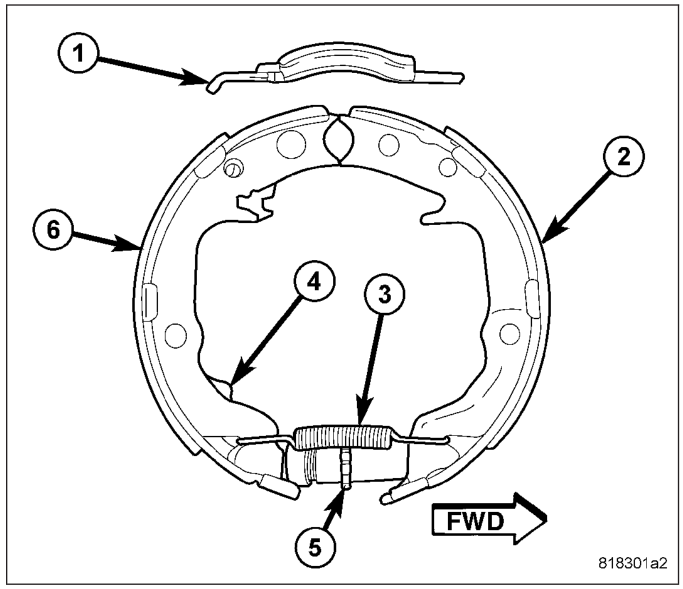


4. Remove the upper return spring (1) from the anchor pin (3) and the rear brake shoe.
5. Remove the upper return spring (2) from the anchor pin (3) and the front brake shoe.

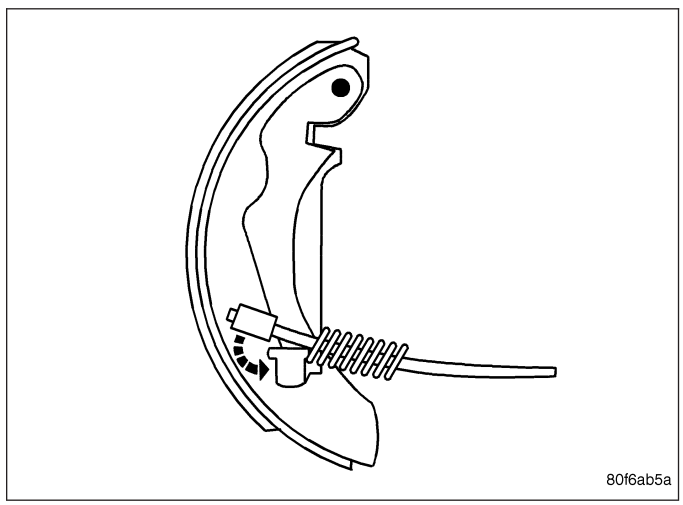


6. Remove the brake shoe hold-down springs and pins (1, 2). Rotate the pins 90° to disengage.

7. Remove the parking brake cable from the lever on the rear parking brake shoe.

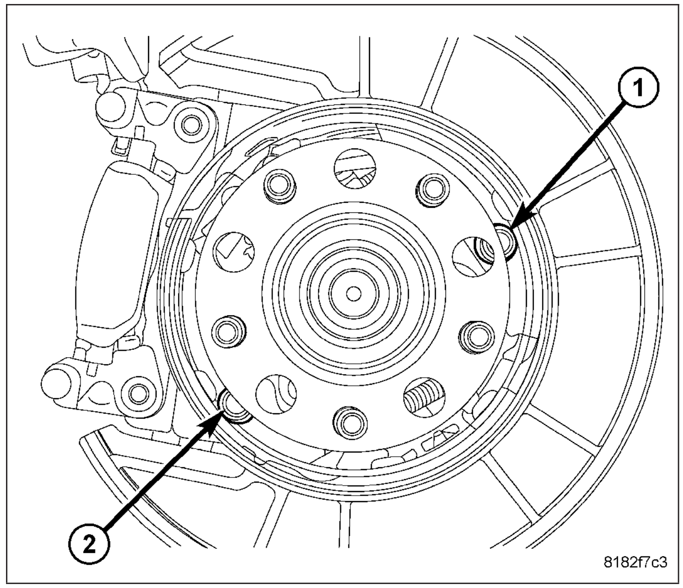


8. Remove the brake shoes (2, 6), adjuster (5) and lower return spring (3) as an assembly from the support plate.
9. If necessary, remove the strut (1).
10. Remove the lower return spring (3) and adjuster (5) from the shoes (2, 6).

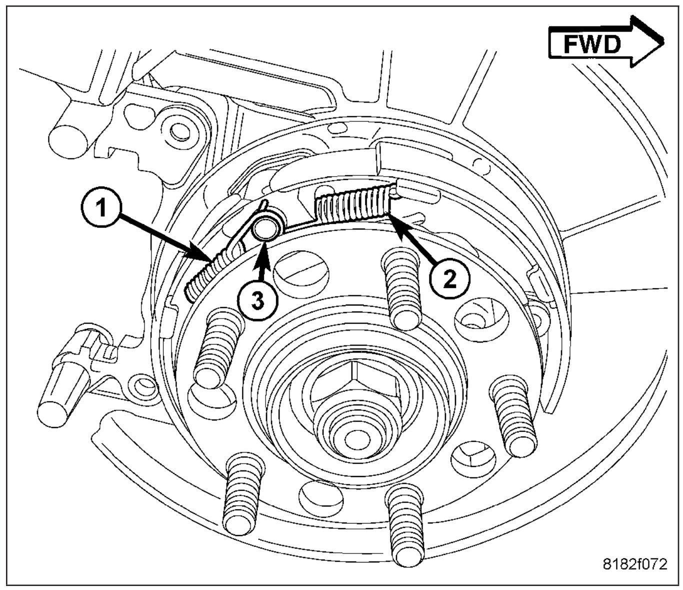


INSTALLATION

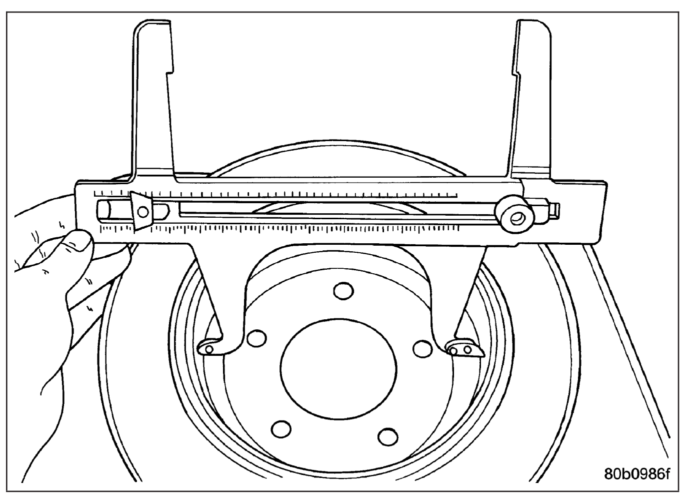
NOTE: If replacing parking brake shoes on both sides of vehicle, perform Step 1 through Step 15 on each side of the vehicle to complete shoe set installation, then proceed to Step 16.



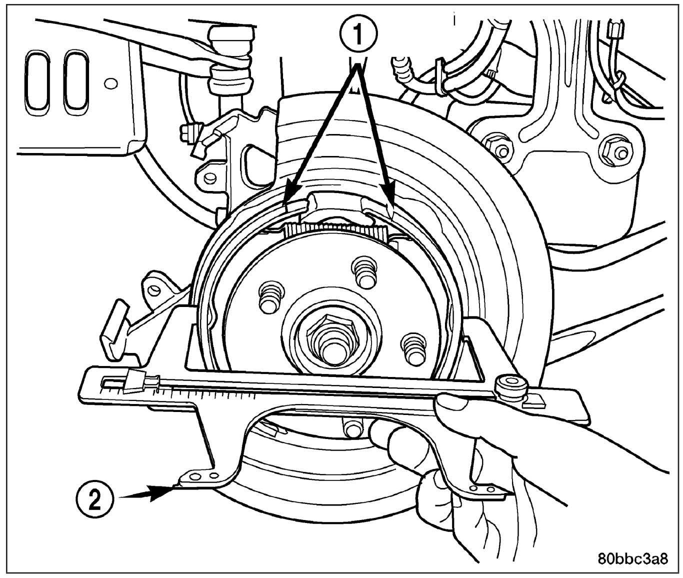
NOTE: Left side shoes are shown in the figure. Right side shoes are a mirror image of the left except for the adjuster. The threaded portion of the adjuster should always be positioned to the left side in order to maintain consistent side-to-side rotational direction for adjustment purposes.



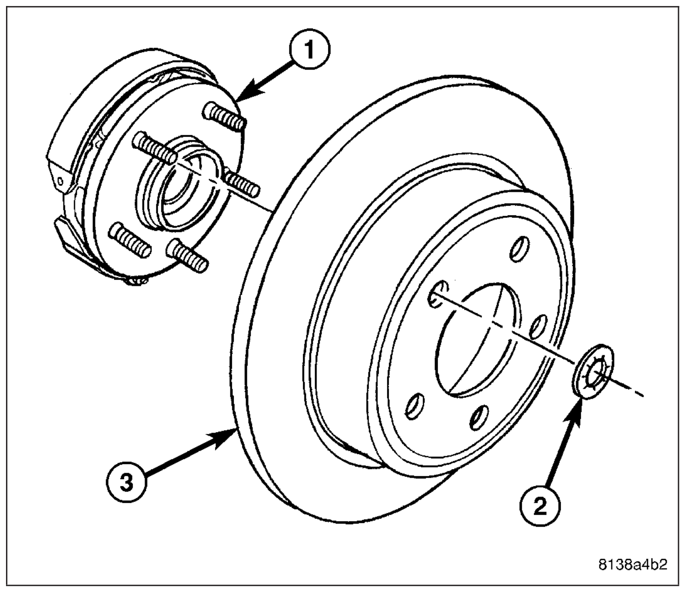
1. Install the lower return spring (3) and adjuster (5) between the parking brake shoes (2, 6). The rear shoe will have the lever mounted on the inside. Make sure the threaded portion of the adjuster is mounted to the left on both right and left side parking brake assemblies (see preceding note).
2. If necessary, place the strut (1) above the hub and bearing on the vehicle. Note the curved end of the strut (1) is positioned to the rear.
3. Install the assembled brake shoes (2, 6), adjuster (5) and lower return spring (3) over the hub and bearing and onto the support plate and anchor. Be sure to install the strut between the front shoe and the lever on the rear shoe.
4. Install the parking brake cable onto the lever on the parking brake shoe.



5. Install the brake shoe hold-down springs and pins (1, 2). Rotate the pins 90° to engage.

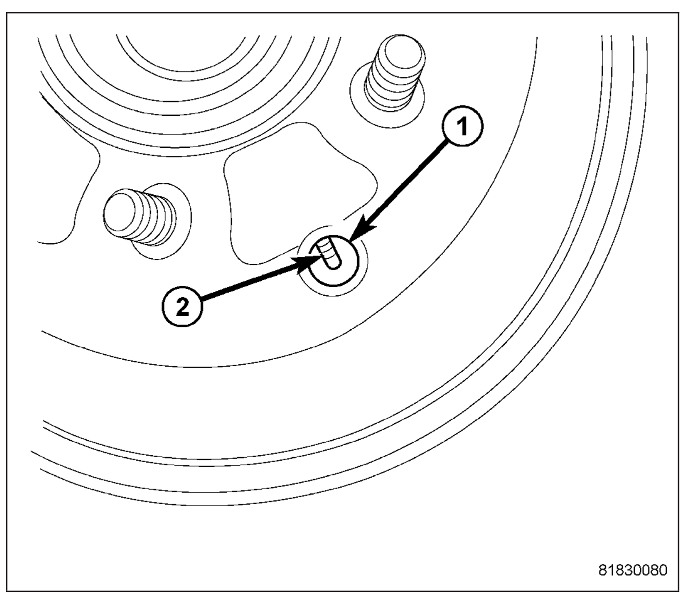


6. Install the front upper return spring (2) holding the front brake shoe and anchor pin (3).
7. Install the rear upper return spring (2) holding the rear brake shoe and anchor pin (3).

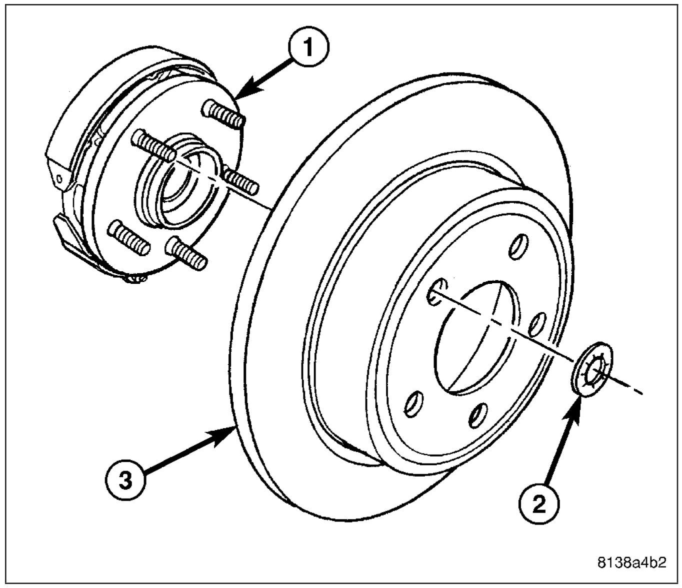


8. Using Brake Shoe Gauge, Special Tool C-3919, or equivalent, measure the inside diameter of parking brake drum portion of rotor. Set the Gauge.

9. Place Gauge (2) over the parking brake shoes (1) at their widest point.
10. Using the adjuster wheel, adjust the parking brake shoes until the linings on both parking brake shoes just touch the jaws on the Gauge.



11. Install the rear brake rotor (3) and install a couple wheel mounting nuts to hold it in place while a final adjustment is made.

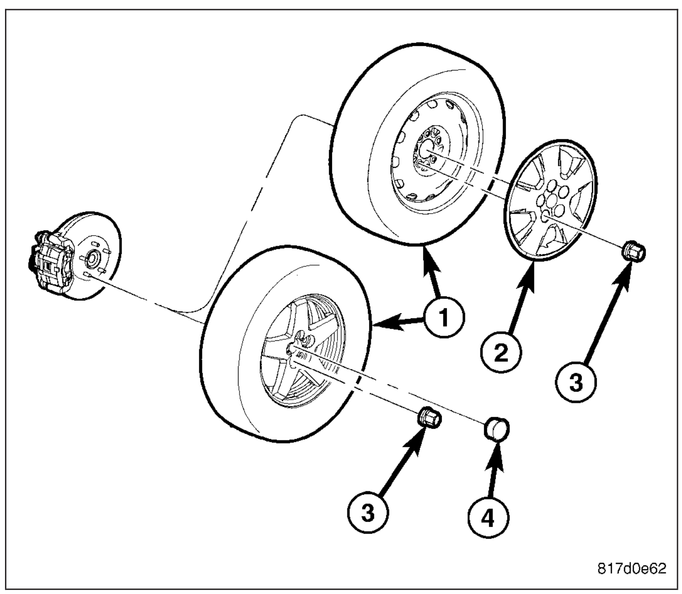


NOTE: To find the adjuster wheel with the drum on position the hole (1) in the front of the rotor drum as follows:
- **Left side – 7 o'clock.**
- **Right side – 5 o'clock.**

NOTE: When adjusting the parking brake shoes with the drum-in hat rotor installed, rotating the adjuster wheel (2) upward will loosen the adjustment. Rotating the adjuster wheel (2) downward will tighten the adjustment.

12. Remove the rubber plug from the hole (1) in the front of the rotor.
13. Utilizing the hole (1) in the front of the rotor, make a final adjustment of the shoes if necessary.
14. Reinstall the rubber plug.

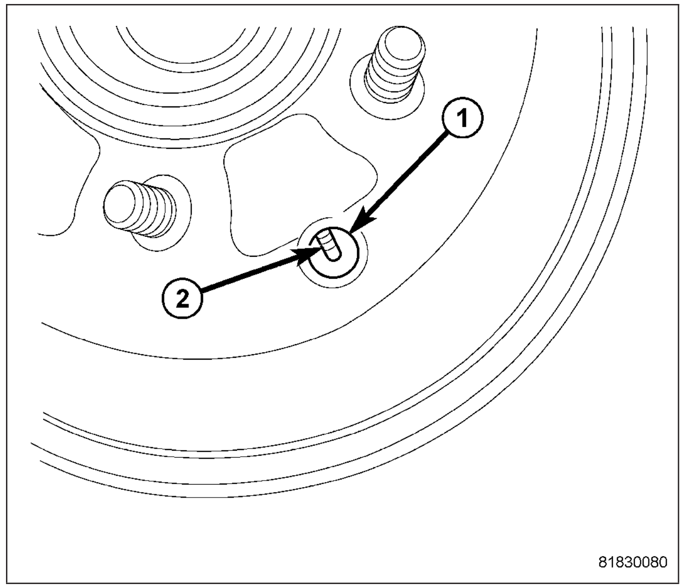
15. Remove the wheel mounting nuts and finish installing the brake rotor (3) as well as all components removed to access it. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION)
16. Lower the vehicle.
17. Cycle the parking brake lever once, verifying proper operation of the parking brake.



ADJUSTMENTS

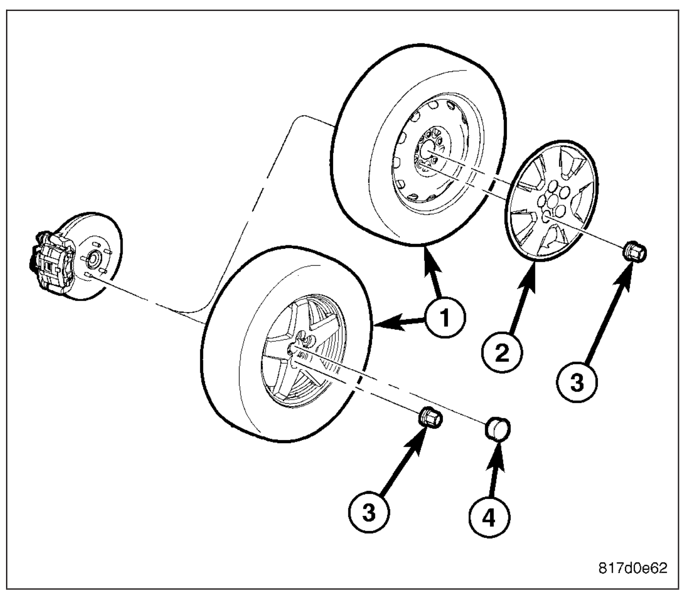
PARKING BRAKE SHOE ADJUSTMENT

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



NOTE: The parking brake shoes used in the drum-in-hat park brake system do not automatically adjust to compensate for brake shoe lining wear. Therefore, it is necessary to manually adjust the parking brake shoes.

1. Verify the parking brake lever is in the released (down) position.
2. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
3. Remove the wheel mounting nuts (3), then the tire and wheel assembly.
4. Install a couple wheel mounting nuts to hold the brake rotor in place while adjustment of the brake shoes is made.



NOTE: To find the adjuster wheel with the drum on position the hole (1) in the front of the rotor drum as follows:
- **Left side – 7 o'clock.**
- **Right side – 5 o'clock.**

NOTE: When adjusting the parking brake shoes with the drum-in hat rotor installed, rotating the adjuster wheel (2) upward will loosen the adjustment. Rotating the adjuster wheel (2) downward will tighten the adjustment.

5. Remove the rubber plug from the hole (1) in the front of the rotor.
6. Utilizing the hole (1) in the front of the rotor, make a fine adjustment of the shoes.
7. Reinstall the rubber plug.
8. Lower the vehicle far enough to access the interior of the vehicle.
9. Reach inside the vehicle and cycle (fully apply and release) the park brakes.
10. With the parking brake lever in the fully applied (up) position, attempt to hand rotate each rear brake rotor to ensure that the parking brake shoes are working properly.
11. With the parking brake lever in the released (down) position, hand rotate each rear brake rotor to ensure that the parking brake shoes are not dragging.
12. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
13. Remove the wheel mounting nuts and install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten the wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
14. Lower the vehicle.

BRAKES - ABS ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

BRAKES - ABS ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

ABS-INTERMITTENT CONDITION

For a complete wiring diagram **Refer to Section 8W**.

POSSIBLE CAUSES
INTERMITTENT CONDITION

1. INTERMITTENT CONDITION

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Refer to any Technical Service Bulletins (TSBs) that may apply.

Review the scan tool Freeze Frame information. If possible, try to duplicate the conditions under which the DTC set.

Turn the ignition off.

Visually inspect the related wire harness. Wiggle the related wire harness and look for an interrupted signal on the affected circuit. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

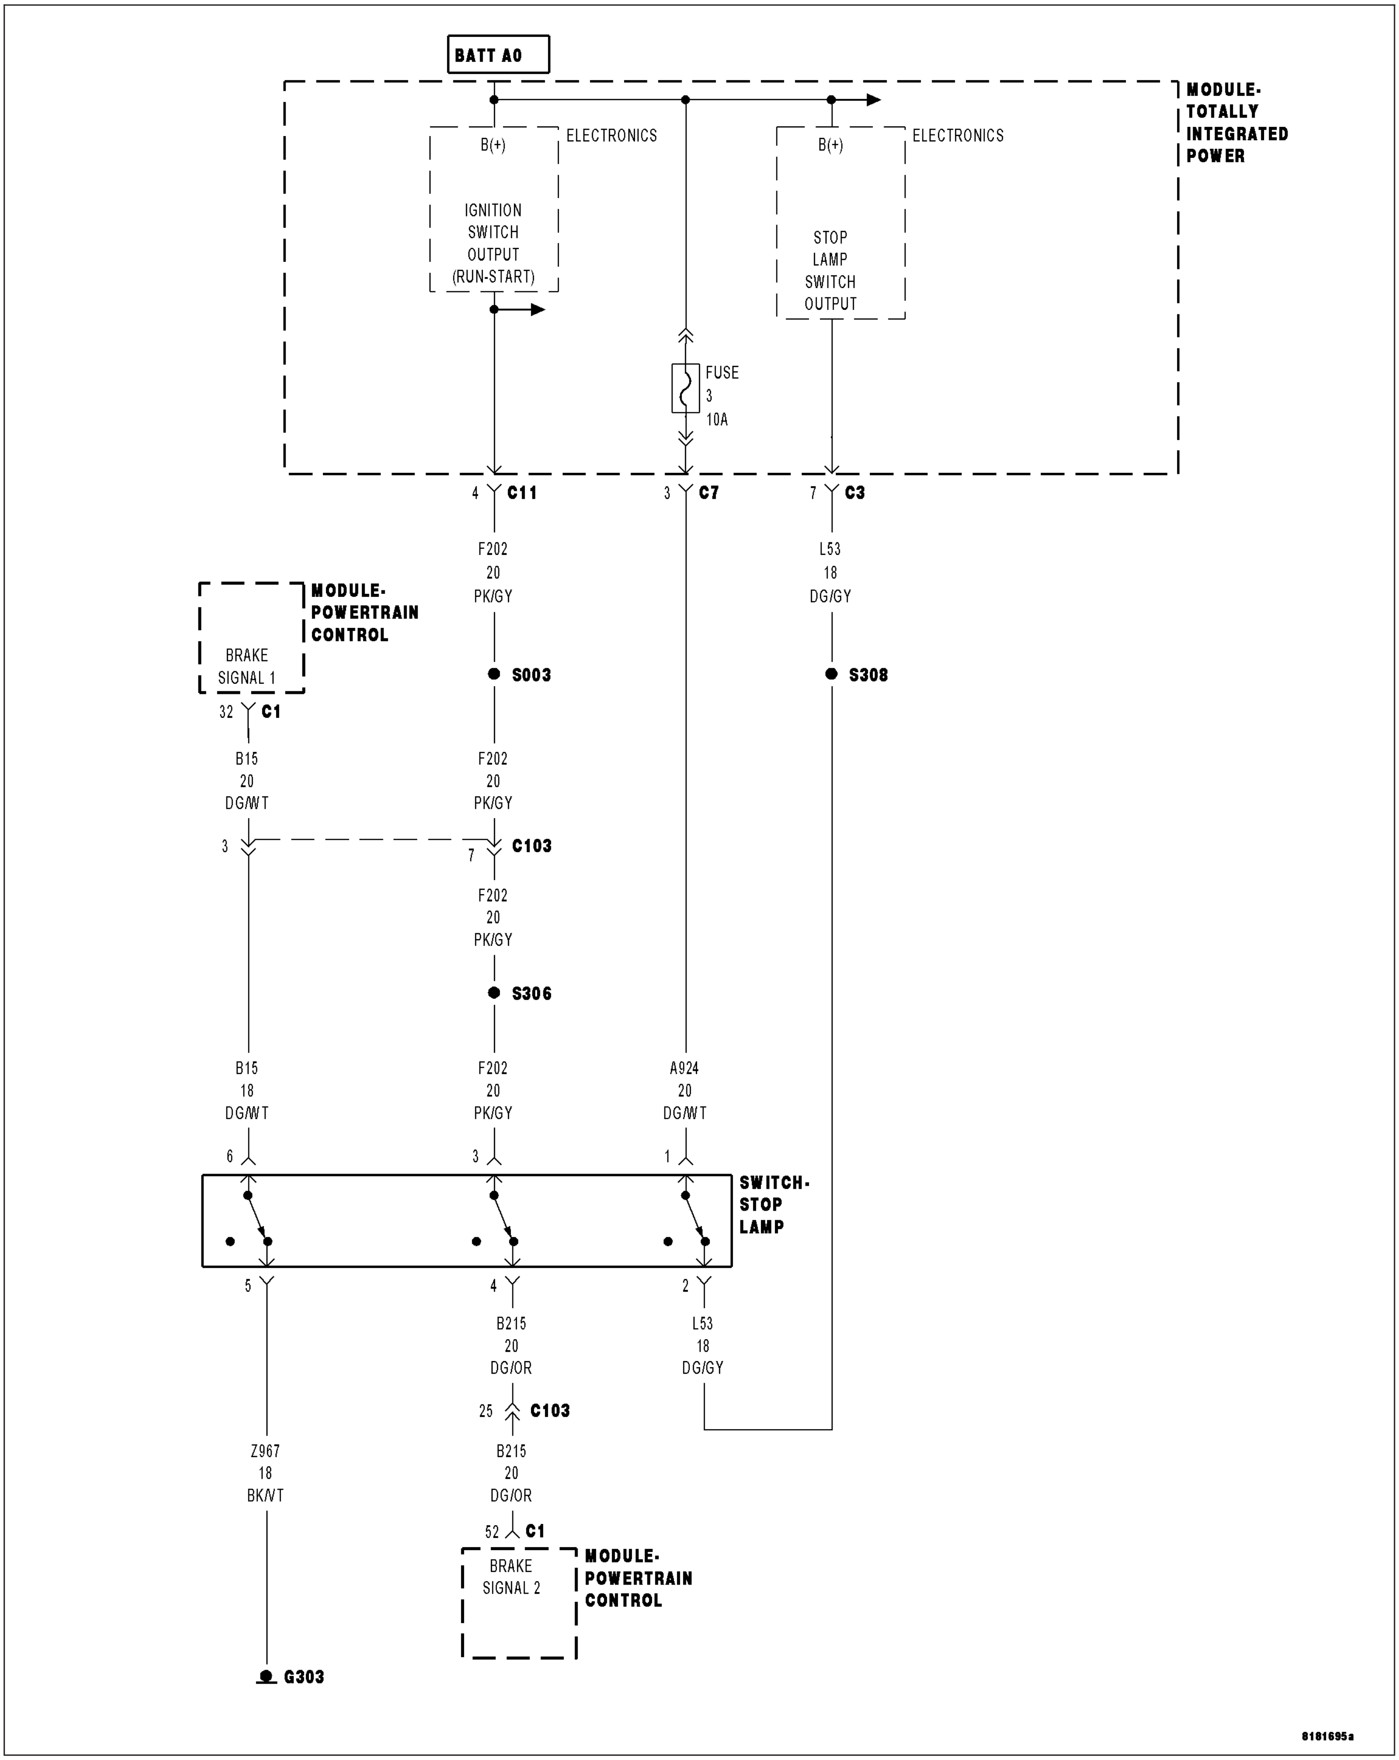
Perform a voltage drop test on the related circuits between the suspected component and the Anti-Lock Brake Module.

Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits

For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.

Use the scan tool to perform a System Test if one applies to failing component.



A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes >> Perform the necessary repairs.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1002-BRAKE PEDAL SWITCH 1 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **Theory of Operation**
  The TIPM monitors the (L53) Primary Brake Switch Signal Circuit (L53] Brake Lamp Switch Output Circuit) for three minutes once the set conditions have been met.
- **When Monitored:**
  Ignition Switch OFF.
  All Doors Closed.
  CAN B and C are Ready to go to sleep. **When Set:**
  The TIPM monitors the L53 Brake Switch Signal Circuit once the set conditions have been met and the brake switch input has been active for more than 3 consecutive minutes.

Possible Causes
(L53) PRIMARY BRAKE SWITCH SIGNAL CIRCUIT OR (L53) BRAKE LAMP SWITCH OUTPUT SHORTED TO VOLTAGE
BRAKE LAMP SWITCH
TIPM

Diagnostic Test

1. CHECK FOR DTC C1002-BRAKE PEDAL SWITCH 1 CIRCUIT HIGH

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

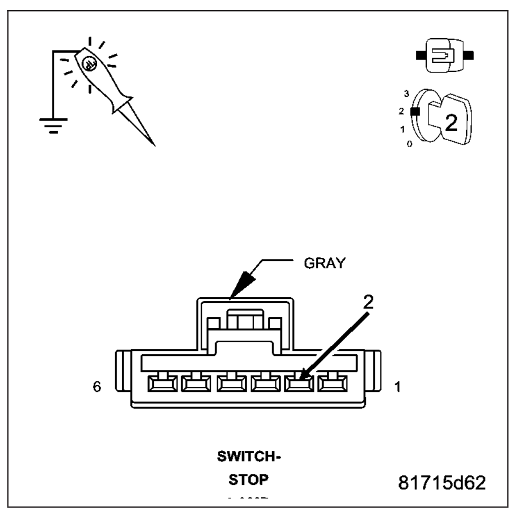
Does the scan tool display: C1002-BRAKE PEDAL SWITCH 1 CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK (L53) PRIMARY BRAKE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition on.

Using a 12-volt test light connected to ground, back probe the (L53) Primary Brake Switch Circuit.

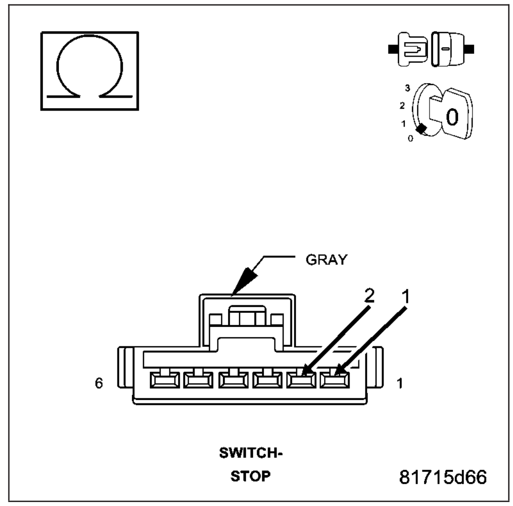
Does the test light illuminate brightly?

Yes >> Go To 3

No >> Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. STOP LAMP BRAKE PEDAL SWITCH SHORTED

Turn the ignition off.



Disconnect the Stop Lamp Switch harness connector.

Measure the resistance of the Stop Lamp Switch between (L53) Pin 2 and (A924) Pin 1.

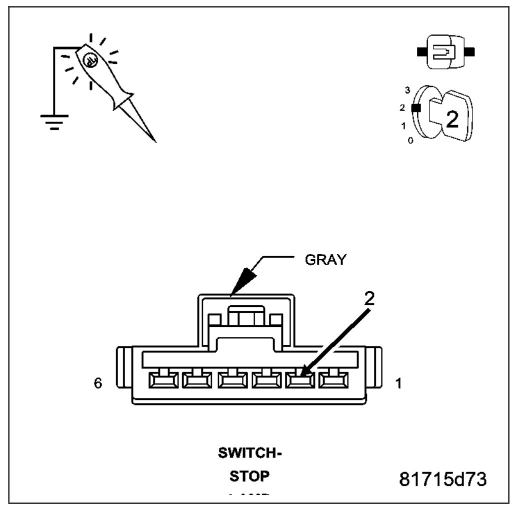
Is there continuity?

Yes >> Replace the Stop Lamp Switch and then Go To 4

No >> Go To 5

4. CHECK (L53) PRIMARY BRAKE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE

Reconnect the Stop Lamp Switch connector.



Turn the ignition on.

Using a 12-volt test light connected to ground, back probe the (L53) Primary Brake Switch Circuit.

Does the test light illuminate?

YES >> Go To 5

NO >> Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

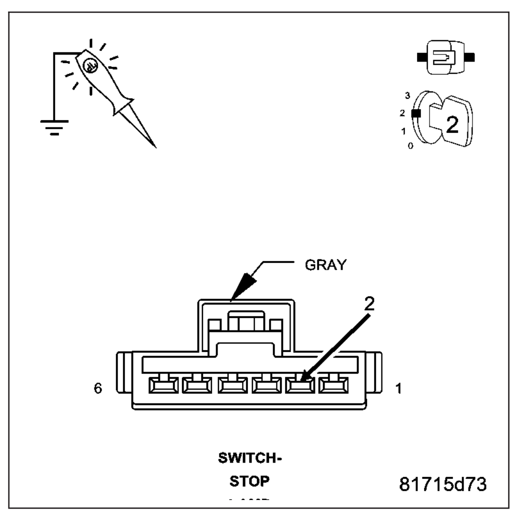
5. CHECK TIPM BACK FEEDING VOLTAGE TO (L53) PRIMARY BRAKE SWITCH SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Totally Integrated Power Module (TIPM) harness connector.

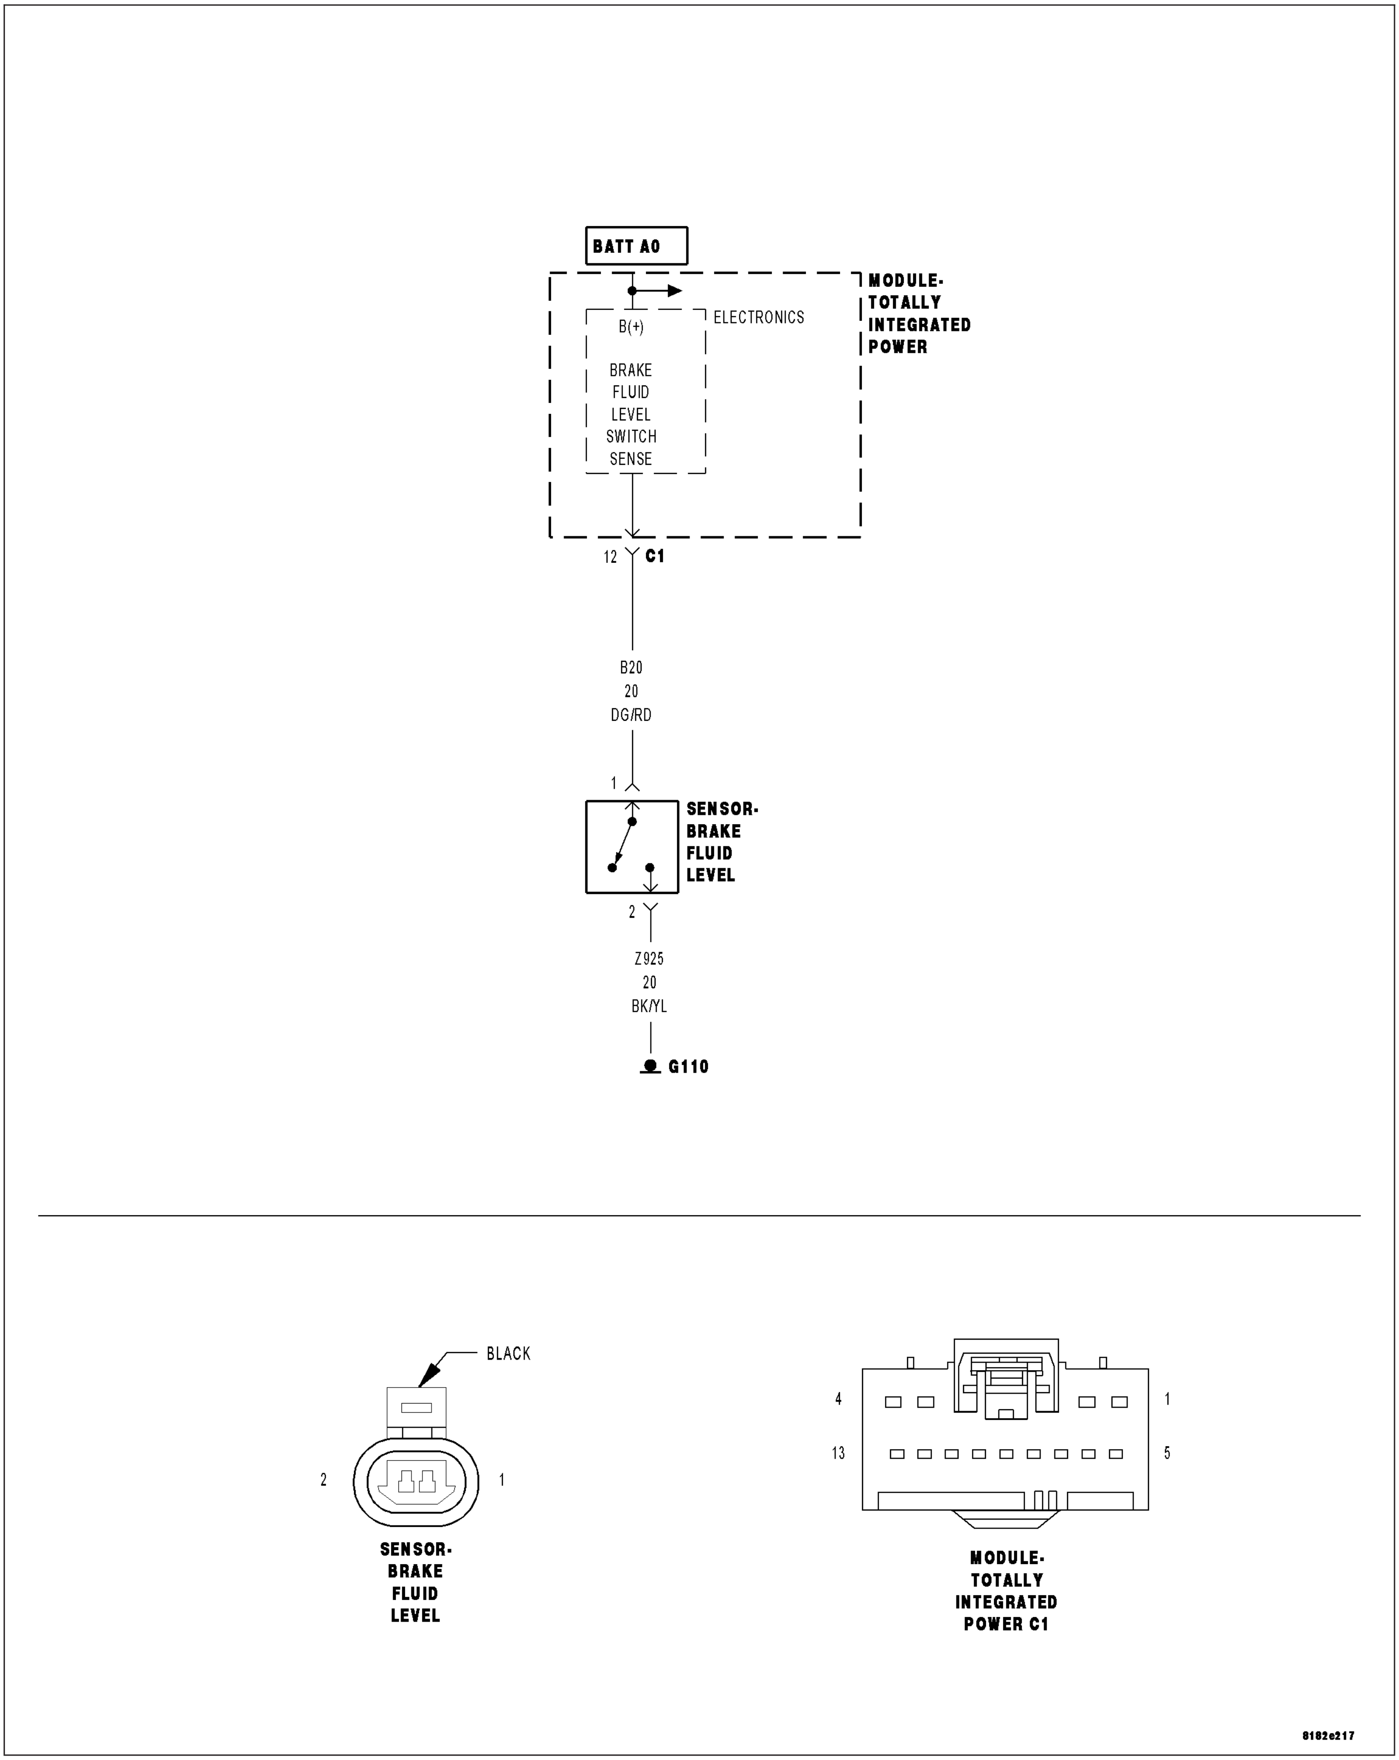
Turn the ignition on.

Using a 12-volt test light connected to ground, test the (L53) Primary Brake Switch Circuit.



Does the test light illuminate?

YES >> Repair the short to voltage in the (L53) Primary Brake Switch Signal circuit.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace and program the Totally Integrated Power Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1007-BRAKE FLUID LEVEL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Totally Integrated Power Module indicates that the Brake Fluid Level Circuit is less then 0.10 volt.

Possible Causes
BRAKE FLUID LEVEL LOW
(B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT IS SHORTED TO GROUND
BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. BRAKE FLUID LEVEL SENSOR SIGNAL VOLTAGE BELOW 0.10 VOLTS

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.
With the scan tool, read Brake Fluid Level Sensor Signal voltage.

Is the voltage below 0.10 volt?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

2. CHECK BRAKE FLUID LEVEL

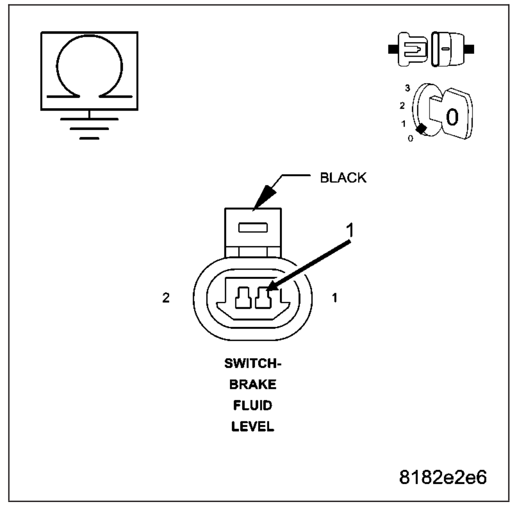
NOTE: Visually inspect for worn brake linings or undersized rotors.

Was low brake fluid level found?

Yes >> Repair as needed.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. BRAKE FLUID LEVEL SENSOR INTERNAL FAILURE



Turn the ignition off.
Disconnect the Brake Fluid Level Sensor harness connector
Turn the ignition on.
With the scan tool, read the Brake Fluid Level Sensor voltage

Is the voltage approximately 5 volts?

Yes >> Replace the Brake Fluid Level Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK THE (B20) BRAKE FLUID LEVEL SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

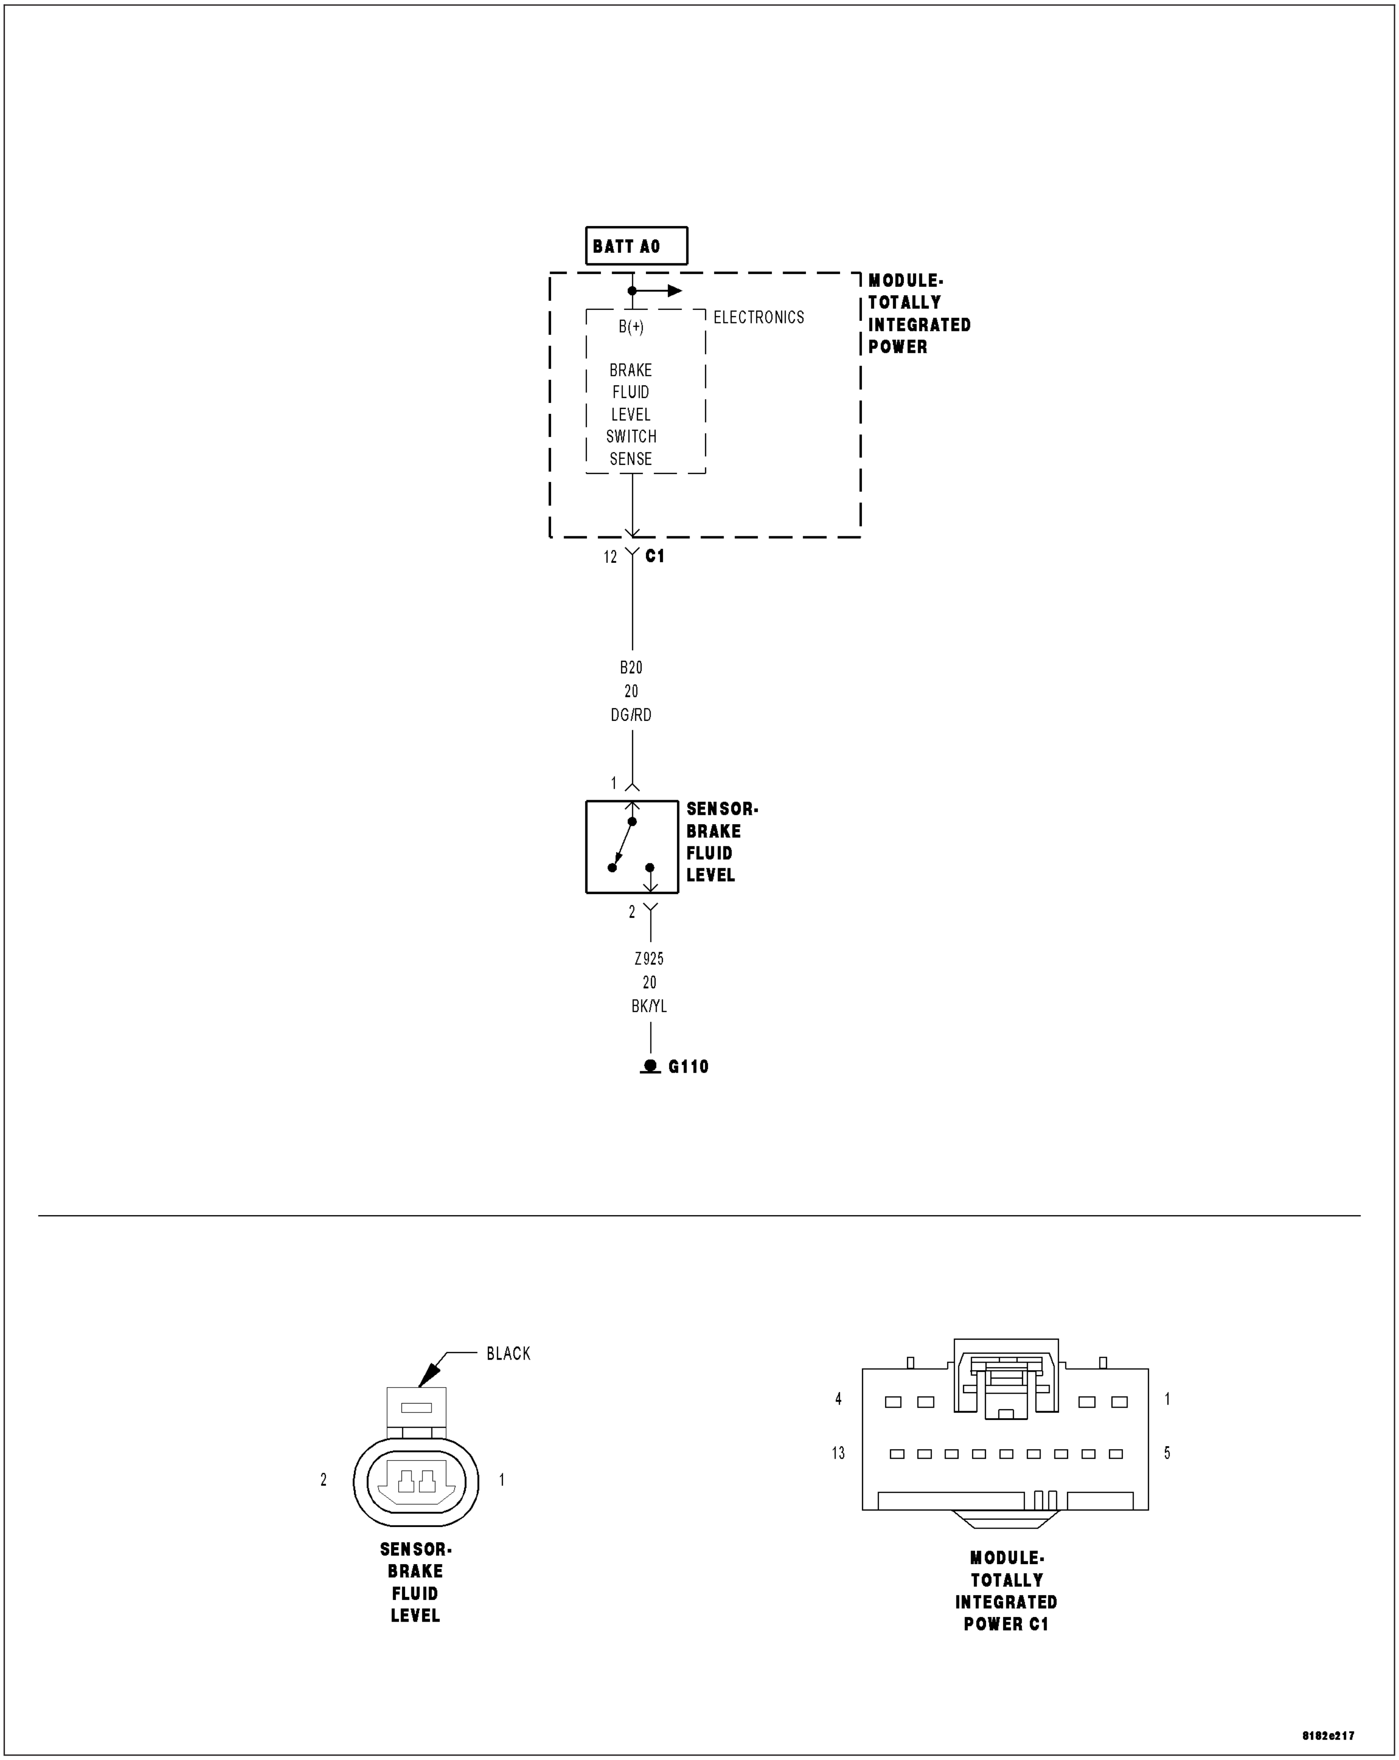
Turn the ignition off.

Disconnect the Totally Integrated Power Module harness connector.

Disconnect the Brake Fluid Level Sensor harness connector.

Measure the resistance of the (B20) Brake Fluid Level circuit in the Brake Fluid Level Sensor harness connector to ground.

Is the resistance below 100 ohms?



Yes >> Repair the (B20) Brake Fluid Level circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace and program the Totally Integrated Power Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1008-BRAKE FLUID LEVEL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

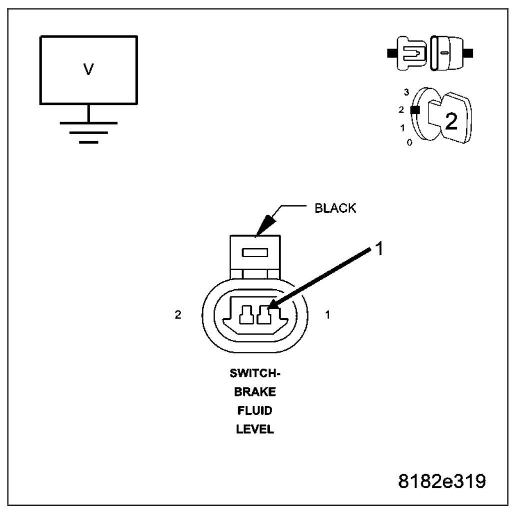
- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Totally Integrated Power Module indicates that the Brake Fluid Level Circuit is greater than 4.9 volts for more then 5 seconds.

Possible Causes
(B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT OPEN
(B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE
BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE
(Z925) SENSOR GROUND CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. BRAKE FLUID LEVEL SWITCH SIGNAL VOLTAGE ABOVE 4.9 VOLTS

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.
With the scan tool, read Fuel Level Switch Signal voltage.



Is the voltage above 4.9 volts?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

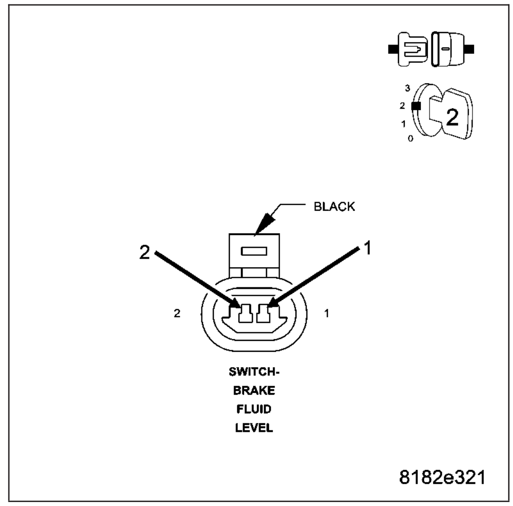
2. (B20) BRAKE FLUID LEVEL SWITCH SIGNAL CIRCUIT FOR SHORT TO BATTERY VOLTAGE

Turn the ignition off.
Disconnect the Brake Fluid Level Switch harness connector.
Turn the ignition on.
Measure the voltage of the (B20) Brake Fluid Level signal circuit in the Brake Fluid Level Switch harness connector to ground.

Is the voltage above 5.2 volts?

Yes >> Repair the (B20) Brake Fluid Level signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3



3. BRAKE FLUID LEVEL SWITCH INTERNAL FAILURE

Turn the ignition off.

Connect a jumper wire between the (B20) Brake Fluid Level signal circuit and the (Z925) Brake Fluid Level ground circuit in the Brake Fluid Level Switch harness connector

Turn the ignition on.

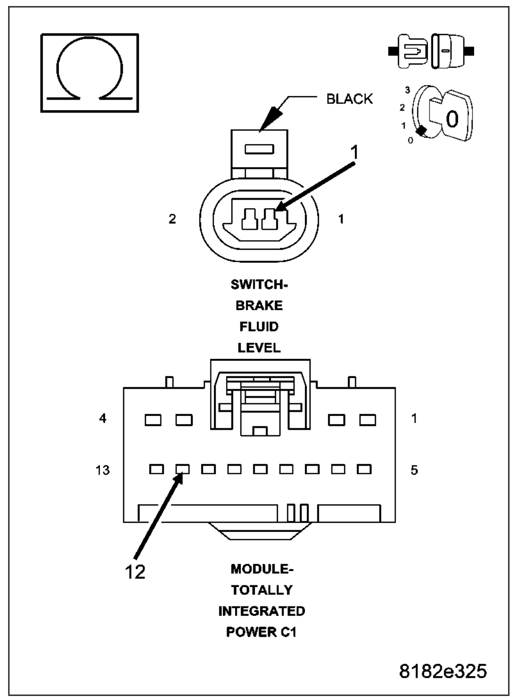
With the scan tool, read the Brake Fluid Level Switch voltage

Is the voltage below 1.0 volt?

Yes >> Replace the Brake Fluid Level Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4



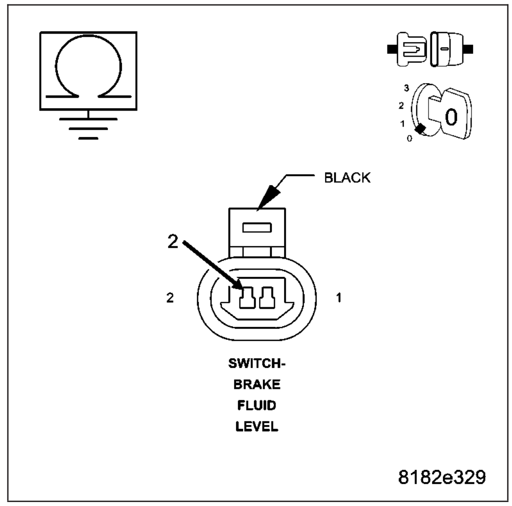
4. (B20) BRAKE FLUID LEVEL SWITCH CIRCUIT OPEN

Turn the ignition off.

Disconnect the Brake Fluid Level Switch.

Disconnect the TIPM harness connector.

Measure the resistance of the (B20) Brake Fluid Level signal circuit between the Brake Fluid Level Switch harness connector and the TIPM harness connector.



Is the resistance below 5 ohms?

Yes >> Go To 5

No >> Repair the open in the (B20) Brake Fluid Level Switch signal circuit.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. (Z925) SENSOR GROUND CIRCUIT OPEN

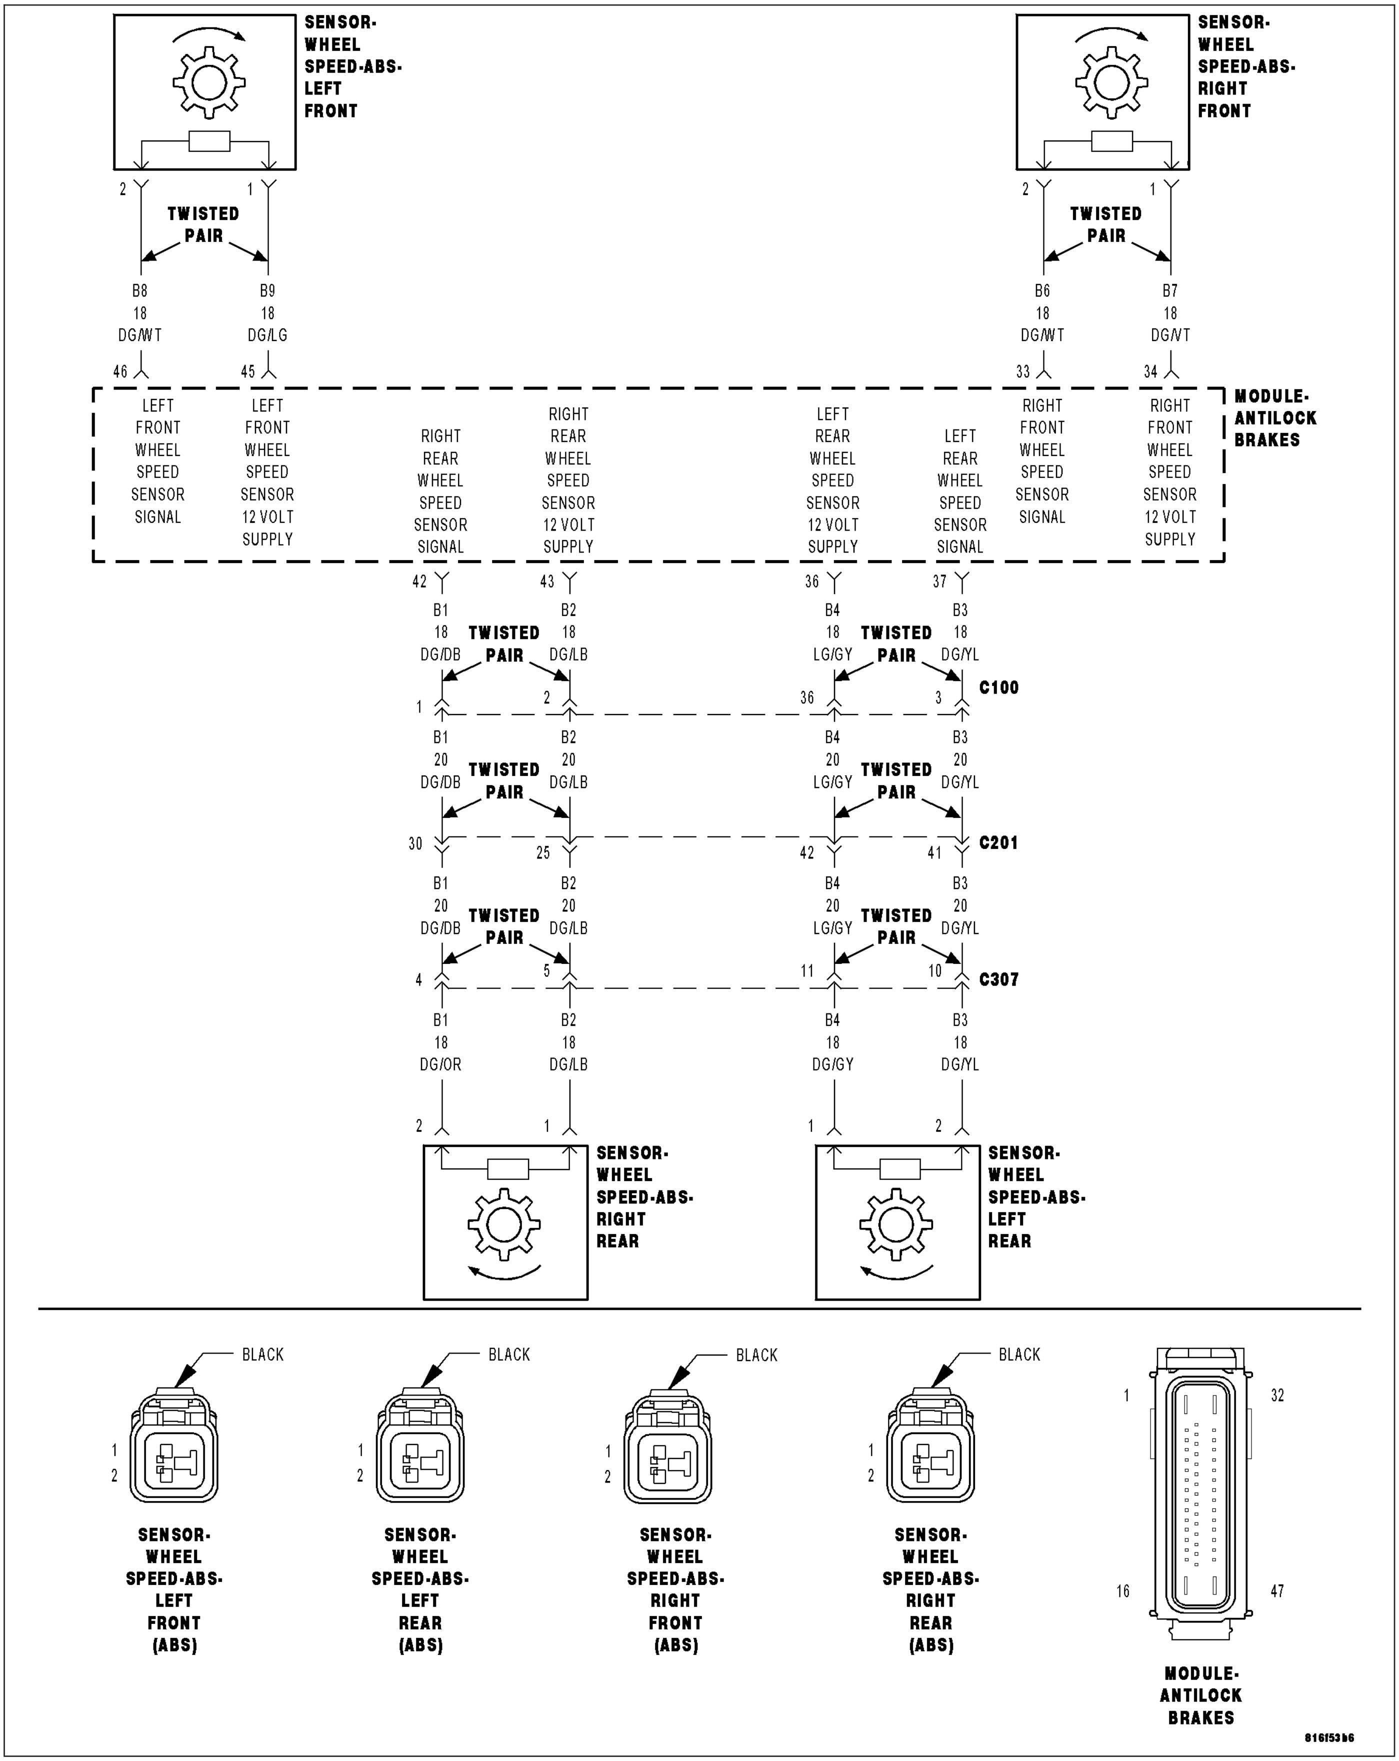
Turn the ignition off.

Disconnect the Brake Fluid Level Switch harness connector.

Reconnect the TIPM harness connector.

Measure the resistance of the (Z925) Brake Fluid Level Switch ground circuit between the Brake Fluid Level Switch harness connector and ground.

Is the resistance below 5.0 ohms?



Yes >> Replace and program the Totally Integrated Power Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Repair the open in the (Z925) Sensor ground circuit.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND OR OPEN
(B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

Is the Left Front WSS or any of the connectors/terminals damaged?

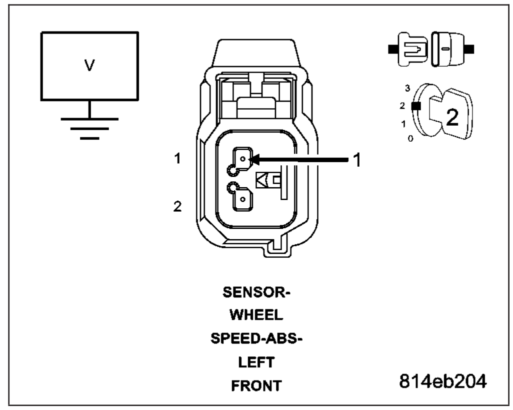
Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT VOLTAGE

Disconnect the Left Front WSS harness connector.



Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply circuit and ground.

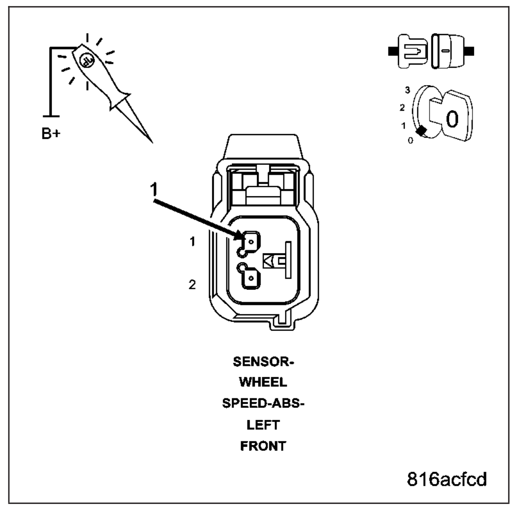
Is the voltage above 10 volts?

Yes >> Go To 6

No >> Go To 4

4. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

Disconnect the Anti-Lock Brake Module harness connector.



Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

Does the test light illuminate brightly?

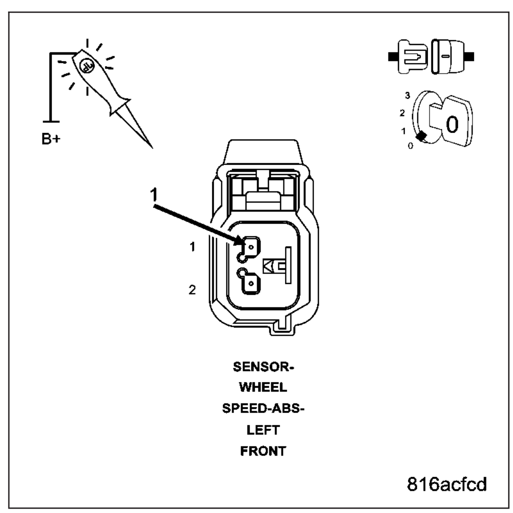
Yes >> Repair the (B9) Left Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

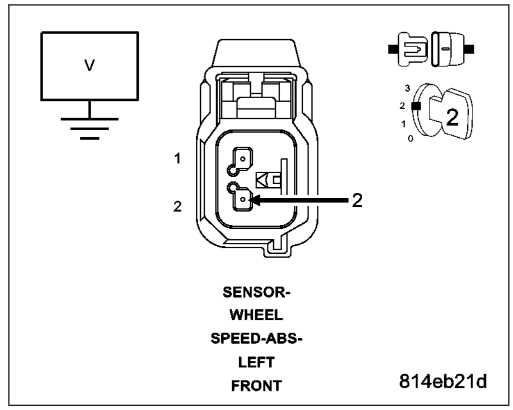
5. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT OPEN

Connect a jumper wire between ground and the (B9) Left Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.



Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

Does the test light illuminate brightly



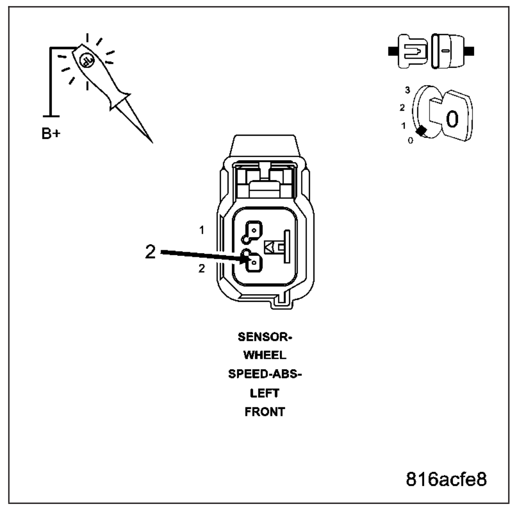
Yes >> Go To 6

No >> Repair the (B9) Left Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.



Measure the voltage between the (B8) Left Front WSS Signal circuit and ground.

Is the voltage above one volt?

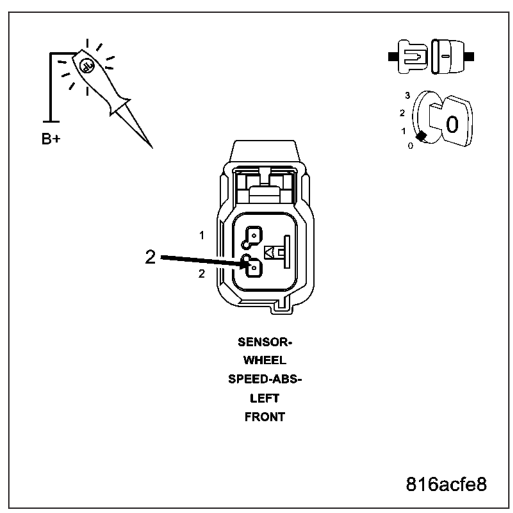
Yes >> Repair the (B8) Left Front WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

7. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND

Turn the ignition off.

If not done previously, disconnect the Anti-Lock Brake Module harness connector.



Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Repair the (B8) Left Front WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

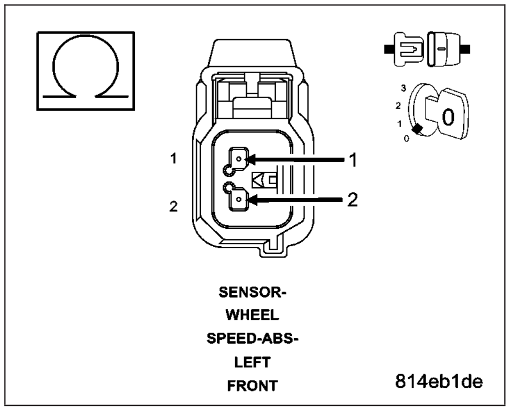
No >> Go To 8

8. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN

Connect a jumper wire between ground and the (B8) Left Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

Does the test light illuminate brightly?



Yes >> Go To 9

No >> Repair the (B8) Left Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

9. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TOGETHER

Remove all jumper wires.

Measure the resistance between the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes >> Go To 10

No >> Repair the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit for a short together.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

10. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.
With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Front WSS Signal is intermittently missing a vehicle speed above 40 kph (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
LEFT FRONT WSS LOOSE — B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT FRONT TONE WHEEL DAMAGE
LEFT FRONT WHEEL BEARING DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: If DTC C100A Left Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Left Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector

Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK LEFT FRONT TONE WHEEL FOR DAMAGE

Inspect the Left Front Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Front Tone Wheel damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK LEFT FRONT WHEEL BEARING FOR DAMAGE

Inspect the Left Front wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Front Wheel Bearing Damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

7. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Front WSS reading is different from the readings received from the other WSS's at a vehicle speed above 40 kph (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
LEFT FRONT WSS LOOSE — B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
LEFT FRONT TONE WHEEL/BEARING DAMAGE
LEFT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.
With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE?

Yes >> Go To 3

No >> Go To 2

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.
Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Left Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector

Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK LEFT FRONT TONE WHEEL FOR DAMAGE

Inspect the Left Front Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Front Tone Wheel damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. LEFT FRONT WHEEL SPEED SENSOR

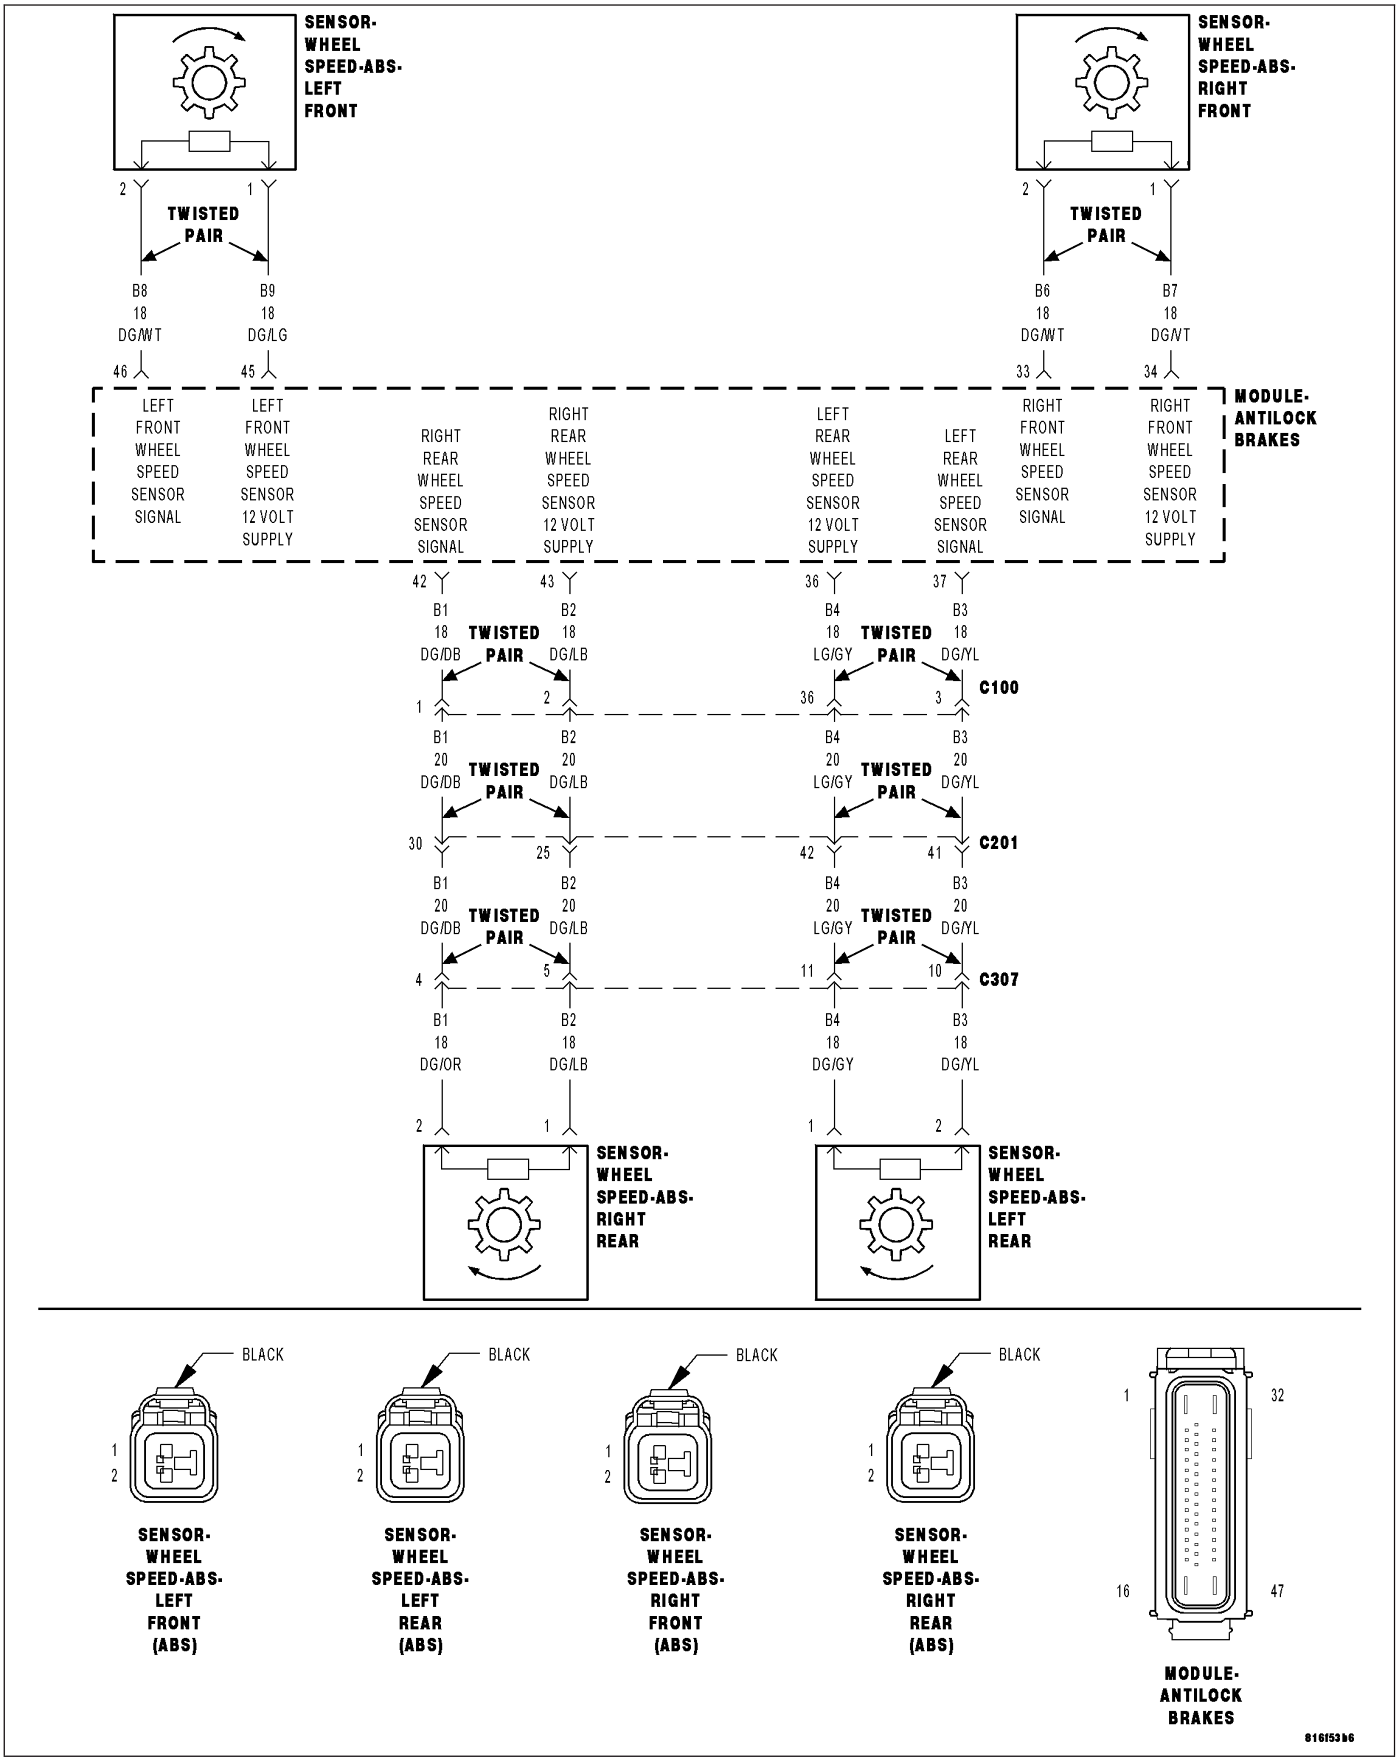
Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.



NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT
RIGHT FRONT WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR DTC C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

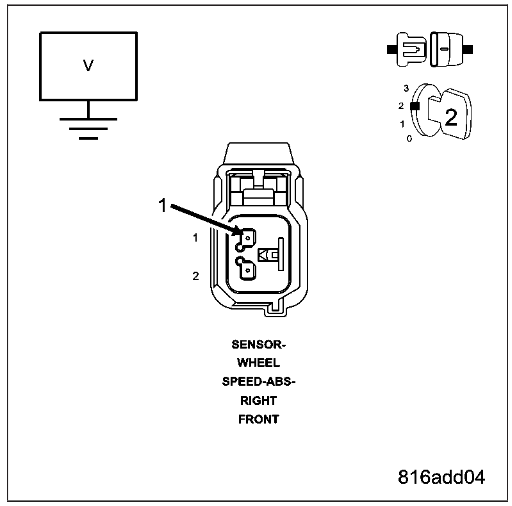
NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector.

Is the Right Front WSS or any of the connectors/terminals damaged?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



No >> Go To 3

3. CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Right Front WSS harness connector.

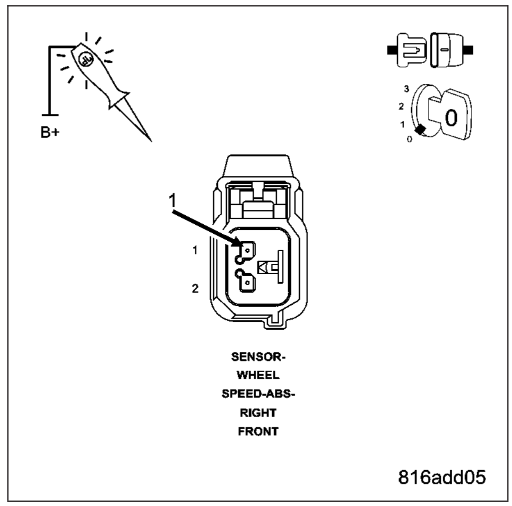
Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS 12 Volt Supply circuit.

Is the voltage above 10.0 volts?

Yes >> Go To 6

No >> Go To 4



4. CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

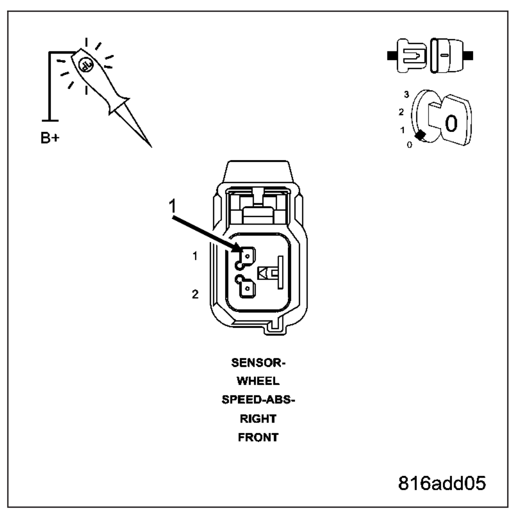
Disconnect the Right Front WSS harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

Does the test light illuminate brightly?

Yes >> Repair the (B7) Right Front WSS Supply circuit for a short to ground.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

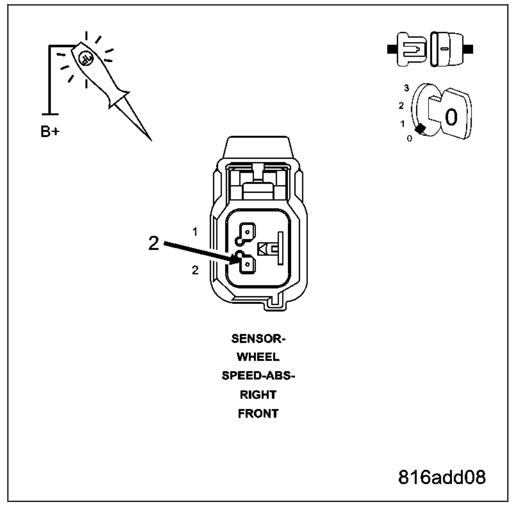
5. CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B7) Right Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

Does the test light illuminate brightly?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

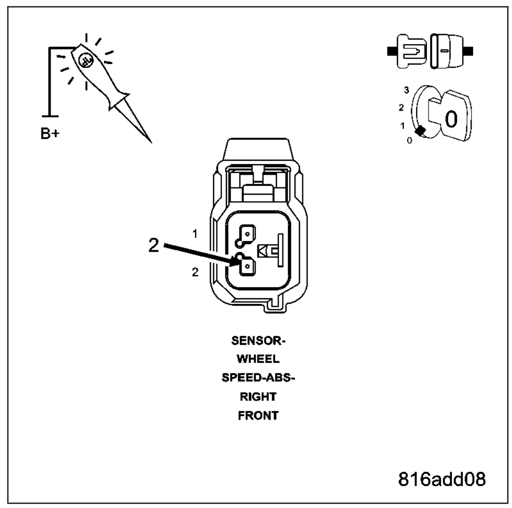
No >> Repair the (B7) Right Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND

Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.

Does the test light illuminate brightly?



Yes >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

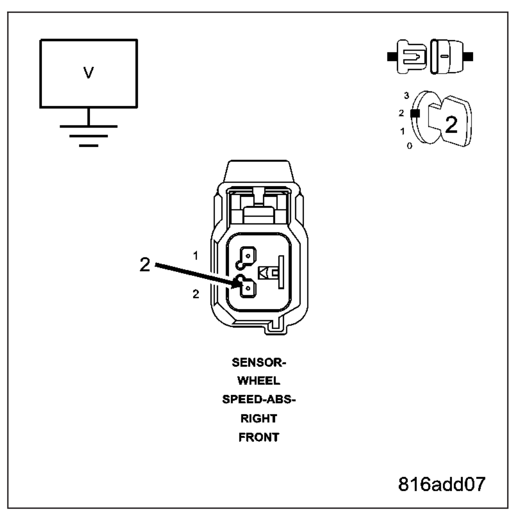
7. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN

Connect a jumper wire between ground and the (B6) Right Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Go To 8



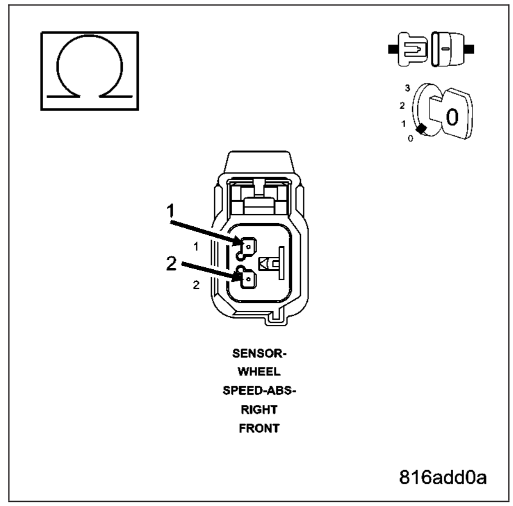
No >> Repair the (B6) Right Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

8. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR AN SHORT TO VOLTAGE

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B6) Right Front WSS Signal circuit and ground.



Is the voltage above one volt?

Yes >> Repair the (B6) Right Front WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 9

9. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TOGETHER

Turn the ignition off.

Measure the resistance between the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes >> Go To 10

No >> Repair the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit for a short together.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

10. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Front WSS Signal is intermittently missing a vehicle speed above 25mph (40 kph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
RIGHT FRONT WSS LOOSE — B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
RIGHT FRONT TONE WHEEL DAMAGE
RIGHT FRONT WHEEL BEARING DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: If DTC C1015–Right Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Right Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

3. CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector

Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK RIGHT FRONT TONE WHEEL FOR DAMAGE

Inspect the Right Front Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Front Tone Wheel damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK RIGHT FRONT WHEEL BEARING FOR DAMAGE

Inspect the Right Front wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Front Wheel Bearing Damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

7. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Front WSS reading is different from the readings received from the other WSS's at a vehicle speed above 40 kph (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
RIGHT FRONT WSS LOOSE — B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT TONE WHEEL/BEARING DAMAGE
RIGHT FRONT WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.
With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE?

Yes >> Go To 3

No >> Go To 2

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.
Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Right Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector

Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK RIGHT FRONT TONE WHEEL FOR DAMAGE

Inspect the Right Front Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Front Tone Wheel damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. RIGHT FRONT WHEEL SPEED SENSOR

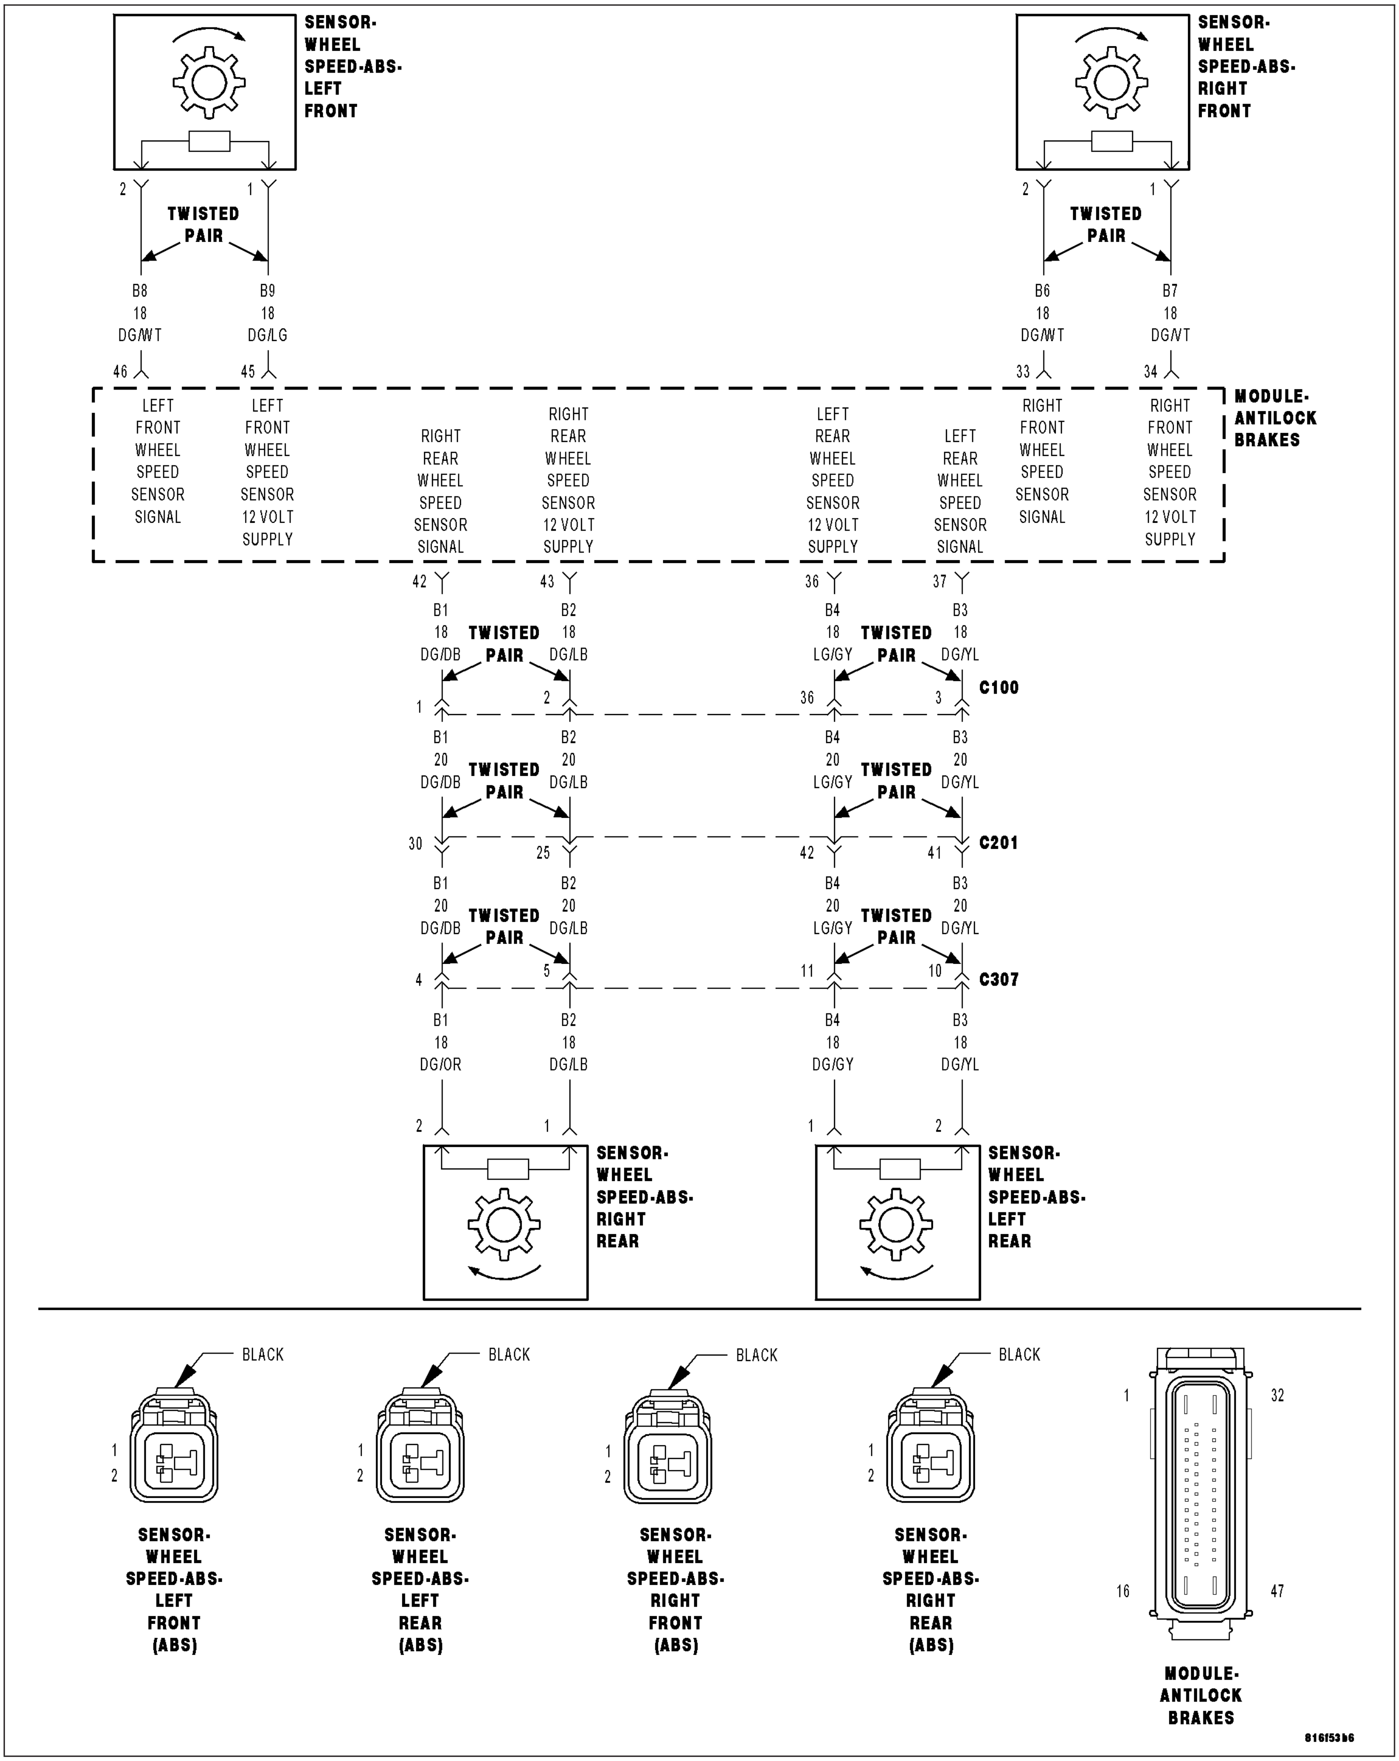
Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.



NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT
LEFT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR DTC C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

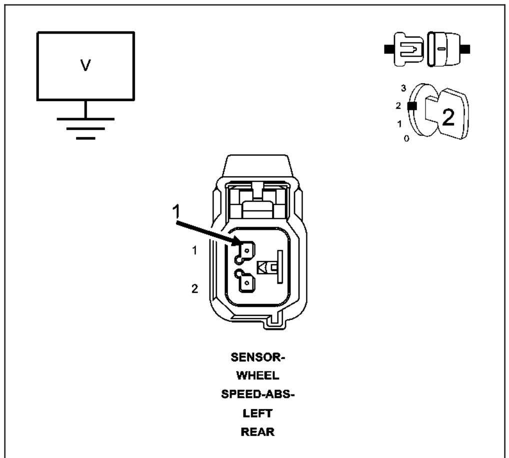
NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.

Is the Left Rear WSS or any of the connectors/terminals damaged?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



No >> Go To 3

3. CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

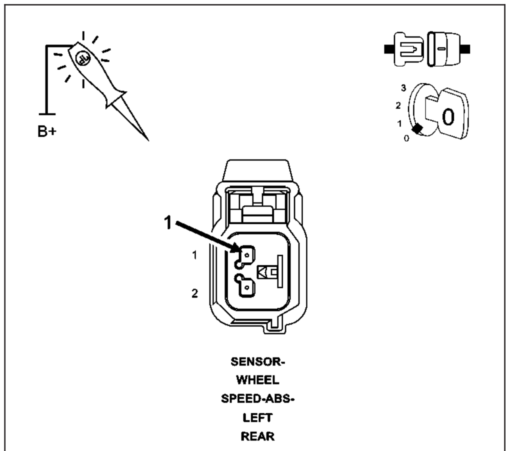
Measure the voltage of the (B4) Left Rear WSS 12 Volt Supply circuit.

816add50

Is the voltage above 10.0 volts?

Yes >> Go To 6

No >> Go To 4



4. CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

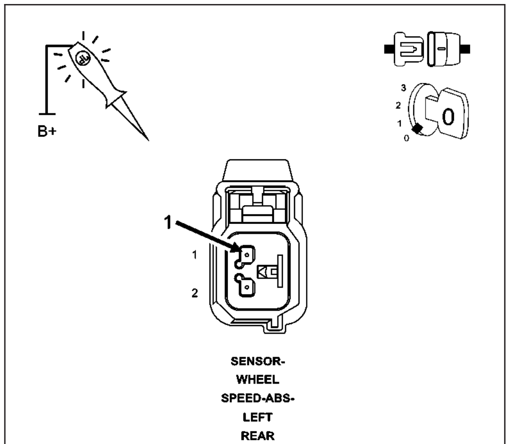
Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B4) Left Rear WSS Supply circuit.

816add52

Does the test light illuminate brightly?

Yes >> Repair the (B4) Left Rear WSS Supply circuit for a short to ground.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

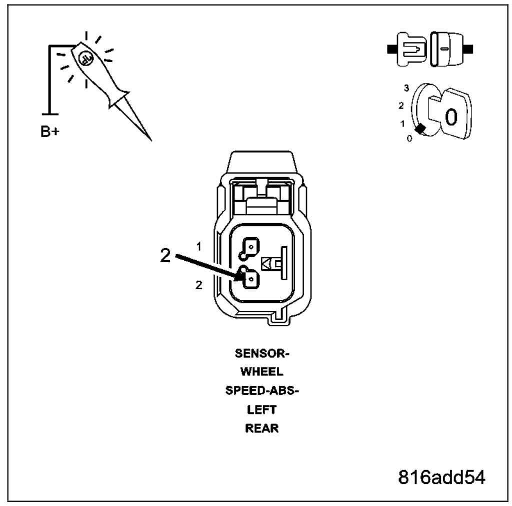
Connect a jumper wire between ground and the (B4) Left Rear WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B4) Left Rear WSS Supply circuit.

816add52

Does the test light illuminate brightly?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

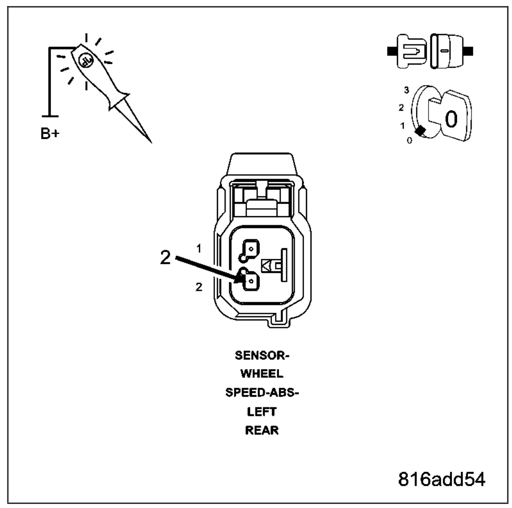
No >> Repair the (B4) Left Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.

Does the test light illuminate brightly?



Yes >> Repair the (B3) Left Rear WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

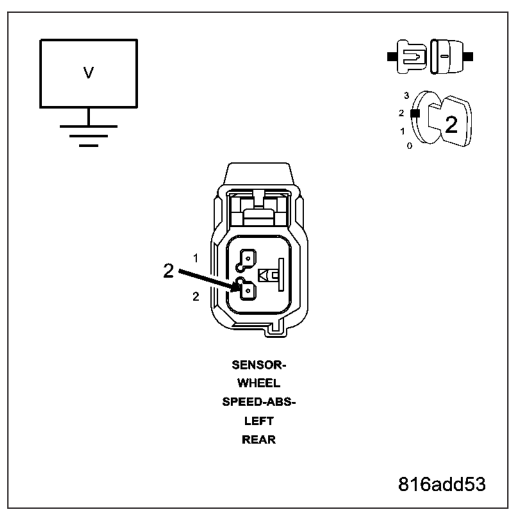
7. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B3) Left Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Go To 8



No >> Repair the (B3) Left Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

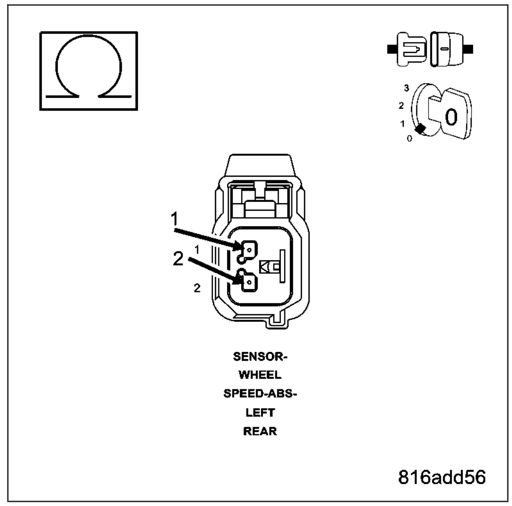
8. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B3) Left Rear WSS Signal circuit and ground.

Is the voltage above one volt?



Yes >> Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 9

9. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TOGETHER

Turn the ignition off.

Measure the resistance between the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes >> Go To 10

No >> Repair the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit for a short together.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

10. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Rear WSS Signal is intermittently missing a vehicle speed above 25mph (40 kph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
LEFT REAR WSS AIR GAP FAULT
LEFT REAR WSS LOOSE — B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT REAR TONE WHEEL DAMAGE
LEFT REAR WHEEL BEARING DAMAGE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
LEFT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK LEFT REAR WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Left Rear WSS air gap.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Rear WSS air gap within specifications?

Yes >> Go To 3

No >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

3. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Left Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 4

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

4. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK LEFT REAR WSS LOOSENESS, INSPECT B4, B5 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector

Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Rear Tone Wheel damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

7. CHECK LEFT REAR WHEEL BEARING FOR DAMAGE

Inspect the Left Rear wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Rear Wheel Bearing Damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 8

8. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).
Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.
With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Rear WSS reading is different from the readings received from the other WSS's at a vehicle speed above 40 kph (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
LEFT REAR WSS LOOSE — B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
LEFT REAR TONE WHEEL DAMAGE
LEFT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.
With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE?

Yes >> Go To 3

No >> Go To 2

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.
Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Left Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK LEFT REAR WSS LOOSENESS, INSPECT B3, B4 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector

Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Rear Tone Wheel damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. LEFT REAR WHEEL SPEED SENSOR

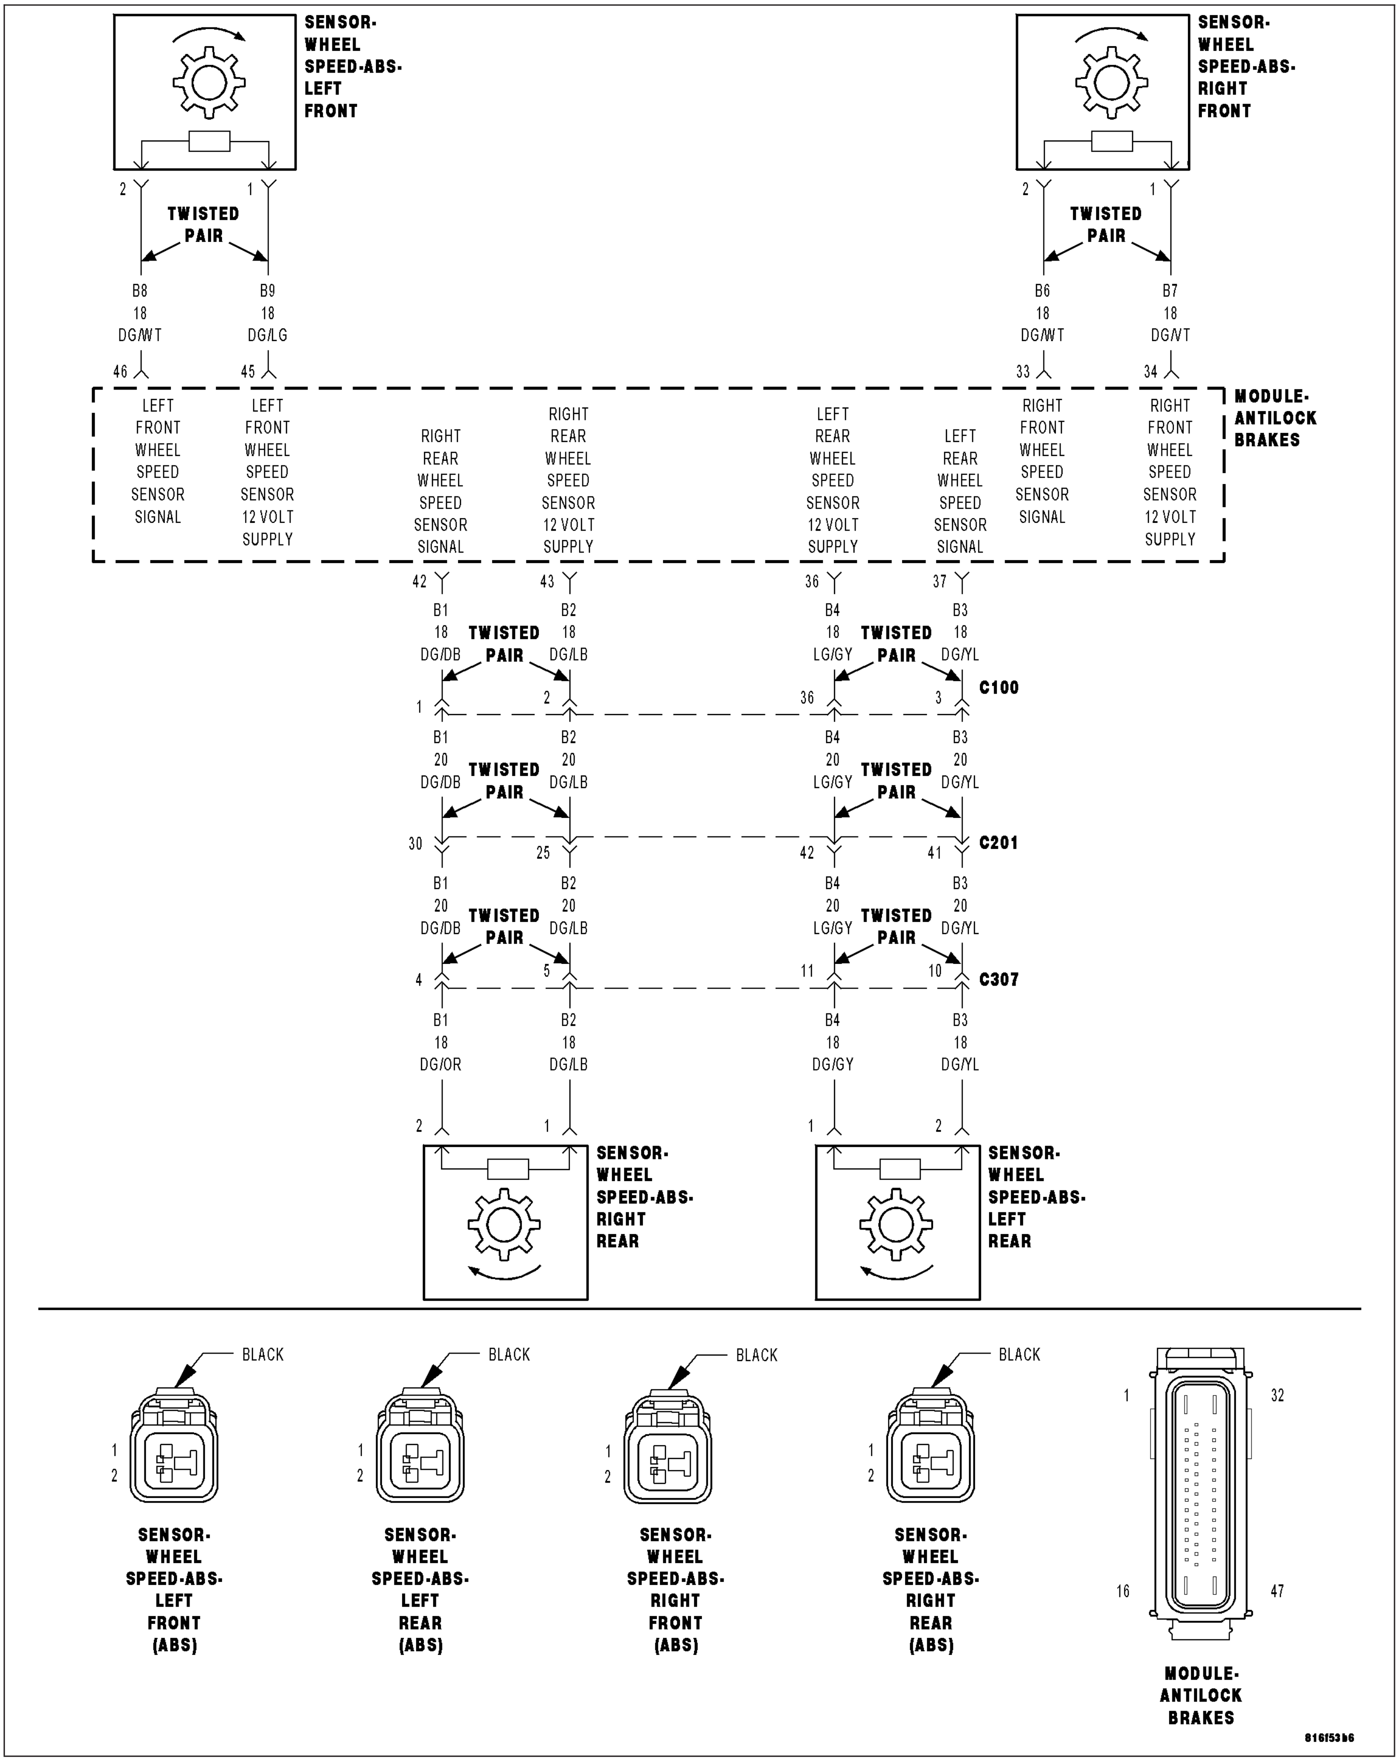
Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.



NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT
RIGHT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR DTC C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

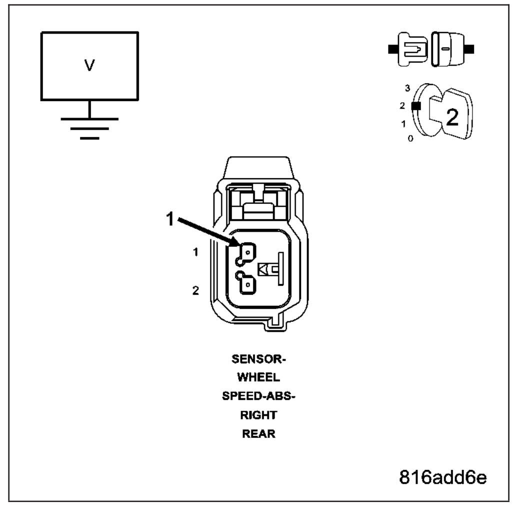
No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.



Is the Right Rear WSS or any of the connectors/terminals damaged?

Yes >> Repair as necessary.

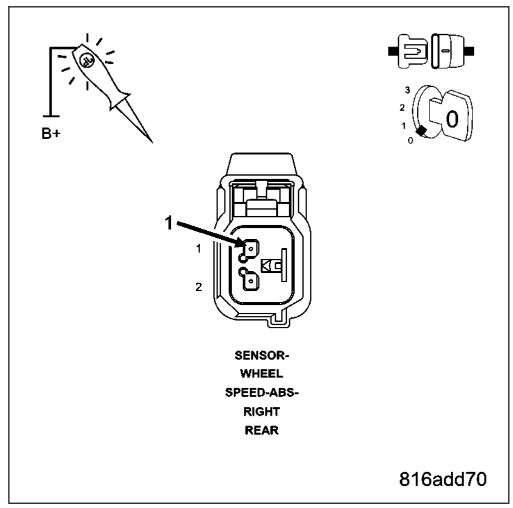
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.



Measure the voltage of the (B2) Right Rear WSS 12 Volt Supply circuit.

Is the voltage above 10.0 volts?

Yes >> Go To 6

No >> Go To 4

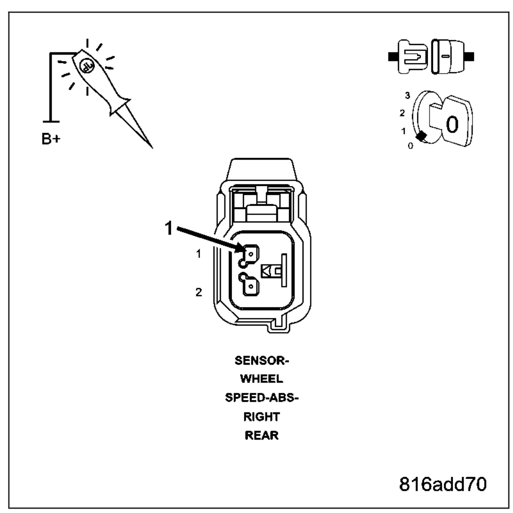
4. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.



Does the test light illuminate brightly?

Yes >> Repair the (B2) Right Rear WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

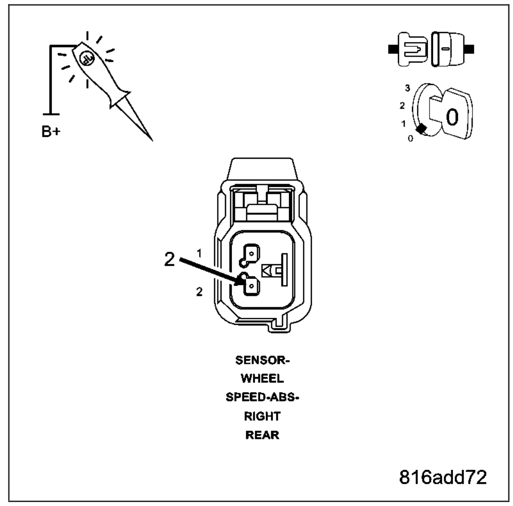
5. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B2) Right Rear WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

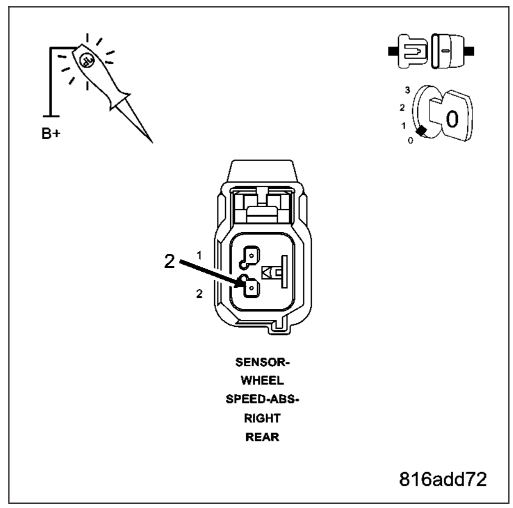
No >> Repair the (B2) Right Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.

Does the test light illuminate brightly?



Yes >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

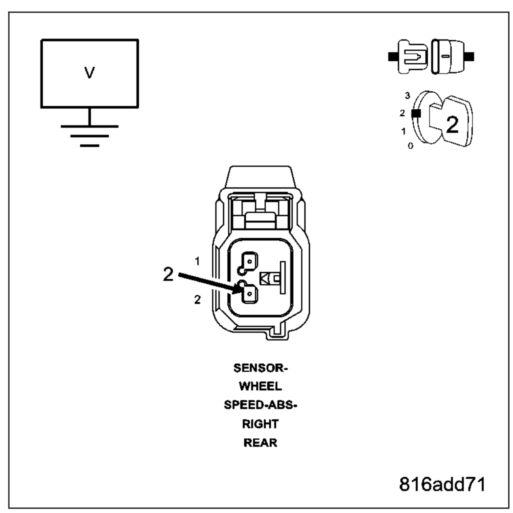
7. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B1) Right Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Go To 8



No >> Repair the (B1) Right Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

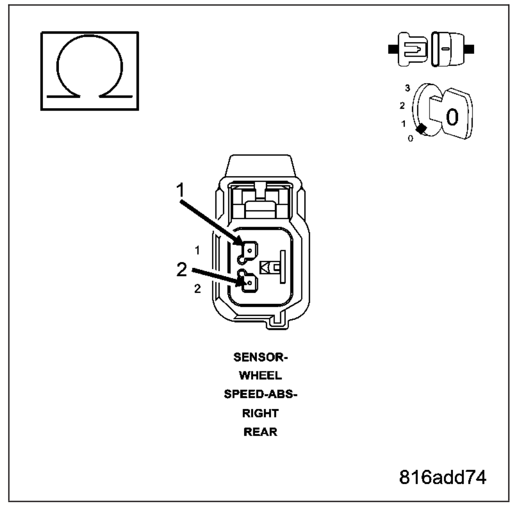
8. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B1) Right Rear WSS Signal circuit and ground.

Is the voltage above one volt?



Yes >> Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 9

9. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT

Turn the ignition off.

Measure the resistance between the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes >> Go To 10

No >> Repair the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit for a short together.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

10. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Rear WSS Signal is intermittently missing a vehicle speed above 25mph (40 kph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
RIGHT REAR WSS AIR GAP FAULT
RIGHT REAR WSS LOOSE — B1, B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
RIGHT REAR TONE WHEEL DAMAGE
RIGHT REAR WHEEL BEARING DAMAGE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
RIGHT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK RIGHT REAR WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Right Rear WSS air gap.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Rear WSS air gap within specifications?

Yes >> Go To 3

No >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

3. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Right Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 4

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

4. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector

Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK RIGHT REAR TONE WHEEL FOR DAMAGE

Inspect the Right Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Rear Tone Wheel damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

7. CHECK RIGHT REAR WHEEL BEARING FOR DAMAGE

Inspect the Right Rear wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Rear Wheel Bearing Damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 8

8. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Rear WSS reading is different from the readings received from the other WSS's at a vehicle speed above 40 kph (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
RIGHT REAR WSS LOOSE — B1, B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
RIGHT REAR TONE WHEEL DAMAGE
RIGHT REAR WSS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.
With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE?

Yes >> Go To 3

No >> Go To 2

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.
Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Right Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

3. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector

Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK RIGHT REAR TONE WHEEL FOR DAMAGE

Inspect the Right Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Rear Tone Wheel damaged?

Yes >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1038–REAR WHEEL SPEED SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO GROUND, OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO GROUND, OR OPEN
RIGHT REAR WSS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR DTC C1038–REAR WHEEL SPEED SENSOR CIRCUIT LOW

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C1038–REAR WHEEL SPEED SENSOR CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

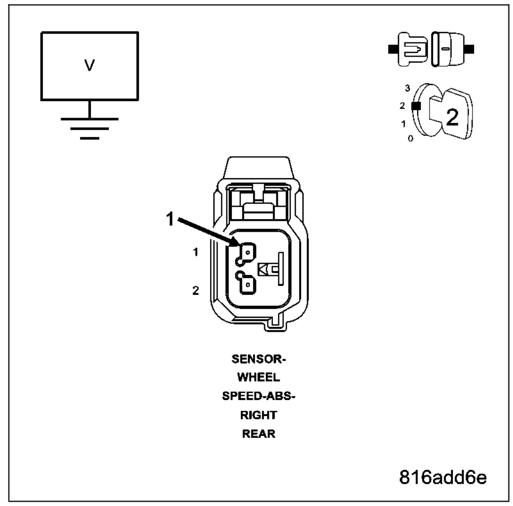
NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.
Turn the ignition off.

Inspect the TIPM harness connector, Right Rear WSS, and Right Rear WSS harness connector.

Is the Right Rear WSS or any of the connectors/terminals damaged?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



No >> Go To 3

3. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Right Rear WSS harness connector.

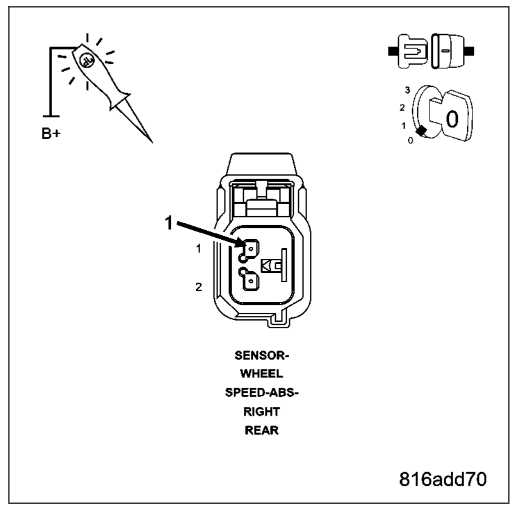
Turn the ignition on.

Measure the voltage of the (B2) Right Rear WSS 12 Volt Supply circuit.

Is the voltage above 10.0 volts?

Yes >> Go To 6

No >> Go To 4



4. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

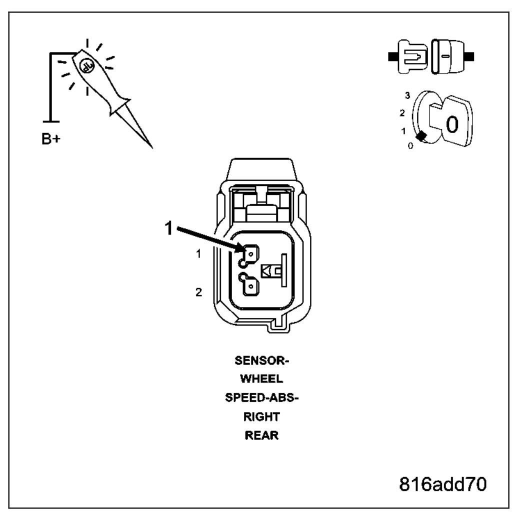
Disconnect the Right Rear WSS harness connector.

Disconnect the TIPM harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes >> Repair the (B2) Right Rear WSS Supply circuit for a short to ground.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

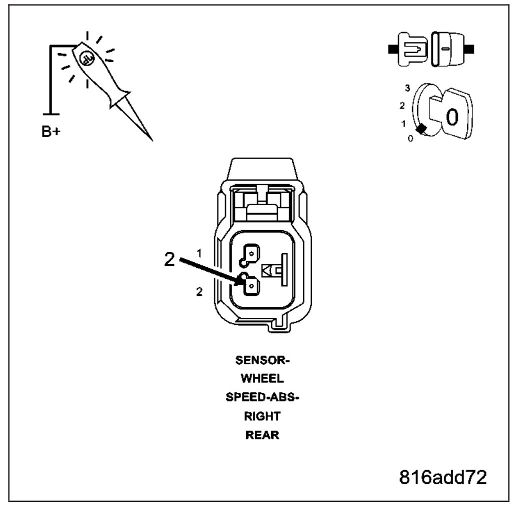
5. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B2) Right Rear WSS Supply circuit in the TIPM harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.

Does the test light illuminate brightly?

Yes >> Replace the TIPM in accordance with the Service Information.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

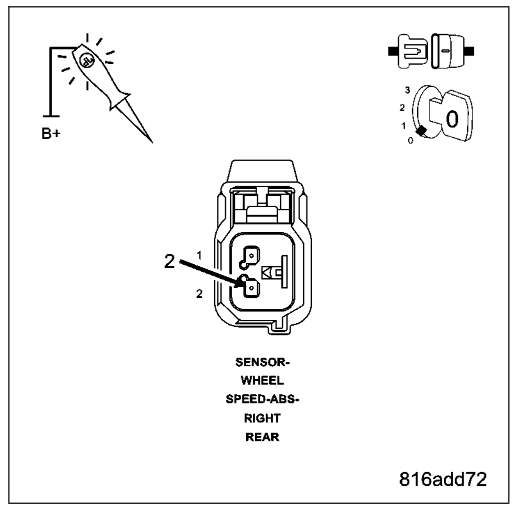
No >> Repair the (B2) Right Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.

Does the test light illuminate brightly?



Yes >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

7. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B1) Right Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Go To 8

No >> Repair the (B1) Right Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

8. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
With the scan tool, read TIPM DTCs.

Did DTC C1038–REAR WHEEL SPEED SENSOR CIRCUIT LOW reset?

Yes >> Replace the TIPM in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1039–REAR WHEEL SPEED SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE,OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT
RIGHT REAR WSS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR DTC C1039–REAR WHEEL SPEED SENSOR CIRCUIT HIGH

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C1039–REAR WHEEL SPEED SENSOR CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the TIPM harness connector, Right Rear WSS, and Right Rear WSS harness connector.

Is the Right Rear WSS or any of the connectors/terminals damaged?

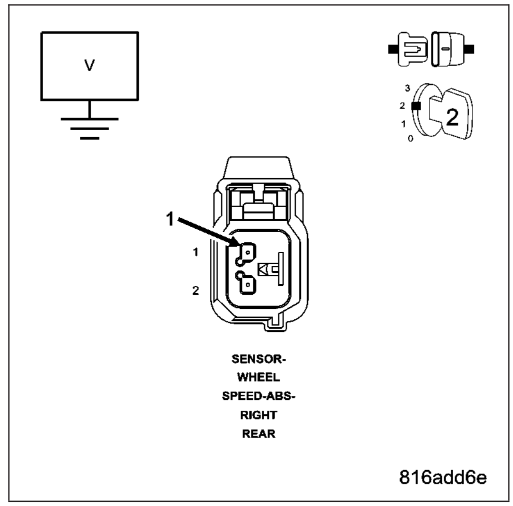
Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Right Rear WSS harness connector.



Turn the ignition on.

Measure the voltage of the (B2) Right Rear WSS 12 Volt Supply circuit.

Is the voltage above 10.0 volts?

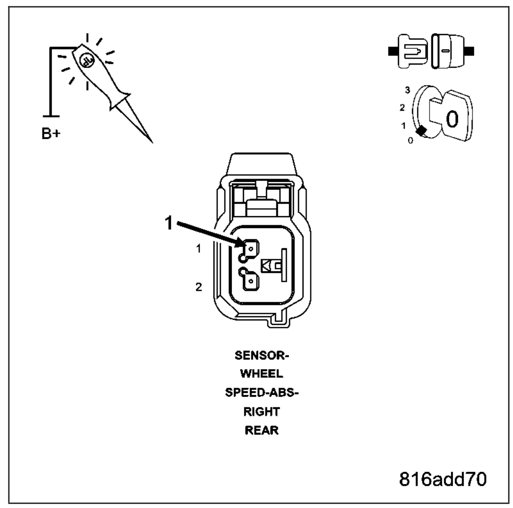
Yes >> Go To 5

No >> Go To 4

4. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B2) Right Rear WSS Supply circuit in the TIPM harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.



Does the test light illuminate brightly?

Yes >> Replace the TIPM in accordance with the Service Information.

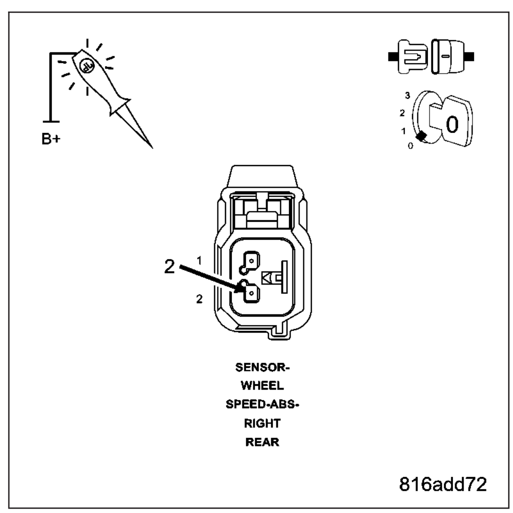
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Repair the (B2) Right Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B1) Right Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.



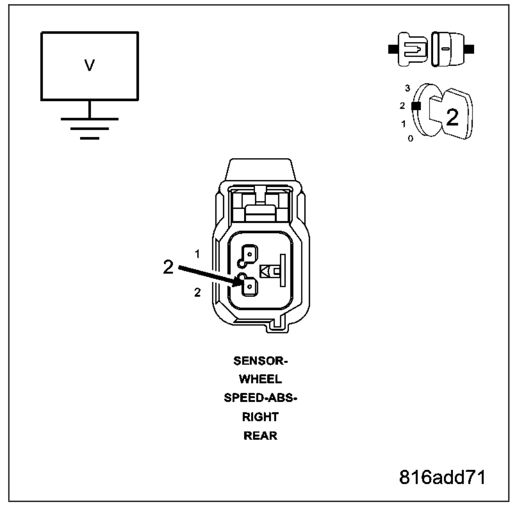
Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Go To 6

No >> Repair the (B1) Right Rear WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



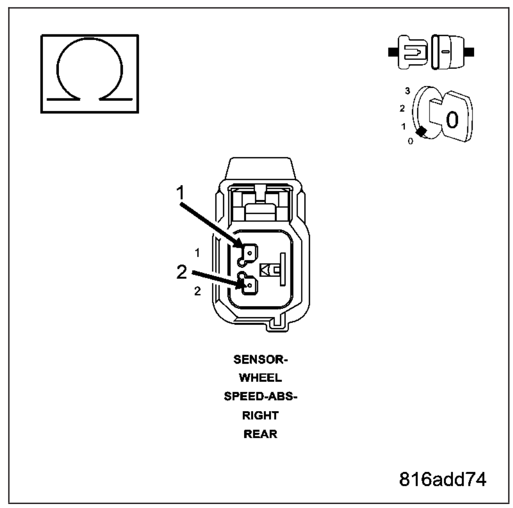
6. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B1) Right Rear WSS Signal circuit and ground.

Is the voltage above one volt?



Yes >> Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 7

7. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT

Turn the ignition off.

Measure the resistance between the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes >> Go To 8

No >> Repair the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit for a short together.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

8. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
With the scan tool, read TIPM DTCs.

Did DTC C1039–REAR WHEEL SPEED SENSOR CIRCUIT HIGH reset?

Yes >> Replace the TIPM in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1041-LEFT FRONT TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
LEFT FRONT TONE WHEEL/BEARING DAMAGE
DIRTY TONE WHEEL/SENSOR

Diagnostic Test

1. CHECK FOR A DTC C1041-LEFT FRONT TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read DTCs.

Does the scan tool display: C1041-LEFT FRONT TONE WHEEL PERFORMANCE?

Yes >> Replace the Left Front Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
RIGHT FRONT TONE WHEEL/BEARING DAMAGE
DIRTY TONE WHEEL/SENSOR

Diagnostic Test

1. CHECK FOR A DTC C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.
With the scan tool, read DTCs.

Does the scan tool display: C1042-RIGHT FRONT TONE WHEEL PERFORMANCE?

Yes >> Replace the Right Front Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C1043-LEFT REAR TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
LEFT REAR TONE WHEEL/BEARING DAMAGE
DIRTY TONE WHEEL/SENSOR

Diagnostic Test

1. CHECK FOR A DTC C1043-LEFT REAR TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.
With the scan tool, read DTCs.

Does the scan tool display: C1043-LEFT REAR TONE WHEEL PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE LEFT REAR TONE WHEEL FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.
Check the Left Rear Tone Wheel for damage.

Check the Left Rear Tone Wheel for dirt.

Was the tone wheel dirty?

Yes >> Clean tone wheel and sensor. Clear codes and retest.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Left Rear Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1044-RIGHT REAR TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
RIGHT REAR TONE WHEEL/BEARING DAMAGE
DIRTY TONE WHEEL/SENSOR

Diagnostic Test

1. CHECK FOR A DTC C1044-RIGHT REAR TONE WHEEL PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Test drive the vehicle in a straight line to 40 Km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.
With the scan tool, read DTCs.

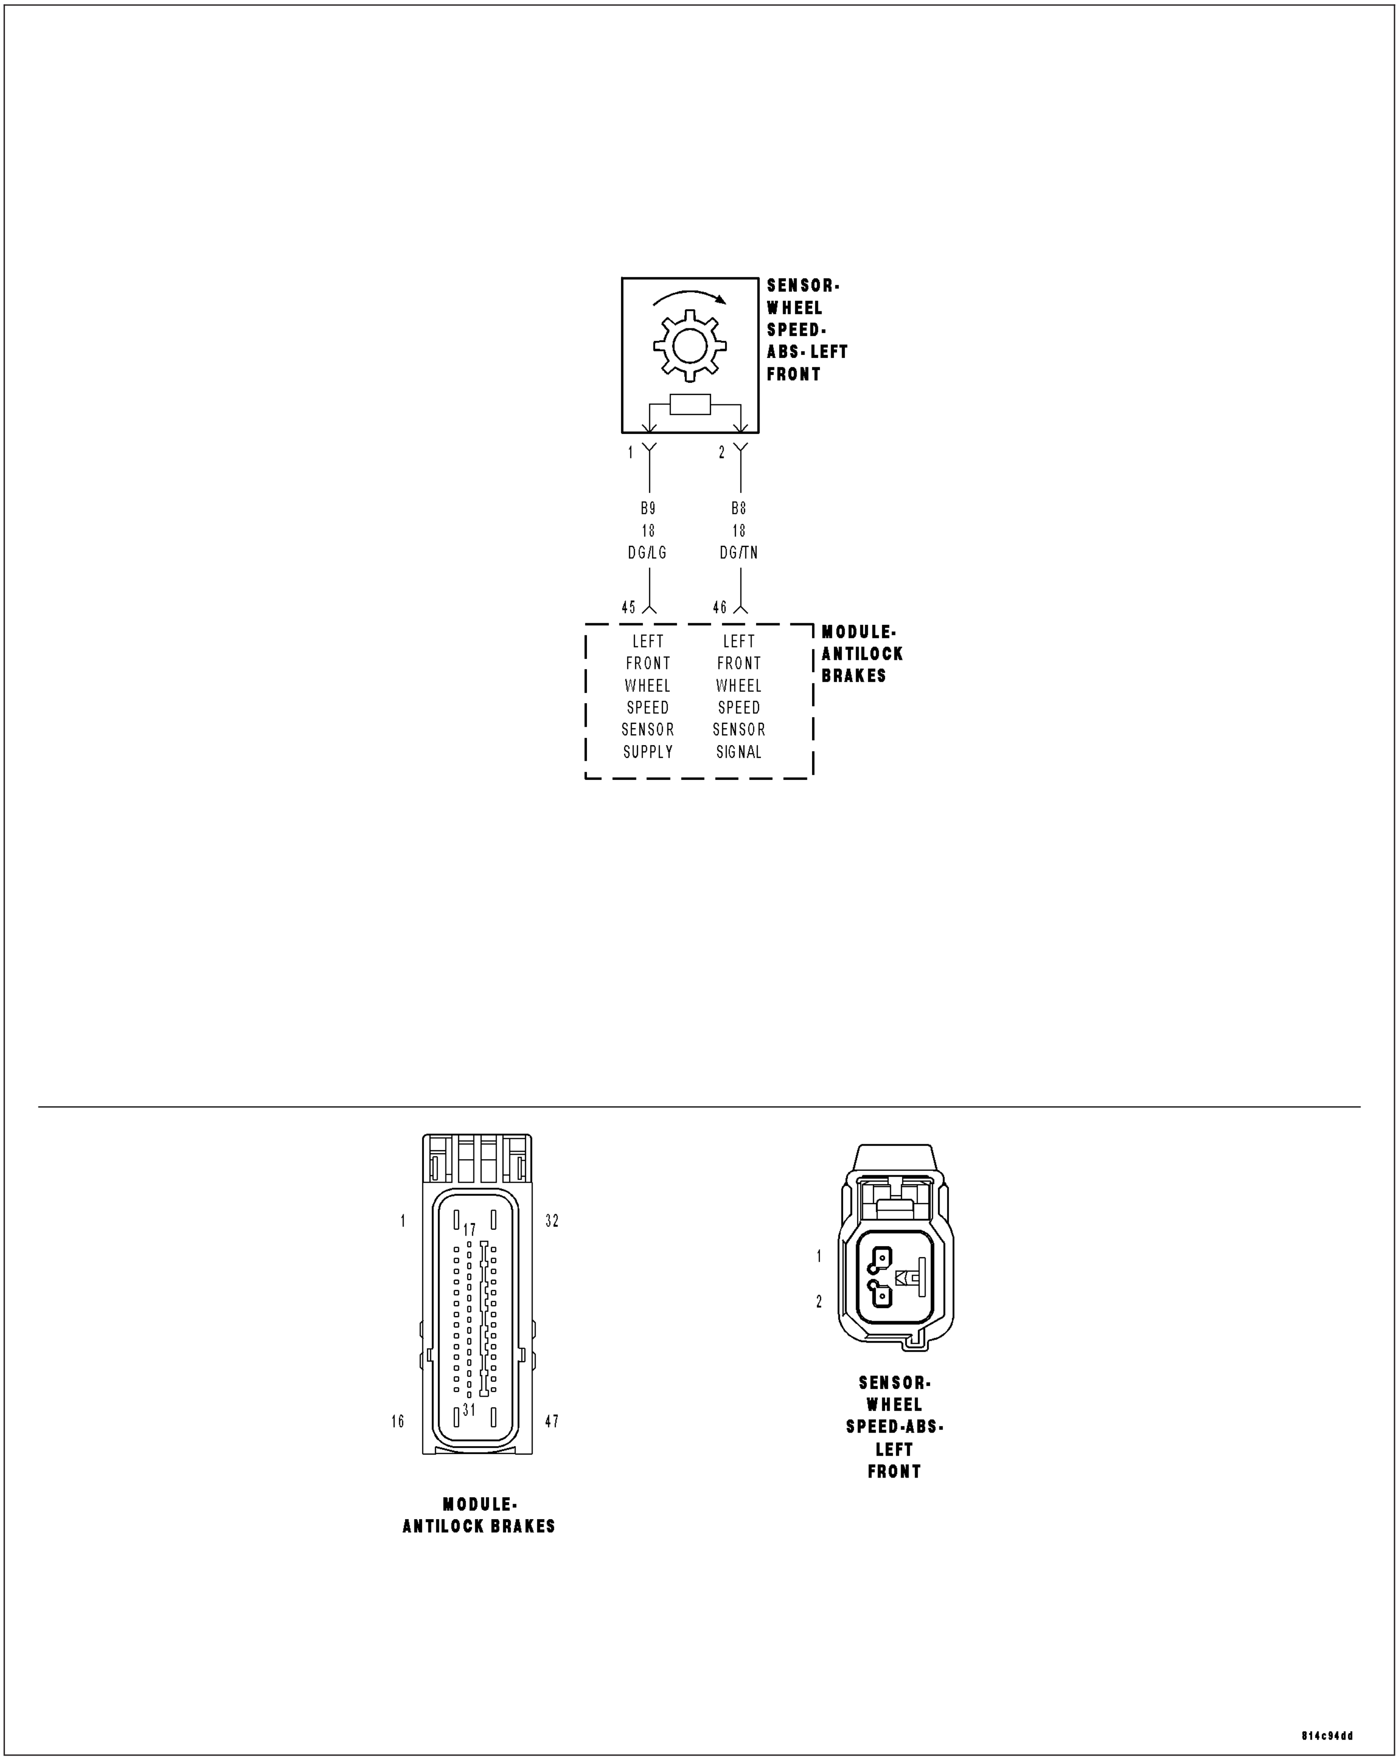
Does the scan tool display: C1044-RIGHT REAR TONE WHEEL PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE RIGHT REAR TONE WHEEL FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.
Check the Right Rear Tone Wheel for damage.



Check the Right Rear Tone Wheel for dirt.

Was the tone wheel dirty?

Yes >> Clean tone wheel and sensor. Clear codes and retest.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Right Rear Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1046–LEFT FRONT WHEEL PRESSURE PHASE MONITORING

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During active ABS control.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
LEFT FRONT TONE WHEEL/BEARING DAMAGED
WHEEL SPEED SIGNALS SWAPPED
LEFT FRONT WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. COMPARE WHEEL SPEED SENSOR SIGNALS

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Does the Left Front WSS speed differ from the other WSS speeds by 8 Km/h (5 m.p.h.) or show NO speed?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

- Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

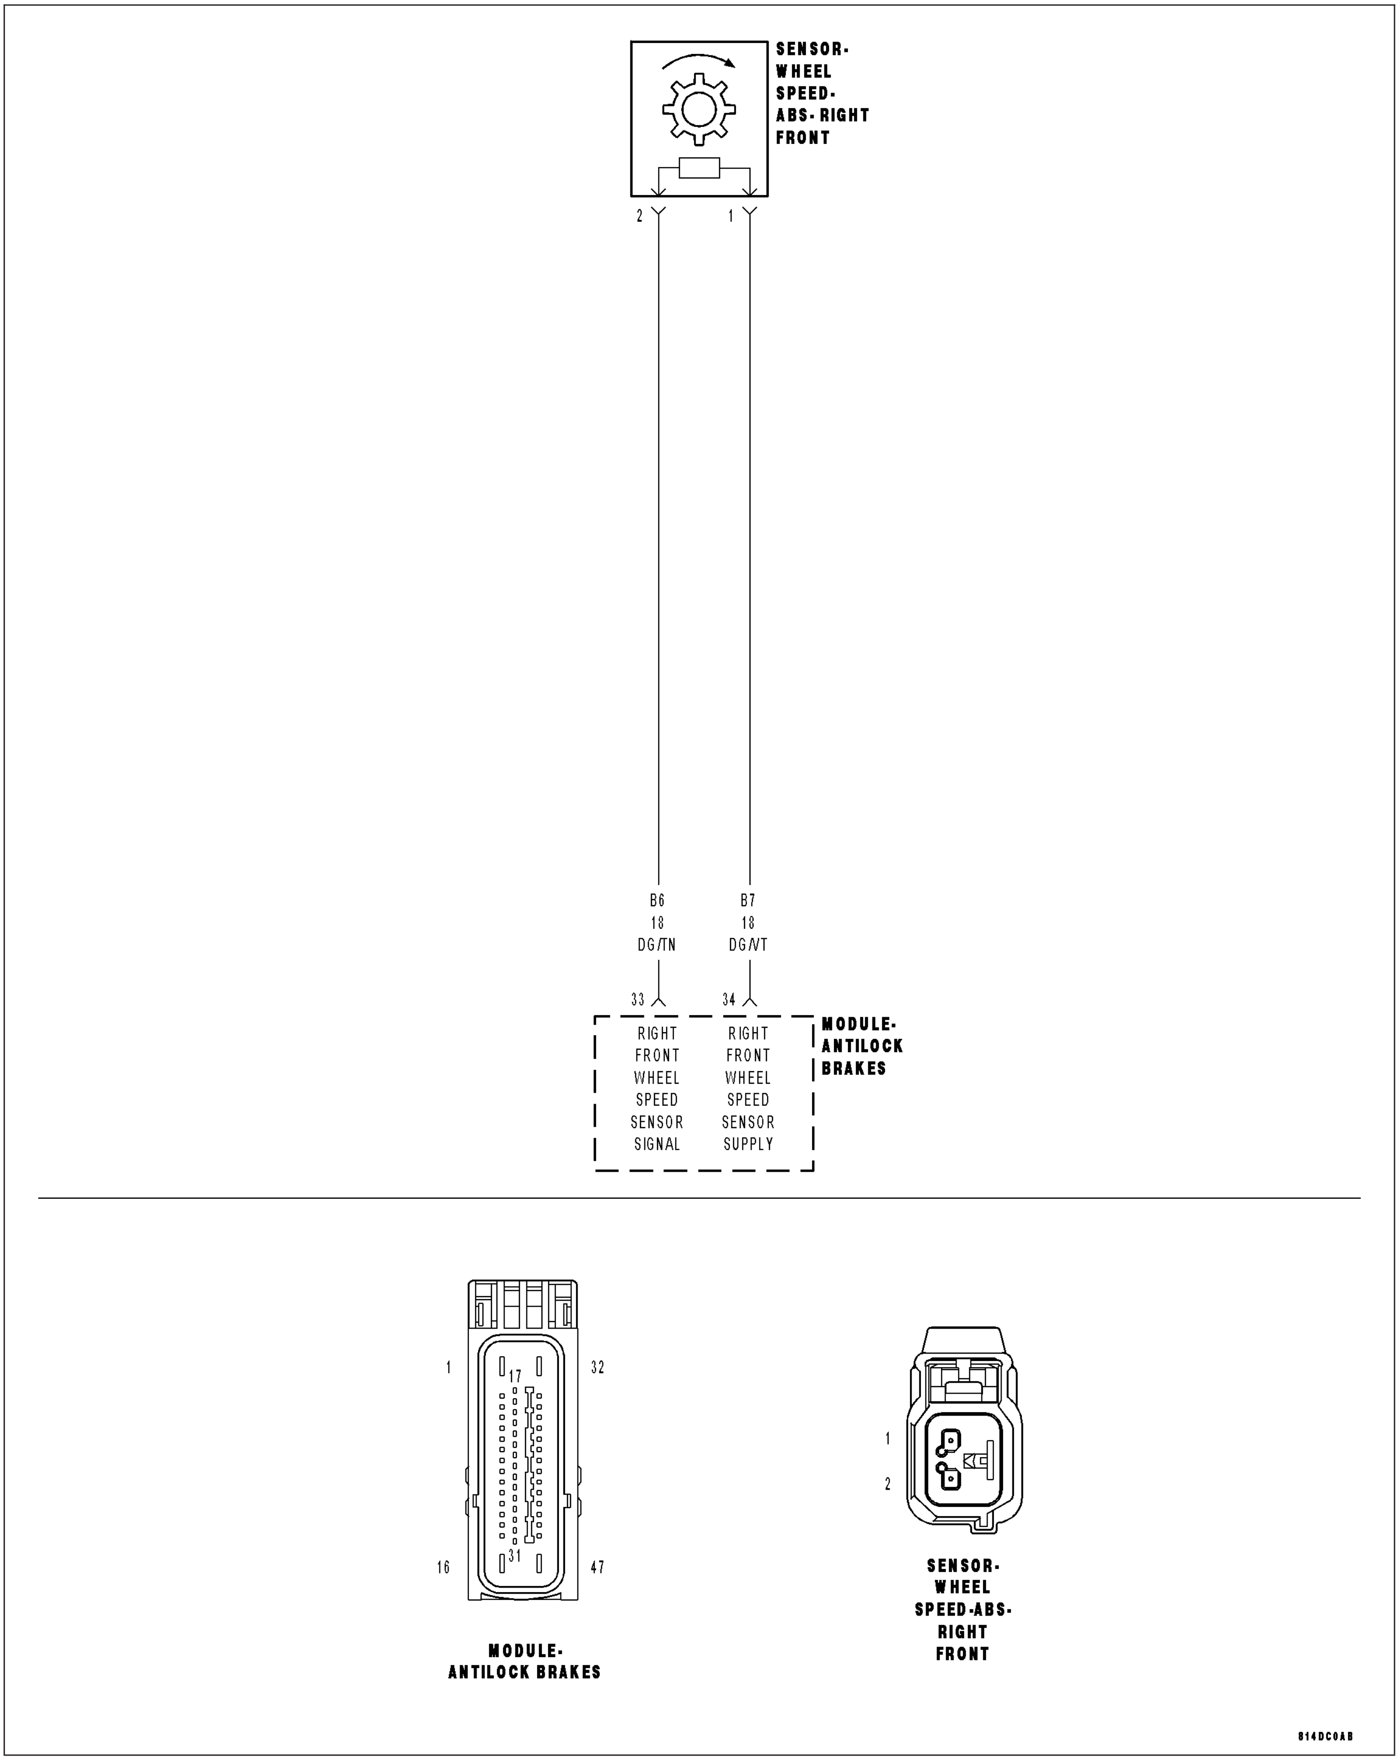
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.



NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1046–LEFT FRONT WHEEL PRESSURE PHASE MONITORING reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1047–RIGHT FRONT WHEEL PRESSURE PHASE MONITORING

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During active ABS control.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
RIGHT FRONT TONE WHEEL DAMAGED
WHEEL SPEED SIGNALS SWAPPED
RIGHT FRONT WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. COMPARE WHEEL SPEED SENSOR SIGNALS

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Does the Right Front WSS speed differ from the other WSS speeds by 8 Km/h (5 m.p.h.) or show NO speed?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

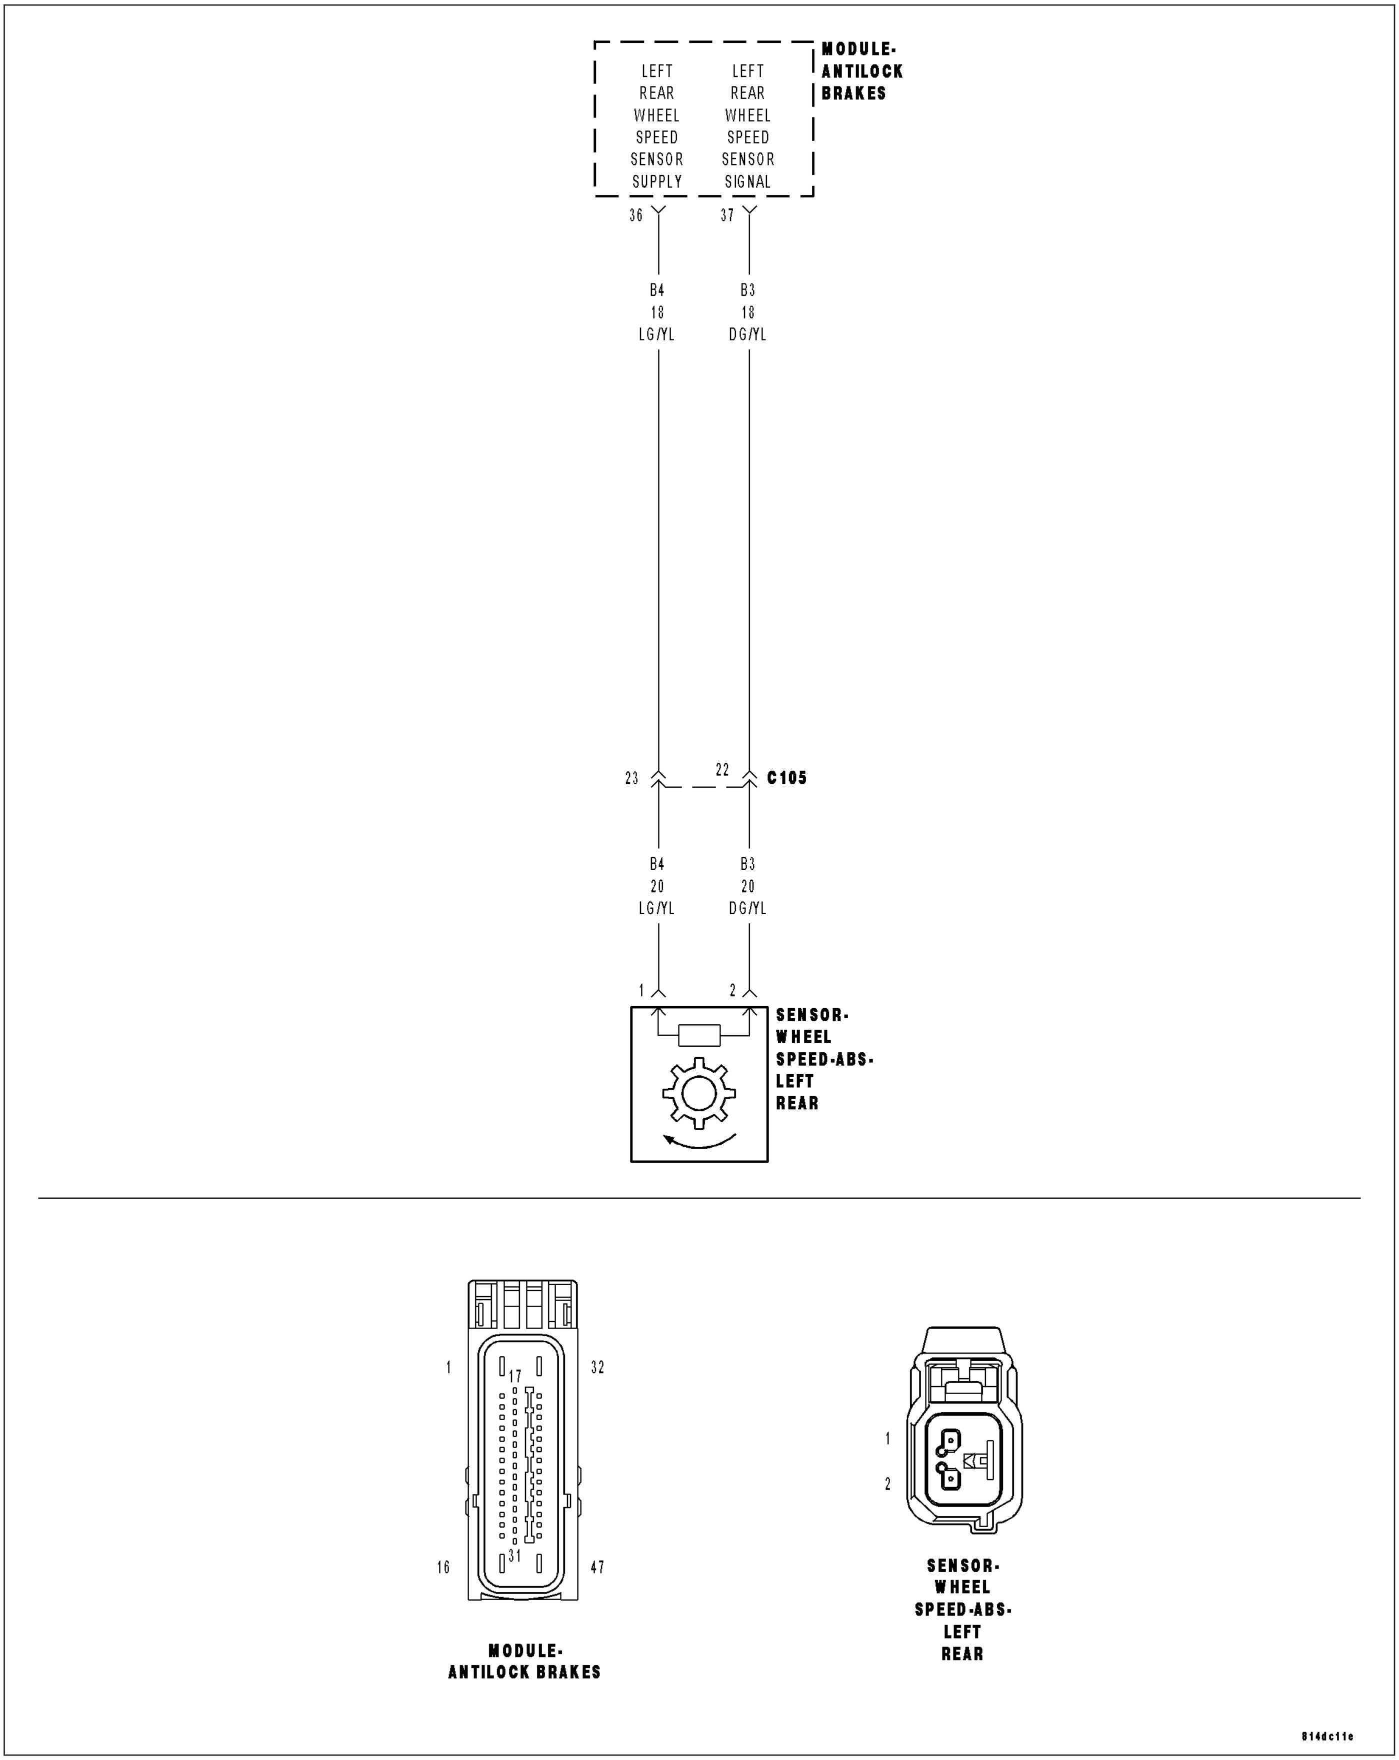
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.



NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1047–RIGHT FRONT WHEEL PRESSURE PHASE MONITORING reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1048–LEFT REAR WHEEL PRESSURE PHASE MONITORING

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During active ABS control.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
LEFT REAR TONE WHEEL/WHEEL BEARING
WHEEL SPEED SIGNALS SWAPPED
LEFT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. COMPARE WHEEL SPEED SENSOR SIGNALS

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
With the scan tool, monitor ALL the WSS speeds while driving the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Does the Left Rear WSS speed differ from the other WSS speeds by 8 Km/h (5 m.p.h.) or show NO speed?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

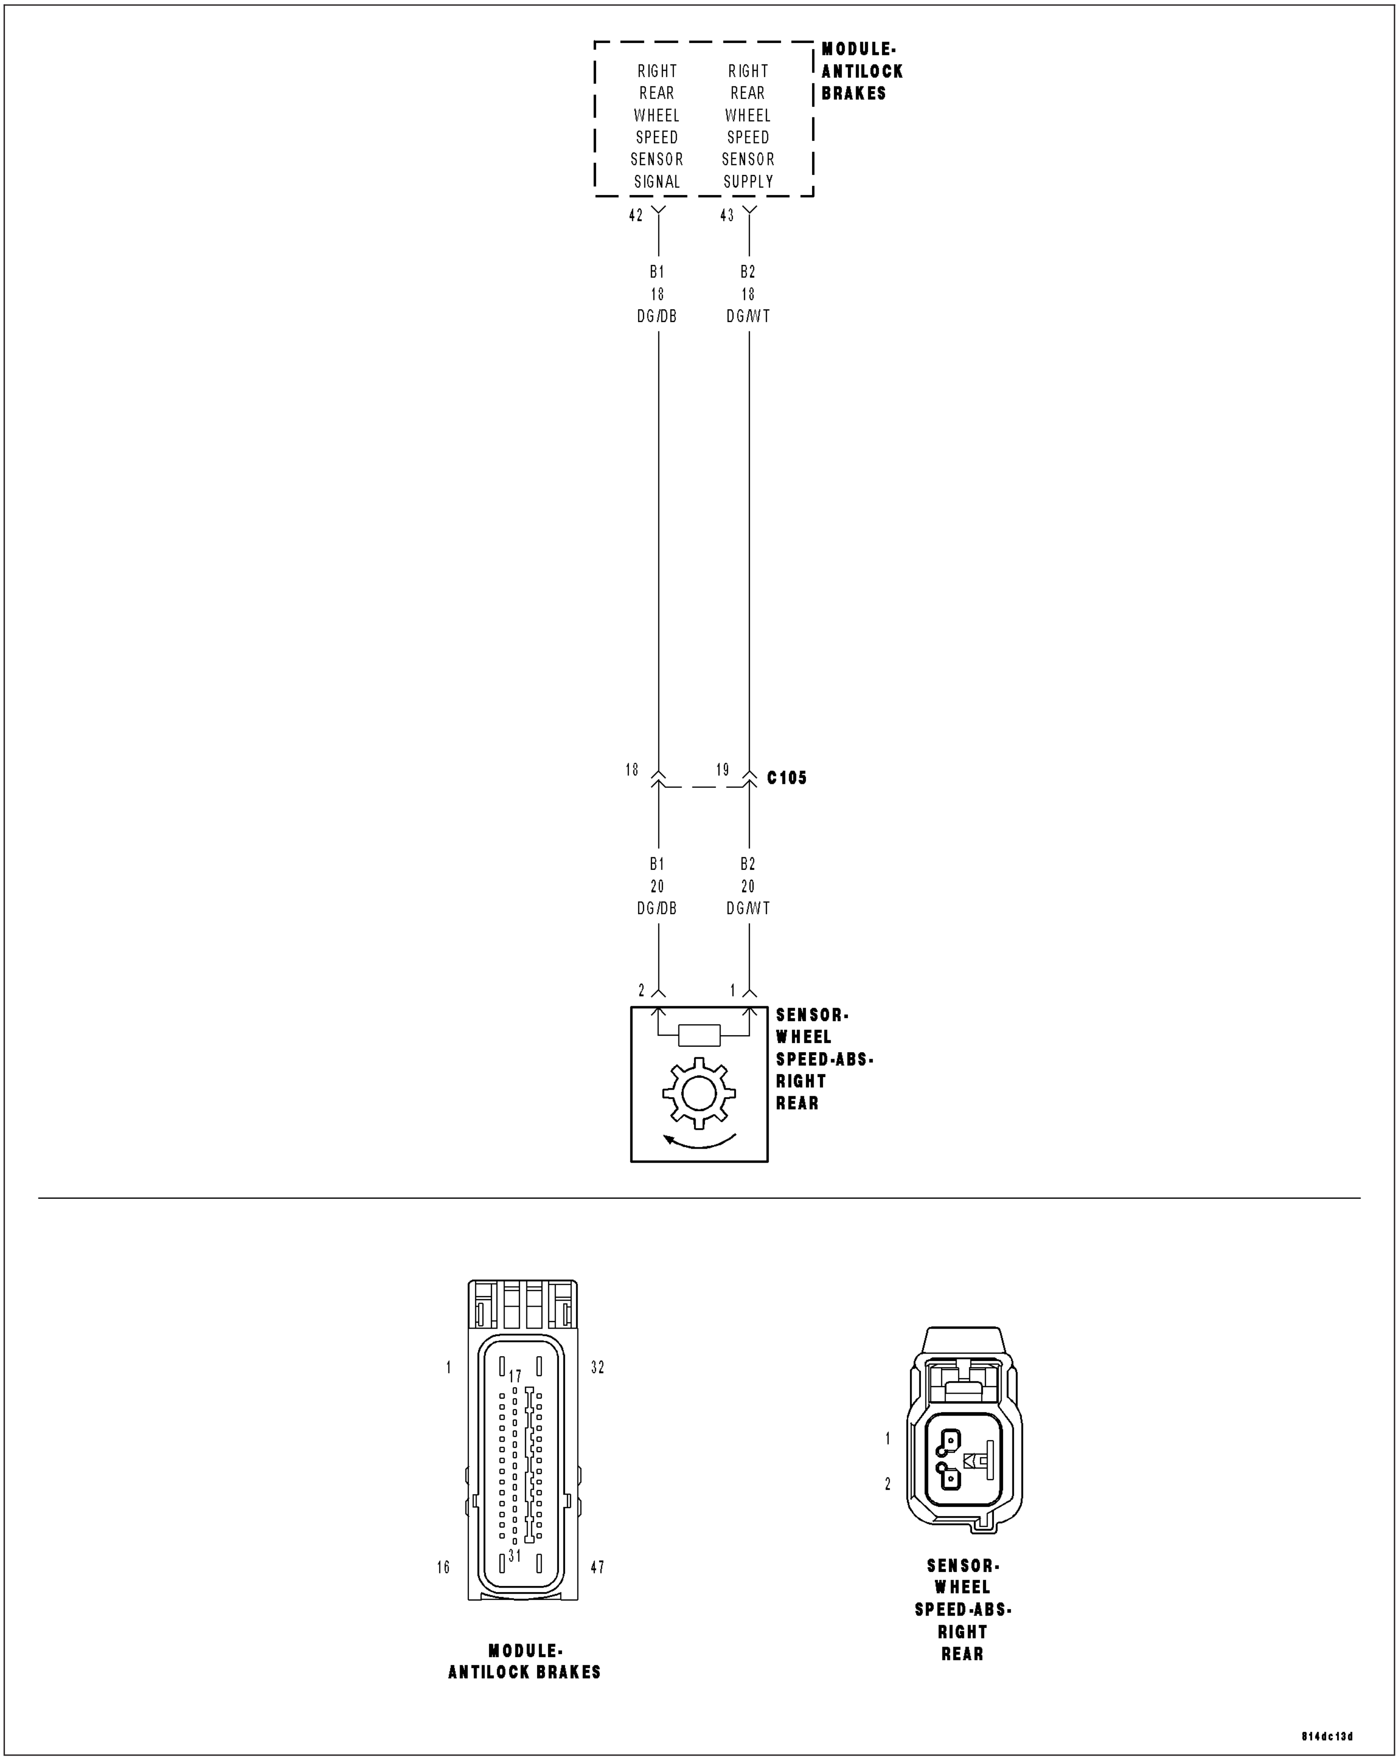
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.



NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1048–LEFT REAR WHEEL PRESSURE PHASE MONITORING reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1049–RIGHT REAR WHEEL PRESSURE PHASE MONITORING

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During active ABS control.
- **Set Condition:**
  When the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
RIGHT REAR TONE WHEEL DAMAGED
WHEEL SPEED SIGNALS SWAPPED
RIGHT REAR WSS
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. COMPARE WHEEL SPEED SENSOR SIGNALS

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Does the Right Rear WSS speed from the other WSS speeds by 8 Km/h (5 m.p.h.) or show NO speed?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

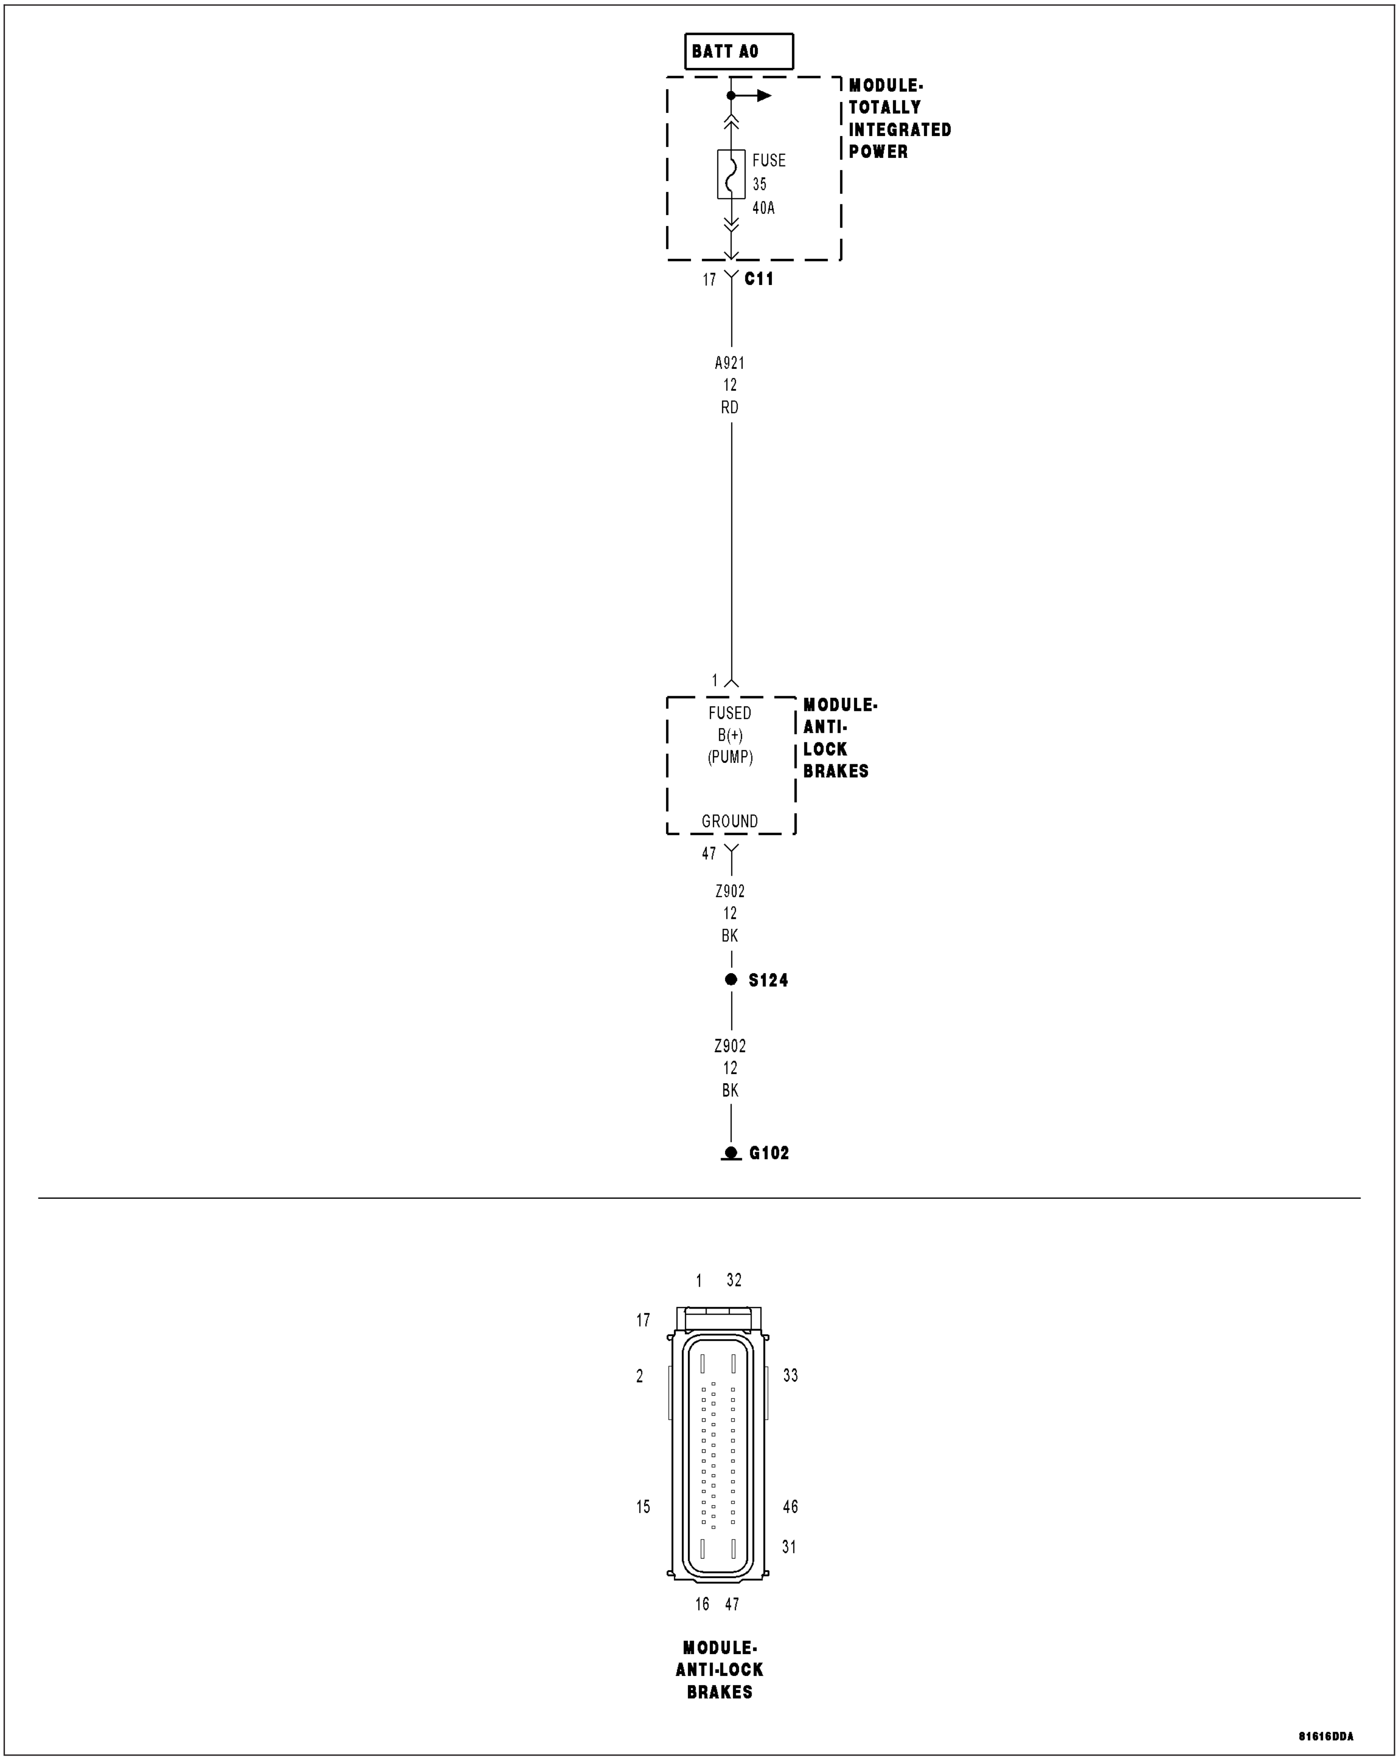
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read ABS DTCs.



NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Did DTC C1049–RIGHT REAR WHEEL PRESSURE PHASE MONITORING reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C1073-ABS PUMP MOTOR CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The ABM detects low pump motor feedback voltage with actuation of the pump motor relay.

Possible Causes
BLOWN PUMP FUSE
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(A921) HIGH RESISTANCE IN B+ CIRCUITS
(Z902) HIGH RESISTANCE IN GROUND CIRCUITS
INTEGRATED CONTROL UNIT

Diagnostic Test

1. CHECK FOR A DTC C1073-ABS PUMP MOTOR CONTROL CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read DTCs.

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1073-ABS PUMP MOTOR CONTROL CIRCUIT?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

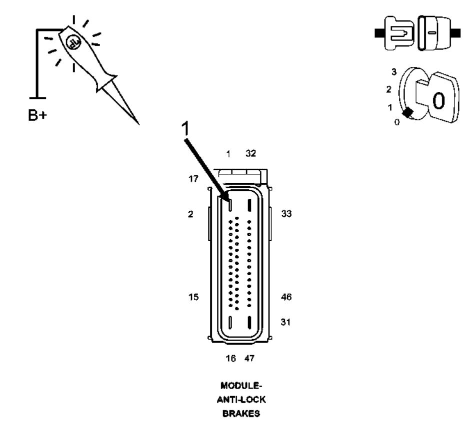
3. CHECK THE ABS PUMP MOTOR FUSED B+ FOR AN OPEN

Turn the ignition off.

Remove and visually inspect the ABS Pump Motor B+ fuse.

Is the ABS Pump Motor B+ fuse open?

Yes >> Go To 4



No >> Go To 6

4. CHECK THE (A921) FUSED B(+) FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12–volt test light connected to 12–volts, probe the (A921) Fused B+ circuit.

81821a9e

Does the test light illuminate brightly?

Yes >> Repair the (A921) Fused B(+) circuit for a short to ground. Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK THE (A921) FUSED B(+) CIRCUIT

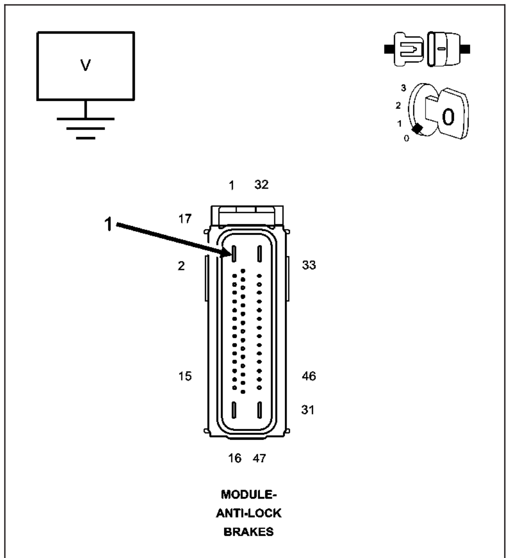
Turn the ignition off.

Visually inspect the (A921) Fused B(+) circuit in the wiring harness.

Look for any signs of intermittent short to ground.

Is the wiring harness OK?

Yes >> Go To 6



No >> Repair the (A921) Fused B(+) circuit for a short to ground. Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK THE VOLTAGE ON THE (A921) FUSED B(+) CIRCUIT

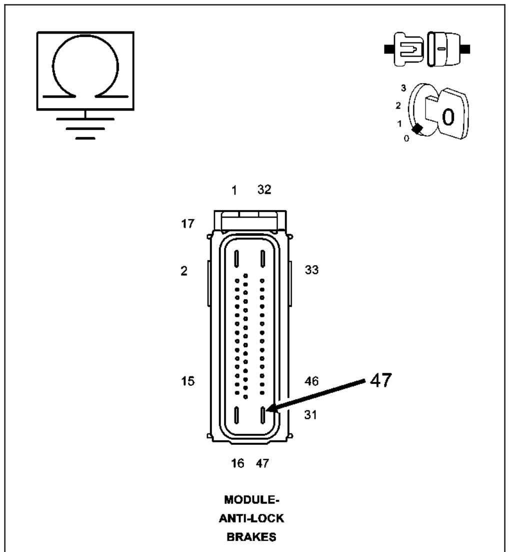
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (A921) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

81616ddd

Is the voltage above 10 volts?



Yes >> Go To 7

No >> Repair the (A921) Fused B(+) circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

7. CHECK THE (Z902) GROUND CIRCUITS FOR AN OPEN

Measure the resistance of the (Z902) Ground circuits between the Anti-Lock Brake Module harness connector and ground

81616dde

Is the resistance below 5.0 ohms?

Yes >> Replace the ICU per service information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Repair the high resistance in the affected circuit.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous.
- **Set Condition:**
  Programmed value for tire size is not within acceptable range.

Possible Causes
INCORRECT VALUE PROGRAMMED INTO TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INCORRECT VALUE PROGRAMMED INTO TIPM

TIRE SIZE	BODY STYLE	ENGINE SIZE	SALES CODE	TIRE CIRCUMFERENCE (MM PER REV)
P205/70R 15 Dunlop SP50	PM	ALL	TPB	2112
P215/60R 17 BSW AS Touring Firestone Affinity 3	PM	ALL	TTU	2087
P215/55R 18 AS Performance Firestone Firehawk GTA 03	PM	ALL	TT1	2115
P215/60R 17 BSW Summer Performance Continental Premium Contact 2	PM	ALL	TMQ	2115
P215/55R 18BSW Summer Performance Continental Premium Contact 2	PM	ALL	TMZ	2117

Verify the correct tire/wheel information is programmed in the TIPM.

Is the correct value programmed in the TIPM according to the chart?

Yes >> Test complete.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Program the correct Tire/Wheel information in the TIPM.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C107C–BRAKE PEDAL SWITCH 1/2 STUCK

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on, but not during first run.
  Or, with low supply voltage.
  Or, if a Pressure Sensor fault is active.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a mismatch between the Brake Test Signal (BTS) from the Pressure Sensor and the (B15) Brake Switch No. 1 Signal circuit.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
STOP LAMP RELATED DTC OR SYMPTOMS PRESENT
ENGINE BRAKE SWITCH DTC PRESENT
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Diagnose and repair all Pressure Sensor and Voltage related DTCs and all Stop Lamp related DTCs and symptoms before diagnosing this DTC.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

Press and release the brake pedal several times.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK FOR ENGINE BRAKE SWITCH DTCS

With the scan tool, check for engine brake switch DTCs.

Are there any engine brake switch DTCs present?

Yes >> Refer to the engine Diagnosis and Testing category and perform the appropriate symptom.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK OTHER CONTROLLERS FOR BRAKE SWITCH DTCS

With the scan tool check other controllers for Brake Switch DTCs.

Do any other controllers report a Brake Switch DTC?

Yes >> Refer to the Engine Diagnosis and Testing category and perform diagnostics for P0571 as though the DTC is active.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Using the schematics as a guide, check the terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C107D–BRAKE PEDAL SWITCH 1/2 CORRELATION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the vehicle is driven.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects an implausible signal from the Stop Lamp Switch.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
STOP LAMP RELATED DTC OR SYMPTOMS PRESENT
ENGINE BRAKE SWITCH DTC PRESENT
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Diagnose and repair all Pressure Sensor and Voltage related DTCs and all Stop Lamp related DTCs and symptoms before diagnosing this DTC.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

Press and release the brake pedal several times.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK FOR ENGINE BRAKE SWITCH DTCS

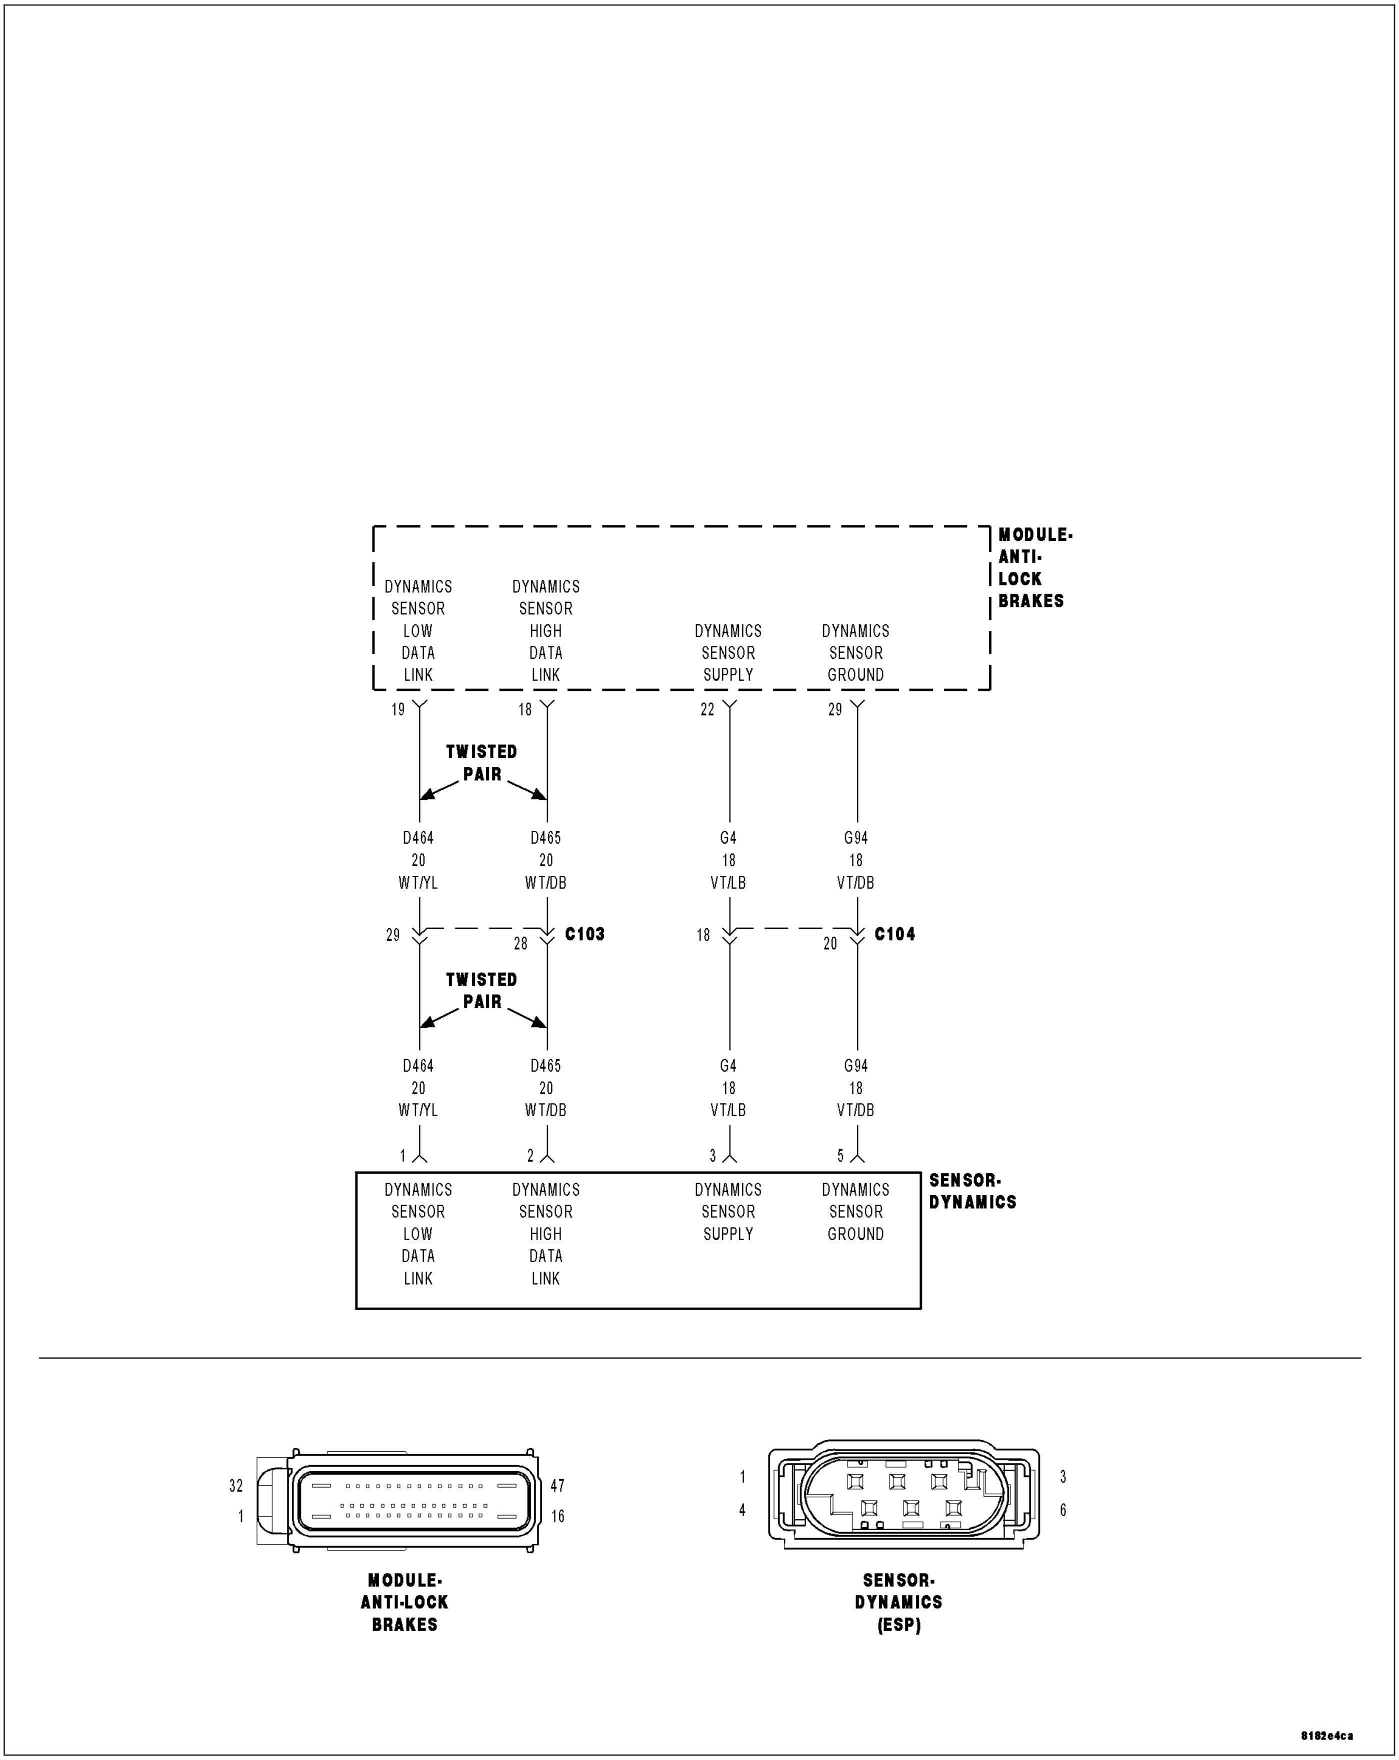
With the scan tool, check for engine brake switch DTCs.

Are there any engine brake switch DTCs present?

Yes >> Refer to the engine Diagnosis and Testing category and perform the appropriate symptom.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK OTHER CONTROLLERS FOR BRAKE SWITCH DTCS



With the scan tool check other controllers for Brake Switch DTCs.

Do any other controllers report a Brake Switch DTC?

Yes >> Refer to the Engine Diagnosis and Testing category and perform diagnostics for P0571 as though the DTC is active.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Using the schematics as a guide, check the terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1210–G SENSOR INPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Once per loop, but not during active test function of acceleration sensor if the sensor voltage is out of range.
- **Set Condition:**
  Longitudinal acceleration sensor signal is out of range.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(G4) DYNAMICS SENSOR SUPPLY HIGH RESISTANCE
(G94) GROUND CIRCUIT HIGH RESISTANCE
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR A DTC C1210–G SENSOR INPUT CIRCUIT PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs.

Does the scan tool display: C1210–G SENSOR INPUT CIRCUIT PERFORMANCE?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check the Steering Angle Sensor installation.

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

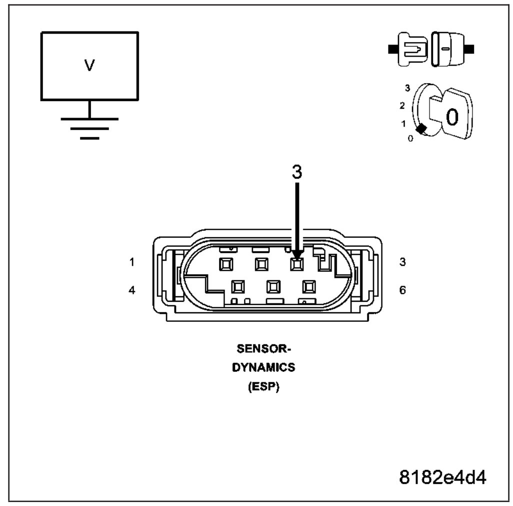
Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3



3. (G4) DYNAMICS SENSOR SUPPLY HIGH RESISTANCE

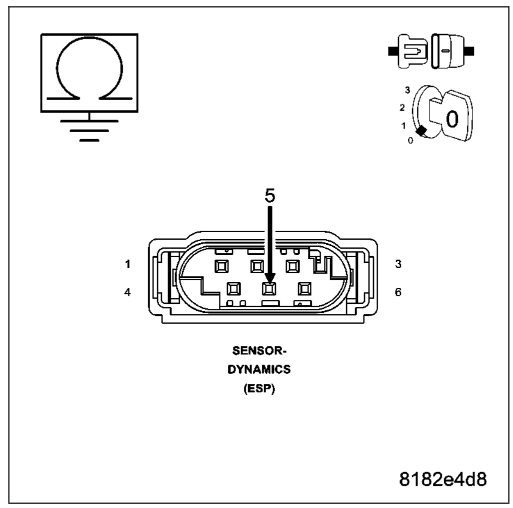
Turn the ignition off.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (G4) Dynamics Sensor Supply circuit at the Dynamics Sensor harness connector.

Is the voltage above 10 volts?



Yes >> Go To 4

No >> Repair the (G4) Dynamics Sensor Supply circuit for high resistance.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

4. (G94) GROUND CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Measure the resistance between the (G94) Ground circuit and ground.

Is the resistance below 5.0 ohms?

Yes >> Go To 5

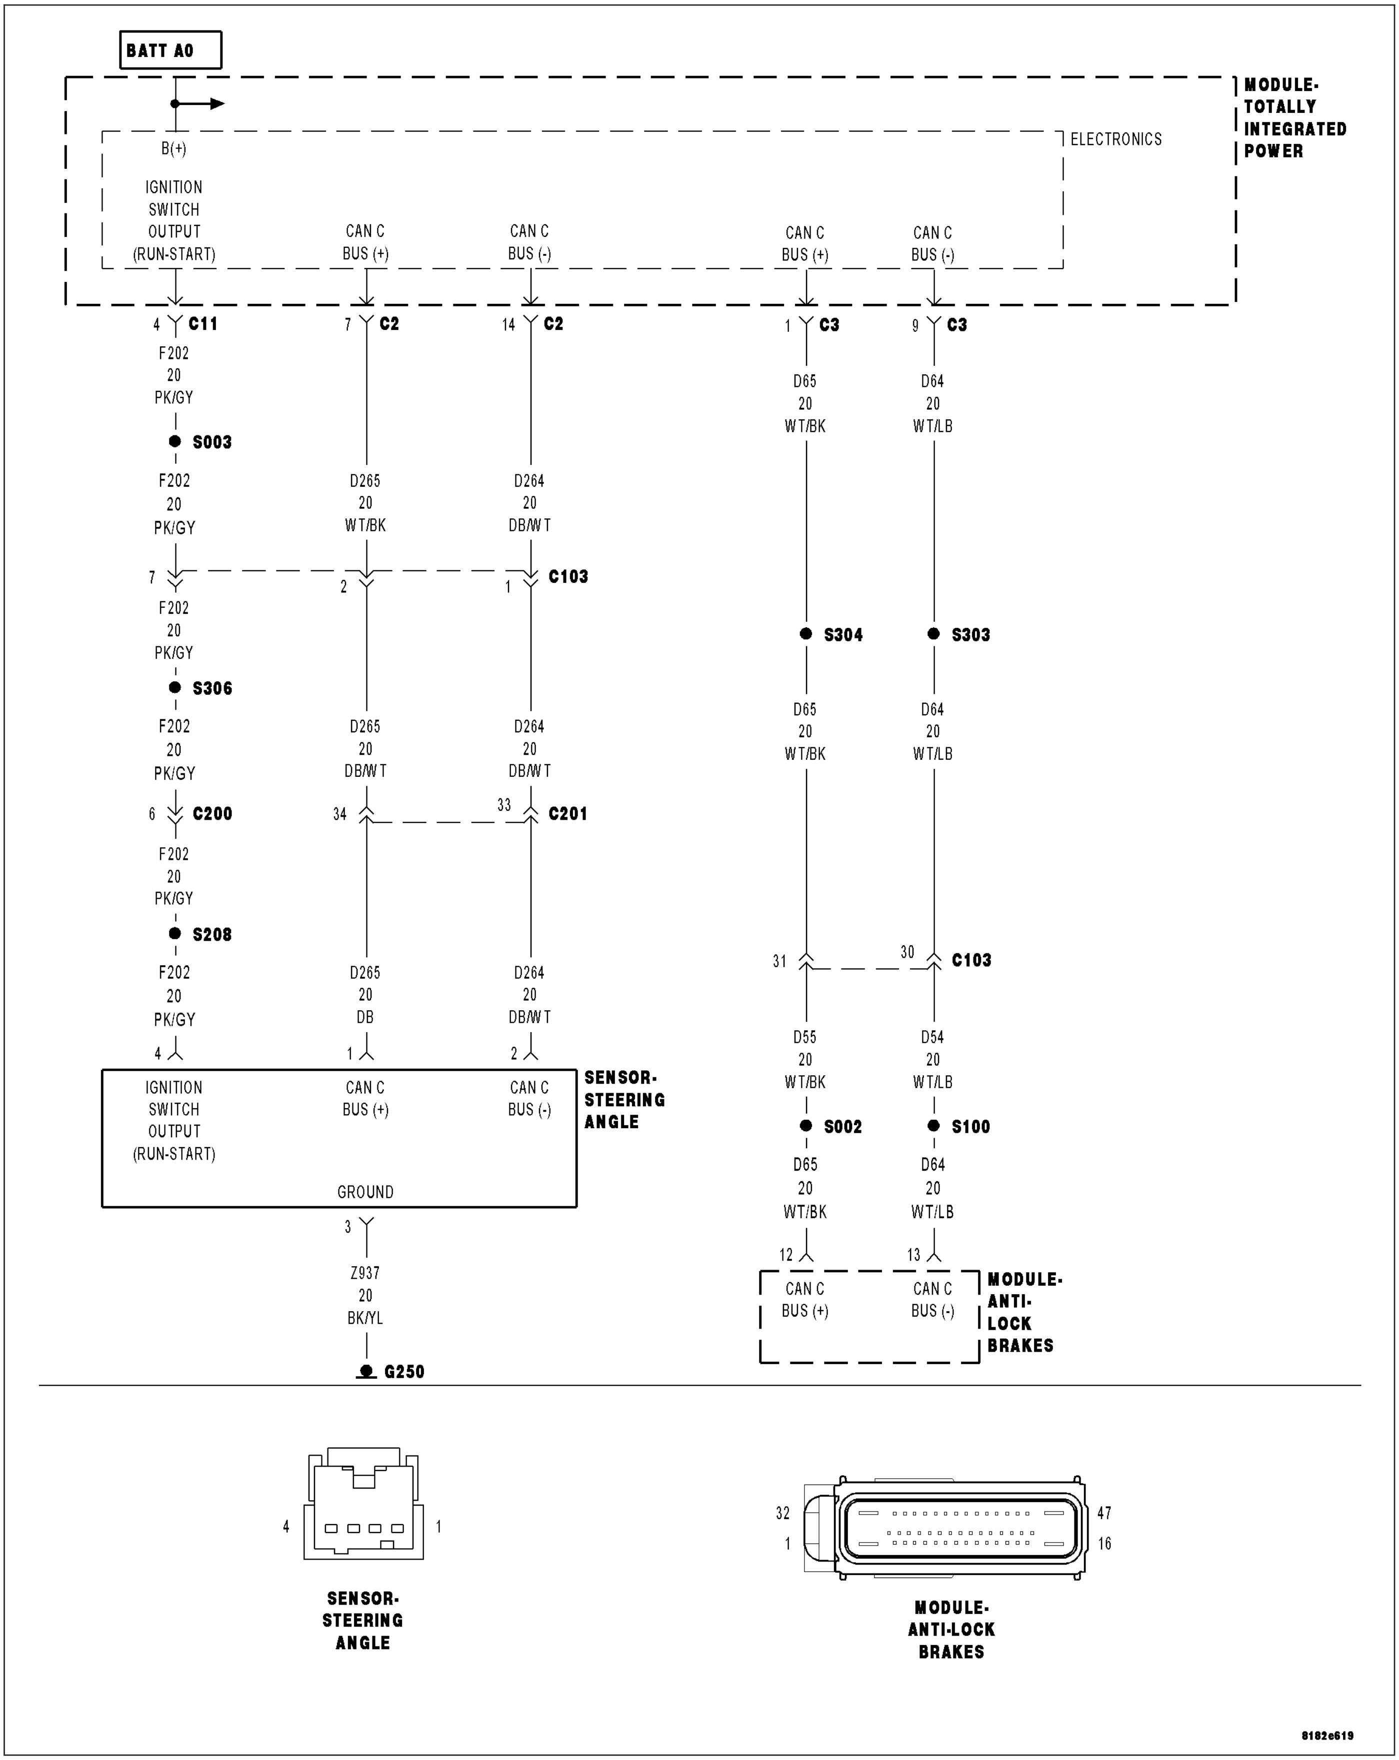
No >> Repair the (G94) Ground circuit for high resistance.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.



Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1219–STEERING ANGLE SENSOR ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brake Module detects that the calculated steering wheel angle exceeds what is physically possible.

Possible Causes
VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING ANGLE SENSOR LOOSE
STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION)
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-ACC) CIRCUIT HIGH RESISTANCE
(Z937) GROUND CIRCUIT HIGH RESISTANCE
STEERING ANGLE SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.

Center the steering wheel.

With the scan tool, read the Steering Angle Sensor Position.

Is the Steering Angle Sensor Position within ±15°?

Yes >> Go To 3

No >> Go To 8

3. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

NOTE: If possible, check vehicle repair history for collision damage.

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems.

Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Verify that the Steering Angle Sensor are properly installed.

Is the Steering Angle Sensor properly installed?

Yes >> Go To 5

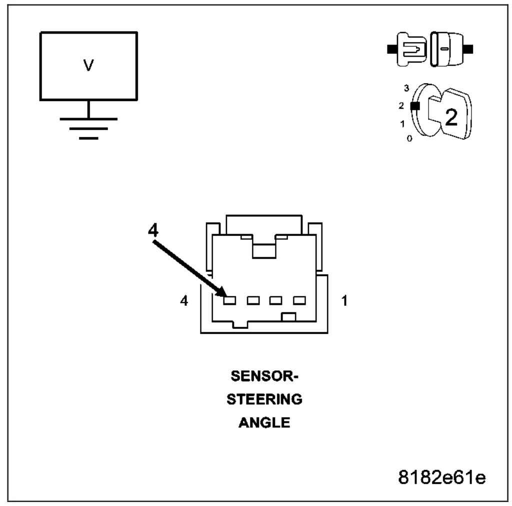
No >> Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: A low voltage condition at the Steering Angle Sensor will cause this DTC to set.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.



Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

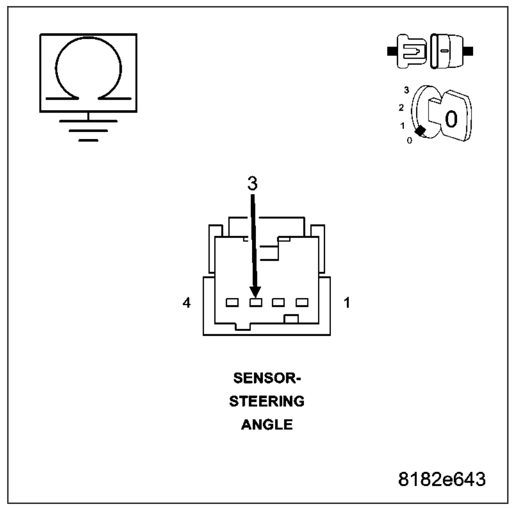
No >> Go To 6

6. CHECK (F202) FUSED IGNITION SWITCH OUTPUT (RUN-ACC) CIRCUIT FOR HIGH RESISTANCE

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (F202) Fused Ignition Switch Output (Run-ACC) circuit.



Is the voltage above 11.0 volts?

Yes >> Go To 7

No >> Repair the (F202) Fused Ignition Switch Output (Run-ACC) circuit for high resistance.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

7. CHECK (Z937) GROUND CIRCUIT FOR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (Z937) Ground circuit between ground and the Steering Angle Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Repair the (Z937) Ground circuit for high resistance.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

8. CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL

With the scan tool, read the Steering Angle Sensor Position while rotating the steering wheel to the right and then to the left. The Steering Angle Sensor Position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

Did the steering angle change accordingly?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C121A–STEERING ANGLE SENSOR NOT INITIALIZED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  This DTC may set with DTC C1231–DRIVE TEST: STEERING ANGLE SENSOR due to cycling of ignition several times or entering and exiting diagnostics several times.

Refer to **C1231–DRIVE TEST: STEERING ANGLE SENSOR** in this Section for the diagnostic test procedure.

C121C-TORQUE REQUEST SIGNAL DENIED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Powertrain Control Module indicates, for an extended period of time, that engine management relevant for Automatic Yaw Control/Traction Control System control can not be accomplished.

Possible Causes
ANTI-LOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE

Diagnostic Test

1. CHECK FOR A DTC C121C-TORQUE REQUEST SIGNAL DENIED

NOTE: This DTC must be active for the results of this test to be valid and this DTC may set while driving under severe load conditions.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

Start Engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C121C-TORQUE REQUEST SIGNAL DENIED?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE POWERTRAIN DTCS

With the scan tool, read and record Powertrain DTCs.

Were any Powertrain related DTCs found?

Yes >> Repair the Powertrain System in accordance with the Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 3

3. ESP TORQUE REQUEST SIGNAL

Engine started.

With the scan tool, read the Allow ESP Torque Request status bit.

Was the Allow ESP Torque Request showing NOT set?

Yes >> Replace the Powertrain Module in accordance with the Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C121D–BRAKE PRESSURE SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
ANTI-LOCK BRAKE MODULE
INTEGRATED CONTROL MODULE

Diagnostic Test

1. CHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. RECHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?

Yes >> Replace the ICU in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test complete

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
ANTI-LOCK BRAKE MODULE
INTEGRATED CONTROL MODULE

Diagnostic Test

1. CHECK FOR A DTC C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

Does the scan tool display: C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. RECHECK FOR A DTC C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

Does the scan tool display: C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?

Yes >> Replace the ICU in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test complete

C1221-BRAKE PRESSURE SENSOR/ACCEL PEDAL POSITION SENSOR CORRELATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor output signal is not plausible.

Possible Causes
AIR IN BRAKE SYSTEM / WORN MECHANICAL COMPONENTS
BRAKE SWITCH SIGNAL OPEN
BRAKE PRESSURE SENSOR
INTEGRATED CONTROL MODULE

Diagnostic Test

1. CHECK FOR A DTC C1221-BRAKE PRESSURE SENSOR/ACCEL PEDAL POSITION SENSOR CORRELATION

Turn the ignition on.
With the scan tool, read and record DTCs.
With the scan tool, read and record Freeze Frame information.
With the scan tool, erase DTCs.
Start the engine.
Depress and release the brake pedal.
With the scan tool, read and record DTCs.

Does the scan tool display: C1221-BRAKE PRESSURE SENSOR/ACCEL PEDAL POSITION SENSOR CORRELATION?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

2. CHECK BRAKE SWITCH

With the scan tool look at the Brake Switch Signal.
Apply the brakes on and off while checking for a Brake Switch Signal change.

Did the Brake Switch Signal change?

Yes >> Go To 3

No >> Repair as needed.

3. CHECK BRAKE PRESSURE SENSOR

With the scan tool look at Pressure Sensor Signal and the Brake Switch Signal.
With the brakes not applied the Pressure Sensor should read ± 15 bar.
Apply the brakes the Pressure Sensor should read above 15 bar.

Did Brake Pressure Sensor increase above 15 bar?

Yes >> Replace the Integrated Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK FOR AIR IN BRAKE SYSTEM

NOTE: Before continuing the brake system must be bled to verify there is no air in the brake system.

Turn ignition off.

Bleed brake system.

Check worn mechanical components.

Was there any air in the brake system or worn mechanical components?

Yes >> Repair as needed.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Integrated Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1231–DRIVE TEST: STEERING ANGLE SENSOR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects implausible Steering Angle Sensor data.

Possible Causes
STEERING ANGLE SENSOR INSTALLATION
STEERING ANGLE SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR A DTC C1231–DRIVE TEST: STEERING ANGLE SENSOR

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: If any of the following DTCs are present they must be repaired before continuing.

DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE

DTC C121A-STEERING ANGLE SENSOR NOT INITIALIZED

DTC C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE

DTC C1240-STEERING ANGLE SENSOR ANGLE OVERTRAVEL PERFORMANCE

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Refer to Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Start the engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C1231–DRIVE TEST: STEERING ANGLE SENSOR?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the Steering Angle Sensor is active on the bus.

Is the Steering Angle Sensor active on the bus?

Yes >> Go To 3

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

3. CHECK STEERING ANGLE

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle.

Is the Steering Angle reading within ±15 degrees?

Yes >> Go To 4

No >> Go To 5

4. CHECK STEERING ANGLE CHANGE

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle.

Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

Did the steering angle change accordingly?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Turn the ignition off.

Verify that the Steering Angle Sensor is properly installed. Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION.

Is the Steering Angle Sensor properly installed?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1232–DRIVE TEST: PRESSURE SENSOR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  If the Pressure Sensor fails to activate.

Possible Causes
HYDRAULIC / BRAKE SYSTEM COMPONENT INSTALLATION
INTEGRATED CONTROL UNIT
PRESSURE SENSOR (HYDRAULIC CONTROL UNIT)

Diagnostic Test

1. CHECK FOR A DTC C1232–DRIVE TEST: PRESSURE SENSOR

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Start the engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C1232–DRIVE TEST: PRESSURE SENSOR?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK HYDRAULIC SYSTEM & BRAKE SYSTEM COMPONENT INSTALLATION & FUNCTION

Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.

Verify that the hydraulic system is properly filled and bled.

Verify that the brake system components are installed and functioning properly.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Clean contacts in HCU first if problem reoccurs replace the Integrated Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1234–DRIVE TEST: SENSOR CLUSTER INSTALLATION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects implausible Dynamics Sensor data.

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR A DTC C1234–DRIVE TEST: SENSOR CLUSTER INSTALLATION

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Start the engine.

With the scan tool, read and record DTCs.

Does the scan tool display: C1234–DRIVE TEST: SENSOR CLUSTER INSTALLATION?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1238-DRIVE TEST: UNSUCCESSFUL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a fault with the Steering Angle Sensor, the Pressure Sensor, or the Dynamics Sensor.

Possible Causes
STEERING ANGLE SENSOR
PRESSURE SENSOR
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. DIAGNOSE & REPAIR ALL DTCs

Repair

Diagnose and repair all DTCs.

C123A–ESP SYSTEM SENSORS CALIBRATION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Once per ignition cycle.
- **Set Condition:**
  If the calculated checksum does not match the stored checksum.

Possible Causes
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. INITIALIZE ANTI-LOCK BRAKES MODULE

Initialize ECU refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Does this DTC reset?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test complete.

C123B–ESP SYSTEM CONTROL TOO LONG

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module indicates ESP control lasting longer the 15 seconds.

Possible Causes
HYDRAULIC/BRAKE ISSUE
DYNAMICS SENSOR
INTEGRATED CONTROL MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: If other DTC's are set they must be repaired before continuing. This DTC must be active for the results of this test to be valid and this DTC may set while driving under excessive driving conditions.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

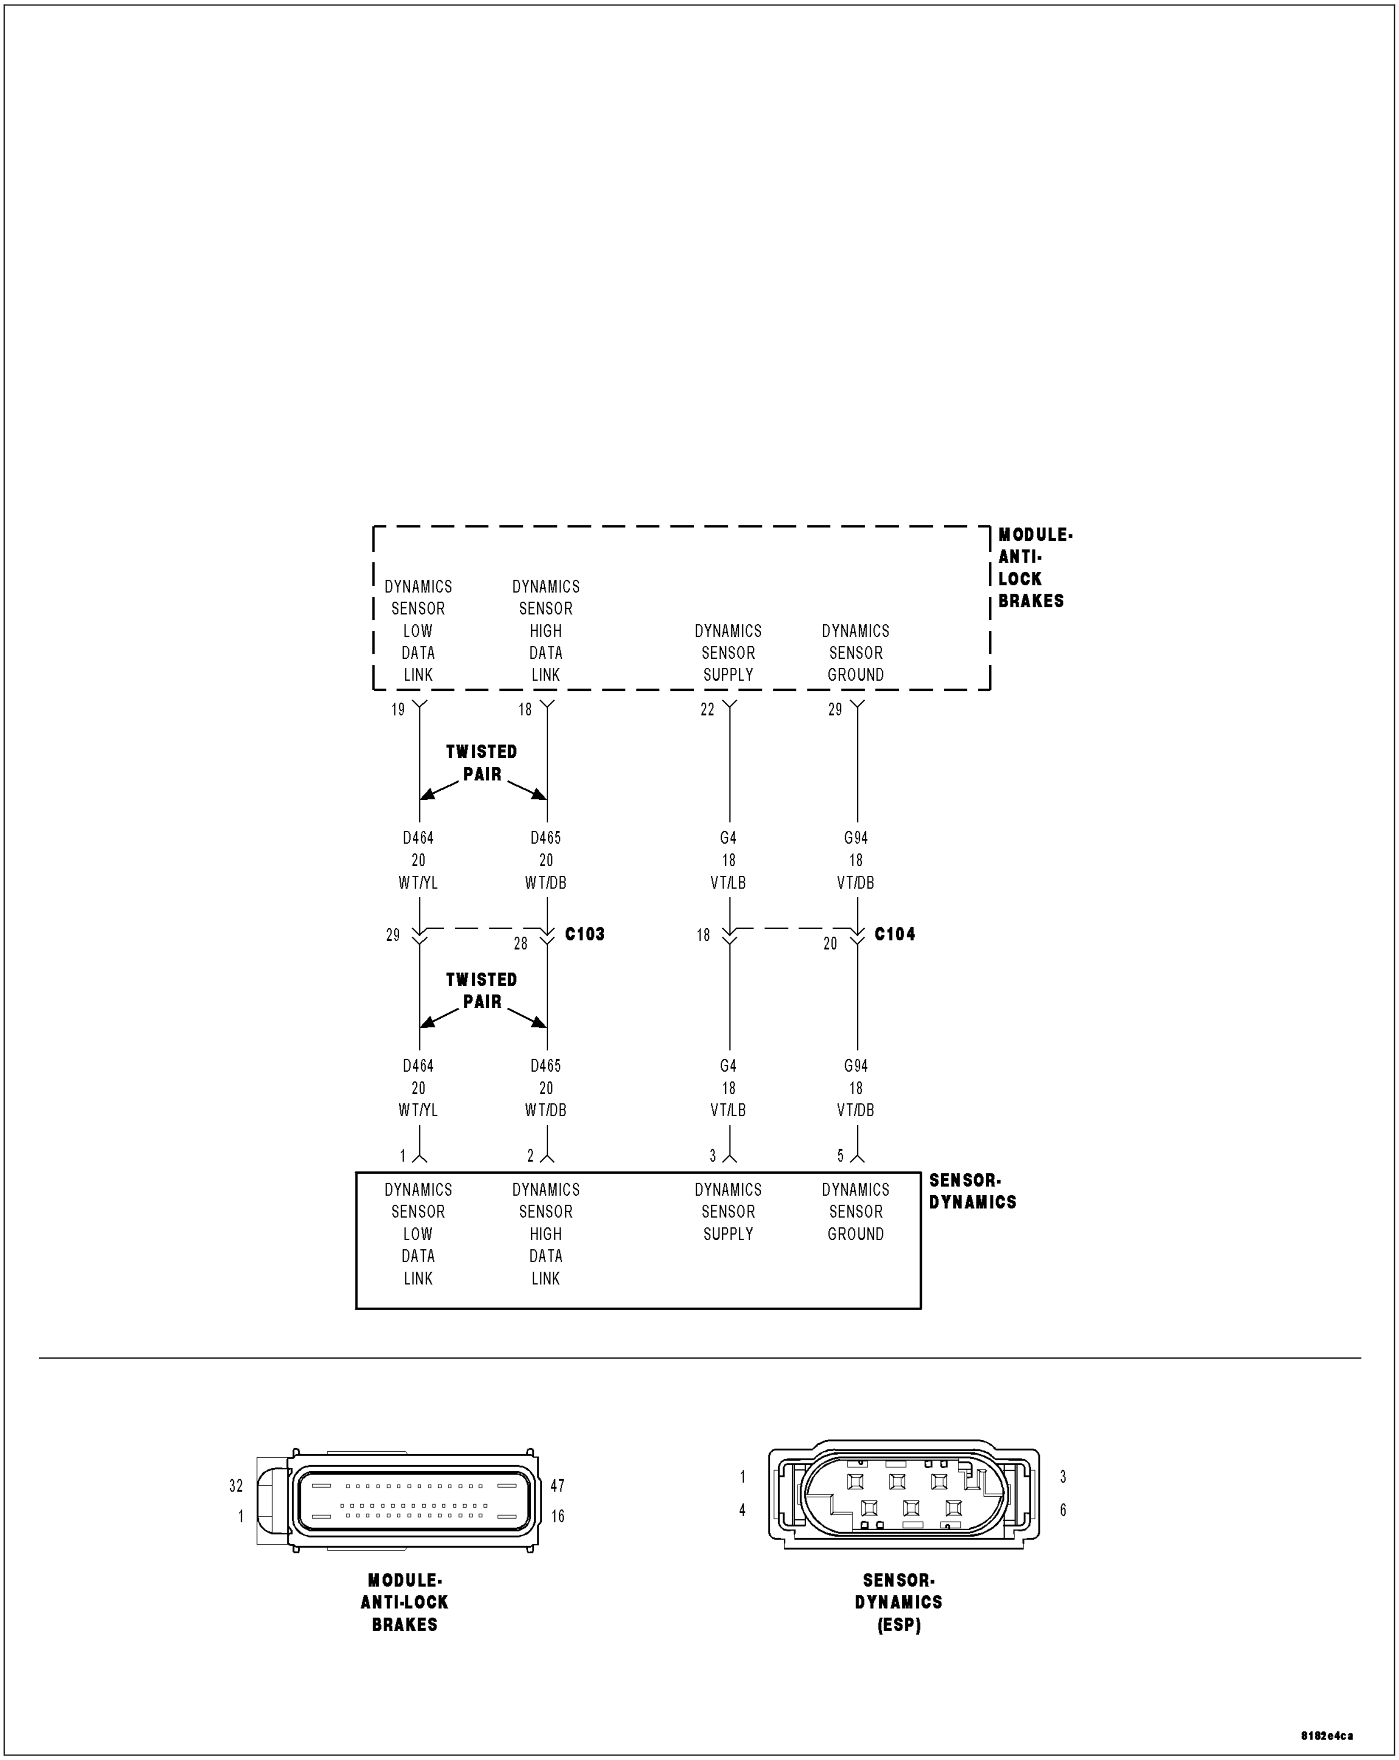
Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK HYDRAULIC SYSTEM & BRAKE SYSTEM COMPONENT INSTALLATION & FUNCTION

Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.

Verify that the hydraulic system is properly filled and bled.



Verify that the brake system components are installed and functioning properly.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C123C–DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With vehicle speed above 11 km/h (7 m.p.h.), but not if the sensor signal is invalid.
  Or, during skidding.
  Or, when driving in reverse.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects implausible Dynamics Sensor values.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: If present, diagnose and repair DTC C2114–DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115–DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before diagnosing this DTC.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C123F–STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on, but not if a checksum failure of the stored offset values is detected.
  Or, a CAN time-out failure is detected.
  Or, a failure is detected by the Steering Angle Sensor.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that either the calculated steering wheel angle offset or the steering wheel angle signal measured output is out of range.

Possible Causes
VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING WHEEL ALIGNMENT
STEERING ANGLE SENSOR LOOSE
STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION)
STEERING ANGLE SENSOR
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

NOTE: If present, diagnose and repair DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE, C121A-STEERING ANGLE SENSOR NOT INITIALIZED, or C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE before diagnosing this DTC.

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

NOTE: If possible, check vehicle repair history for collision damage.

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.

Turn the steering wheel so wheels point in a straight ahead position.

With the scan tool, read the Steering Angle Sensor position.

Is the Steering Angle Sensor Position within ± 15° degrees?

Yes >> Go To 5

No >> Go To 4

4. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.
Verify that the Steering Angle Sensor are properly installed.

Is the Steering Angle Sensor properly installed?

Yes >> Go To 5

No >> Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. RE-INITIALIZE THE ESP MODULE

Perform ECU initialization with drive test to clear offsets. Refer to Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Is DTC C123F–STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE still active?

Yes >> Go To 6

No >> Sensor was probably loose or calibrated with wheels not centered to vehicle. Test complete.
Perform the ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL

With the scan tool, read the Steering Angle Sensor position while rotating the steering wheel to the right and then to the left. The Steering Angle Sensor position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

Did the steering angle change accordingly?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform the ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1240–STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on, but not if a CAN time out failure is detected.
  Or, if a fault is detected by the Steering Angle Sensor.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the absolute value of the measured steering wheel angle is greater than 720 degrees.

Possible Causes
VEHICLE DAMAGE
STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE
STEERING WHEEL ALIGNMENT
STEERING ANGLE SENSOR LOOSE
STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION)
STEERING ANGLE SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

NOTE: If possible, check vehicle repair history for collision damage.

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK STEERING ANGLE CHANGE

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle if reading travels to 720 degrees whiling rotating wheel from lock to lock.

NOTE: Sensor damage can occur if wheel is turned over 720 degrees.

Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

Did the steering angle change accordingly and display less the 720 degrees from lock to lock?

Yes >> Go To 4

No >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

4. CHECK STEERING ANGLE SENSOR INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.

Verify that the Steering Angle Sensor are properly installed. Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION.

Is the Steering Angle Sensor properly installed?

Yes >> Replace the Steering Angle Sensor and clear offsets by initializing ECU with wheels pointing straight ahead, in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1242–G SENSOR INPUT SIGNAL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously, with ignition on, until vehicle speed exceeds 20 km/h (12.4 m.p.h.) for the first time, but not if the sensor voltage is out of range,
  Or, during diagnostic mode.
  Or, if the monitoring was inhibited by a corresponding diagnostics command.
  Or, if the vehicle speed has exceeded 20 km/h (12.4 m.p.h.) during the actual ignition cycle.
  Or, if at least one over spinning wheel is detected.
  Or, if one of the control functions is active.
- **Set Condition:**
  If the measured acceleration signal is higher than 0.8 g and longer than the specified detection time.

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR OR ANTI-LOCK BRAKE MODULE
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.
Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >>

NOTE: Vehicles without a Dynamics Sensor replace Anti-Lock Brake Module.
Replace the Dynamics Sensor or Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C1243–G SENSOR NOT INITIALIZED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Once after ignition on.
- **Set Condition:**
  If the stored zero point calibration value of the longitudinal acceleration sensor is invalid.

Possible Causes
DYNAMICS SENSOR NOT CALIBRATED
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. PERFORM ECU INITIALIZATION

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Perform ECU initialization with drive test refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

NOTE: The ECU Initialization process must include driving the vehicle into a 90° turn.
Park the vehicle.

>> Go To 2

2. VERIFY IF DTC IS STILL ACTIVE

Cycle the ignition switch.

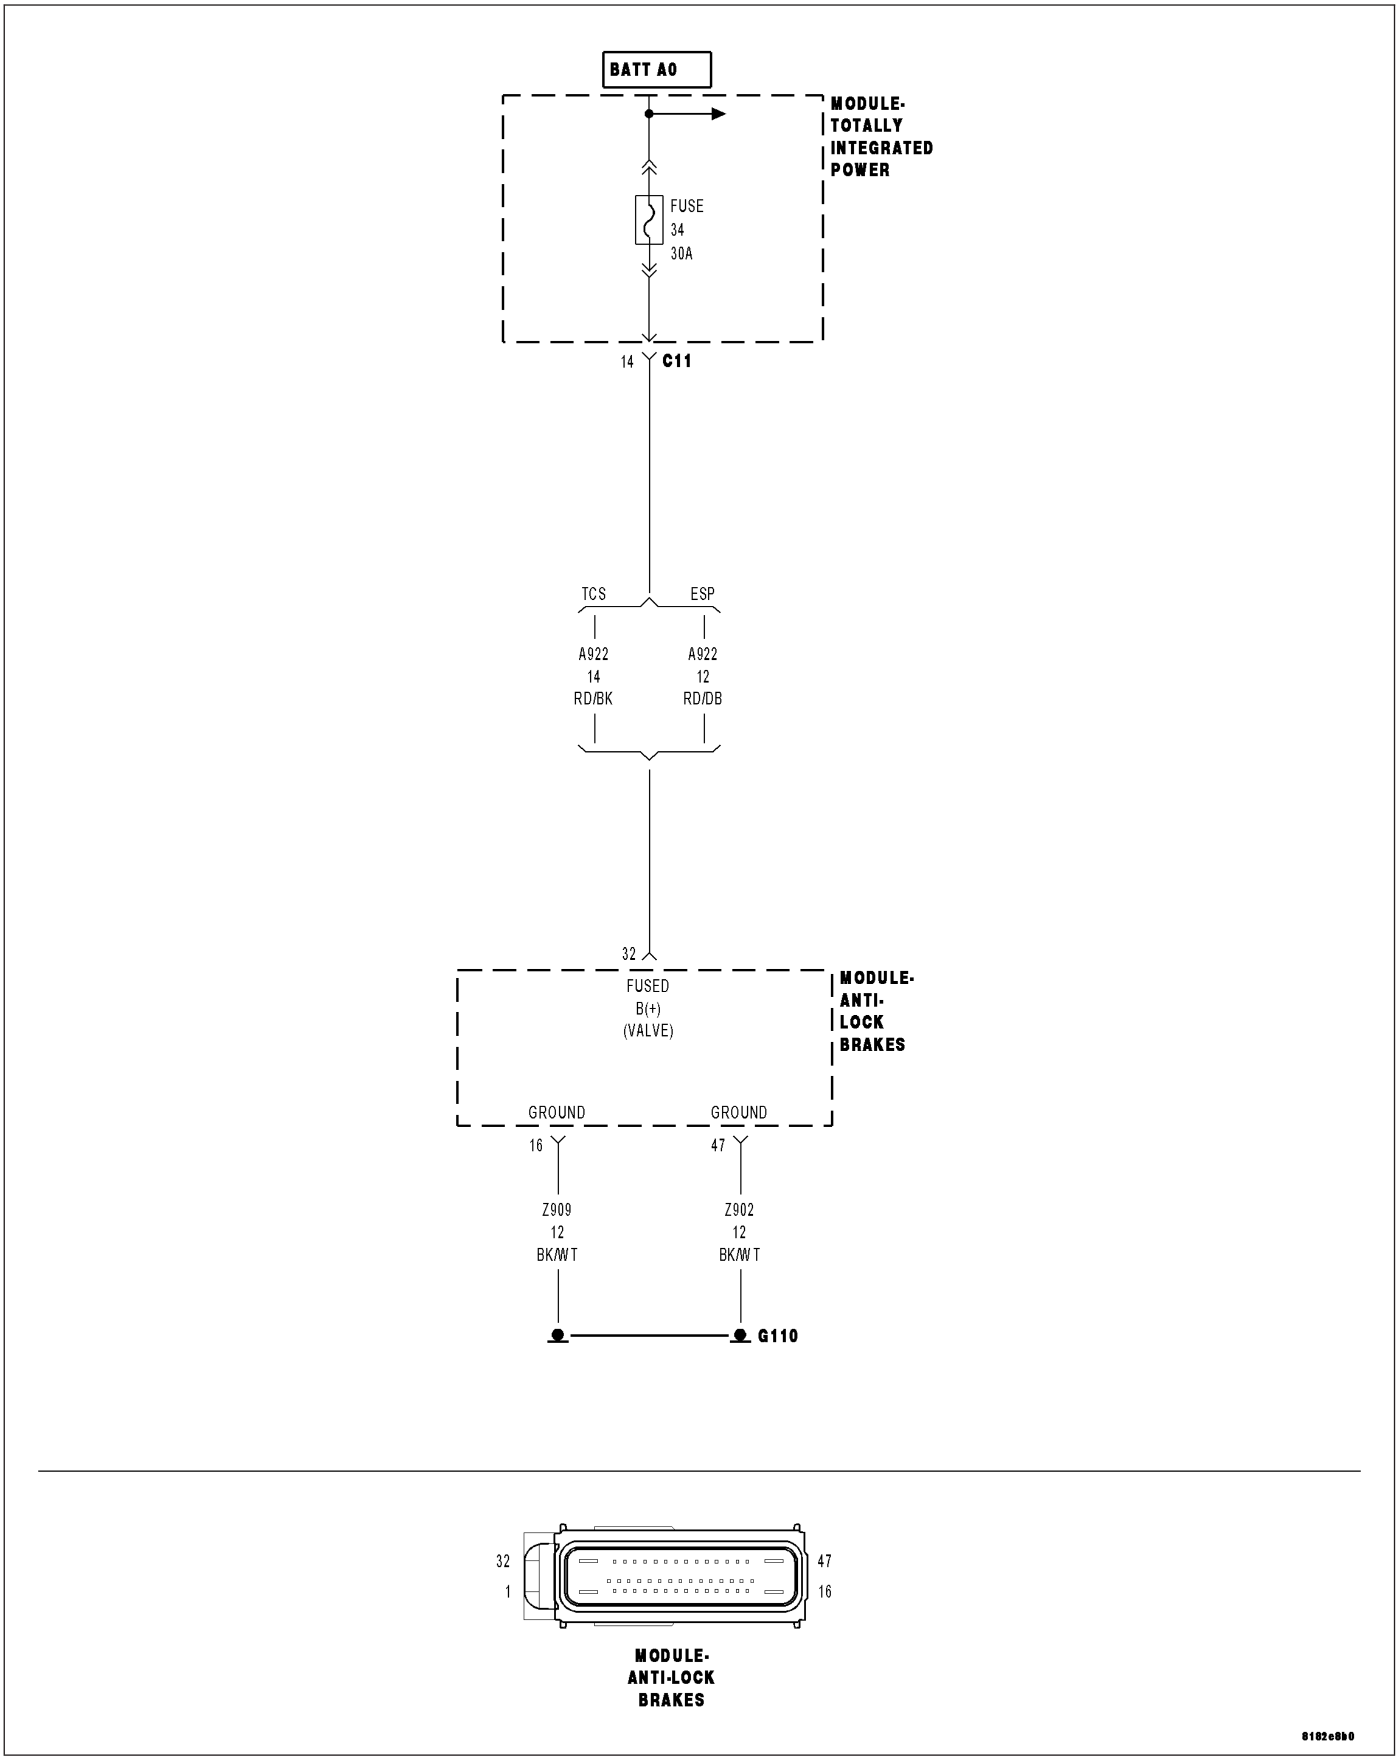
WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >>



NOTE: Vehicles without a Dynamics Sensor replace Anti-Lock Brake Module.
Replace the Dynamics Sensor or Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C2100–BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects system voltage is below 7.5 volts.

Possible Causes
ECM OR PCM DTCs PRESENT
VEHICLE BATTERY / CHARGING SYSTEM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. DTC'S IN THE PCM

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs from the PCM.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

With the scan tool, read and record DTCs.

With the scan tool read DTCs from the PCM.

Are any charging system codes present?

Yes >> Repair the charging system DTC in the PCM.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 2

2. CHARGING SYSTEM FAILURE

Start the engine.

Connect voltmeter to vehicle battery.

Is the vehicle battery voltage under 8.2 volts?

No >> Go To 3

Yes >> Repair the charging system per service information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

3. CHARGING POWER SUPPLY VOLTAGE

With a scan tool read Power Supply Voltage.

Is Power Supply Voltage under 8.2 volts?

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2111–SENSOR SUPPLY 1 VOLTAGE CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the supply voltage for external analog sensors is out of range.

Possible Causes
ANTI-LOCK BRAKES MODULE
PRESSURE SENSOR (HYDRAULIC CONTROL UNIT)

Diagnostic Test

1. REPLACE ANTI-LOCK BRAKES MODULE & VERIFY IF DTC IS STILL ACTIVE

Turn the ignition off.

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Turn the ignition on.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Replace the Hydraulic Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C2112–SENSOR SUPPLY 1 VOLTAGE CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the supply voltage for external analog sensors is out of range.

Possible Causes
ANTI-LOCK BRAKES MODULE
PRESSURE SENSOR (HYDRAULIC CONTROL UNIT)

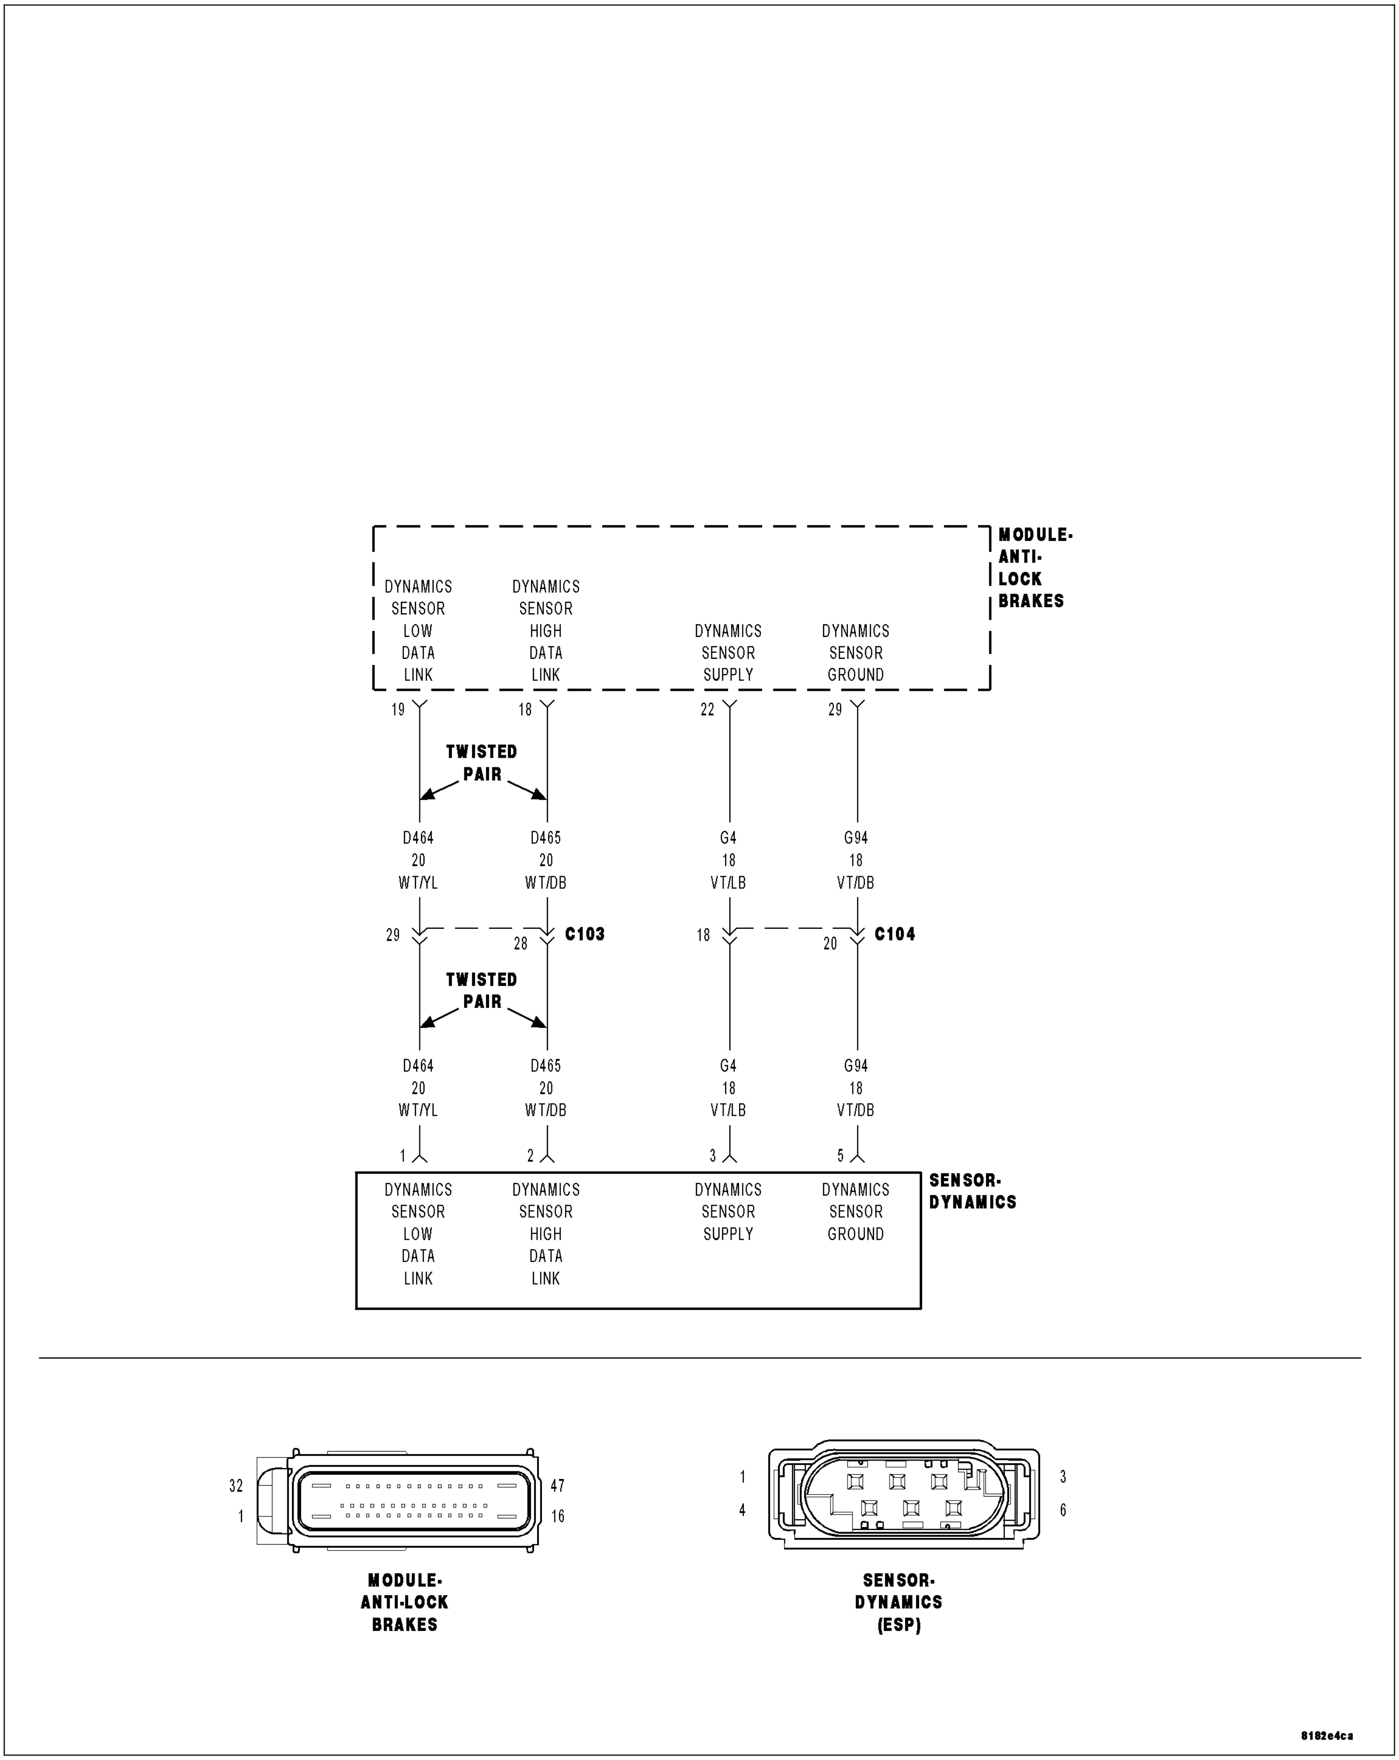
Diagnostic Test

1. REPLACE ANTI-LOCK BRAKES MODULE & VERIFY IF DTC IS STILL ACTIVE

Turn the ignition off.

Replace the Anti-Lock Brakes Module in accordance with the Service Information. Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Turn the ignition on.



With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Replace the Hydraulic Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C2114–DYNAMICS SENSOR SUPPLY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Dynamics Sensor status changes from initialized to not initialized due to low voltage on the (G4) Dynamics Sensor Supply circuit.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT HIGH RESISTANCE
(G94) DYNAMICS SENSOR GROUND CIRCUIT HIGH RESISTANCE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO OTHER ABS CIRCUITS
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

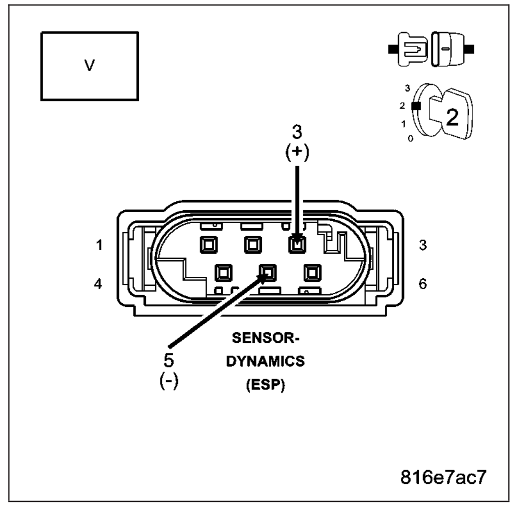
Turn the ignition off.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



No >> Go To 3

3. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT & (G94) DYNAMICS SENSOR GROUND CIRCUIT FUNCTION

Disconnect the Dynamics Sensor harness connector.

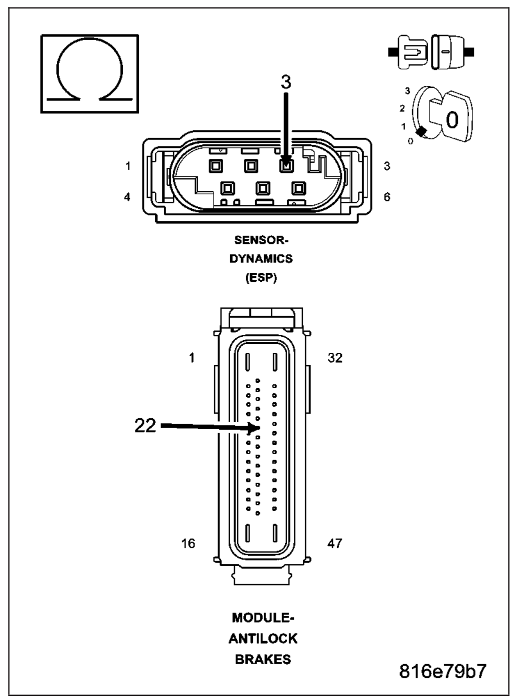
Turn the ignition on.

Measure the voltage between the (G4) Dynamics Sensor Supply Circuit and the (G94) Dynamics Sensor Ground Circuit.

Is the voltage above 4.5 volts?

Yes >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



No >> Go To 4

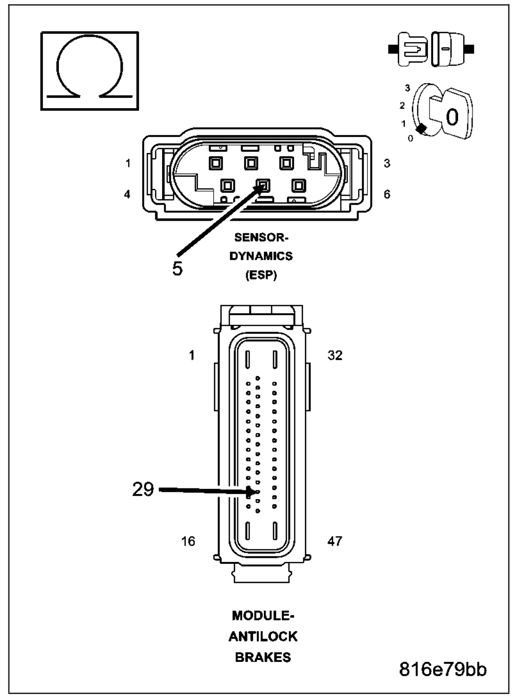
4. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Anti-Lock Brakes Module harness connector.

Measure the resistance of the (G4) Dynamics Sensor Supply circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go To 5

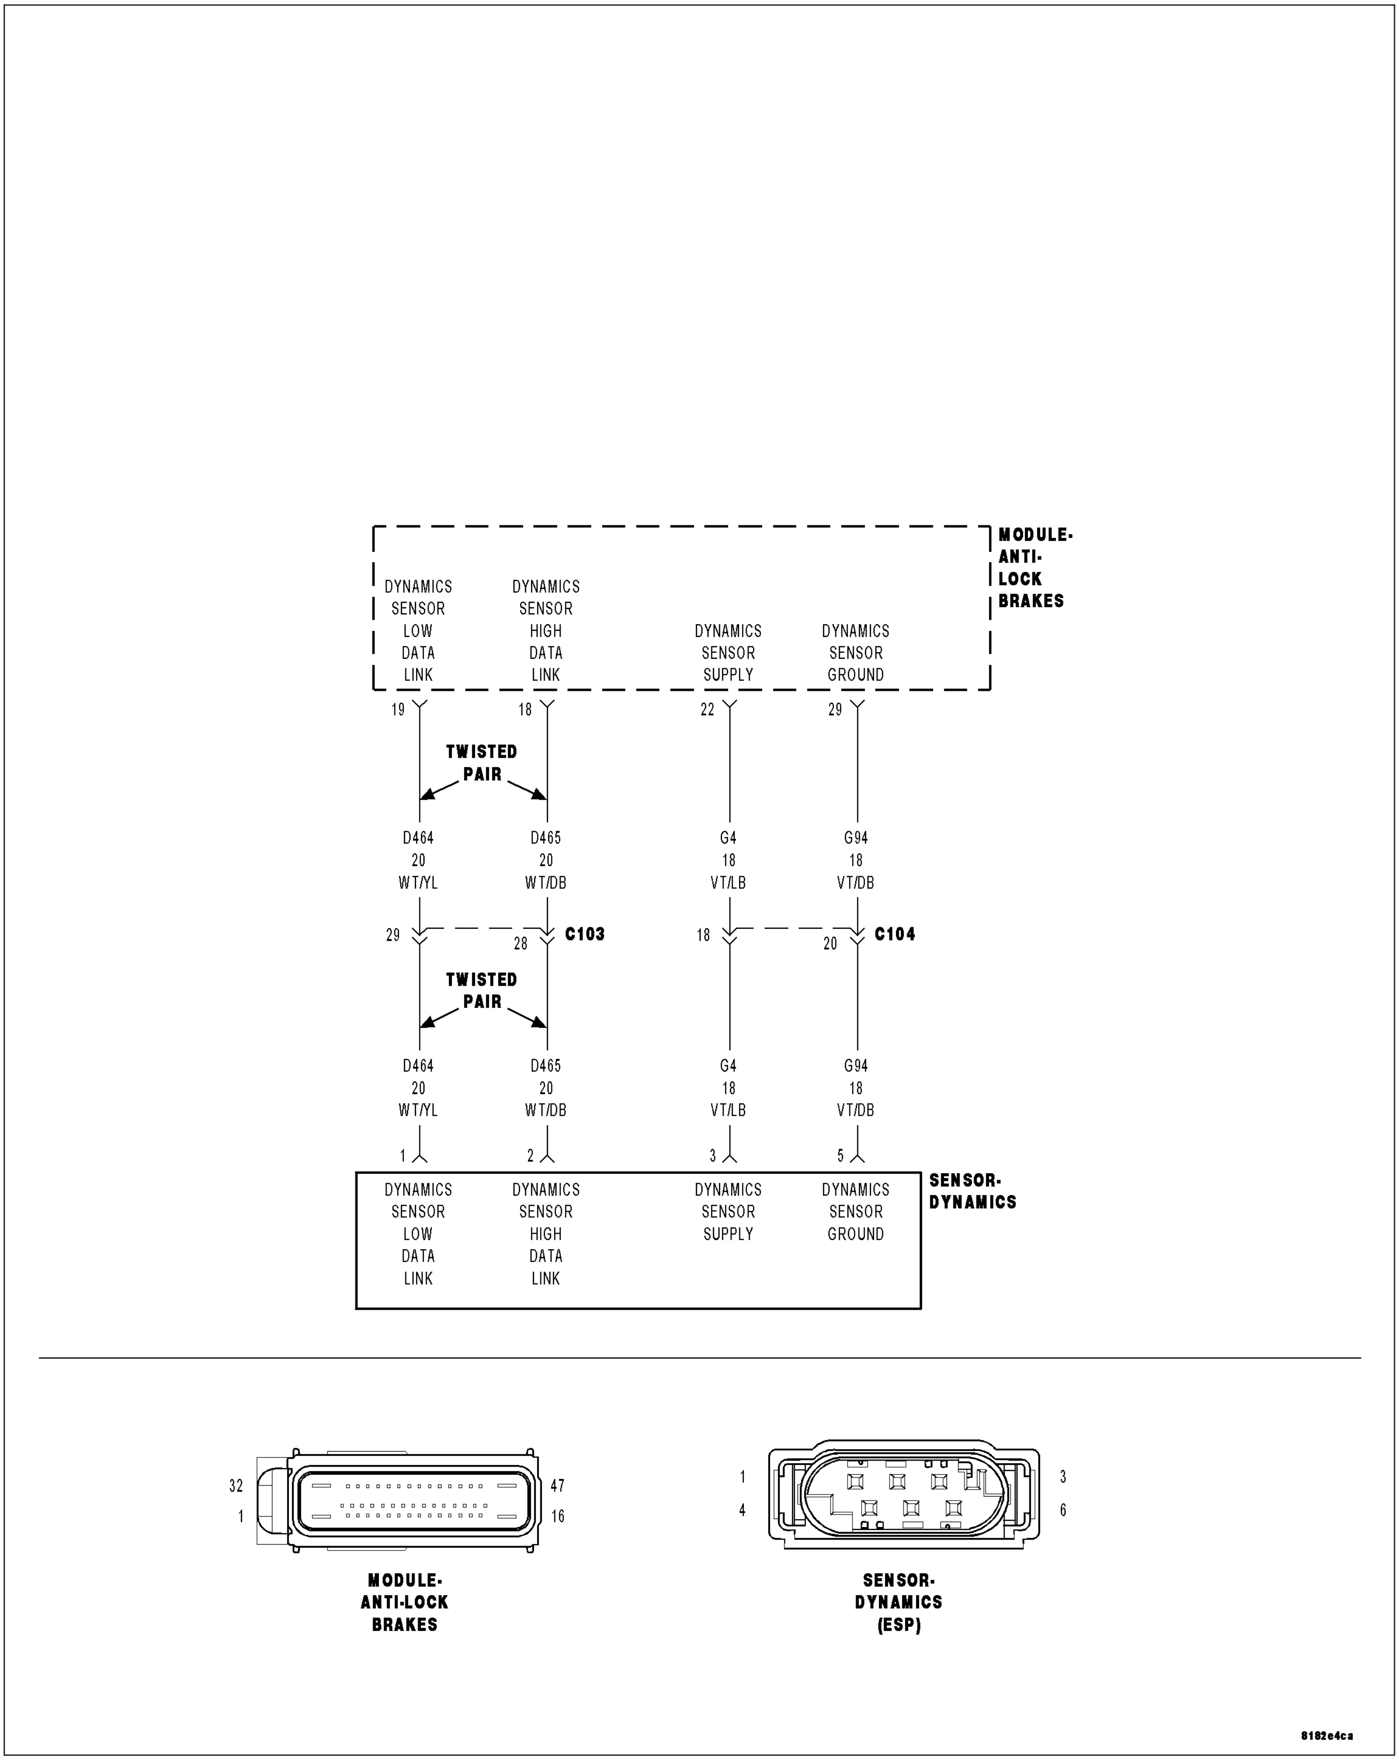
No >> Repair the (G4) Dynamics Sensor Supply circuit for high resistance.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

5. CHECK (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

Measure the resistance of the (G94) Dynamics Sensor Ground circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?



Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Repair the (G94) Dynamics Sensor Ground circuit for high resistance.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2115–DYNAMICS SENSOR SUPPLY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Upon ignition on, prior to switching the (G4) Dynamics Sensor Supply circuit power on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects voltage on the (G4) Dynamics Sensor Supply circuit when the circuit's power is turned off.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
ANTI-LOCK BRAKES MODULE

1. VERIFY DTC IS ACTIVE

Turn the ignition on.
With the scan tool, read and record ABS DTCs.
With the scan tool, read and record Environmental Data (EV Data).
With the scan tool, erase ABS DTCs.
Cycle the ignition switch.
With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

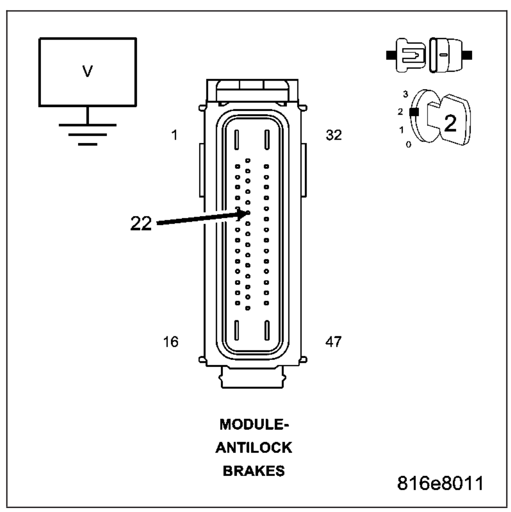
2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.
Check all related wiring for pinched, chafed, pierced, and partially broken wires.
Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?

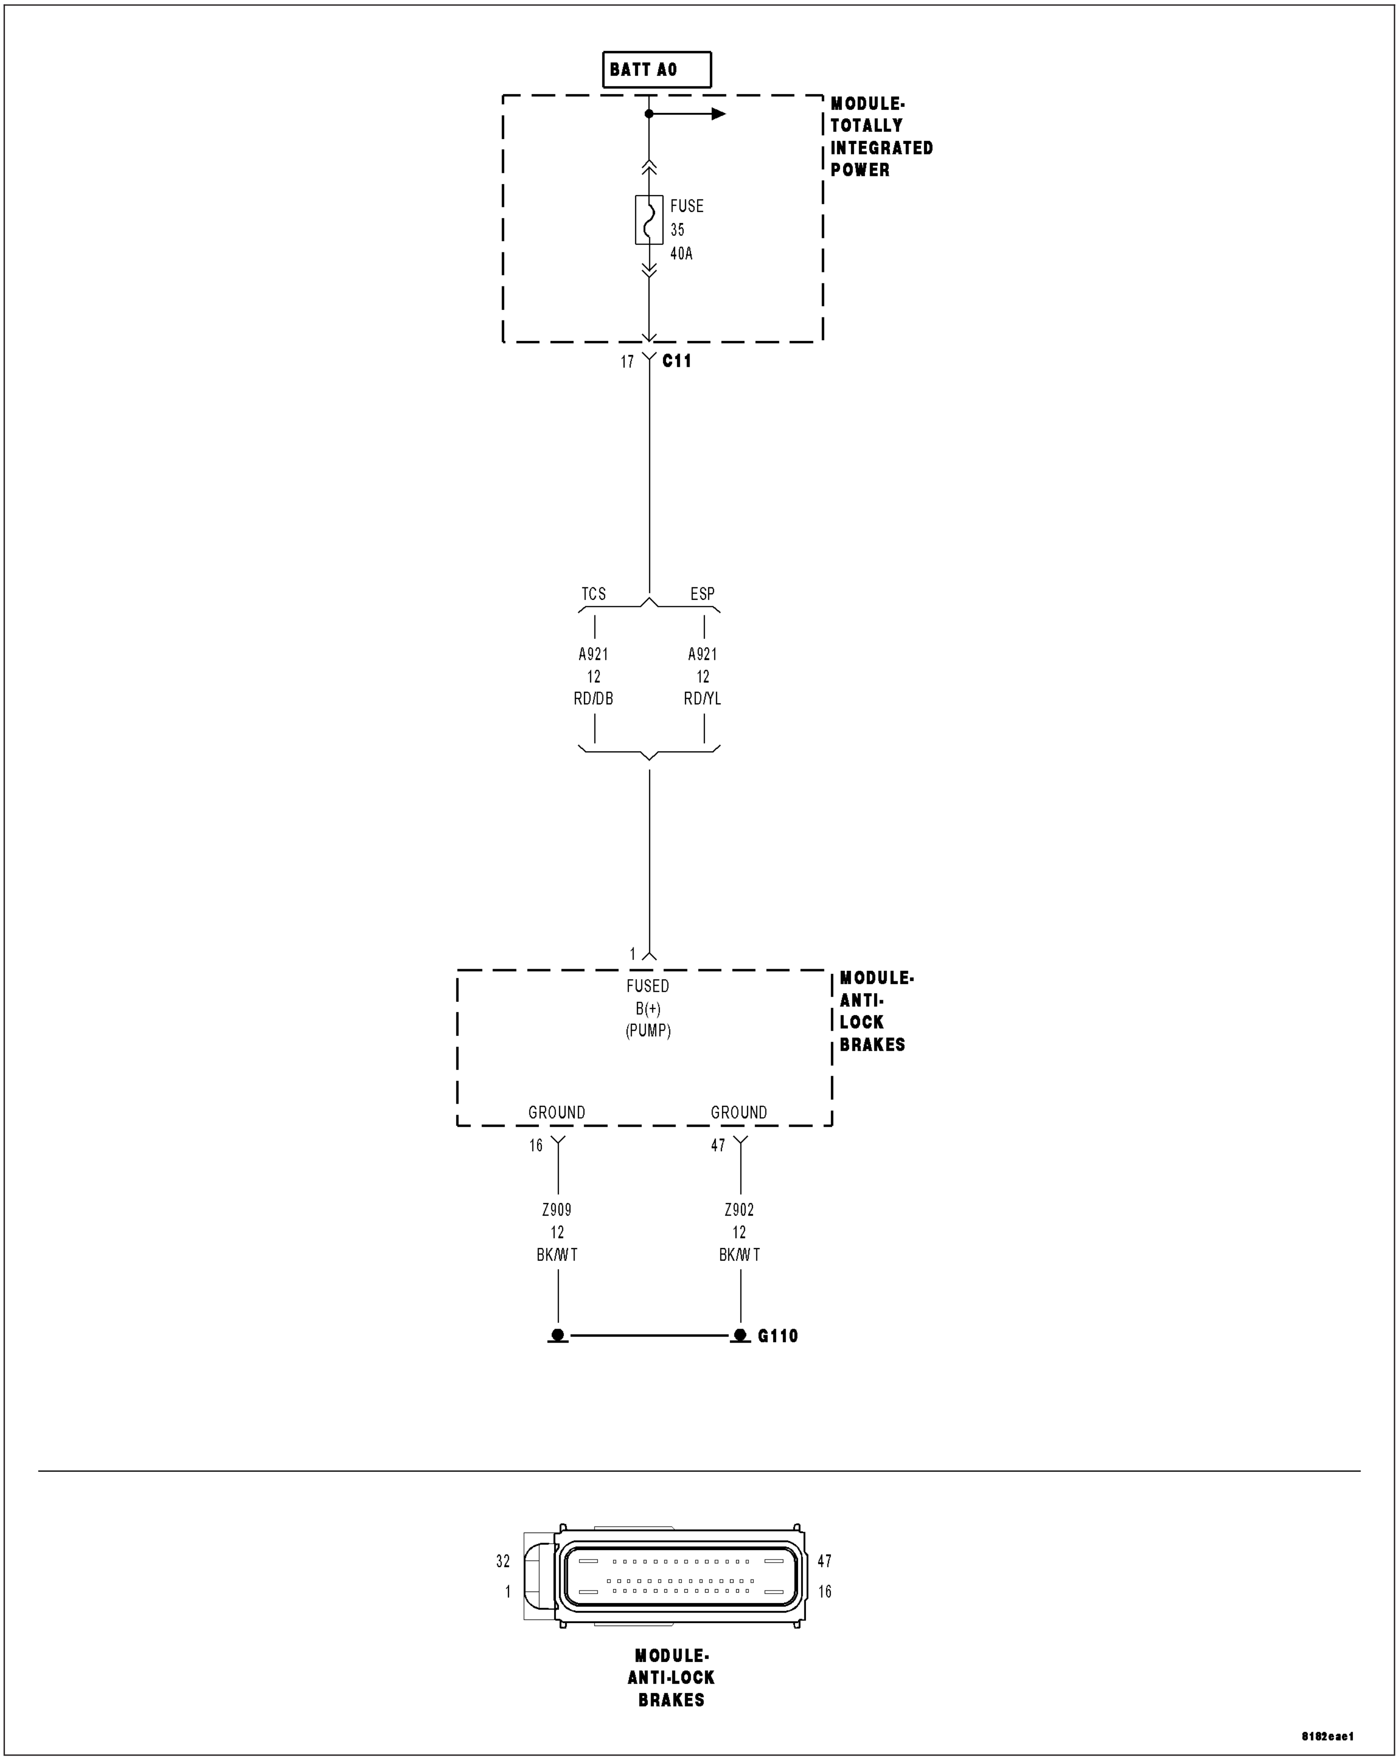
Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3



3. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORT FOR A SHORT TO VOLTAGE

Disconnect the Anti-Lock Brakes Module harness connector.
Turn the ignition on.
Measure the voltage of the (G4) Dynamics Sensor Supply Circuit.



Is the voltage above 0.2 volts?

Yes >> Repair the (G4) Dynamics Sensor Supply Circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2116–ABS PUMP MOTOR SUPPLY LOW VOLTAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and the ABS Pump Motor deactivated, but not if supply voltage faults are detected. Or, if the control is switched off.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects either a low voltage condition when the ABS Pump Motor is activated or deactivated or a high voltage condition when the ABS Pump Motor is deactivated.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
ABS PUMP MOTOR FUSE OPEN
(A921) FUSED B(+) CIRCUIT SHORTED TO GROUND, OPEN, OR HIGH RESISTANCE
(Z909) and (Z902) GROUND CIRCUIT OPEN, OR HIGH RESISTANCE
ANTI-LOCK BRAKES MODULE
PUMP MOTOR (HYDRAULIC CONTROL UNIT)

Diagnostic Test

1. CHECK FOR A DTC C2116–ABS PUMP MOTOR SUPPLY LOW VOLTAGE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

Road test the vehicle over 40 km/h (25 m.p.h.).

NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.

With the scan tool, read DTCs.

Does the scan tool display: C2116–ABS PUMP MOTOR SUPPLY LOW VOLTAGE?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) Diagnostic Test

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the Anti-Lock Brakes Module harness connector and wiring harness for damage.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

Were any problems found?

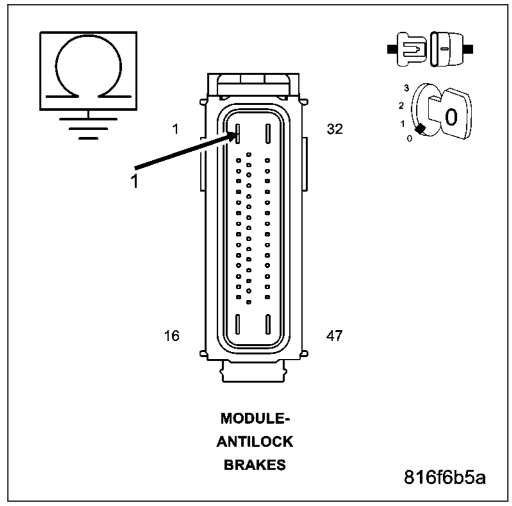
Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK ABS PUMP MOTOR FUSE

Remove and visually inspect the ABS Pump Motor fuse.

Is the fuse open?



Yes >> Go To 4

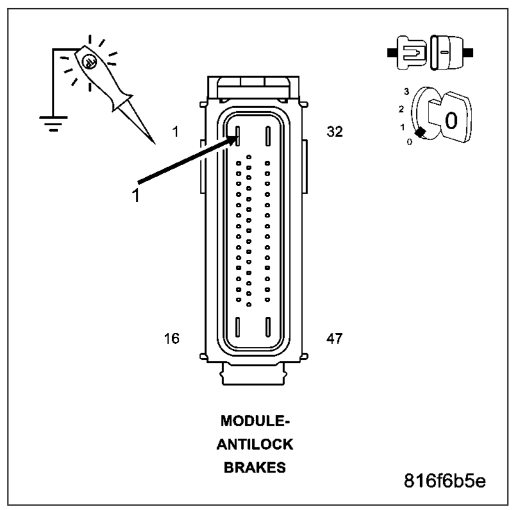
No >> Go To 5

4. CHECK (A921) FUSED B(+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Anti-Lock Brakes Module harness connector.

Measure the resistance of the (A921) Fused B(+) circuit between ground and the Anti-Lock Brakes Module harness connector.

Is the resistance below 10k ohms?



Yes >> Repair the (A921) Fused B(+) circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

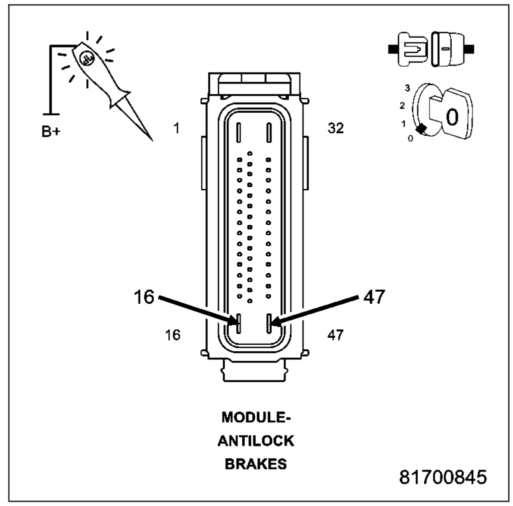
5. CHECK (A921) FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Replace the ABS Pump Motor fuse.

Using a 12-volt test light connected to ground, probe the (A921) Fused B(+) circuit.

NOTE: The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?



Yes >> Go To 6

No >> Repair the (A921) Fused B(+) circuit for an open or high resistance.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

6. CHECK (Z909) AND (Z902) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Using a 12-volt test light connected to 12 volts, probe the (Z909) and (Z902) Ground circuit.

NOTE: The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly on both circuits?

Yes >> Go To 7

No >> Repair (Z909) and (Z902) circuit for an open or high resistance.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

7. REPLACE ANTI-LOCK BRAKES MODULE & VERIFY IF DTC IS STILL ACTIVE

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Turn the ignition on.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Replace the Hydraulic Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C2200–ANTI-LOCK BRAKE MODULE INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on. The Anti-Lock Brake Module monitors its internal microprocessors for correct operation.
- **Set Condition:**
  If the Anti-lock brake module detects an internal fault, the DTC is set.

Possible Causes
ABM - INTERNAL FAULT

Diagnostic Test

1. ABM INTERNAL FAILURE DTC PRESENT

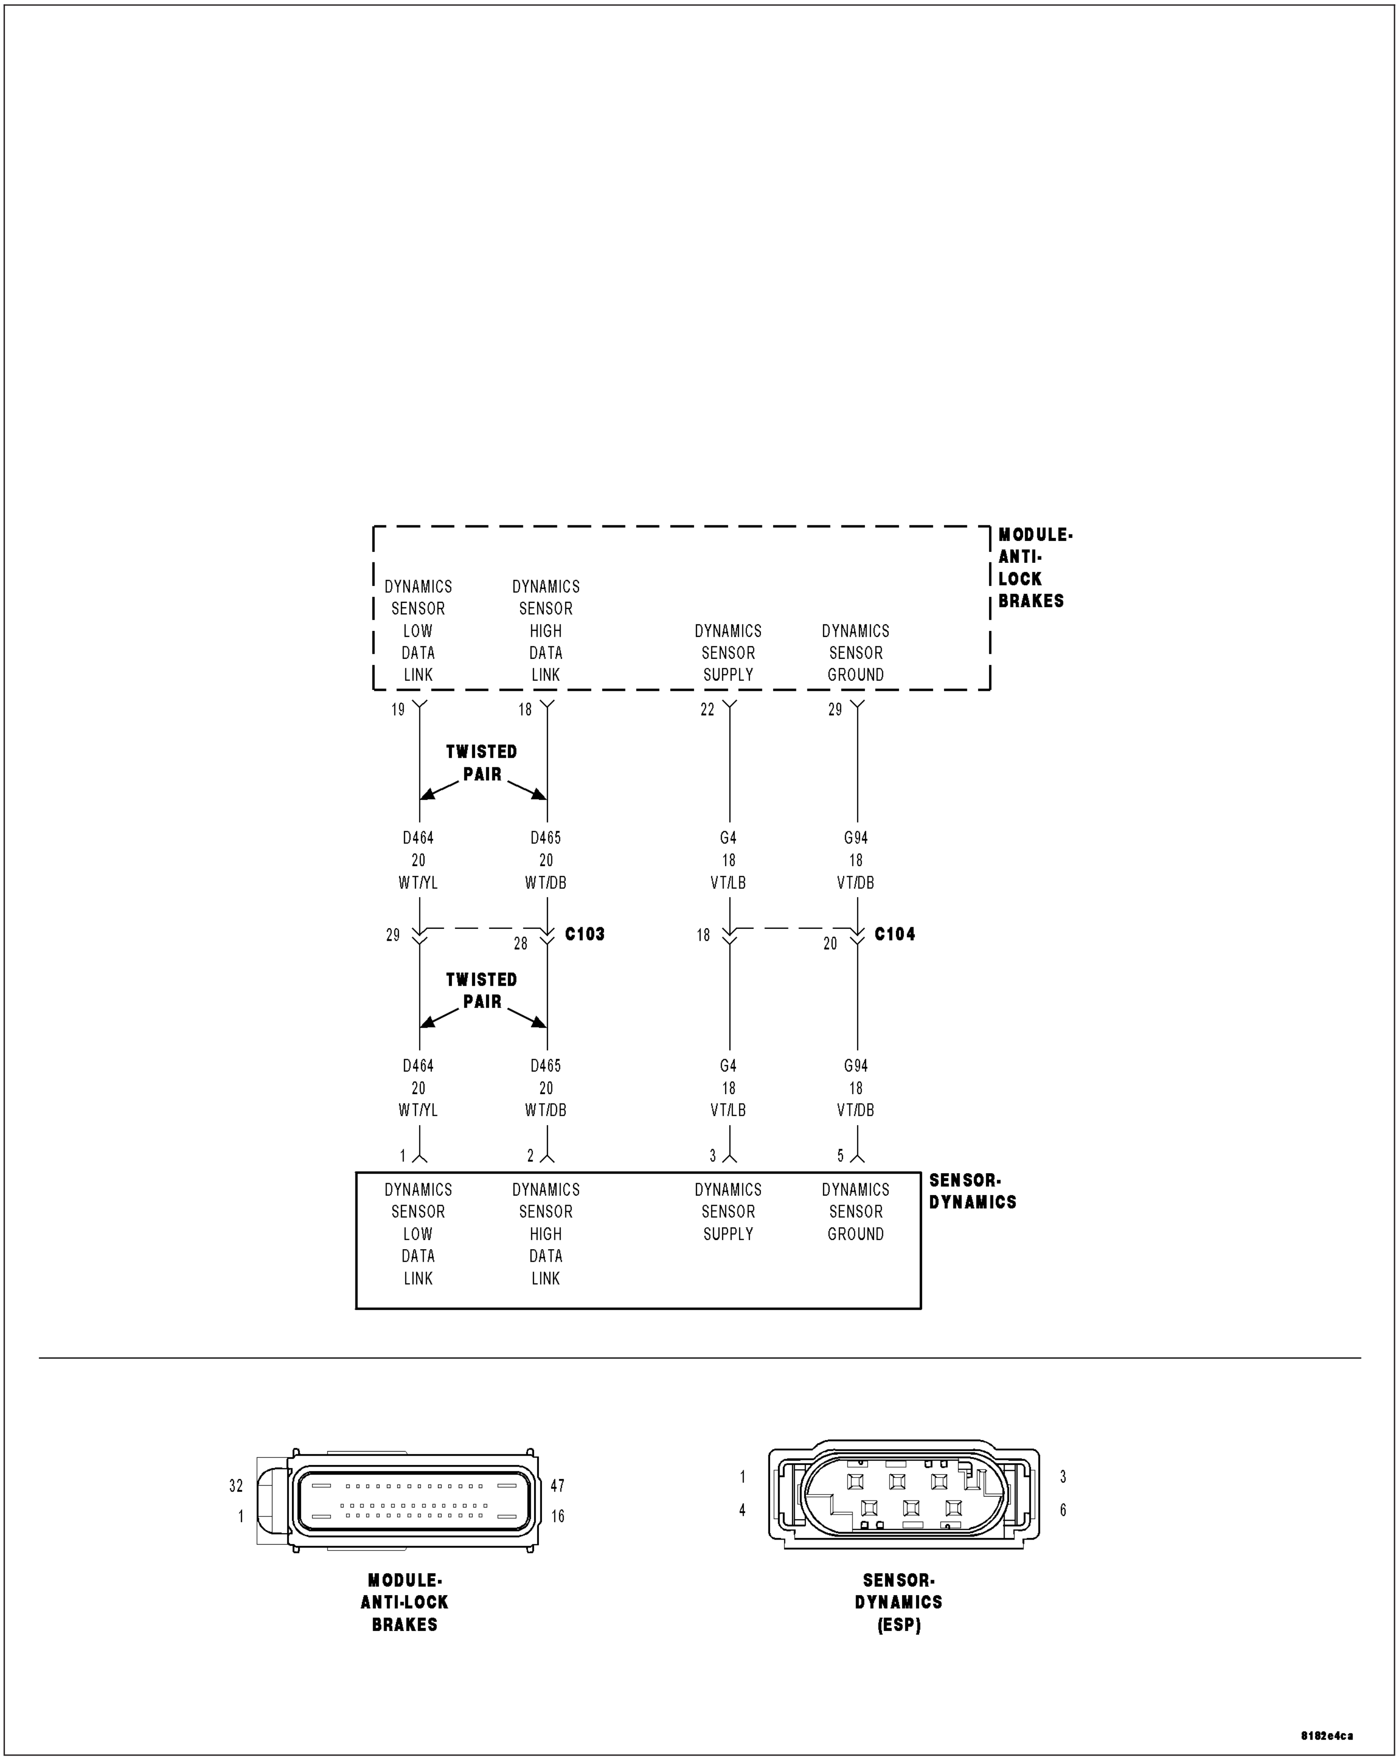
Turn the ignition on.

With the scan tool, read DTCs.

With the scan tool, erase DTCs.

Turn the ignition off.

Turn the ignition on.



With the scan tool, read DTCs.

Does the scan tool display ANTI-LOCK BRAKE MODULE INTERNAL FAILURE?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

C2204–DYNAMICS SENSOR INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously, with ignition on, until vehicle speed exceeds 20 km/h (12.4 m.p.h.) for the first time, but not if the sensor voltage is out of range.
  Or, during diagnostic mode.
  Or, if the monitoring was inhibited by a corresponding diagnostics command.
  Or, if the vehicle speed has exceeded 20 km/h (12.4 m.p.h.) during the actual ignition cycle.
  Or, if at least one over spinning wheel is detected.
  Or, if one of the control functions is active.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the Lateral Sensor signal is out of range.

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.
Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK DYNAMICS SENSOR OUTPUT

CAUTION: All previously removed connectors must be connected before test driving the vehicle, to avoid personal injury or death,

Connect all previously disconnected components and connectors.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

Monitor Dynamics Sensor operation while an assistant drives the vehicle.

Is Lateral Sensor output between 0.02 G to 0.16 G and Yaw Sensor output between 1.30° to 5.70°

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

C2205–STEERING ANGLE SENSOR INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on, but not if supply voltage faults are detected.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the Steering Angle Sensor is either not calibrated, or not initialized, or its status changes from initialized to not initialized, or if the sensor sends an internal failure message.

Possible Causes
STEERING ANGLE SENSOR NOT INITIALIZED
STEERING ANGLE SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. CHECK FOR A DTC C2205-STEERING ANGLE SENSOR INTERNAL

NOTE: This DTC must be active for the results of this test to be valid.
Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read and record DTCs.

Does the scan tool display: C2205-STEERING ANGLE SENSOR INTERNAL?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. STEERING ANGLE SENSOR

Replace the Steering Angle Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

WARNING: To avoid personal injury or death, check brake capability is available before road testing.
Road test the vehicle over 25 km/h (6 and 15 m.p.h).

NOTE: Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.). for set conditions to be meet.
With the scan tool, read ABS DTCs.

Did DTC C2205-STEERING ANGLE SENSOR INTERNAL reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Test Complete.

C2206–VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects the signal from the gateway module relevant for vehicle characteristic is missing or does not match for a period greater than the specified fault duration.

Possible Causes
TIPM / PCM NOT CONFIGURED CORRECTLY
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C2206-VEHICLE CONFIGURATION MISMATCH

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: This DTC will be active when a new module is installed until initialization is performed.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Perform ECU initialization with drive test on ABM. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs.

Does the scan tool display: C2206-VEHICLE CONFIGURATION MISMATCH?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. VERIFY THAT THE TIPM/PCM IS CONFIGURED CORRECTLY

Turn the ignition on.

Check the following data to verify the TIPM/PCM is configured correctly. Engine Displacement (PCM), XWD 4x2, 4x4, all Wheel Drive, (TIPM), Axle ratio (TIPM), Vehicle Line (TIPM), Brake type 0= ABS 1=ESP (TIPM).

NOTE: The DTC will be active when a new controller is installed until initialization is performed.

Was the TIPM/PCM configured correctly?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Reprogram the appropriate module.
Perform ABS or PCM VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U0002–CAN C BUS OFF PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The TIPM detects a short in either CAN C Bus circuit.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTI-LOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE
TRANSMISSION CONTROL MODULE
STEERING CONTROL MODULE
TOTALLY INTEGRATED CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase ABM DTCs.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active ABM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. ANTILOCK BRAKE MODULE — INTERNAL SHORT

Turn the ignition off.
Disconnect the Anti-Lock Brake Module harness connector.
Turn the ignition on.
With the scan tool, record and erase TIPM DTCs.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Antilock Brake Module in accordance with the service information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Powertrain Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 4

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.

Perform POWERTRAIN VERIFICATION TEST.

4. TRANSMISSION CONTROL MODULE-INTERNAL SHORT

Turn the ignition off.

Disconnect the Transmission Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 5

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.

Perform TRANSMISSION VERIFICATION TEST.

5. STEERING CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

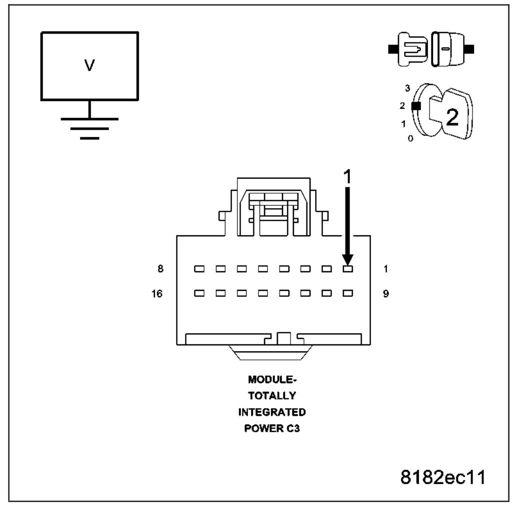
With the scan tool, read active TIPM DTCs.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 6

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Steering Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



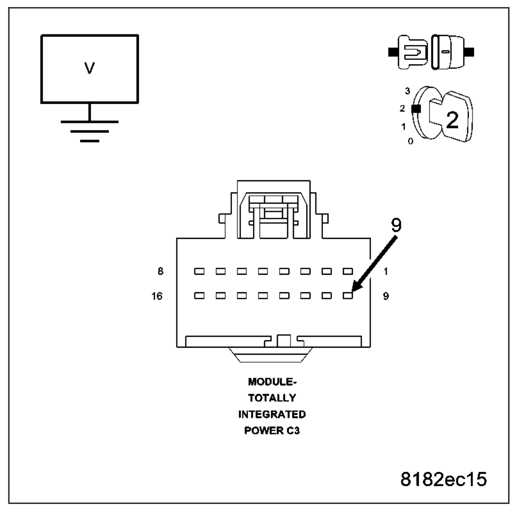
6. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Turn the ignition on.

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.



Is there any voltage present?

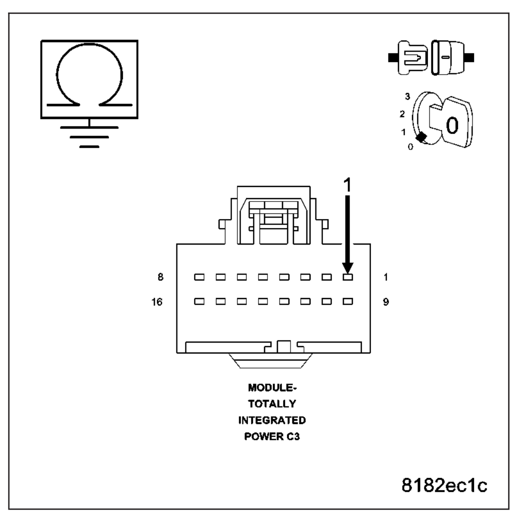
Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 7

7. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?



Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 8

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

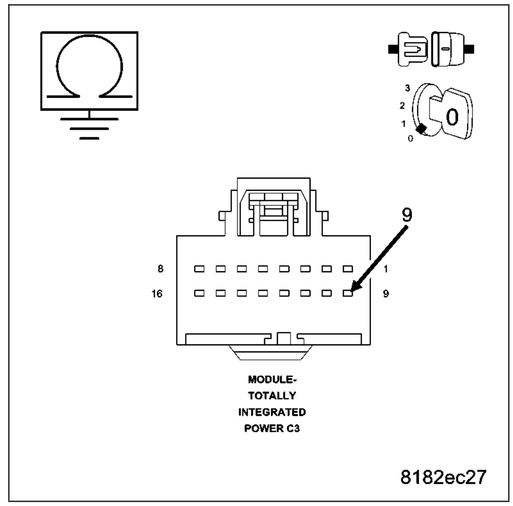
Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

Is any resistance present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 9

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

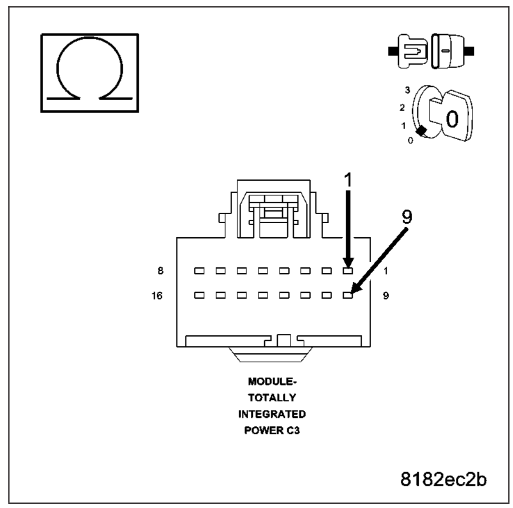
Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)..

No >> Go To 10

10. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.



Is any resistance present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0100–LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the Anti-Lock Brakes Module fails to receive bus messages from the ECM or PCM for approximately 500 ms.

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
ECM OR PCM POWER AND GROUND
ECM OR PCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No >> Go To 3

3. VERIFY THAT THE ECM OR PCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the ECM or PCM is active on the bus.

Is the ECM or PCM active on the bus?

Yes >> Go To 4

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the ECM or PCM?

Yes >> Replace/update the ECM or PCM in accordance with the service information.
Perform POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)..
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Anti-Lock Brakes Module in accordance with the service information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U0101–LOST COMMUNICATION WITH TCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the Anti-Lock Brakes Module fails to receive bus messages from the TCM for approximately 500 ms.

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
TCM POWER AND GROUND
PCM DTCs PRESENT
TCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

NOTE: If present, diagnose and repair DTC U0002–CAN C BUS OFF PERFORMANCE, DTC U0146–LOST COMMUNICATION WITH CENTRAL GATEWAY, or DTC U1502–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM FCM / BCM before diagnosing this DTC.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. Refer to the table of contents in this section. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No >> Go To 3

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs "Logged Against" the TCM?

Yes >> Replace/update the TCM in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Anti-Lock Brakes Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0114-LOST COMMUNICATION WITH FINAL DRIVE MODULE (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - TIPM is configured correctly
- **Set Condition:**
  Bus messages not received from the Totally Integrated Power Module (TIPM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED CONTROL MODULE
TOTALLY INTEGRATED CONTROL MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

3. VERIFY THAT THE TIPM IS ACTIVE ON THE BUS

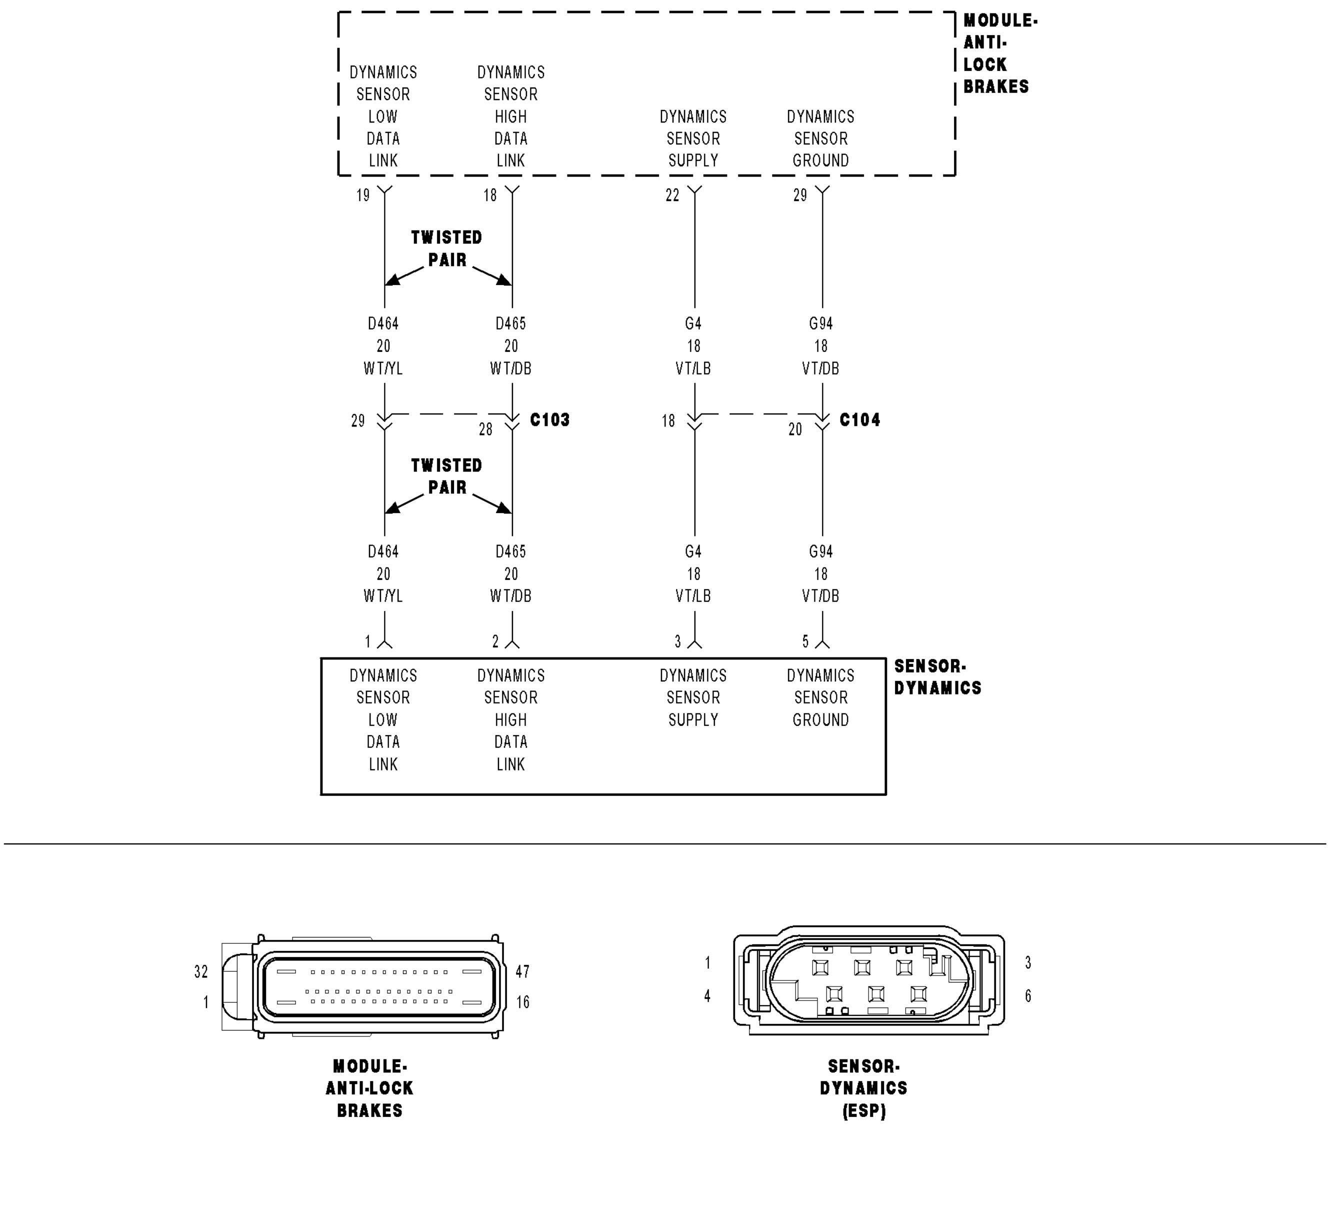
Turn the ignition on.
With the scan tool, select Network Diagnostics.
Verify that the TIPM is active on the bus.

Is the TIPM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform BODY VERIFICATION TEST – VER 1.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS



With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the TIPM?

Yes >> Replace/update the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0125–LOST COMMUNICATION WITH DYNAMICS SENSOR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module fails to receive bus messages from the Dynamics Sensor.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: If present, diagnose and repair DTC C2114–DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115–DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before proceeding.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

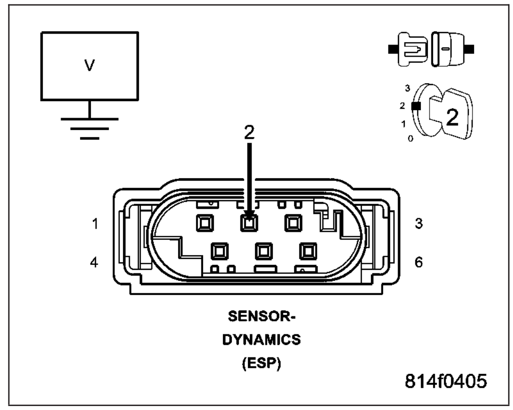
Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3



3. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

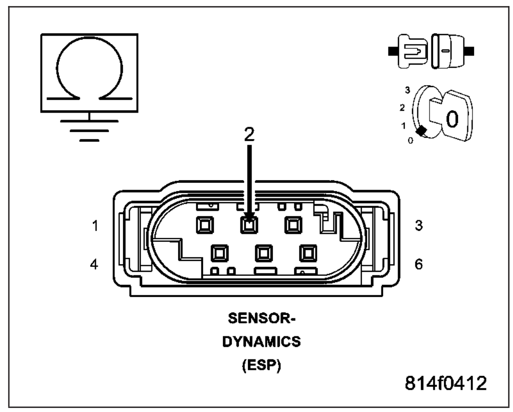
Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

Is there any voltage present?



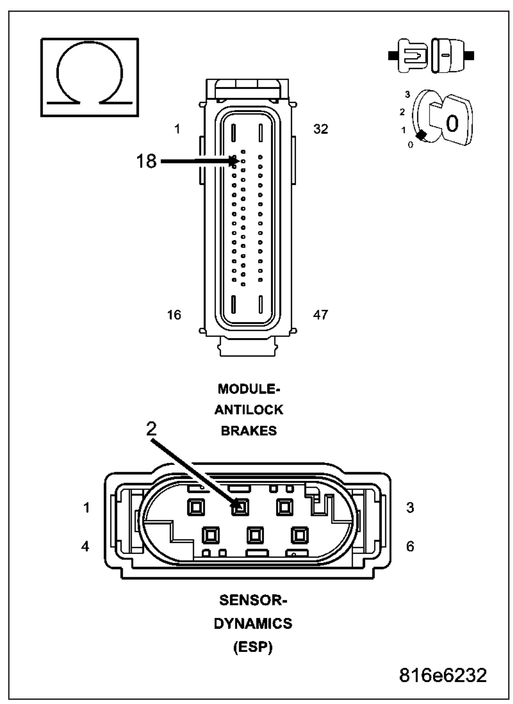
Yes >> Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.



Is the resistance below 5.0 ohms?

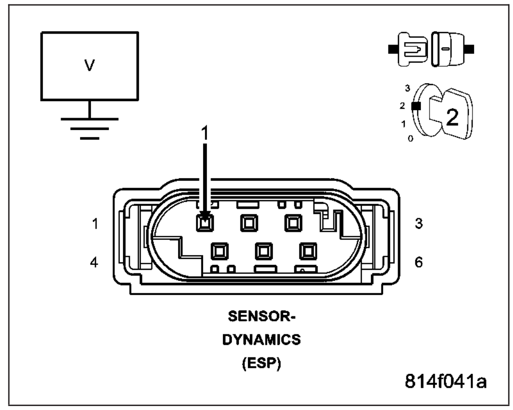
Yes >> Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go To 6

No >> Repair the (D465) Dynamics Sensor High Data Link circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

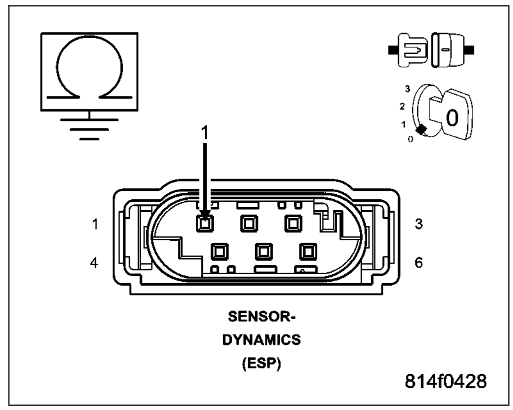
6. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

Is there any voltage present?

Yes >> Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

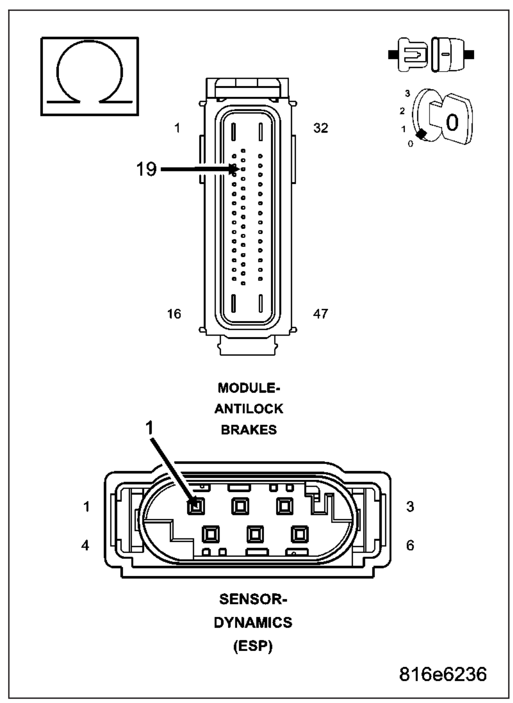
No >> Go To 7

7. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?



Yes >> Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 8

8. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Repair the (D464) Dynamics Sensor Low Data Link circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - TIPM is configured correctly
- **Set Condition:**
  Bus messages not received from the TIPM for approximately 2 to 5 seconds.

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. VERIFY THAT THE TIPM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TIPM is active on the bus.

Is the TIPM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the TIPM?

Yes >> Replace/update the Totally Integrated Power Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0146–LOST COMMUNICATION WITH CENTRAL GATEWAY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the Anti-Lock Brakes Module either fails to receive bus messages from the Totally Integrated Control Module (TIPM) for approximately 500 ms, or it receives invalid messages from the TIPM, or it detects messages from the TIPM are of improper data length.

Possible Causes
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
TIPM POWER AND GROUND
TIPM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No >> Go To 3

3. VERIFY THAT THE TIPM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the TIPM is active on the bus.

Is the TIPM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs "Logged Against" the TIPM?

Yes >> Replace/update the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Anti-Lock Brakes Module in accordance with the service information.

Perform ABS VERIFICATION TEST - VER 1. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U0401–IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.
- **Set Condition:**
  When the Anti-Lock Brake Module detects an incorrect CAN message from the Engine Module.

Possible Causes
ABM CAN BUS DTCS
ENGINE DTCS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR DTC U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM?

Yes >> Go To 2

No >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) . Diagnostic Test

2. CHECK IF TIPM CAN BUS DTCs ARE PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTCs present?

Yes >> Refer to the appropriate diagnostic. (Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

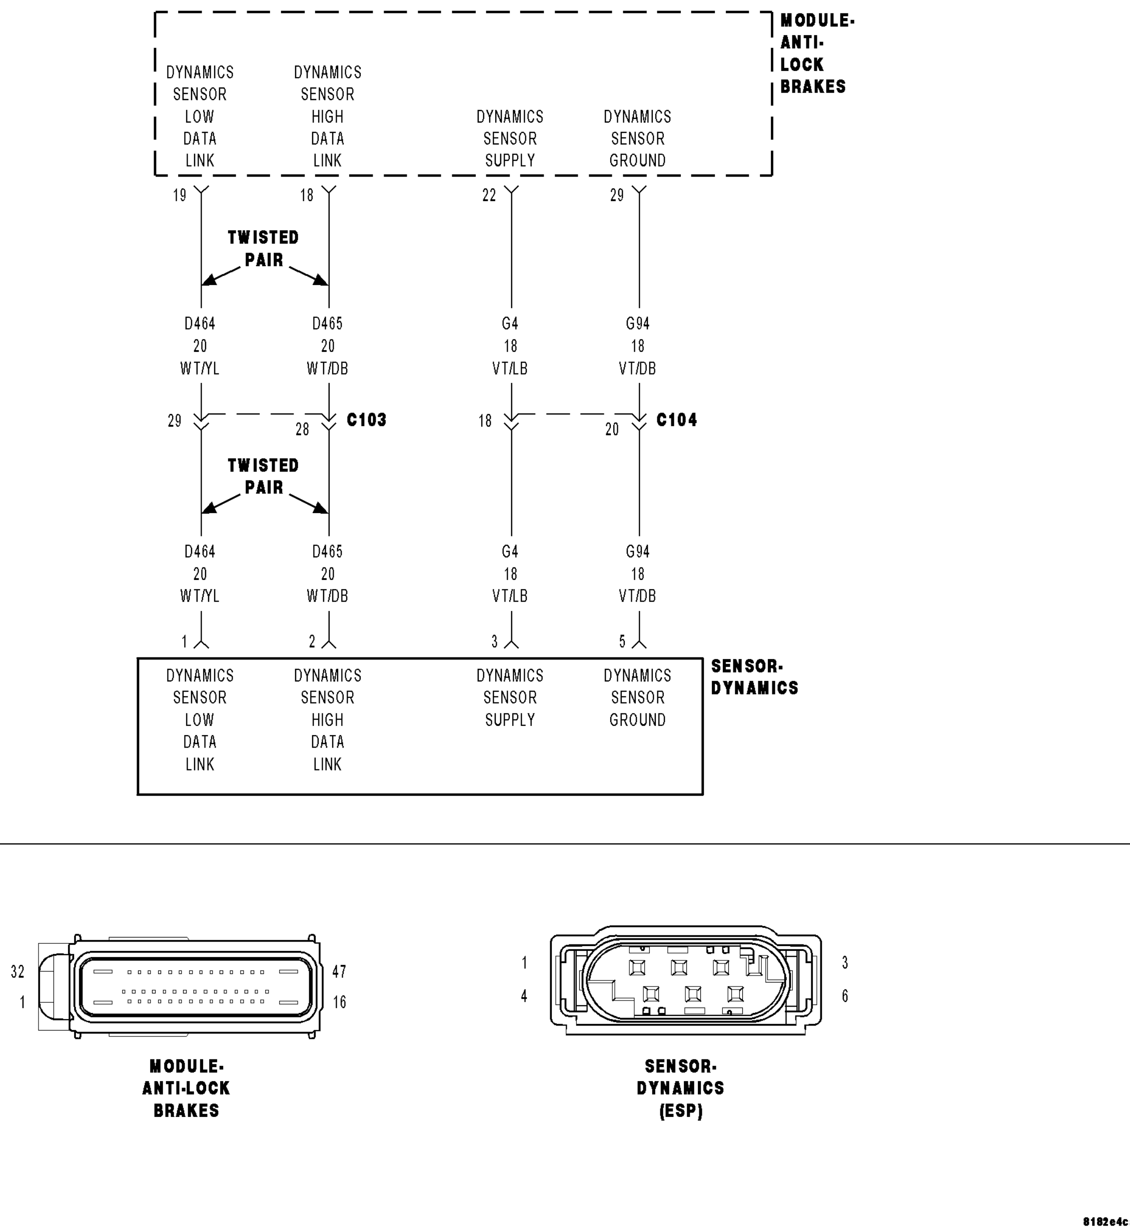
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK IF ENGINE DTCs ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTCs present?



Yes >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1003–ESP CAN C BUS PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects too many CAN Bus off events on the Dynamics Sensor Data Link circuits.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN
DYNAMICS SENSOR
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

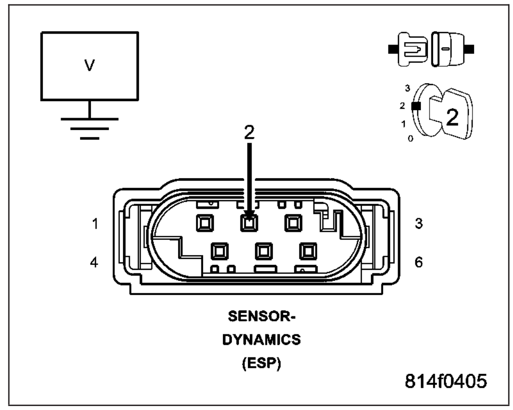
Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3



3. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

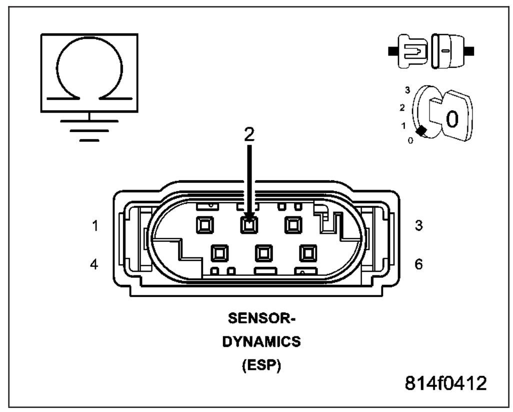
Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

Is there any voltage present?



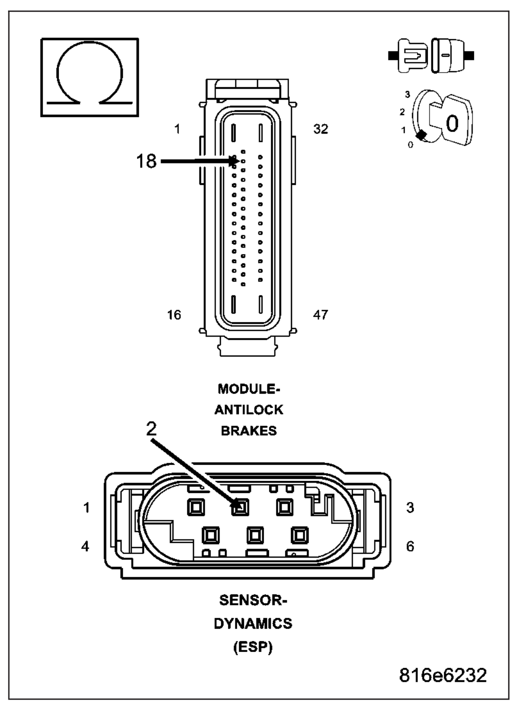
Yes >> Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.



Is the resistance below 5.0 ohms?

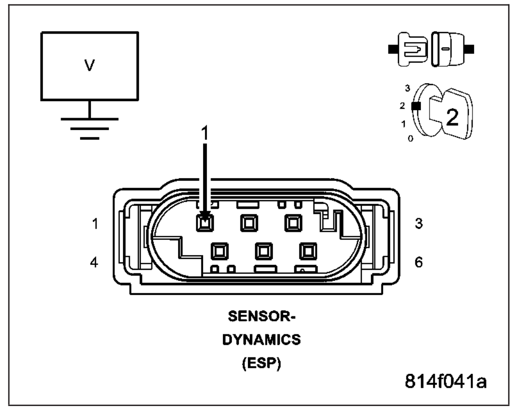
Yes >> Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go To 6

No >> Repair the (D465) Dynamics Sensor High Data Link circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

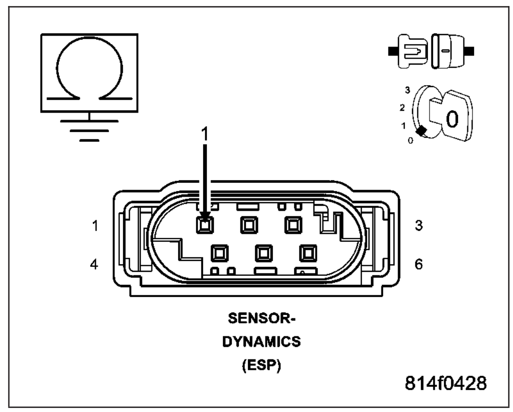
6. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

Is there any voltage present?

Yes >> Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.



Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

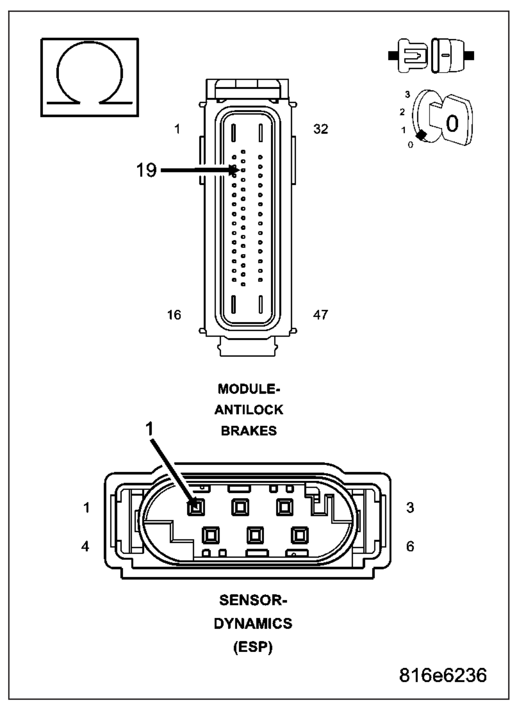
No >> Go To 7

7. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?



Yes >> Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 8

8. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 9

No >> Repair the (D464) Dynamics Sensor Low Data Link circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

9. REPLACE DYNAMICS SENSOR & VERIFY IF DTC IS STILL ACTIVE

Replace the Dynamics Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Turn the ignition on.

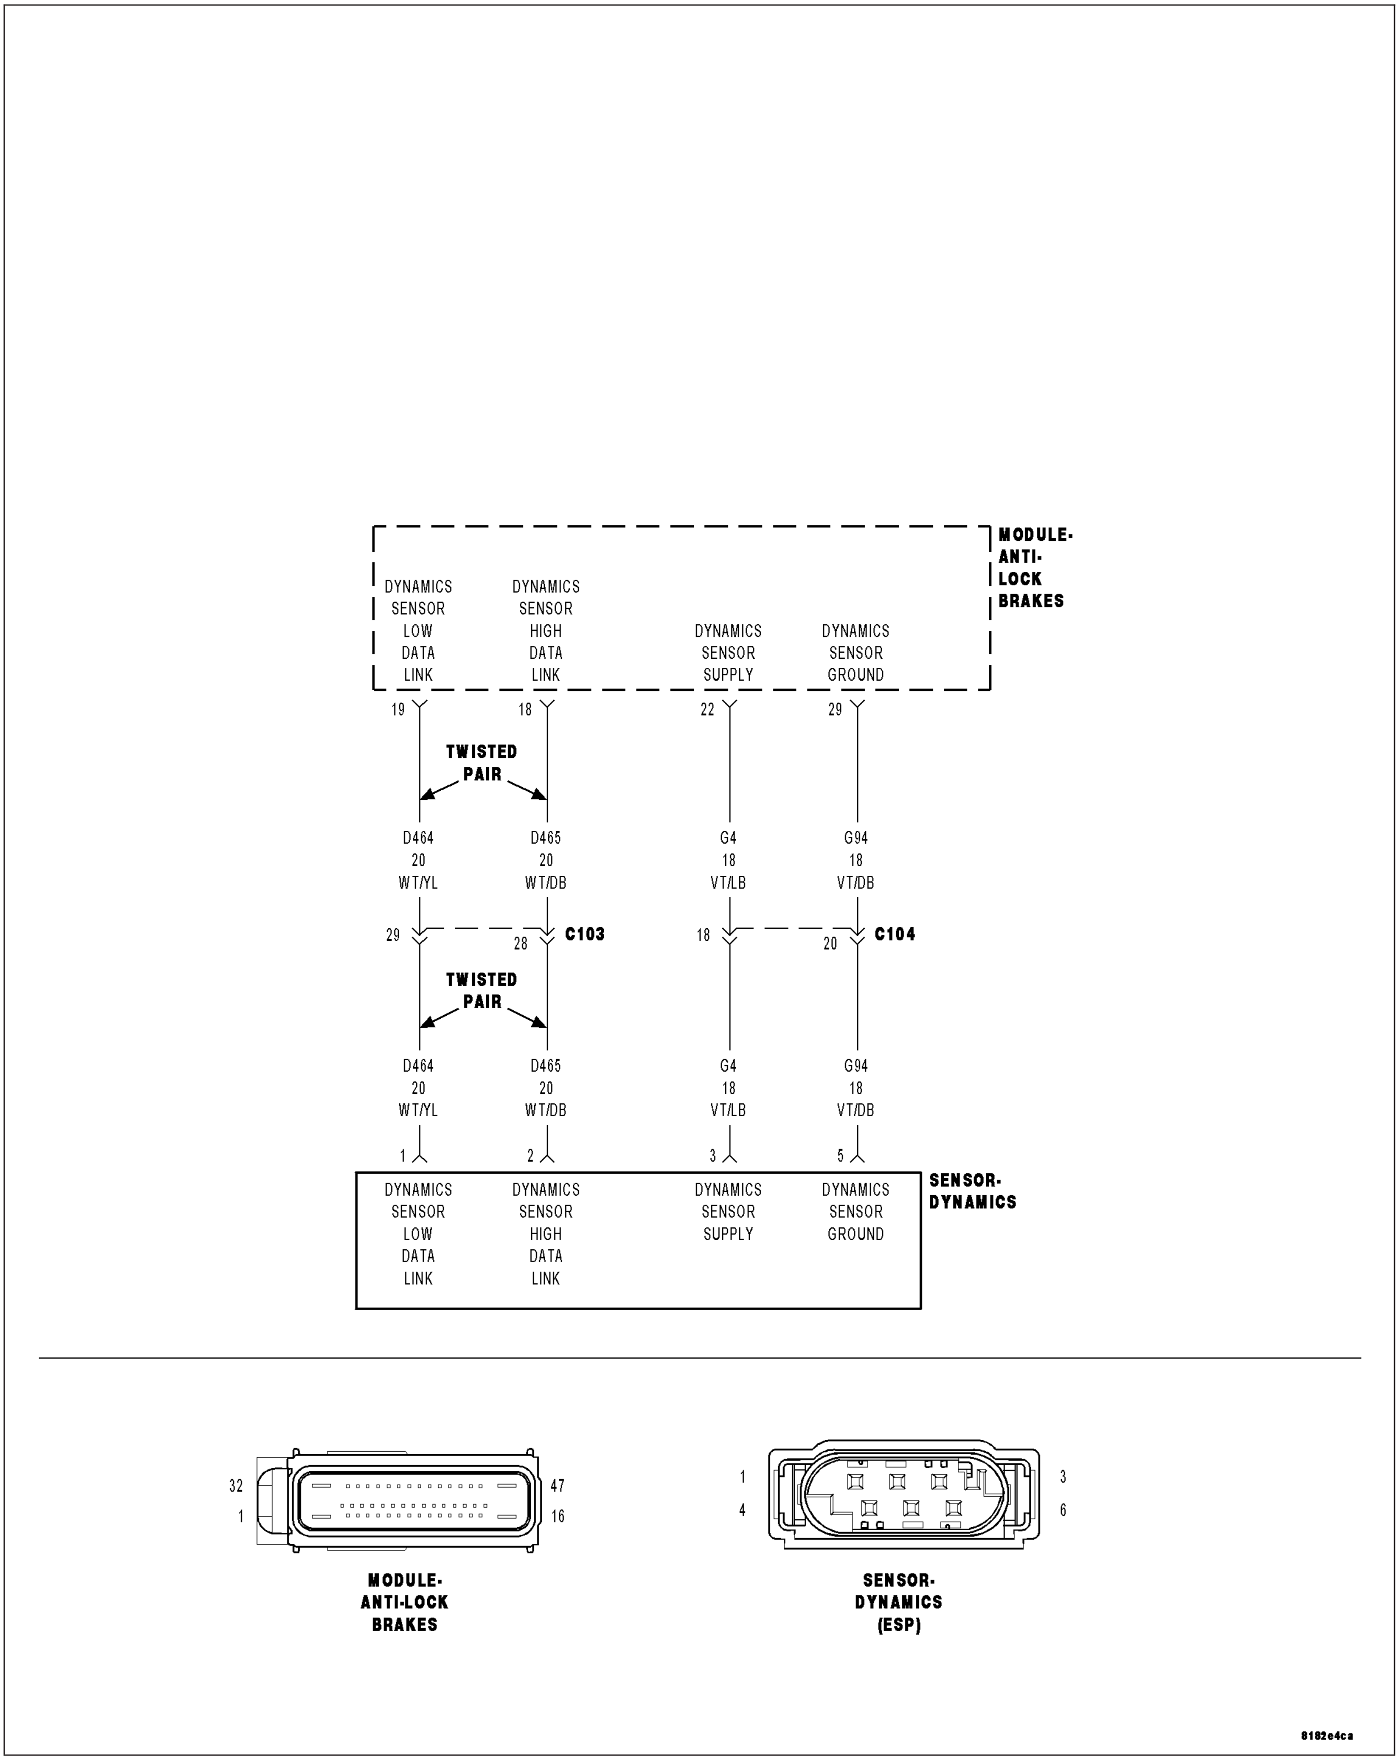
With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

WARNING: Ensure brake capability is available before road testing.

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.



With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1104–CAN C BUS CRC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects an invalid CAN message from the Dynamics Sensor.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

2. CHECK THE DYNAMICS SENSOR INSTALLATION

NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

Were any problems found?

Yes >> Repair as necessary.

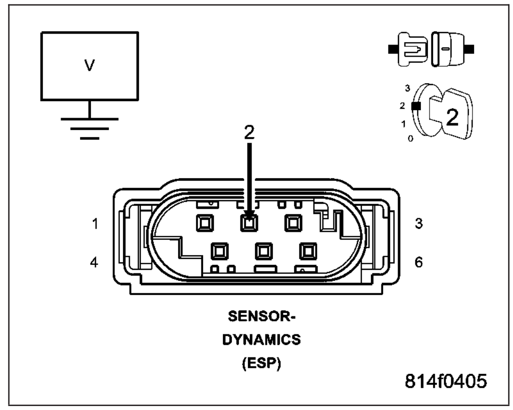
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 3

3. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.



Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

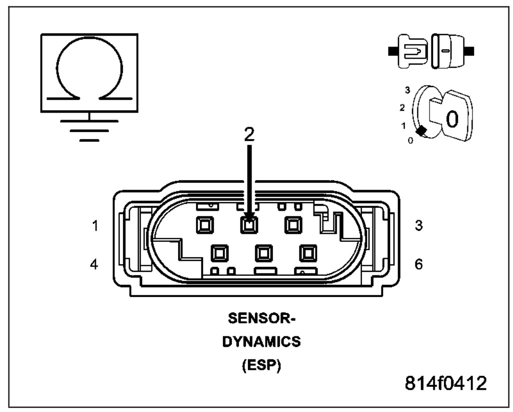
4. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.



Is there any voltage present?

Yes >> Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.

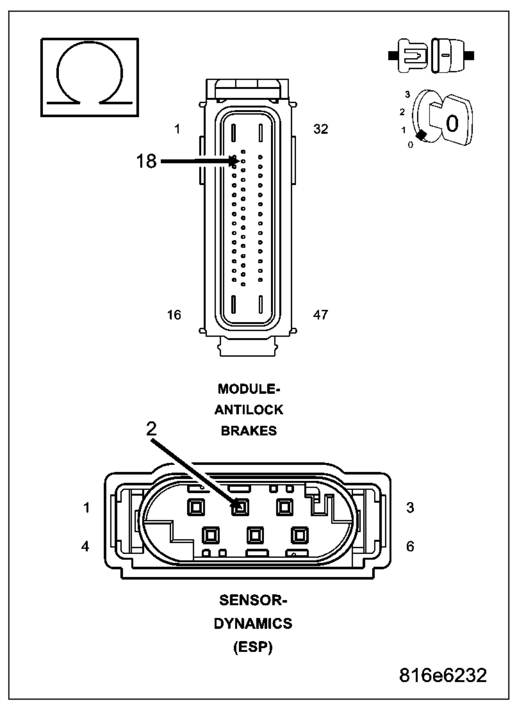
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.



Is the resistance below 5.0 ohms?

Yes >> Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

Is the resistance below 5.0 ohms?

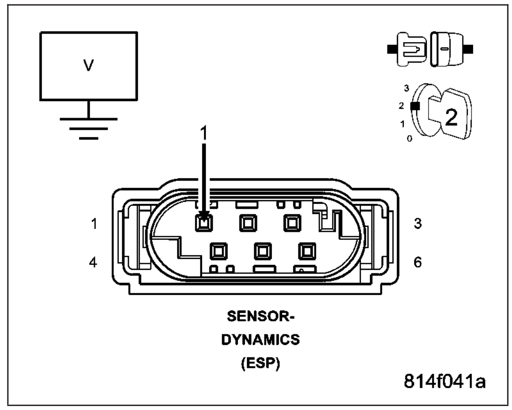
Yes >> Go To 7

No >> Repair the (D465) Dynamics Sensor High Data Link circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

7. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.



Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

Is there any voltage present?

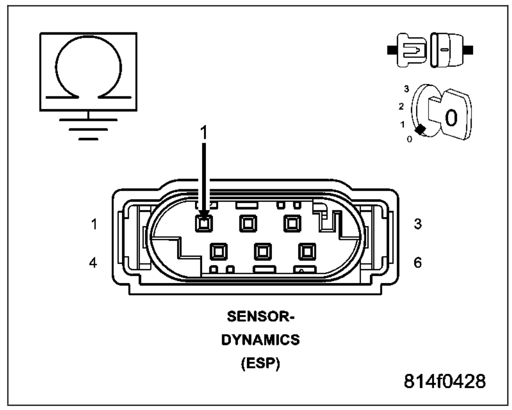
Yes >> Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 8

8. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.



Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

Is the resistance below 5.0 ohms?

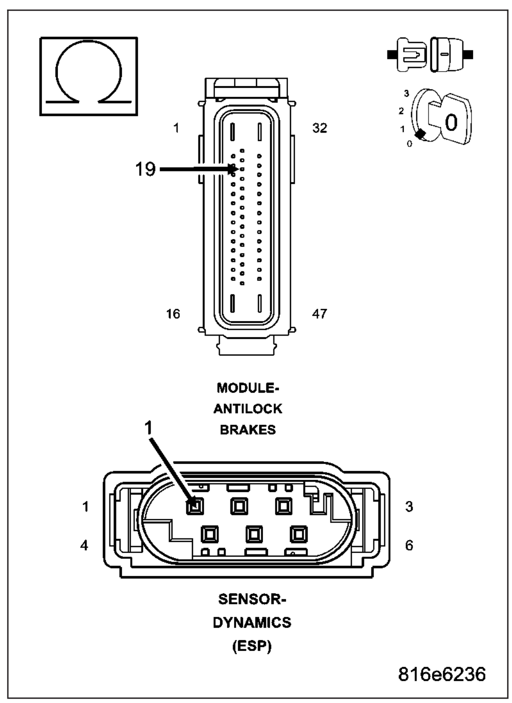
Yes >> Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 9

9. CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Repair the (D464) Dynamics Sensor Low Data Link circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U140E–IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Once per ignition cycle, but not during cranking.
  Or, if low supply voltage faults are detected.
- **Set Condition:**
  If the Anti-Lock Brakes Module either fails to receive vehicle configuration data from the Engine Control Module (ECM) or Powertrain Control Module (PCM) or the configuration data it receives from the ECM or PCM is different than that received during the previous ignition cycle.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
ECM OR PCM DTCs PRESENT
ECM OR PCM NOT PROGRAMMED OR PROGRAMMED WITH INCORRECT VIN
ECM OR PCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No >> Go To 3

3. CHECK IF ECM OR PCM DTCs ARE PRESENT

With the scan tool, read ECM or PCM DTCs.

Are any DTCs present?

Yes >> Diagnose and repair the DTC(s). Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. VERIFY CORRECT ECM OR PCM IS INSTALLED IN THE VEHICLE

With the scan tool, verify that the ECM or PCM part number is correct for the vehicle.

Is the correct ECM or PCM installed in the vehicle?

Yes >> Replace and program the ECM or PCM in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 5

5. VERIFY ECM OR PCM IS PROGRAMMED WITH CORRECT VIN

With the scan tool, verify that the ECM or PCM is programmed with the correct VIN.

Is the ECM or PCM programmed with the correct VIN?

Yes >> Using the scan tool, perform PCM Replaced to update the VIN in the PCM.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs "Logged Against" the ECM or PCM?

Yes >> Replace/update the ECM or PCM in accordance with the service information.
Perform POWERTRAIN VERIFICATION TEST. Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1501–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM ECM/PCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously, with ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects bus messages from the Engine Control Module (ECM) or Powertrain Control Module (PCM) are of improper data length.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
ECM OR PCM DTCs PRESENT
ECM OR PCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No >> Go To 3

3. CHECK IF ECM OR PCM DTCs ARE PRESENT

With the scan tool, read ECM or PCM DTCs.

Are any DTCs present?

Yes >> Diagnose and repair the DTC(s). Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the ECM or PCM?

Yes >> Replace/update the ECM or PCM in accordance with the service information.
Perform POWERTRAIN VERIFICATION TEST. Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1502–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously, with ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects bus messages from the Transmission Control Module (TCM) are of improper data length.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CAN C BUS CIRCUITS OPEN OR SHORTED
TCM DTCs PRESENT
TCM
ANTI-LOCK BRAKES MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

Does this DTC reset?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs related to the conditions listed above?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

No >> Go To 3

3. CHECK IF TCM DTCs ARE PRESENT

With the scan tool, read TCM DTCs.

Are any TCM DTCs present?

Yes >> Diagnose and repair the DTC(s).

Perform TRANSMISSION VERIFICATION TEST - VER 1.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

U1503–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TIPM (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects an incorrect CAN message from the Totally Integrated Control Module (TIPM).

Possible Causes
TIPM CAN BUS DTCS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK IF TIPM CAN BUS DTCs ARE PRESENT

With the scan tool, read TIPM DTCs.

Are there any TIPM CAN BUS DTCs present?

Yes >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

No >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

STANDARD PROCEDURE

ABS VERIFICATION TEST

1. ABS VERIFICATION TEST

WARNING: To avoid personal injury or death, check brake capability is available before road testing.

NOTE: If the ABM (Anti-Lock Brake Module), SAS (Steering Angle Sensor), Dynamics Sensor was replaced, it must be initialized using the scan tool. If not initialized, the ABS indicator will flash continuously with no DTCs. To initialize the ABM and clear offsets have wheels pointing straight ahead and follow the directions on the scan tool. The drive test requires a 90° turn. If the Dynamics Sensor was replaced, test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Verify all accessories are turned off and the battery is fully charged.
4. Verify that the ignition is on, with the scan tool, erase all Diagnostic Trouble Codes from All modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was indicating the failure.
5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the scan tool, read DTCs from all modules.
6. If any Diagnostic Trouble Codes are present, return to symptom list and trouble shoot new or recurring symptom.

NOTE: For Sensor Signal and Pump Motor faults, the ABM must sense all 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicator.

7. If there are no DTCs present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several anti-lock braking stops.
8. Again, with the scan tool read DTCs. If any DTCs are present, refer to the Table of Contents in the applicable Section for the diagnostic test procedure and troubleshoot the new or recurring symptom.
9. If there are no Diagnostic Trouble Codes (DTCs) present, and the customer's concern can no longer be duplicated, the repair is complete.

Are any DTCs present or is the original concern still present?

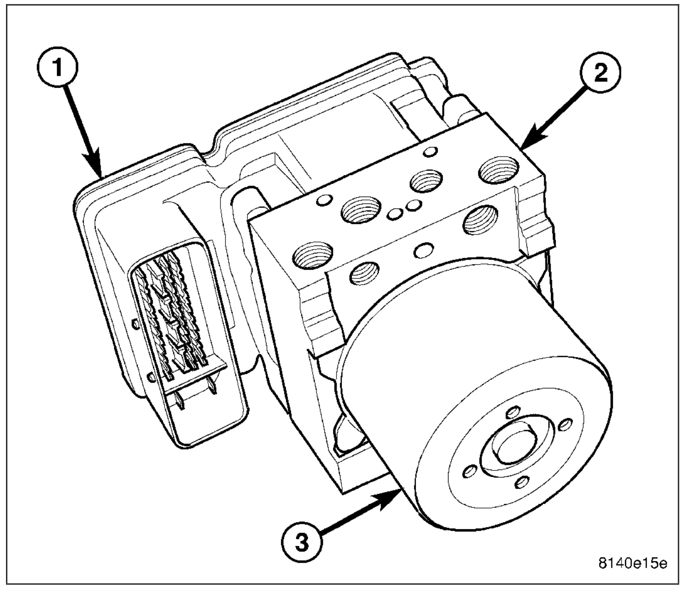
Yes >> Repair is not complete, refer to appropriate symptom.

No >> Repair is complete.

BRAKES - ABS SERVICE INFORMATION

TABLE OF CONTENTS

BRAKES - ABS SERVICE INFORMATION



DESCRIPTION

ANTILOCK BRAKE SYSTEM

This vehicle uses an antilock brake system designated MK25e. For this vehicle, MK25e is available with Electronic Stability Program (ESP) and All-Speed Traction Control or without.

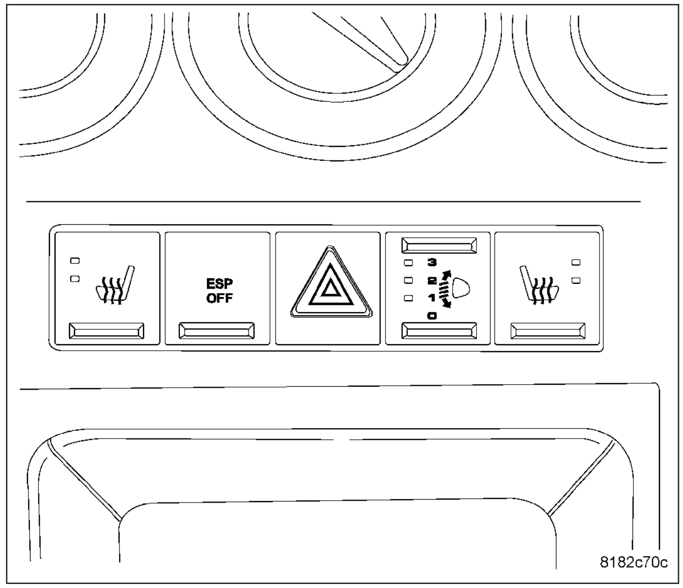
This antilock brake system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Hydraulic Control Unit (HCU) (2) and Antilock Brake Module (ABM) (1)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)

The MK25e ICU is made up of the Hydraulic Control Unit (HCU) and the Antilock Brake Module (ABM). For additional information on these components, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - DESCRIPTION) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ANTILOCK BRAKE MODULE - DESCRIPTION).

ABS

The purpose of the antilock brake system (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.



All vehicles equipped with ABS use Electronic Variable Brake Proportioning (EVBP) to balance front-to-rear braking when the brakes are applied in the partial braking range. For more information on electronic brake distribution, (Refer to 5 - BRAKES - ABS - DESCRIPTION).

ALL-SPEED TRACTION CONTROL

The traction control system that is part of the Electronic Stability Program (ESP), is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

All-Speed Traction Control is effective up to 85 mph (137 km/h).

The traction control system may be turned off or on by depressing the ESP Off switch button located on the instrument panel.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use Electronic Variable Brake Proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the Integrated Control Unit (ICU).

EVBP activation is invisible to the customer since there is no pump motor noise or brake pedal feedback.

OPERATION

ANTILOCK BRAKE SYSTEM

The following information applies to both antilock brakes (ABS) without Electronic Stability Program (ESP) and traction control and ABS with ESP and traction control.

ABS

There are a few performance characteristics of the Antilock Brake System (ABS) that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a diagonally split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 3–5 mph (5–8 km/h) If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation, although for vehicle stability, both rear wheel solenoids receive the same electrical signal. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the Integrated Control Unit (ICU) regulates hydraulic pressure at all four of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the

hydraulic pressure at either rear wheel does not exceed that of the highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the Wheel Speed Sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3–4 mph (5–6 km/h). There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph (5 km/h) or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25–30 percent. This means that the wheel rolling velocity is 25–30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12–25 mph (20–40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no faults are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel speed sensor mounting bosses; and loose wheel speed sensor mounting screws.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ALL-SPEED TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing “all-speed” traction control.

The traction control system is enabled at each ignition cycle. It may be turned off by depressing the traction control switch button. The ESP/TCS function indicator lamp illuminates immediately upon depressing the button. Pressing this button again or turning off and restarting the vehicle will enable the traction control system.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP, the inlet valve for the rear brake circuit is switched on so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the Low Pressure Accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the outlet valve and draining through the inlet valve check valve. At the same time the inlet valve is switched on in case of another brake application.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

CAUTION

The antilock brake system uses an electronic control module known as the Antilock Brake Module (ABM). This module is designed to withstand normal current draws associated with vehicle operation. Care must be taken to avoid overloading the circuits.

CAUTION: In testing for open or short circuits, do not ground or apply voltage to any of the circuits unless instructed to do so for a diagnostic procedure.

CAUTION: These circuits should only be tested using a high impedance multi-meter or the designated scan tool as described in this section. Power should never be removed or applied to any control module with the ignition in the ON position. Before removing or connecting battery cables, fuses, or connectors, always turn the ignition to the OFF position.

CAUTION: The ABM 47-way connector should never be connected or disconnected with the ignition switch in the ON position.

CAUTION: This vehicle utilizes active wheel speed sensors. Do not apply voltage to wheel speed sensors at any time.

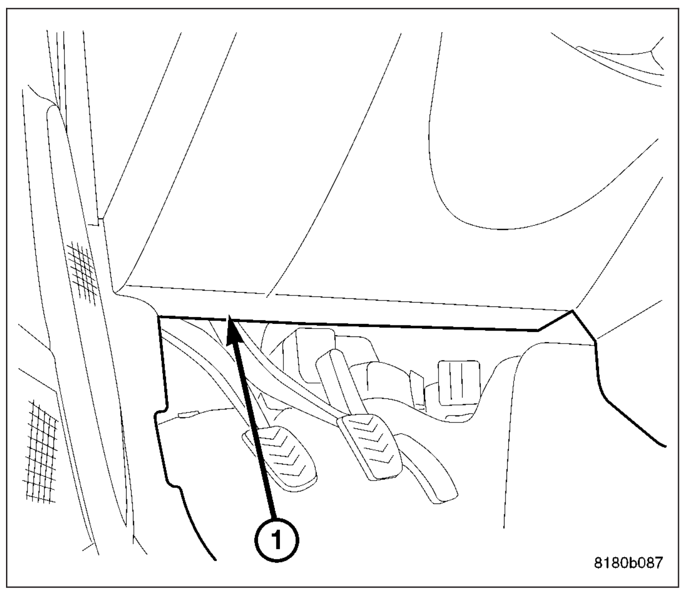
CAUTION: Use only factory wiring harnesses. Do not cut or splice wiring to the brake circuits. The addition of aftermarket electrical equipment (car phone, radar detector, citizen band radio, trailer lighting, trailer brakes, etc.) on a vehicle equipped with antilock brakes may affect the function of the antilock brake system.

CAUTION: When performing any service procedure on a vehicle equipped with ABS, do not apply a 12-volt power source to the ground circuit of the pump motor in the HCU. Doing this will damage the pump motor and will require replacement of the entire HCU.

CAUTION: An attempt to remove or disconnect certain system components may result in improper system operation. Only those components with approved removal and installation procedures in this manual should be serviced.

CAUTION: If welding work is to be performed on the vehicle using an electric arc welder, the ABM connector should be disconnected during the welding operation.

CAUTION: Many components of the ABS are not serviceable and must be replaced as an assembly. Do not disassemble any component which is not designed to be serviced.



CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surface, wash off with water immediately.

CAUTION: Only the recommended jacking or hoisting positions for this vehicle are to be used whenever it is necessary to lift a vehicle.

DIAGNOSIS AND TESTING

INSPECTION AND ROAD TEST

1. Visually inspect the ABS for damaged or disconnected components and connectors.
2. Verify the brake lamps are operational. If they are not, repair them prior to continuing.
3. Connect a scan tool to the Data Link Connector located under the instrument panel to the left of the steering column (1). If the scan tool does not power-up, check the power and ground supplies to the connector.
4. Turn the ignition key to the ON position.
5. Using the scan tool, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate diagnostic information.

If no problems are observed, it will be necessary to road test the vehicle.

Many ABS conditions judged to be a problem by the driver may be normal operating conditions. To become familiarized with the normal operating characteristics of this antilock brake system, (Refer to 5 - BRAKES - ABS OPERATION).

WARNING: Conditions that result in turning on the red brake warning indicator lamp may indicate reduced braking ability.

Before road testing a brake complaint vehicle, note whether the red BRAKE warning indicator lamp, amber ABS warning indicator lamp, or both are turned on. If it is the red BRAKE warning indicator, there is a brake hydraulic problem that must be corrected before driving the vehicle (Refer to 5 - BRAKES - BASE - DIAGNOSIS AND TESTING).

If the amber ABS warning indicator is on, road test the vehicle as described below. While only the amber ABS warning indicator is on, the ABS is not functional. The ability to stop the car using the base brake system should not be affected.

6. Turn the key to the OFF position and then back to the ON position. Note whether the amber ABS warning indicator lamp continues to stay on.
7. If the amber ABS warning indicator lamp stays on, shift into gear and drive the car to a speed of approximately 15 mph (25 km/h) to complete the ABS Start-Up and Drive-Off Cycles (Refer to 5 - BRAKES - ABS - OPERATION). If at this time the amber ABS warning indicator lamp stays on, refer to the appropriate diagnostic information.
8. If the amber ABS warning indicator lamp goes out at any time, drive the vehicle a short distance. Accelerate the vehicle to a speed of at least 64 km/h (40 mph). Bring the vehicle to a complete stop, braking hard enough to cause the ABS to cycle. Repeat this action several times. Using the scan tool, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate diagnostic information.

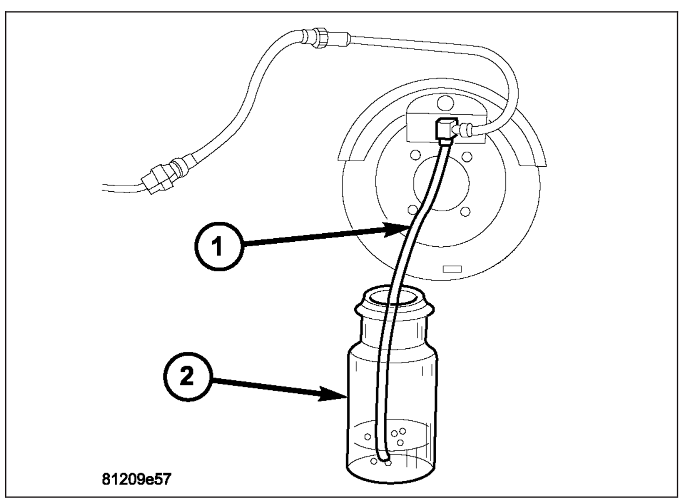
STANDARD PROCEDURE

ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The ABS must always be bled anytime it is suspected that the HCU has ingested air.

Brake systems with ABS must be bled as two independent braking systems. The non-ABS portion of the brake system with ABS is to be bled the same as any non-ABS system.

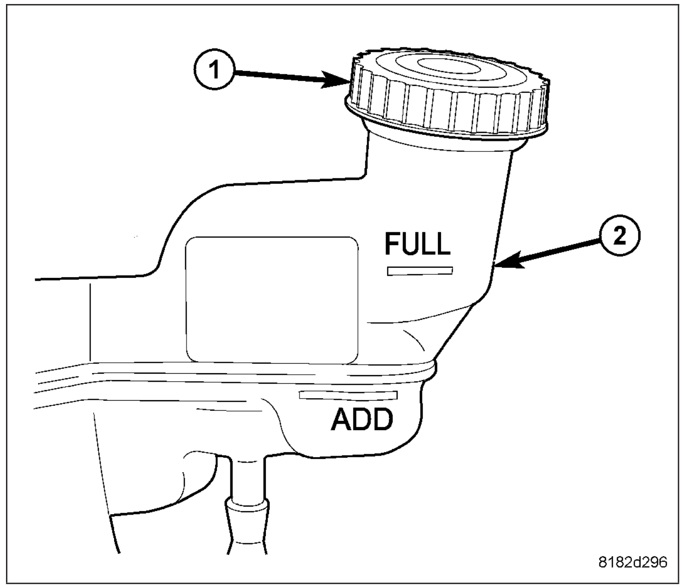
The ABS portion of the brake system must be bled separately. Use the following procedure to properly bleed the brake hydraulic system including the ABS.



NOTE: During the brake bleeding procedure, be sure the brake fluid level remains close to the FULL level in the master cylinder fluid reservoir. Check the fluid level periodically during the bleeding procedure and add Mopar® DOT 3 brake fluid as required.

BLEEDING

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.



1. Make sure all hydraulic fluid lines are installed and properly torqued.
2. Connect the scan tool to the diagnostics connector. The diagnostic connector is located under the lower steering column cover to the left of the steering column.
3. Using the scan tool, check to make sure the ABM does not have any fault codes stored. If it does, clear them.

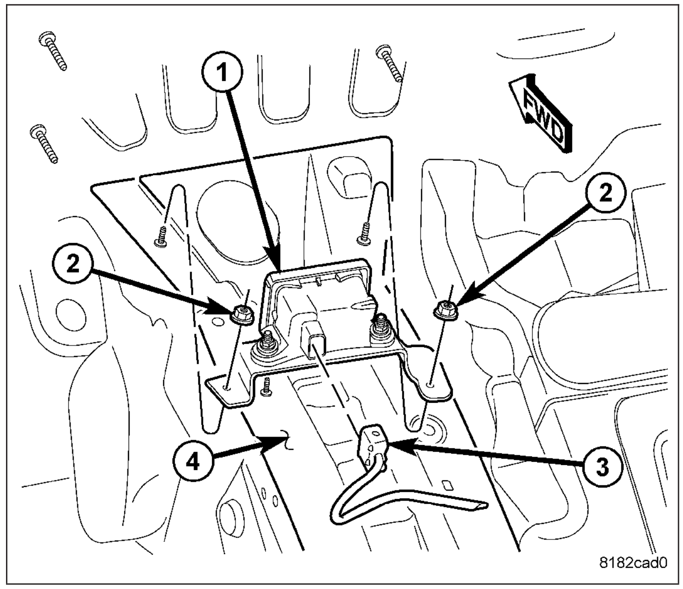
WARNING: When bleeding the brake system wear safety glasses. A clear bleed tube (1) must be attached to the bleeder screws and submerged in a clear container filled part way with clean brake fluid (2). Direct the flow of brake fluid away from yourself and the painted surfaces of the vehicle. Brake fluid at high pressure may come out of the bleeder screws when opened.

NOTE: Pressure bleeding is recommended to bleed the base brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

4. Bleed the base brake system. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE)
5. Using the scan tool, select ECU VIEW, followed by ABS MISCELLANEOUS FUNCTIONS to access bleeding. Follow the instructions displayed. When finished, disconnect the scan tool and proceed.
6. Bleed the base brake system a second time. Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.
7. Fill the master cylinder fluid reservoir (1) to the FULL level.
8. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

SPECIFICATIONS

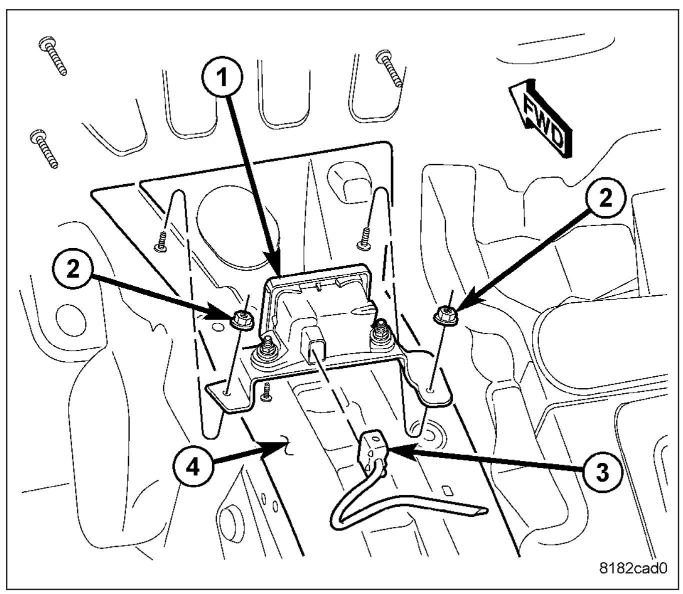
ABS FASTENER TORQUE



(Refer to 5 - BRAKES - BASE - SPECIFICATIONS - BRAKE FASTENER TORQUE)

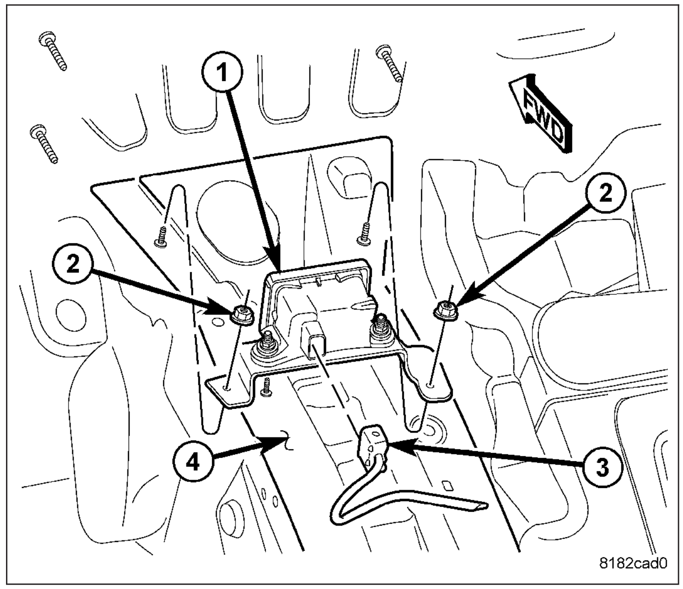
SENSOR-DYNAMICS (ESP)

DESCRIPTION



The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor (1). The sensor is used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor must be replaced when necessary.

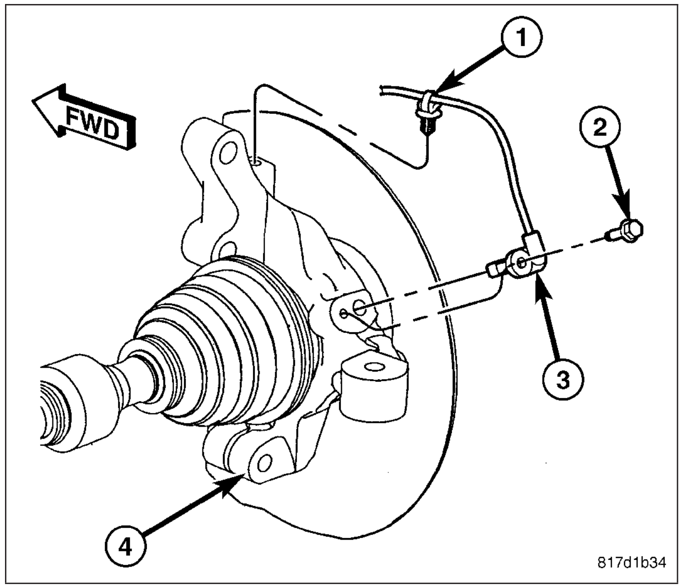


REMOVAL

1. Disconnect and isolate the battery negative cable from the battery post.
2. Remove the shifter housing center console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
3. Disconnect the wiring harness connector (3) at the dynamics sensor (1).
4. Remove the nuts (2) mounting the dynamics sensor to the floor pan tunnel (4).
5. Remove the dynamics sensor (1).

INSTALLATION

1. Install the dynamics sensor (1) over the studs mounted to the floor pan tunnel (4).
2. Install the two mounting nuts (2). Tighten the nuts to 9 N·m (80 in. lbs.).
3. Connect the wiring harness connector (3) to the dynamics sensor (1).
4. Install the shifter housing center console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
5. Connect the battery negative cable to the battery post. It is important that this be performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
6. Perform the Verification Test and clear any faults. (Refer to 5 - BRAKES - STANDARD PROCEDURE)



SENSOR-FRONT WHEEL SPEED

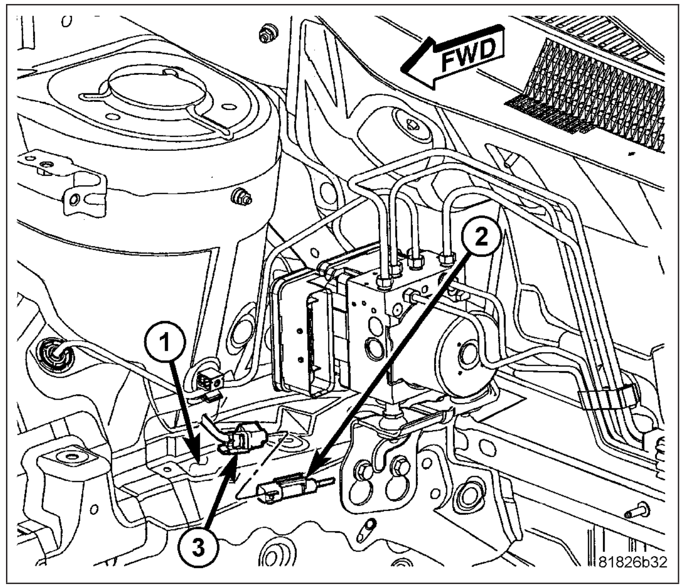
DESCRIPTION

The antilock brake system uses two-wire wheel speed sensors, known as active wheel speed sensors. The sensors use an electronic principle known as magnetoresistive to help increase performance and durability. The sensors convert wheel speed into a small digital signal. A Wheel Speed Sensor (WSS) is used at each wheel. A magnetic pole encoder serves as the trigger mechanism for each sensor. At each wheel of the vehicle there is one wheel speed sensor and one encoder.

A front wheel speed sensor (3) is attached to a mounting boss on each front knuckle (4). The encoder is an integral part of the hub and bearing.

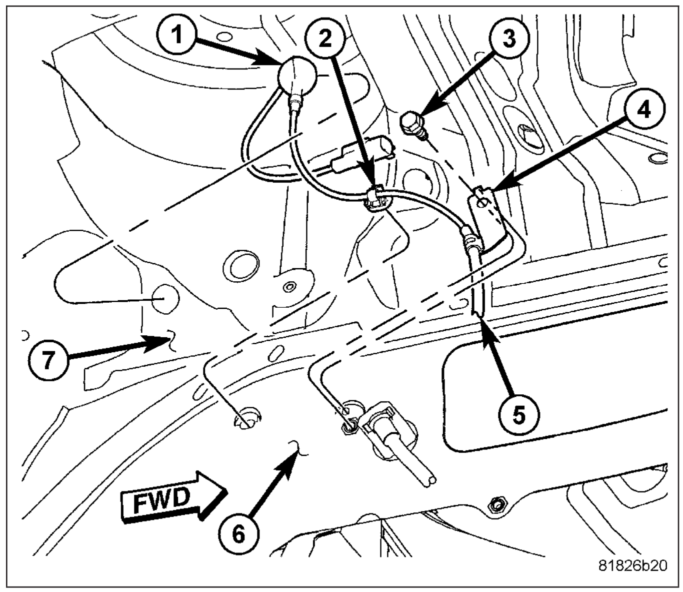
WSS air gaps are not adjustable.

OPERATION



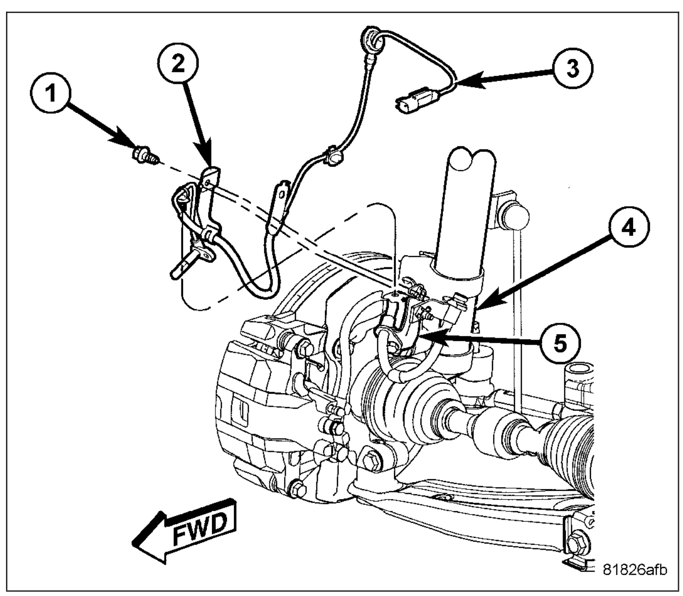
The ABM sends 12 volts to power an Integrated Circuit (IC) in the sensor. The IC supplies a constant 7 mA power supply to the ABM. The relationship of the magnetic pole encoder to the permanent magnet in the sensor, signals the IC to enable a second 7 mA power supply. The output of the sensor, sent to the ABM, is a DC voltage signal with changing voltage and current levels. The ground for the IC and the current sense circuit is provided by the ABM.

When a pole is properly aligned with the sensor, the voltage signal is approximately 0.8 volts and a constant 7 mA current is sent to the ABM. As the magnetic pole encoder rotates, the encoder shifts the magnetic field and the IC enables a second 7 mA current source. The ABM senses a voltage signal of approximately 1.6 volts and 14 mA. The ABM measures the amperage of the digital signal for each wheel. The resulting signal is interpreted by the ABM as the wheel speed.



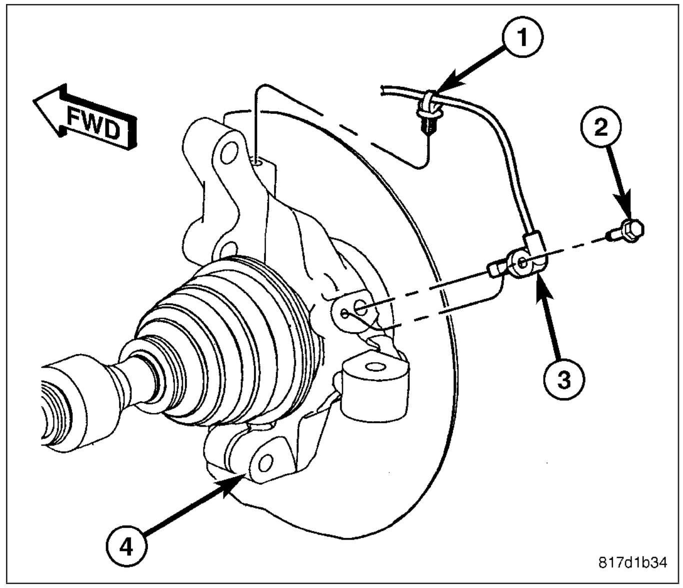
REMOVAL

NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



1. Open the hood.
2. Disconnect the wheel speed sensor cable connector (2) from the wiring harness connector (3) on top of the frame rail (1) to the inside of the strut tower.
3. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

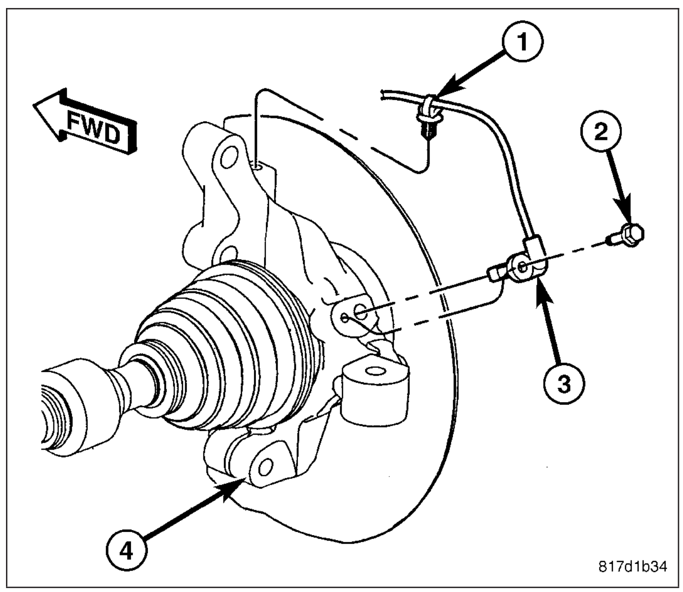
4. Remove the grommet (1) from the hole in the body (7) and pull the wheel speed sensor cable out of the hole.
5. Remove the speed sensor cable routing clip (2) from the outside frame rail (6).
6. Remove the screw fastening the cable routing clamp (3) to the outside frame rail (6).



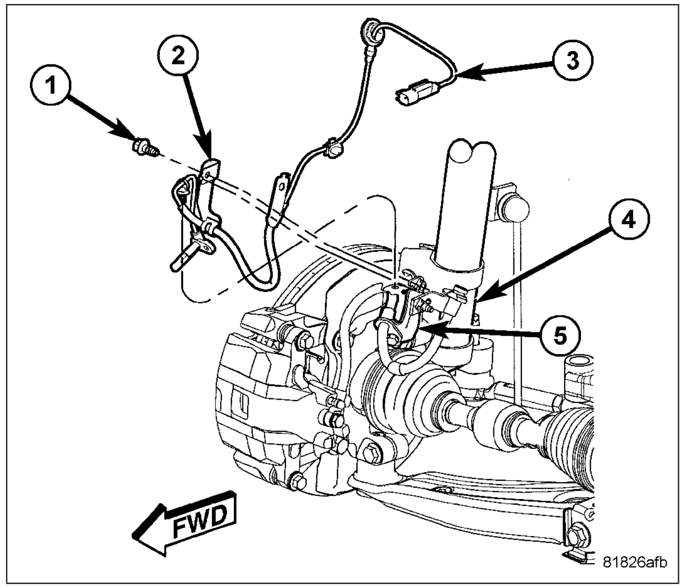
7. Remove the screw (1) securing the wheel speed sensor routing bracket (2) to the brake flex hose bracket (5).

8. Remove the mounting screw (2) fastening the wheel speed sensor head (3) to the knuckle (4). Pull the sensor head out of the knuckle.

NOTE: In the following step, the routing clip can be easily removed without damaging it by rotating it (with entire sensor) counterclockwise.

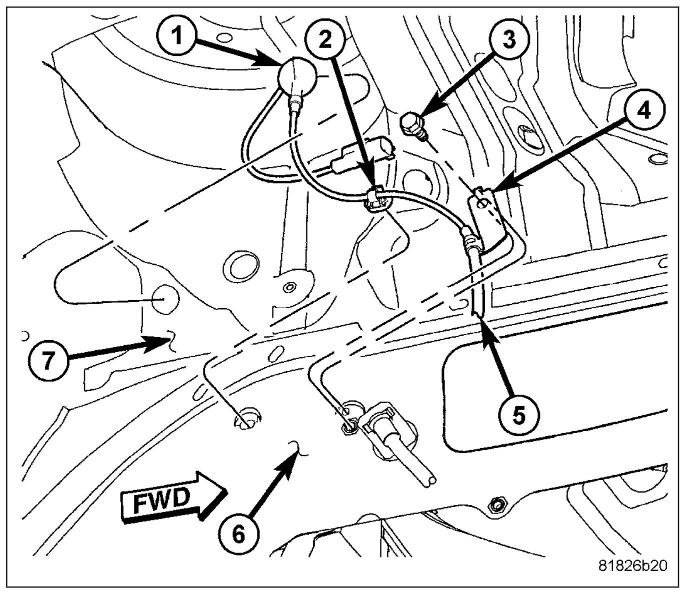


9. Remove the routing clip (1) securing wheel speed sensor cable to the knuckle (4). Remove the sensor from the vehicle.

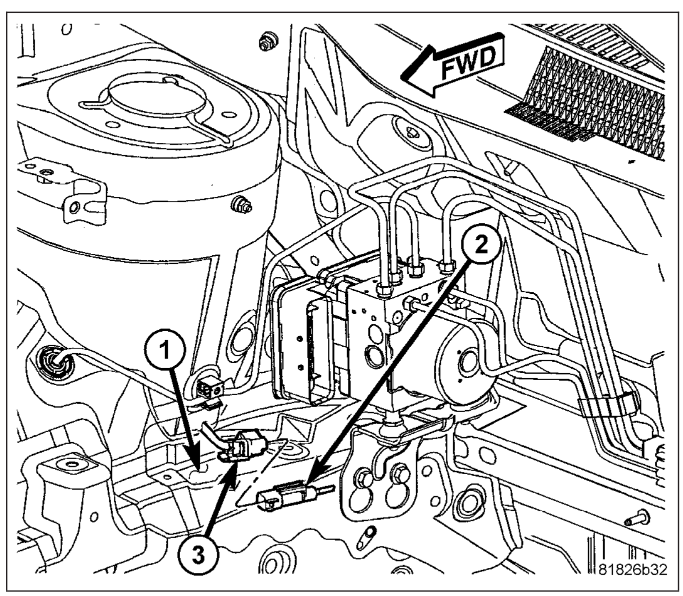


INSTALLATION

CAUTION: Failure to install speed sensor cables properly may result in contact with moving parts or an over extension of cables causing an open circuit. Be sure that cables are installed, routed, and clipped properly.



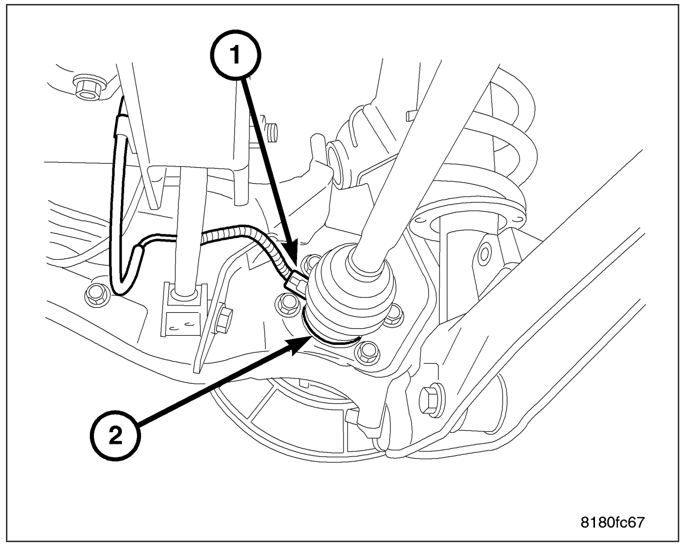
1. Install the wheel speed sensor head (3) into the knuckle (4). Install the mounting screw (2) and tighten it to 12 N·m (106 in. lbs.).
2. Install the routing clip (1) securing the wheel speed sensor cable to the knuckle (4).



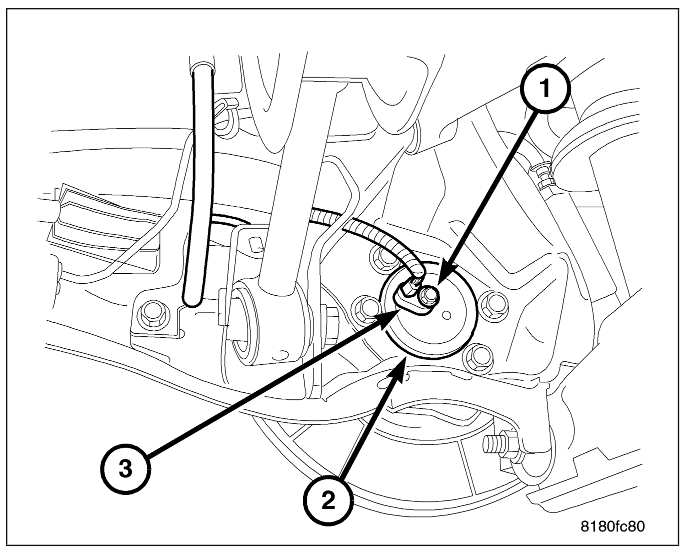
3. Position the wheel speed sensor routing bracket (2) on the brake flex hose bracket (5) and install the mounting screw (1). Tighten the mounting screw to 18 N·m (13 ft. lbs.).

4. Position the wheel speed sensor cable routing clamp (4) on the outside frame rail (6) and install the mounting screw (3). Tighten the mounting screw to 18 N·m (13 ft. lbs.).
5. Install the speed sensor cable routing clip (2) on the outside frame rail (6).
6. Insert the wheel speed sensor cable through the hole in the body (7) and install the grommet (1) in the hole.

7. Lower the vehicle.
8. Connect the wheel speed sensor cable connector (2) to the wiring harness connector (3) on top of the frame rail (1).
9. Perform the Diagnostic Verification Test and clear any faults. (Refer to 5 - BRAKES - STANDARD PROCEDURE)



SENSOR-REAR WHEEL SPEED



DESCRIPTION

The antilock brake system uses two-wire wheel speed sensors, known as active wheel speed sensors. The sensors use an electronic principle known as magnetoresistive to help increase performance and durability. The sensors convert wheel speed into a small digital signal. A Wheel Speed Sensor (WSS) is used at each wheel. A magnetic pole encoder serves as the trigger mechanism for each sensor. At each wheel of the vehicle there is one wheel speed sensor and one encoder.

On all-wheel-drive vehicles, the rear wheel speed sensor head (1) is secured to the rear hub and bearing (2) by a spring-loaded clip on the rear of the assembly. The encoder is integral to the hub and bearing assembly. The encoder is serviced as part of the rear hub and bearing.

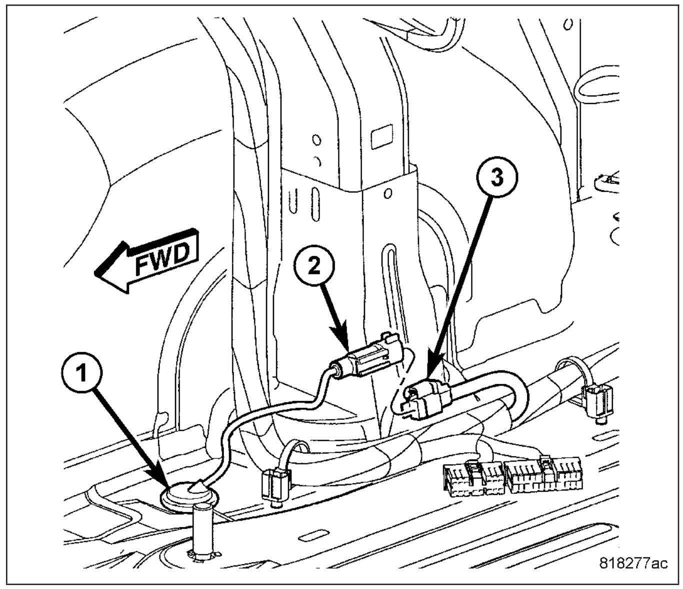
On front-wheel-drive vehicles, the rear wheel speed sensor head (3) is mounted to the rear of the hub and bearing by a screw. The encoder is integral to the hub and bearing assembly. The encoder is are serviced as part of the rear hub and bearing.

The WSS air gaps are not adjustable.

OPERATION

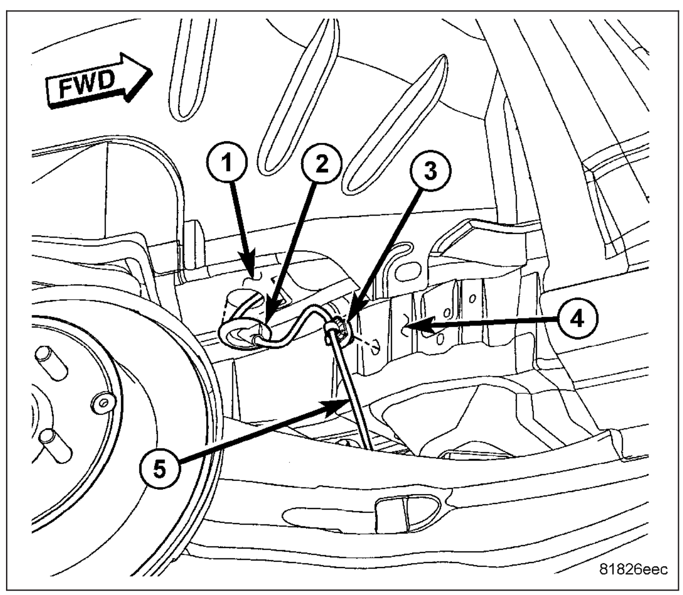
The ABM sends 12 volts to power an Integrated Circuit (IC) in the sensor. The IC supplies a constant 7 mA power supply to the ABM. The relationship of the magnetic pole encoder to the permanent magnet in the sensor, signals the IC to enable a second 7 mA power supply. The output of the sensor, sent to the ABM, is a DC voltage signal with changing voltage and current levels. The ground for the IC and the current sense circuit is provided by the ABM.

When a pole is properly aligned with the sensor, the voltage signal is approximately 0.8 volts and a constant 7 mA current is sent to the ABM. As the magnetic pole encoder rotates, the encoder shifts the magnetic field and the IC enables a second 7 mA current source. The ABM senses a voltage signal of approximately 1.6 volts and 14 mA.



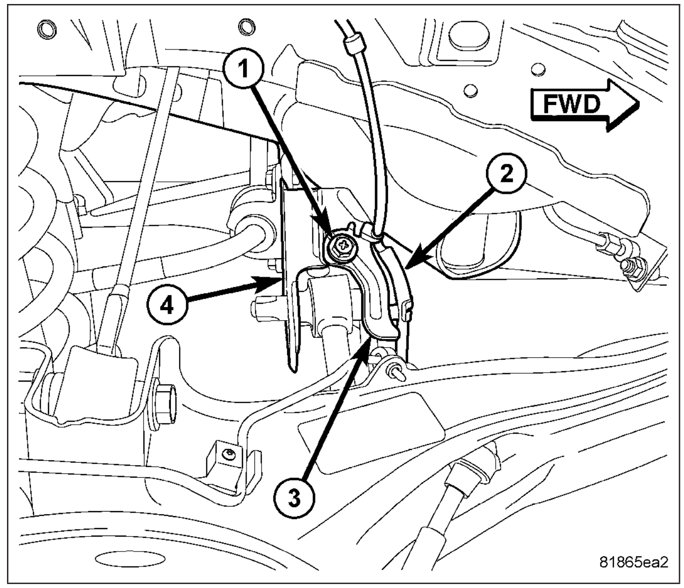
The ABM measures the amperage of the digital signal for each wheel. The resulting signal is interpreted by the ABM as the wheel speed.

REMOVAL

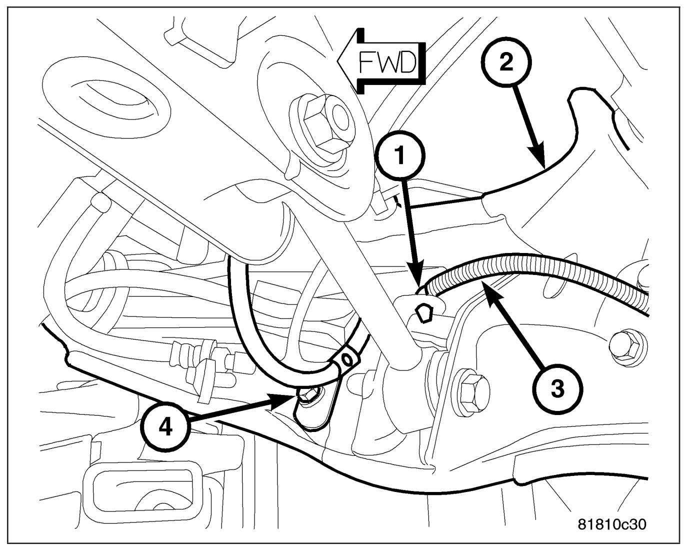


ALL-WHEEL-DRIVE

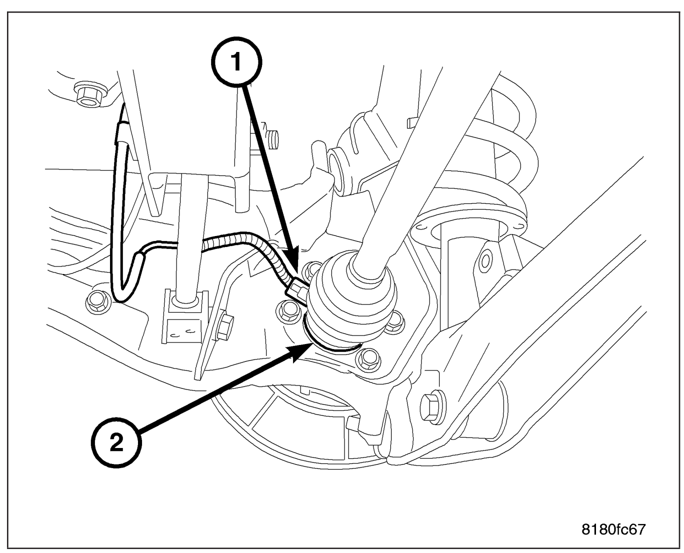
NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



1. Remove the interior rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL)
2. Disconnect the wheel speed sensor cable connector (2) at the body wiring harness connector (3).

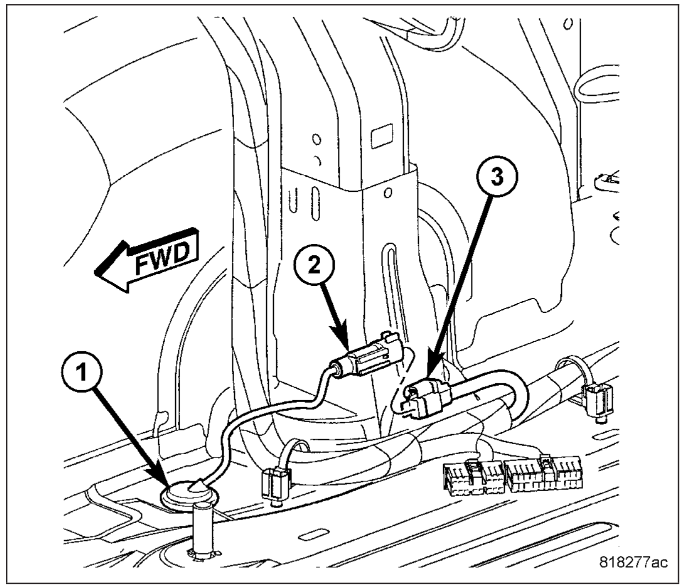


3. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
4. Remove the grommet (2) from the hole in the body (1) and pull the wheel speed sensor cable out through the hole.
5. Remove the speed sensor cable routing clip (3) from the outside frame rail (4).

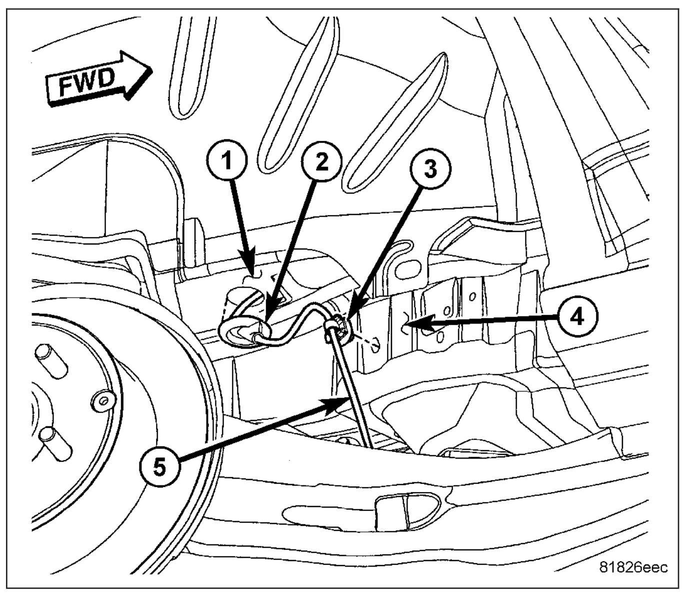


6. Remove the screw (1) fastening the cable routing clamp (3) to the rear suspension crossmember (4).

7. Remove the speed sensor cable routing clip (1) from the trailing link (2).
8. Remove the screw (4) fastening the cable routing clamp to the trailing link.

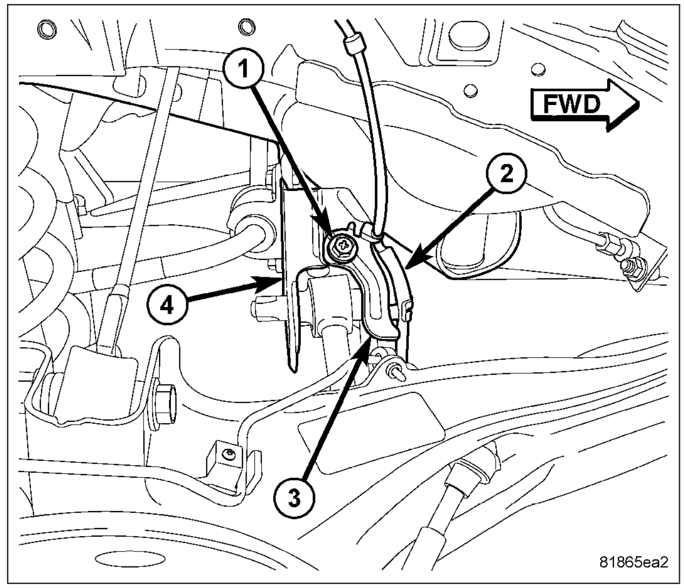


9. Unclip the wheel speed sensor head (1) from the spring-loaded retainer on the rear of the hub and bearing (2). Remove the sensor from the vehicle.

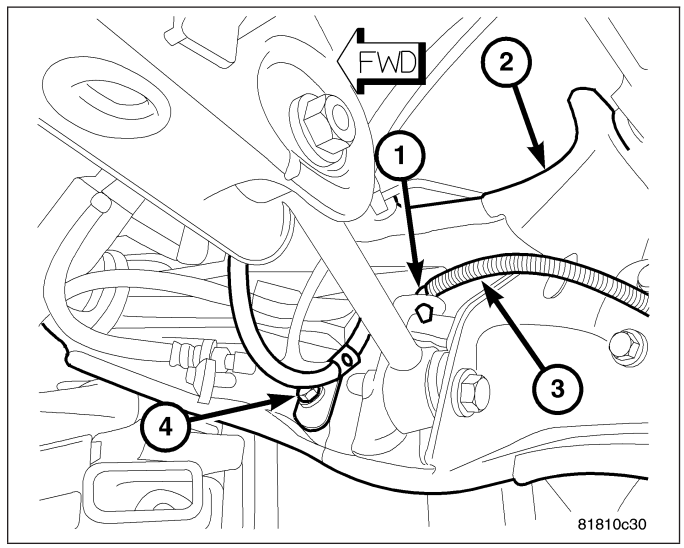


FRONT-WHEEL-DRIVE

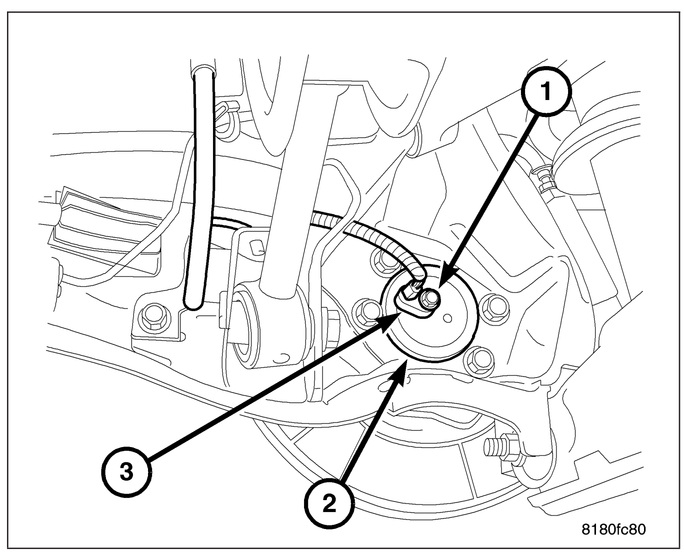
NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



1. Remove the interior rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL)
2. Disconnect the wheel speed sensor cable connector (2) at the body wiring harness connector (3).



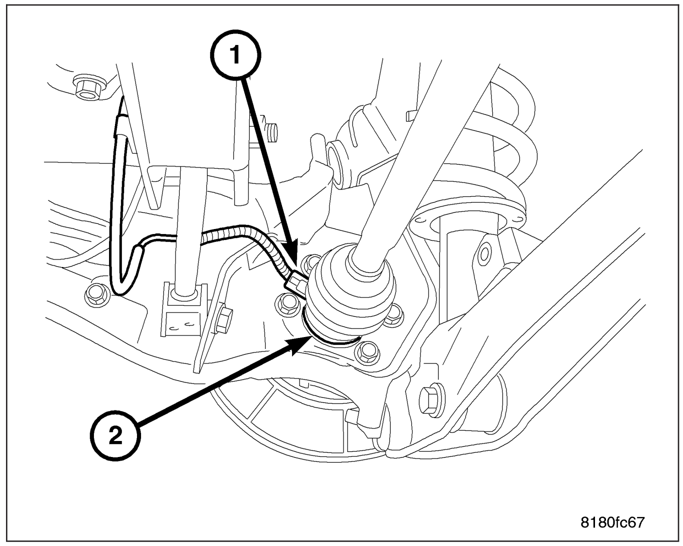
3. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
4. Remove the grommet (2) from the hole in the body (1) and pull the wheel speed sensor cable out through the hole.
5. Remove the speed sensor cable routing clip (3) from the outside frame rail (4).



6. Remove the screw (1) fastening the cable routing clamp (3) to the rear suspension crossmember (4).

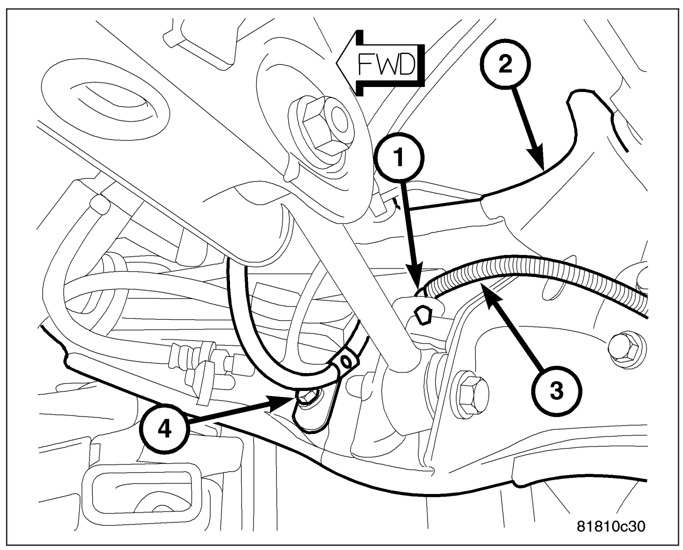
7. Remove the speed sensor cable routing clip (1) from the trailing link (2).
8. Remove the screw (4) fastening the cable routing clamp to the trailing link.

9. Remove the screw (1) fastening the wheel speed sensor head (3) in the rear of the hub and bearing (2). Remove the sensor from the vehicle.



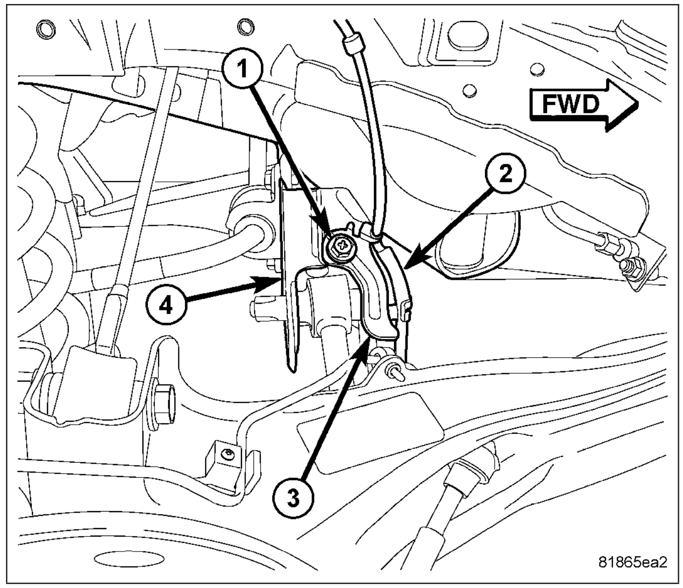
INSTALLATION

ALL-WHEEL-DRIVE

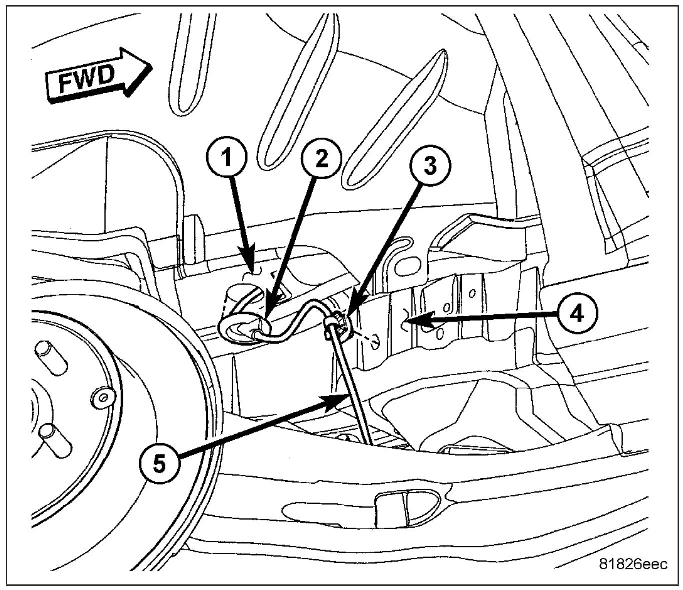


CAUTION: Failure to install speed sensor cables properly may result in contact with moving parts or an over extension of cables causing an open circuit. Be sure that cables are installed, routed, and clipped properly.

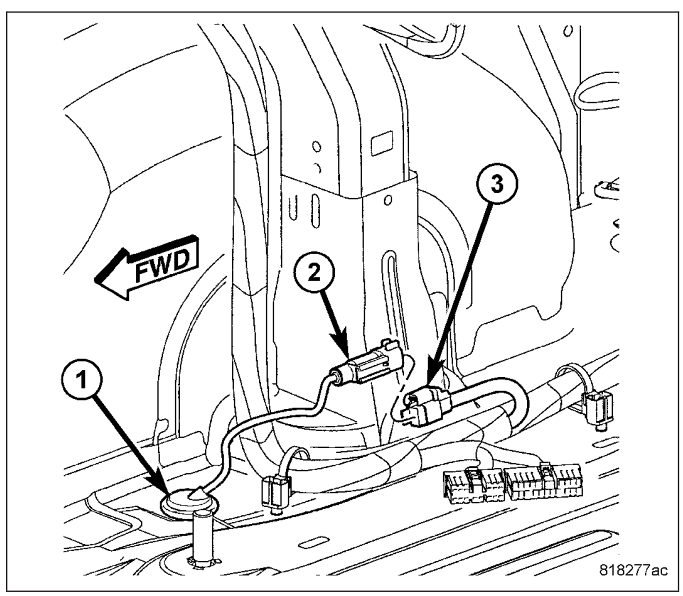
NOTE: When installing the sensor head to the spring-loaded retainer on the hub and bearing, make sure the head is held snug in the retainer. If there is any play, the clip is deformed and the hub and bearing must be replaced. The retainer is not serviced separately.



1. Clip the wheel speed sensor head (1) (flat side to bearing rear face) into the spring-loaded retainer on the rear of the hub and bearing (2).

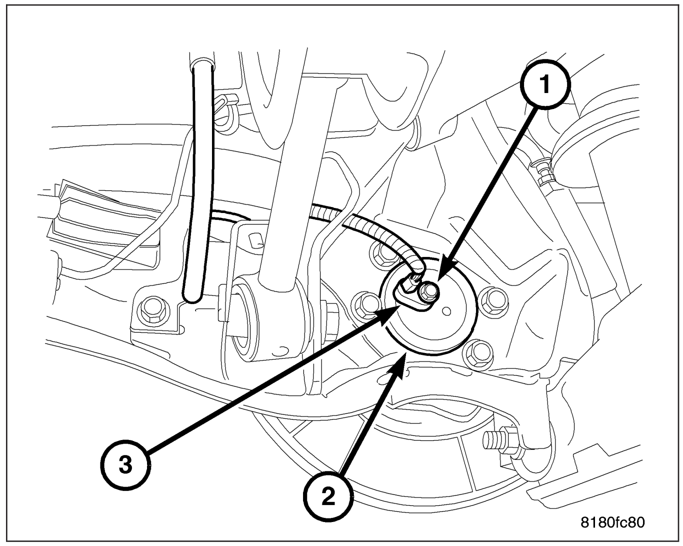


2. Position the wheel speed sensor (3) on the trailing link (2) and install the screw (4) securing it in place. Tighten the mounting screw to 18 N·m (13 ft. lbs.).
3. Position the wheel speed sensor (3) and install the routing clip (1) fastening the sensor to the trailing link (2).

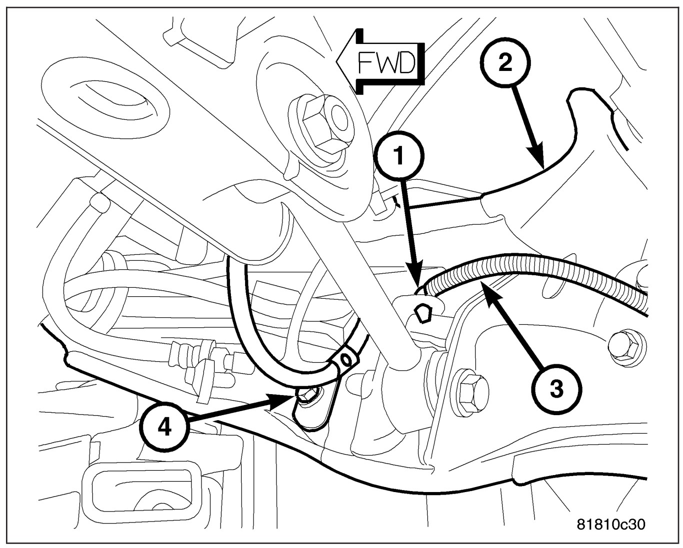


4. Position the wheel speed sensor cable routing clamp (3) on the rear suspension crossmember (4) and install the mounting screw (1). Tighten the mounting screw to 18 N·m (13 ft. lbs.).

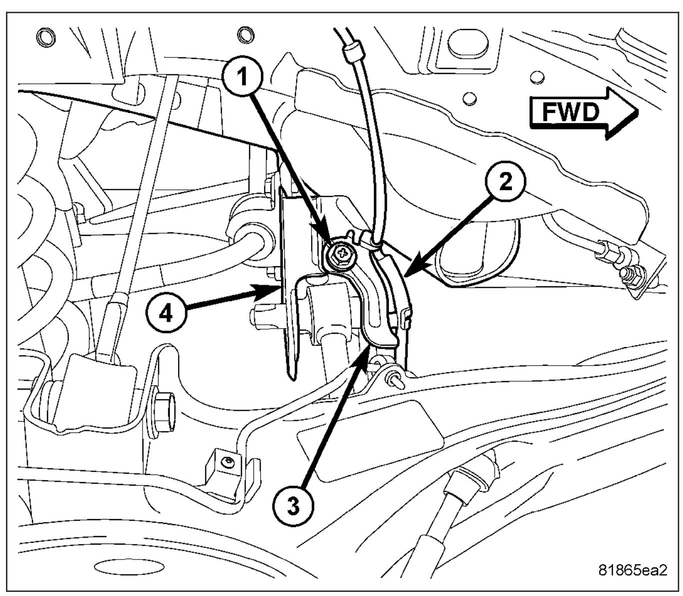
5. Install the speed sensor cable routing clip (3) on the outside frame rail (4).
6. Insert the wheel speed sensor cable (5) through the hole in the body (1) and install the grommet (2) in the hole.
7. Lower the vehicle.



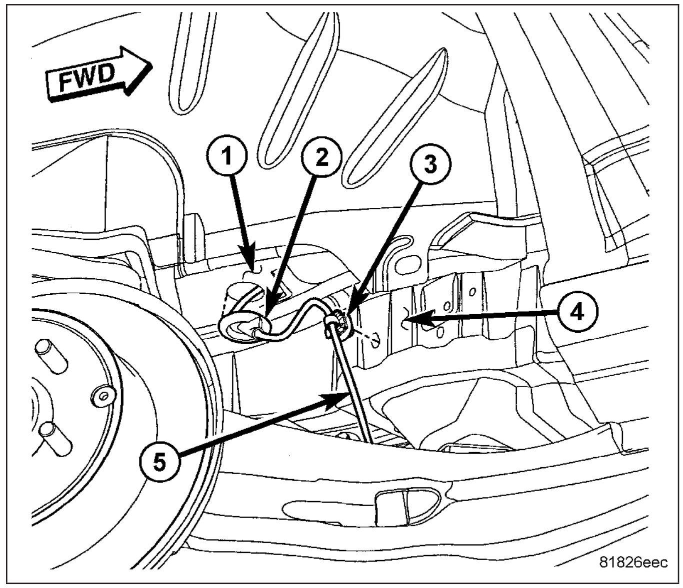
8. Connect the wheel speed sensor cable connector (2) at the body wiring harness connector (3).
9. Install the interior rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION)
10. Perform the Diagnostic Verification Test and clear any faults. (Refer to 5 - BRAKES - STANDARD PROCEDURE)



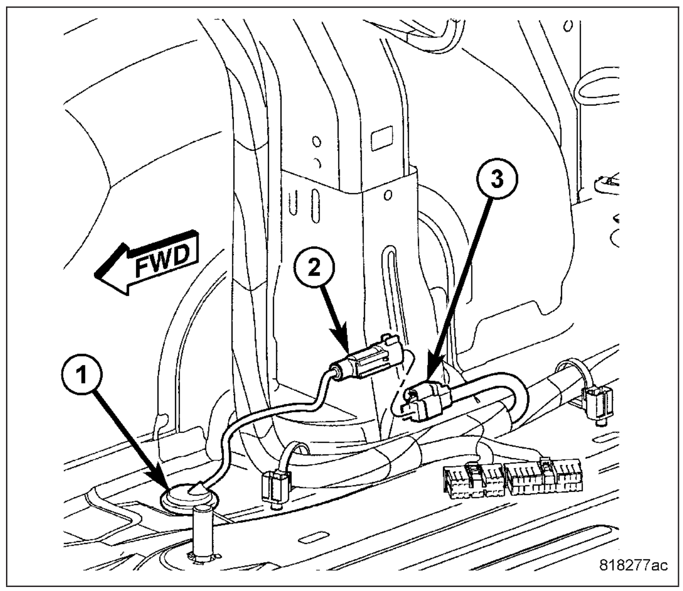
FRONT-WHEEL-DRIVE



1. Install the wheel speed sensor head (3) into the rear of the hub and bearing (2).
2. Install the wheel speed sensor head mounting screw (1). Tighten the screw to 10 N·m (89 in. lbs.).



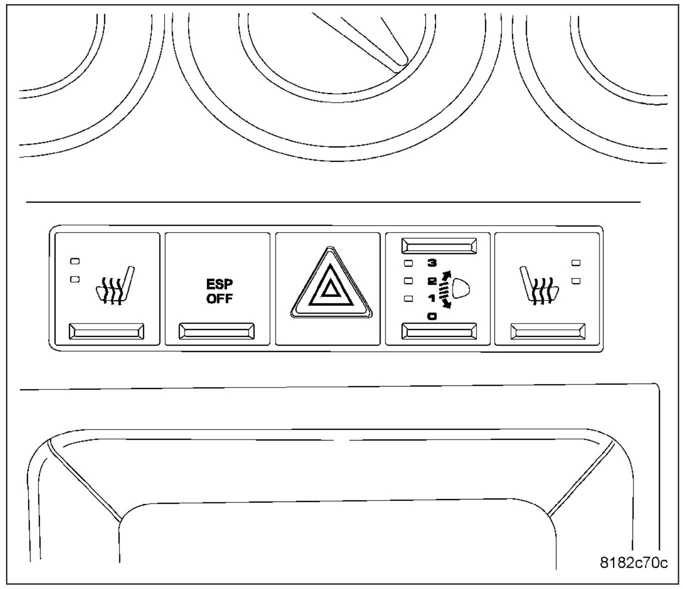
3. Position the wheel speed sensor (3) on the trailing link (2) and install the screw (4) securing it in place. Tighten the mounting screw to 18 N·m (13 ft. lbs.).
4. Position the wheel speed sensor (3) and install the routing clip (1) fastening the sensor to the trailing link (2).



5. Position the wheel speed sensor cable routing clamp (3) on the rear suspension crossmember (4) and install the mounting screw (1). Tighten the mounting screw to 18 N·m (13 ft. lbs.).

6. Install the speed sensor cable routing clip (3) on the outside frame rail (4).
7. Insert the wheel speed sensor cable (5) through the hole in the body (1) and install the grommet (2) in the hole.
8. Lower the vehicle.

9. Connect the wheel speed sensor cable connector (2) at the body wiring harness connector (3).
10. Install the interior rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION)
11. Perform the Diagnostic Verification Test and clear any faults. (Refer to 5 - BRAKES - STANDARD PROCEDURE)



SWITCH-ESP

DESCRIPTION

The ESP Off Switch is part of the accessory switch bank module located in the center bezel on the instrument panel above the transmission gear shifter. The ESP Off switch turns the Electronic Stability Program off whenever the switch is depressed. Depressing the switch a second time turns the ESP back on. The switch resets itself each time the ignition is cycled.

When the ESP Off switch is depressed and released, turning ESP off, it does not completely turn the system off. The ESP system reduces torque management to a lesser amount, but ESP function can still occur if the system perceives the need.

The ESP Off switch is serviced as part of the accessory switch bank. There are different accessory switch banks available based on the option content of the vehicle. Ensure the accessory switch bank being installed matches the vehicle options.

REMOVAL

NOTE: The ESP Off switch is integral to the accessory switch bank and cannot be serviced separately.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel from the instrument panel and place it on a work bench (Refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - REMOVAL).
3. Remove the screws that secure the accessory switch bank to the back of the center bezel and remove the accessory switch bank.

INSTALLATION

NOTE: The ESP Off switch is serviced as part of the accessory switch bank.

NOTE: There are different instrument panel accessory switch banks available based on the option content of the vehicle. Ensure the accessory switch bank being installed matches the vehicle options.

1. Position the accessory switch bank onto the back of the instrument panel center bezel.
2. Install the screws that secure the accessory switch bank to the center bezel. Tighten the screws to 2 N·m (17 in. lbs.).
3. Install the center bezel onto the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - INSTALLATION).
4. Reconnect the negative battery cable.
5. Perform the ABS Verification Test and make sure the ESP Off switch operates properly. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
6. Verify proper operation of all components controlled by the switch bank.

HYDRAULIC CONTROL UNIT (HCU)

DESCRIPTION

The Hydraulic Control Unit (HCU) is mounted to the Antilock Brake Module (ABM) as part of the Integrated Control Unit (ICU). The HCU controls the flow of brake fluid to the brakes using a series of valves and accumulators. A pump/motor is mounted on the HCU to supply build pressure to the brakes during an ABS stop.

VALVES AND SOLENOIDS

The valve block contains four inlet valves and four outlet solenoid valves. The inlet valves are spring-loaded in the open position and the outlet valves are spring-loaded in the closed position during normal braking. The fluid is allowed to flow from the master cylinder to the wheel brakes.

During an ABS stop, these valves cycle to maintain the proper slip ratio for each wheel. The inlet valve closes preventing further pressure increase and the outlet valve opens to provide a path from the wheel brake to the HCU accumulators and pump/motor. This releases (decays) pressure from the wheel brake, thus releasing the wheel from excessive slippage. Once the wheel is no longer slipping, the outlet valve is closed and the inlet valve is opened to reapply (build) pressure.

If the ABS includes the traction control feature, there are four other valves in the HCU. Two traction control (TC) valves, mounted in the HCU valve block, are normally in the open position and close only when the traction control is applied. There are also two shuttle valves which control pressure return to the master cylinder under ABS and traction control conditions.

These TC valves are used to isolate the rear (non-driving) wheels of the vehicle from the hydraulic pressure that the HCU pump/motor is sending to the front (driving) wheels when traction control is being applied. The rear brakes need to be isolated from the master cylinder when traction control is being applied so the rear wheels do not drag.

BRAKE FLUID ACCUMULATORS

There are two fluid accumulators in the HCU: one for the primary hydraulic circuit, and one for the secondary hydraulic circuit. Each hydraulic circuit uses a 3 cc accumulator.

The fluid accumulators temporarily store brake fluid that is removed from the wheel brakes during an ABS cycle. This stored fluid is used by the pump/motor to provide build pressure for the brake hydraulic system. When the antilock stop is complete, the accumulators are drained by the pump/motor.

There are two noise dampening chambers in the HCU on this vehicle equipped with traction control.

PUMP/MOTOR

There are two pump assemblies in the HCU: one for the primary hydraulic circuit, and one for the secondary hydraulic circuit. Both pumps are driven by a common electric motor. This DC-type motor is integral to the HCU and is controlled by the ABM.

The pump/motor provides the extra amount of brake fluid needed during antilock braking. Brake fluid is released to the accumulators when the outlet valve is opened during an antilock stop. The pump mechanism consists of two opposing pistons operated by an eccentric camshaft. In operation, these pistons are used to purge fluid from the accumulators back into the master cylinder circuits. When the antilock stop is complete, the pump/motor drains the accumulators.

The pump motor is also used to build pressure when the system goes into Electronic Stability Program (ESP) and traction control mode.

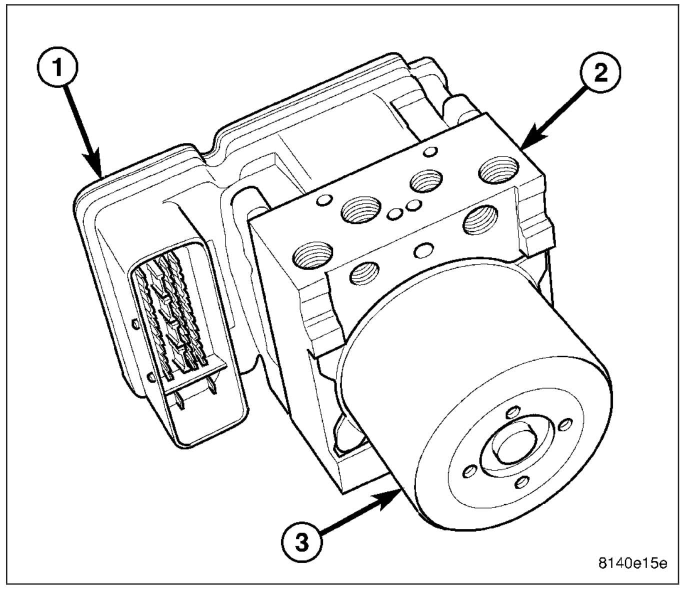
The ABM may turn on the pump/motor when an antilock stop is detected. The pump/motor continues to run during the antilock stop and is turned off after the stop is complete. Under some conditions, the pump/motor runs to drain the accumulators during the next drive-off.

The pump/motor is not a serviceable item; if it requires replacement, the HCU must be replaced.

For more information, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - OPERATION - HYDRAULIC CIRCUITS AND VALVES).

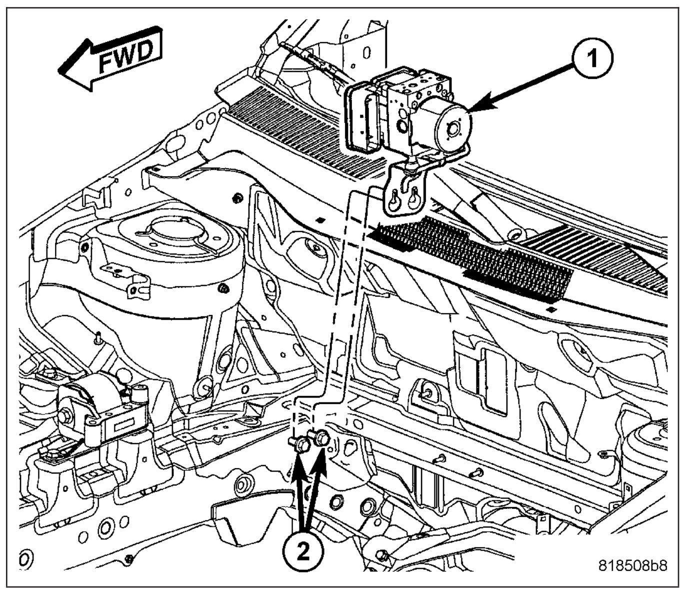
REMOVAL

To remove the HCU, the ICU must be removed and disassembled. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - REMOVAL) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - DISASSEMBLY)



INSTALLATION

To install the HCU, assemble and install the ICU. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - ASSEMBLY) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - INSTALLATION)



INTEGRATED CONTROL UNIT (ICU)

DESCRIPTION

The Hydraulic Control Unit (HCU) (2) and the Antilock Brake Module (ABM) (1) used with this antilock brake system are combined (integrated) into one unit, which is called the Integrated Control Unit (ICU).

The ICU (1) is located in the engine compartment, mounted to the right side body frame rail near the strut tower.

Two different ICU's are used on this vehicle depending on whether or not the vehicle is equipped with traction control and Electronic Stability Program (ESP). The HCU on a vehicle equipped with traction control or ESP has a valve block that is approximately one inch longer than a HCU on a vehicle that is equipped with ABS only.

The ABS-only ICU consists of the following components: the ABM, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), valve block, fluid accumulators, a pump, and an electric motor.

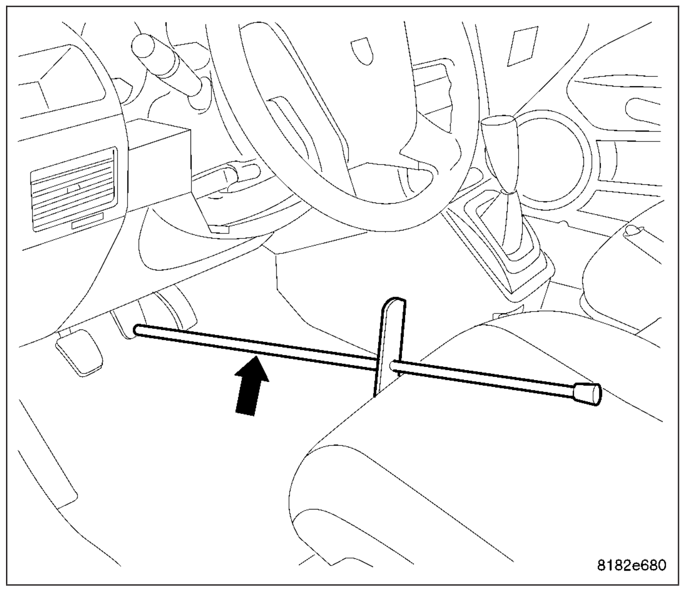
The ABS with ESP and All-Speed Traction Control ICU consists of the following components: the ABM, 12 (build/decay) solenoid valves, two traction control solenoid valves, two hydraulic shuttle valves, valve block, fluid accumulators, a pump, and an electric pump/motor.

The replaceable components of the ICU are the HCU and the ABM. No attempt should be made to service any components of the HCU or ABM.

For additional information on the ABM, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ANTILOCK BRAKE MODULE - DESCRIPTION). For additional information on the HCU, (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - DESCRIPTION).

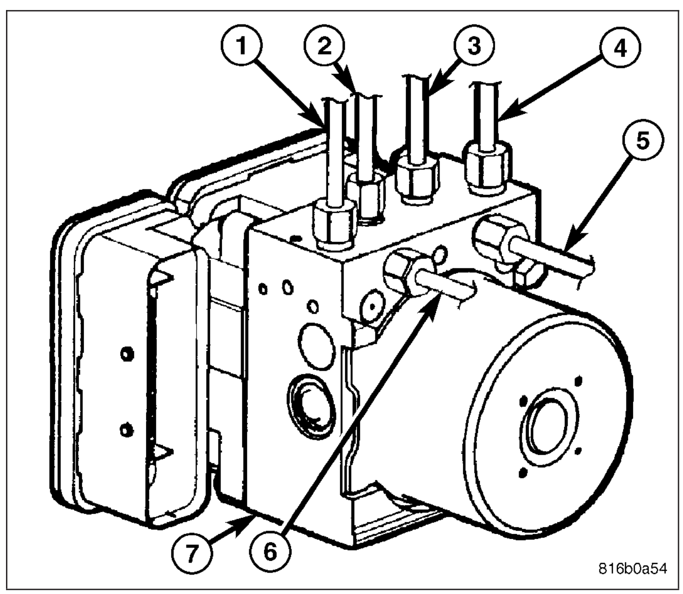
OPERATION

For information of the ICU, refer to these individual components of the ICU:



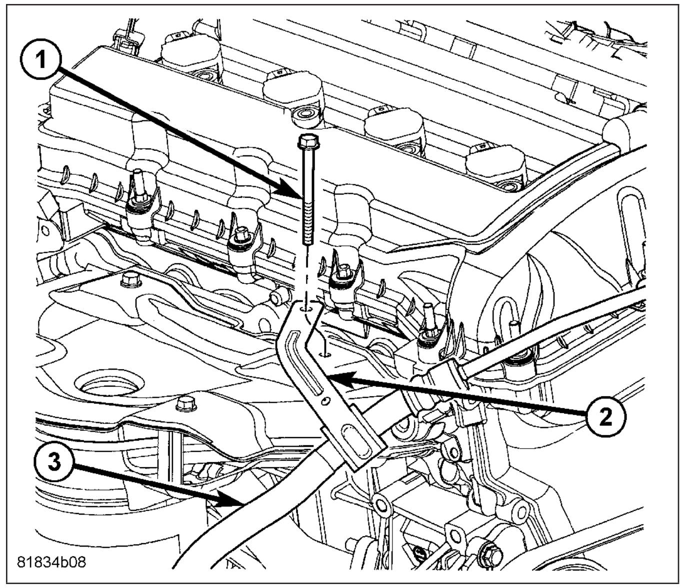
- ANTILOCK BRAKE MODULE (ABM) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ANTILOCK BRAKE MODULE - DESCRIPTION)
- HYDRAULIC CONTROL UNIT (HCU) (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - OPERATION)

REMOVAL

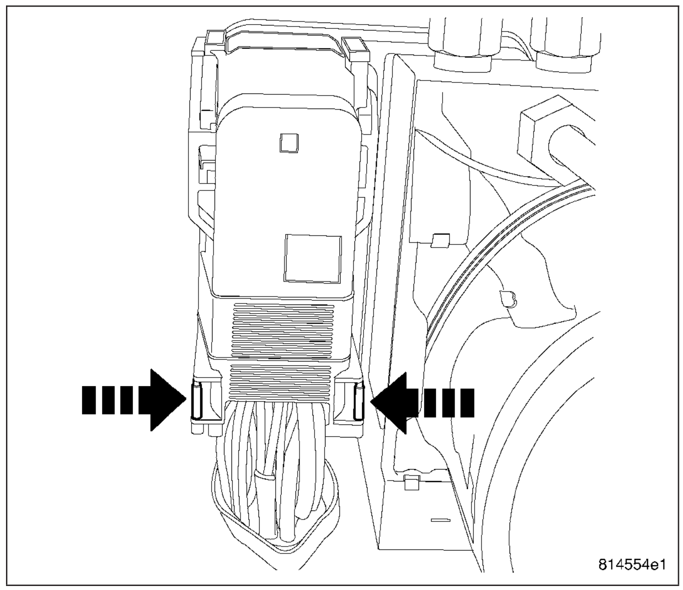


GAS ENGINE

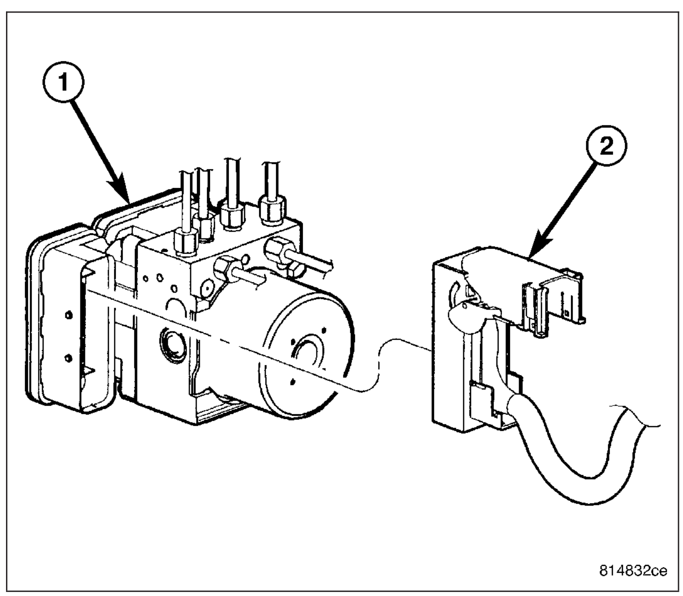
NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).



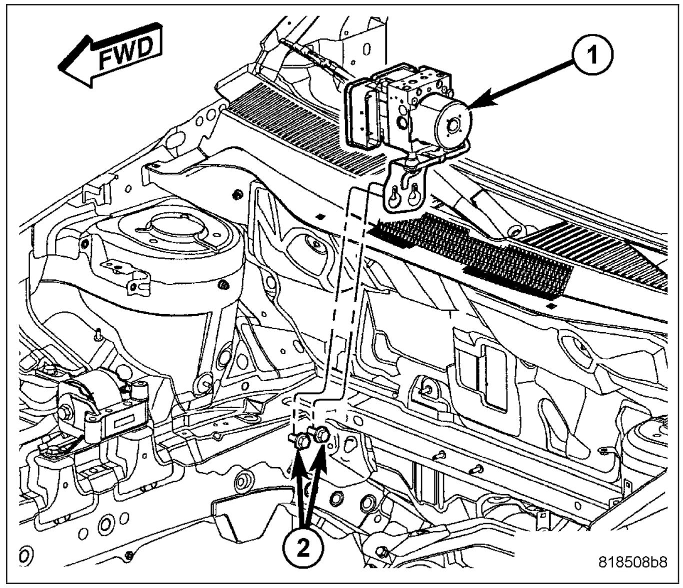
1. Disconnect and isolate battery negative cable from battery post.
2. Using a brake pedal holding tool as shown, depress the brake pedal past its first one inch of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir while the lines are disconnected.
3. Remove the engine appearance cover.
4. Loosen lower and upper mounting nuts, then remove the exhaust heat shield from the dash panel.
5. Pull the brake tube bundle routing clips (with tubes) loose from studs on the dash panel.



6. Remove the primary (4) and secondary (1) brake tubes (from master cylinder) at the hydraulic control unit (7).
7. Remove the remaining brake tubes (2, 3, 5, 6) at the hydraulic control unit (7).

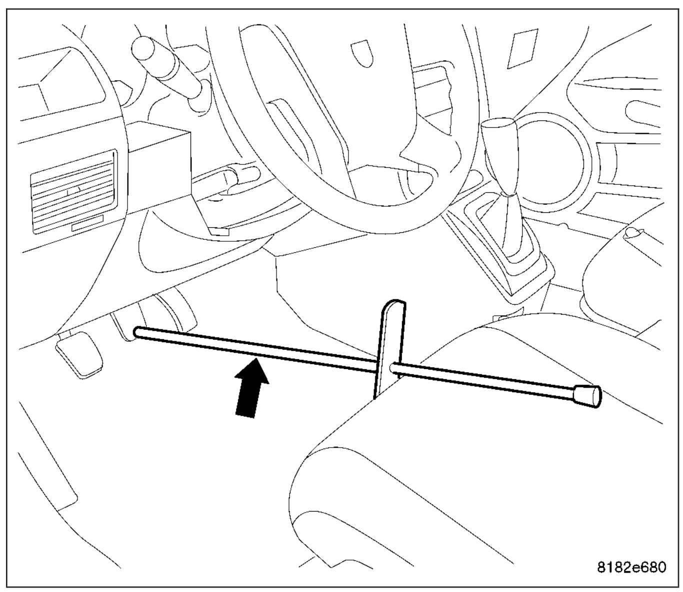


8. Remove the screw (1) fastening the power steering pressure hose routing clamp (2) to the exhaust manifold.



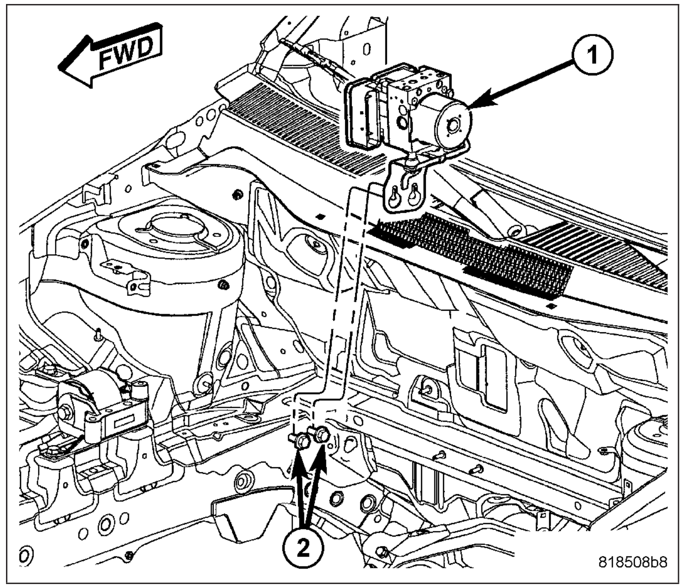
NOTE: Use this figure in the following step to release the ABM harness connector cover. It shows the location of the release tabs.

9. Disconnect the ABM harness connector from the Antilock Brake Module (ABM). To do so:
   a. Depress the tabs on each side of the connector cover, then
   b. Pull outward and upward on the lower half of the cover until it locks into position pointing straight outward (2). The connector can then be pulled straight outward off the ABM (1).



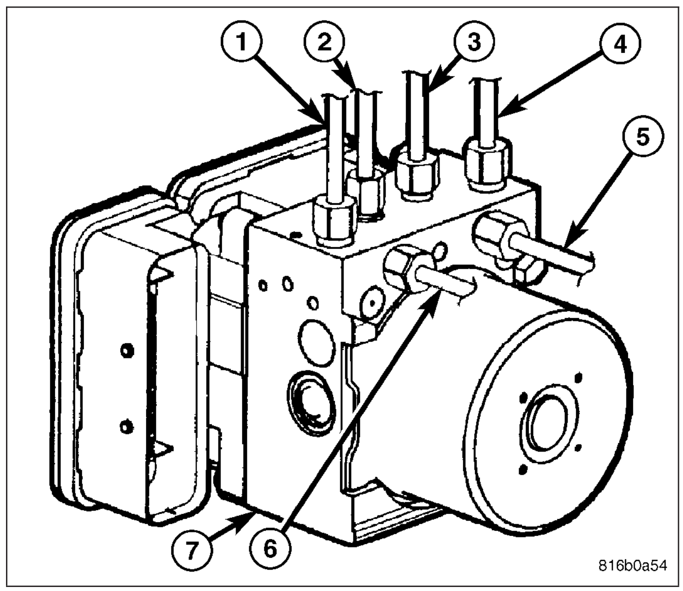
10. Loosen, but do not remove, the two mounting screws (2) attaching the ICU (1) mounting bracket to the body.
11. Lift the ICU and mounting bracket (1) off the mounting screws (2).
12. Move the brake tubes around as necessary without bending them and remove the ICU with bracket through the opening between the A/C lines and the exhaust manifold.
13. To separate the ABM from the HCU, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - DISASSEMBLY).

DIESEL ENGINE

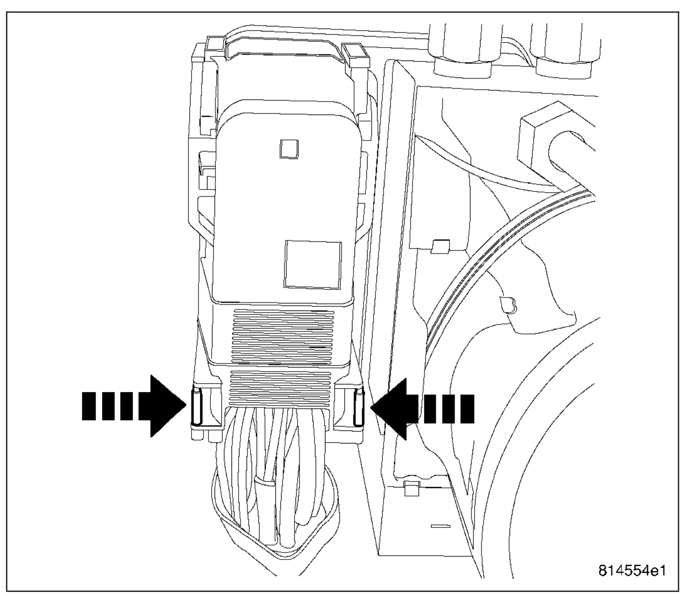


NOTE: Before proceeding, (Refer to 5 - BRAKES - WARNING) (Refer to 5 - BRAKES - CAUTION).

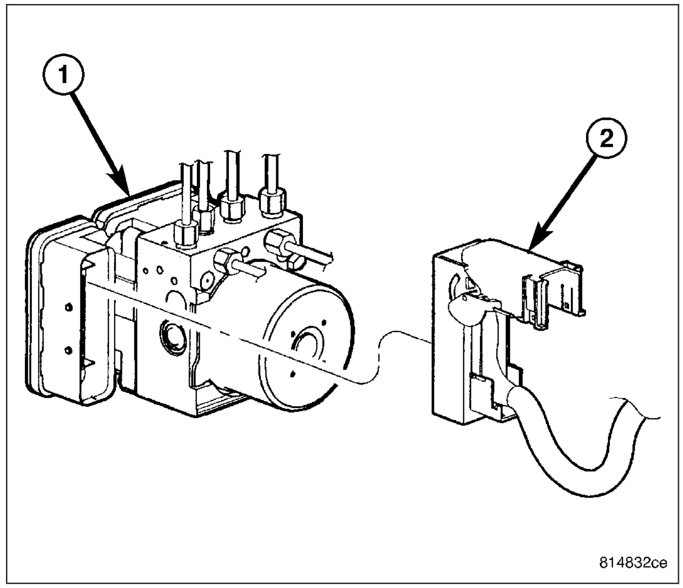
1. Disconnect and isolate battery negative cable from battery post.
2. Using a brake pedal holding tool as shown, depress the brake pedal past its first one inch of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir while the lines are disconnected.



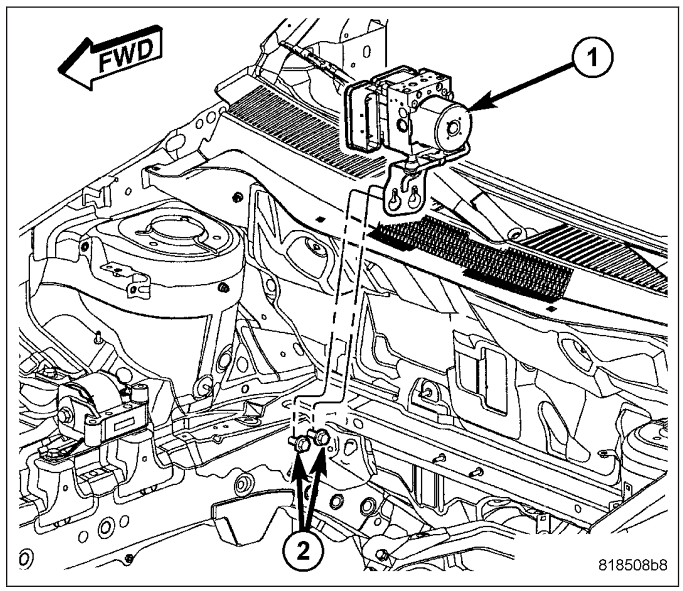
3. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)



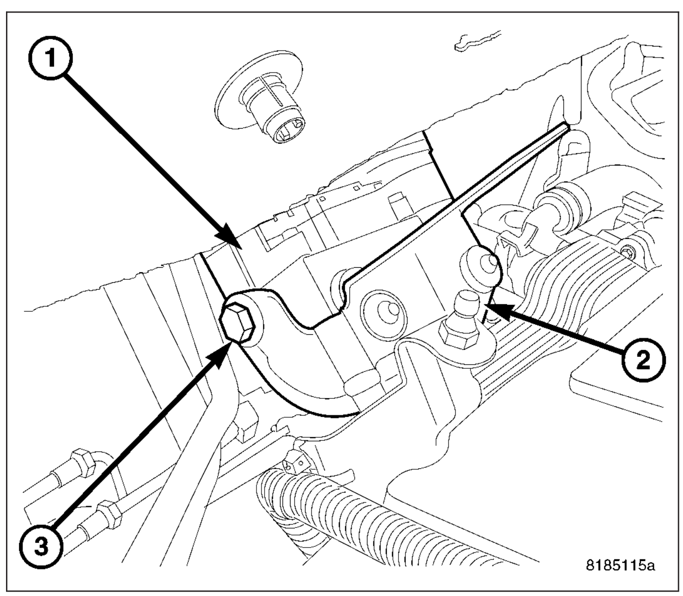
4. Loosen, but do not remove, the two mounting screws (2) attaching the ICU (1) mounting bracket to the body.
5. Loosen the air inlet tube at the turbocharger.
6. Lower the vehicle.
7. Remove the engine appearance cover.
8. Loosen the air inlet tube at the air cleaner and engine cylinder head cover, then remove the tube.
9. Loosen lower and upper mounting nuts, then remove the heat shield from the dash panel.
10. Pull the brake tube bundle routing clips (with tubes) loose from studs on the dash panel.



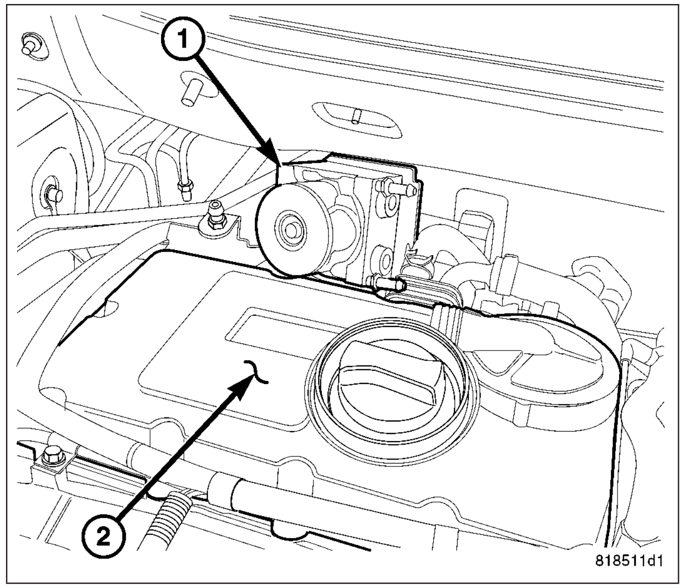
11. Remove primary (4) and secondary (1) brake tubes (from master cylinder) at hydraulic control unit (7).
12. Remove remaining brake tubes (2, 3, 5, 6) at hydraulic control unit (7).



NOTE: Use this figure in the following step to release the ABM harness connector cover. It shows the location of the release tabs.

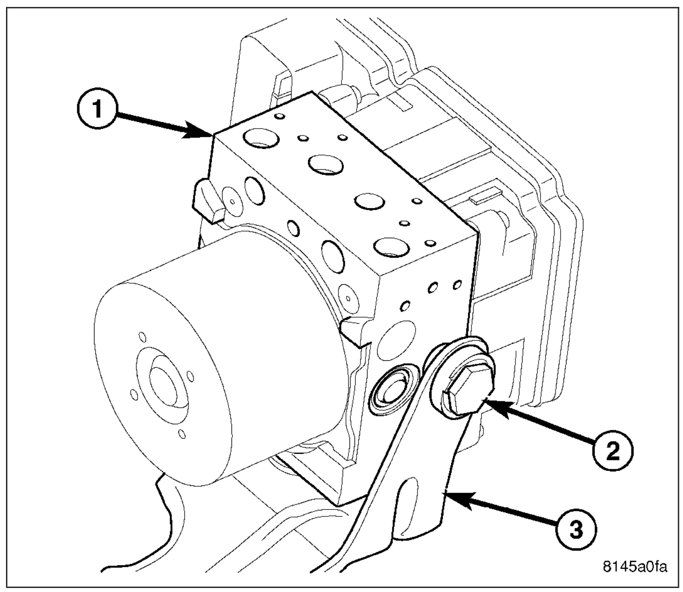


13. Disconnect the ABM harness connector from the Antilock Brake Module (ABM). To do so:
    a. Depress the tabs on each side of the connector cover, then
    b. Pull outward and upward on the lower half of the cover until it locks into position pointing straight outward (2). The connector can then be pulled straight outward off the ABM (1).

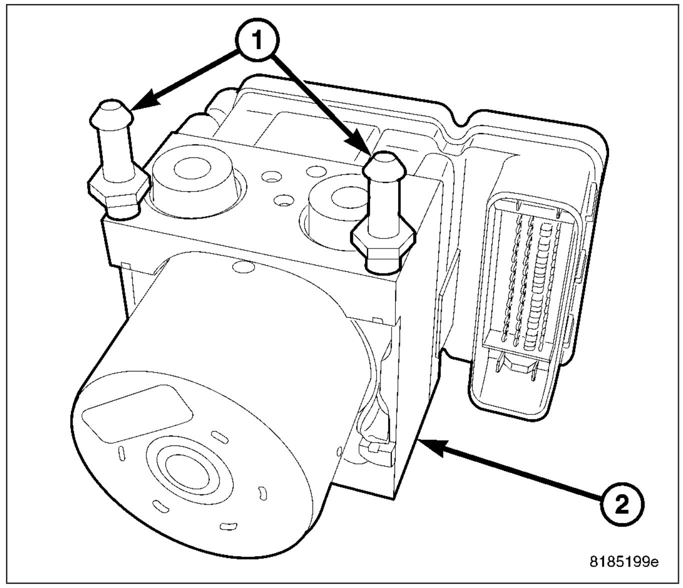


14. Lift the ICU and mounting bracket (1) off the mounting screws (2).

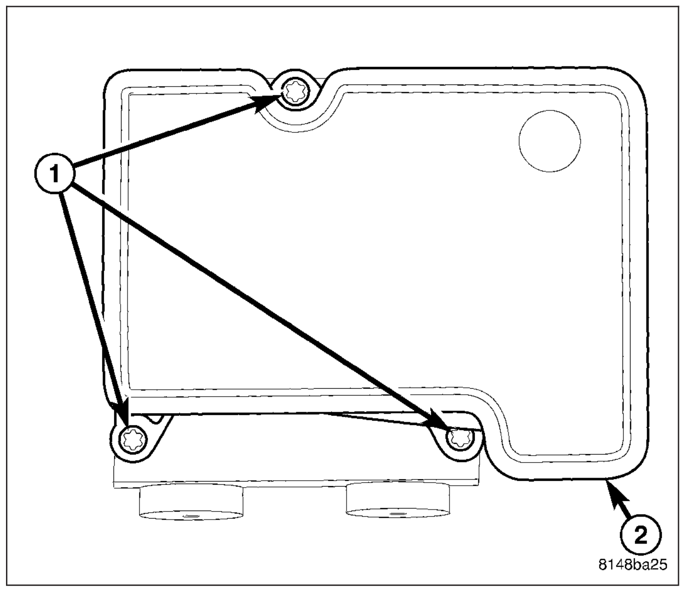
15. Rotate the ICU (1) around behind the engine until the bracket mounting screw (3) can be accessed.
16. Remove the ICU bracket mounting screw (3), then remove the bracket (2) from the ICU (1). The ICU has mounting pins that are inserted into grommets in the bracket that must be overcome to remove bracket.



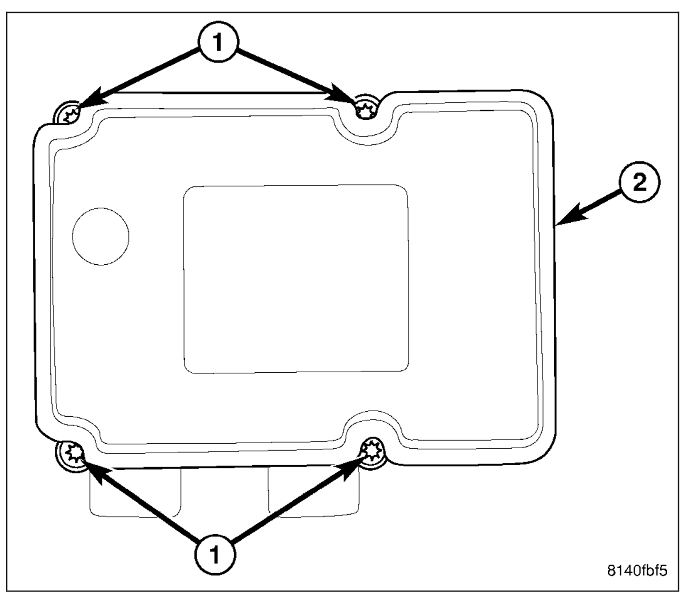
17. Remove the ICU (1) from the engine compartment out over the engine cylinder head cover (2).
18. To separate the ABM from the HCU, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - DISASSEMBLY).



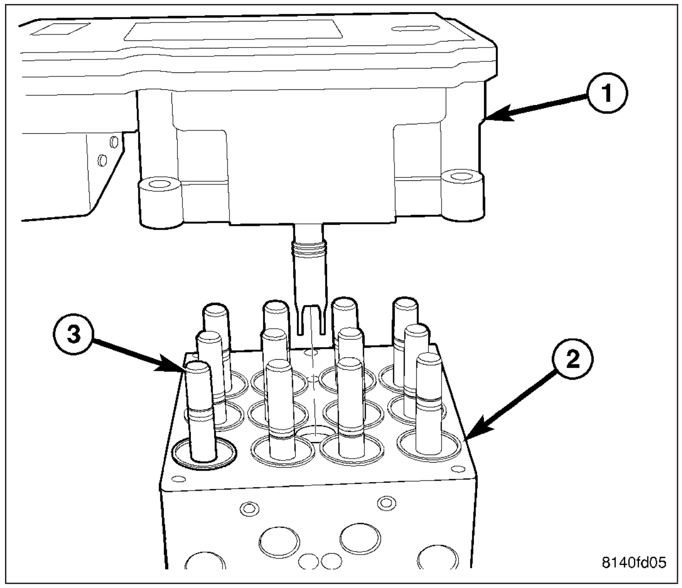
DISASSEMBLY



1. If the mounting bracket (3) needs to be removed from the ICU, remove the single mounting bolt (2), then slide the ICU's mounting pins out of the grommets in the bracket and remove the bracket.



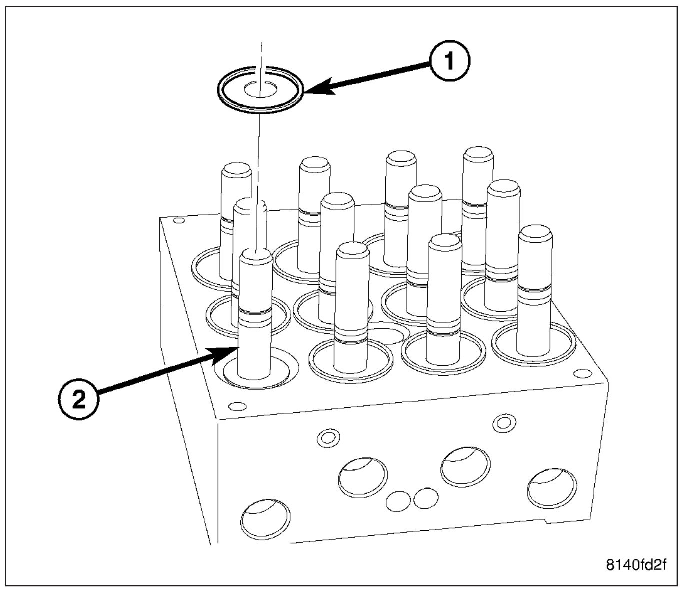
2. Remove the mounting pins from the ICU.



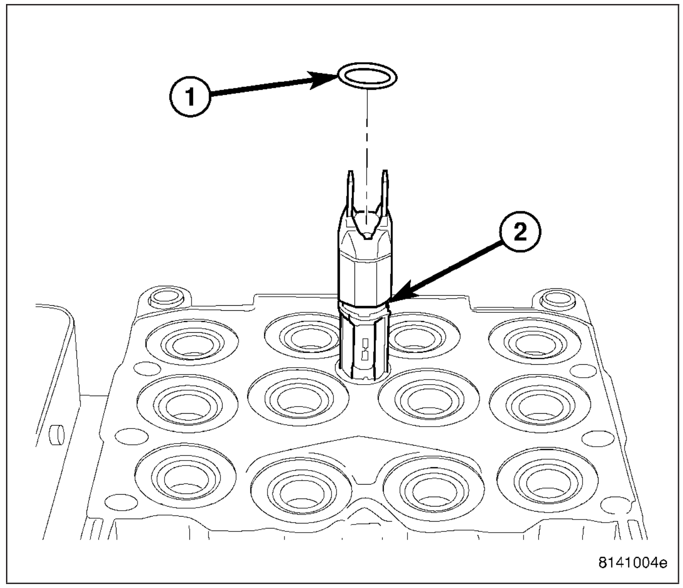
3. If not equipped with traction control, remove the three screws (1) attaching the ABM (2) to the HCU.

4. If equipped with traction control or ESP, remove the four screws (1) attaching the ABM (2) to the HCU.

5. Separate the ABM (1) from the HCU (2).

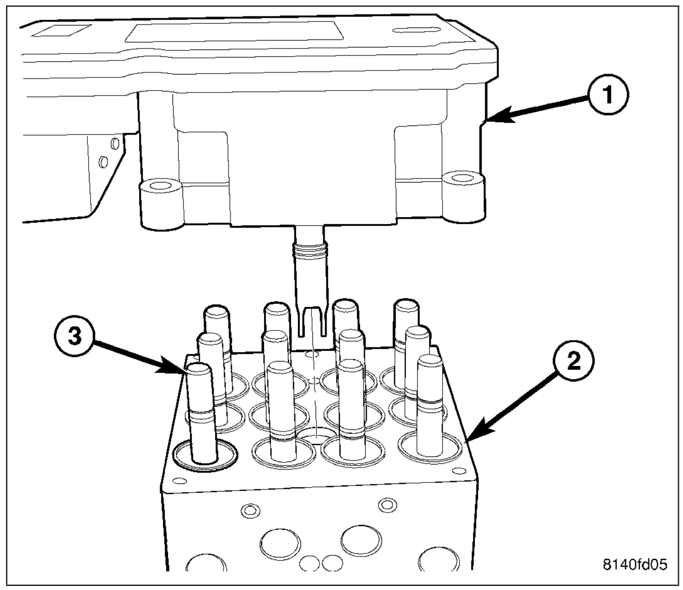


ASSEMBLY

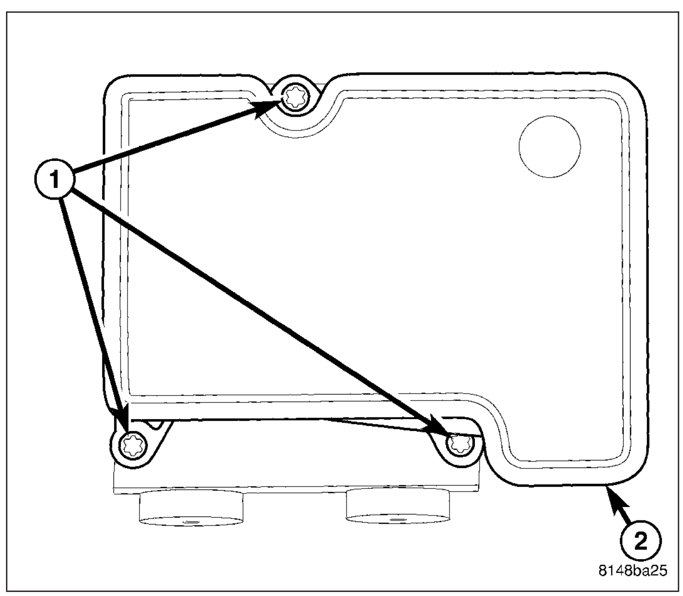


1. Clean any debris off the mating surfaces of the HCU and ABM.

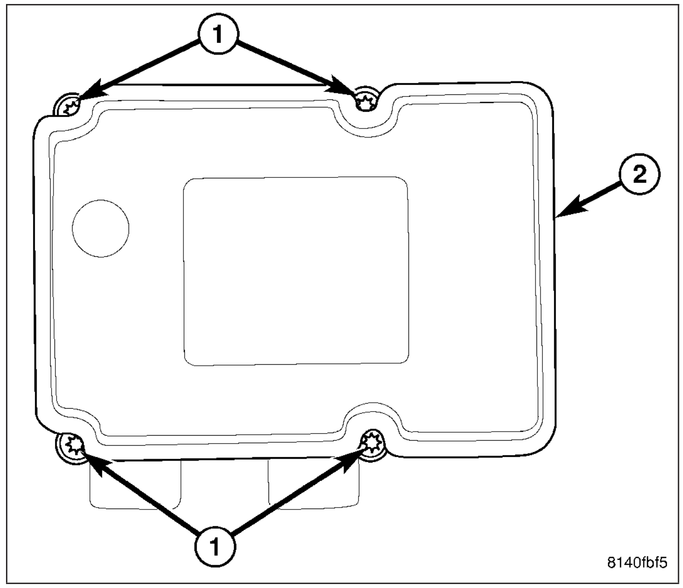
CAUTION: When installing new O-rings or solenoid valve stem seals, do not use any type of lubricant.



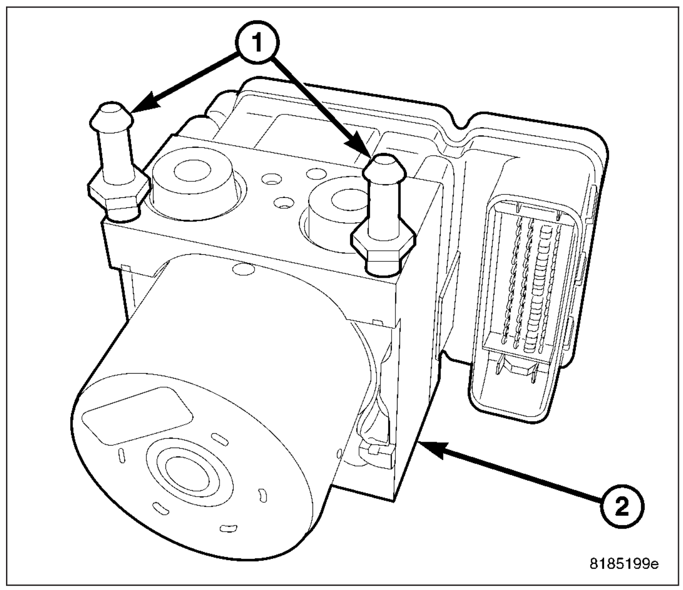
2. If the seals (1) on the solenoid valve stems (2) are not new, replace them all. Each of the solenoid valve stem seals must be new to keep out moisture and debris; **do not reuse solenoid valve stem seals.**



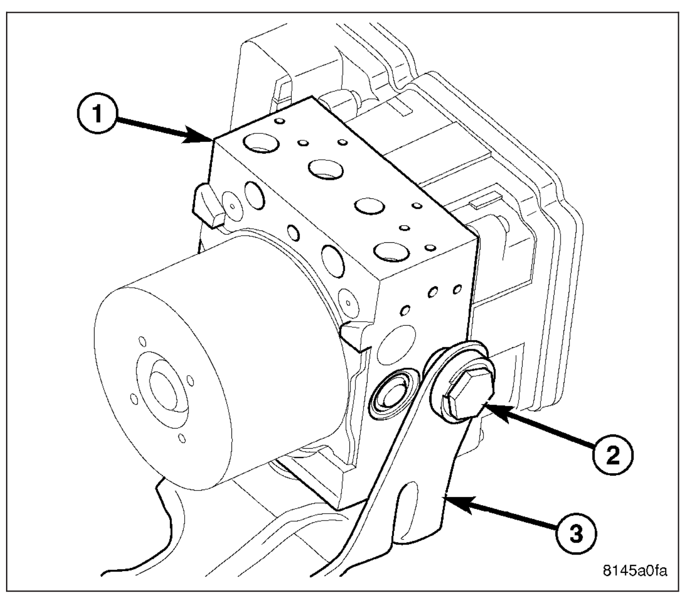
3. Replace the pump/motor connector O-ring (1) if it is not new. Be sure the O-ring is properly seated in the mounting groove (2).



4. Align components and install the ABM (1) on the HCU (2).

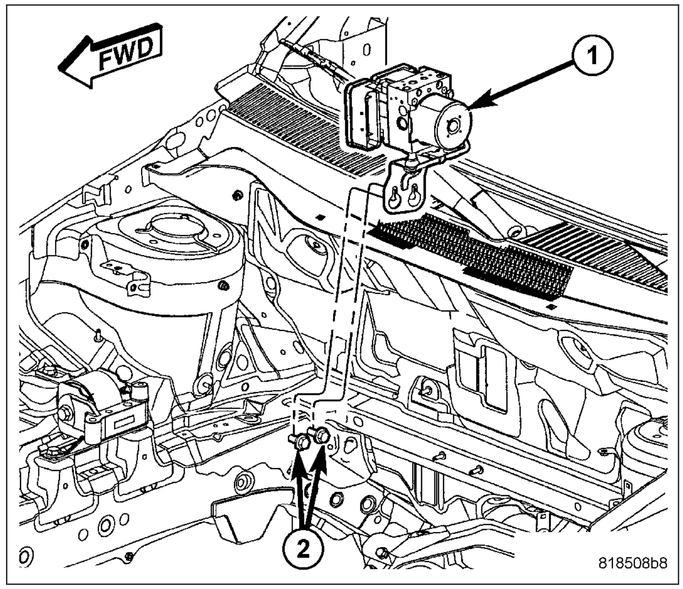


5. If not equipped with traction control, install the three screws (1) attaching the ABM (2) to the HCU. Tighten the mounting screws to 2 N·m (17 in. lbs.).



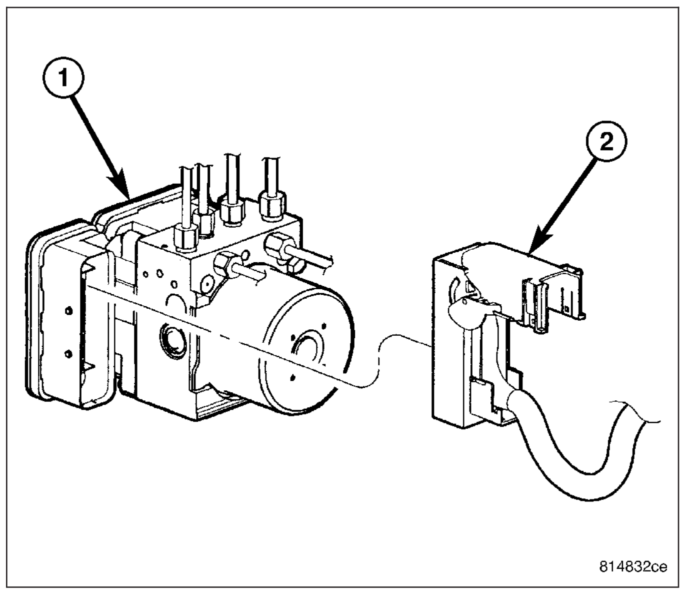
6. If equipped with traction control, install the four screws (1) attaching the ABM (2) to the HCU. Tighten the mounting screws to 2 N·m (17 in. lbs.).

7. If necessary, install the mounting pins (1) in the ICU (2) and tighten to 11 N·m (97 in. lbs.).



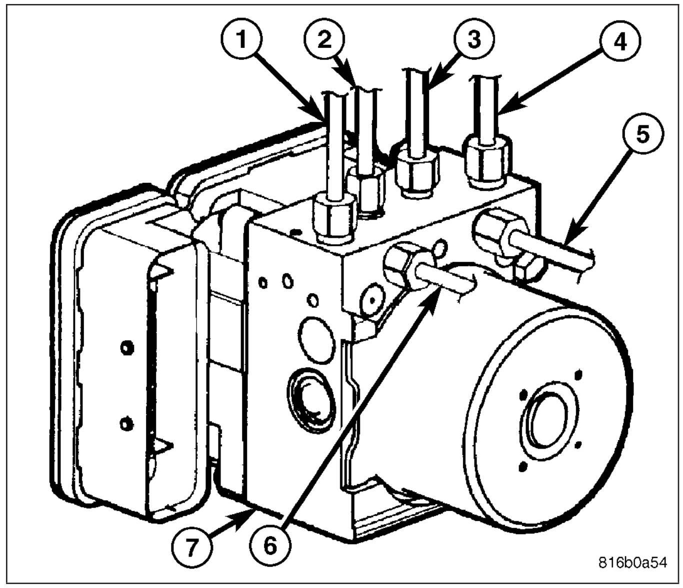
8. If the mounting bracket (3) needs to be installed on the ICU (1), install the mounting pins in the ICU as necessary and tighten to 11 N·m (97 in. lbs.). Insert the mounting pins into the grommets mounted in the bracket, then install the single mounting bolt (2). Tighten the mounting bolt to 11 N·m (97 in. lbs.).
9. Install the ICU in the vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - INSTALLATION)

INSTALLATION

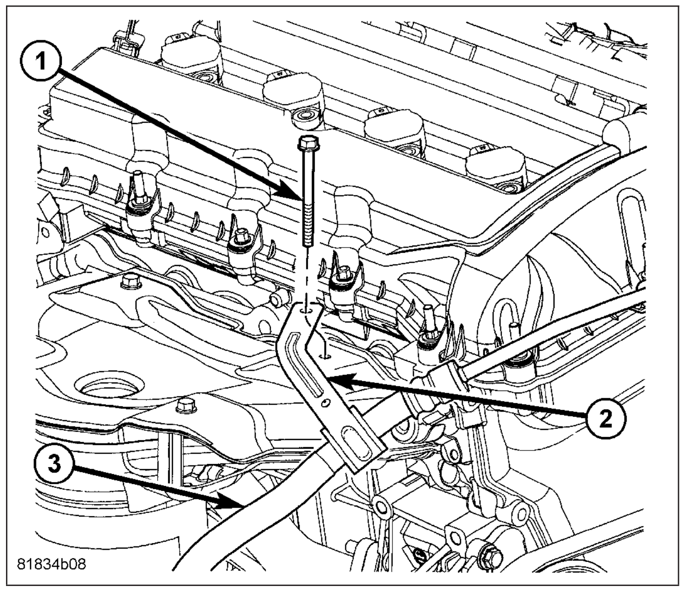


GAS ENGINE

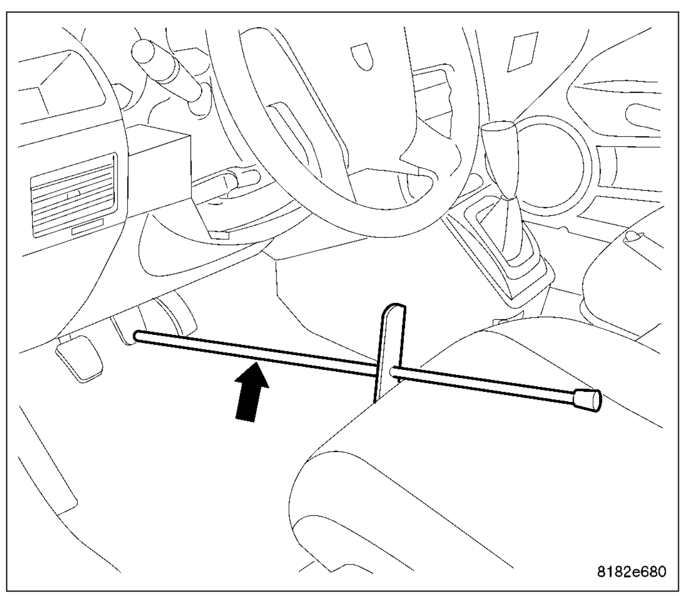
1. Install the ICU with bracket (1) through the opening between the A/C lines and the exhaust manifold using the opposite of how it was removed.
2. Place the mounting bracket for the ICU (1) over the mounting screws (2) and hang the assembly in place. Tighten the two mounting screws (2) to 23 N·m (17 ft. lbs.).



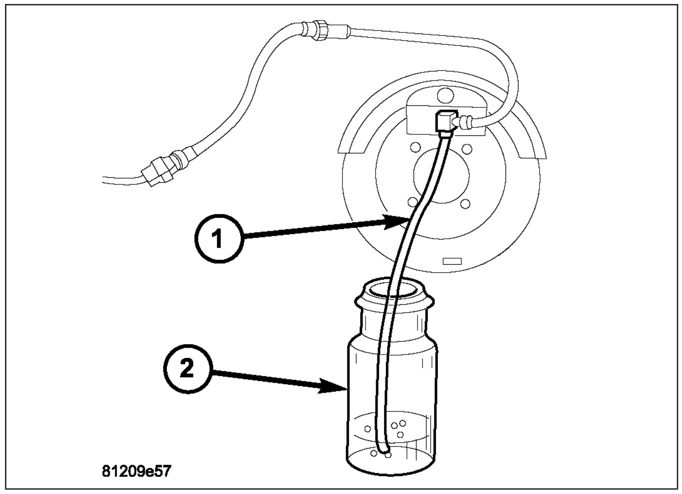
CAUTION: Before installing the ABM harness connector on the ABM, be sure the seal is properly installed in the connector.



3. Insert the ABM wiring harness connector (2) into the socket of the ABM (1) and close the cover, locking the connector in place.

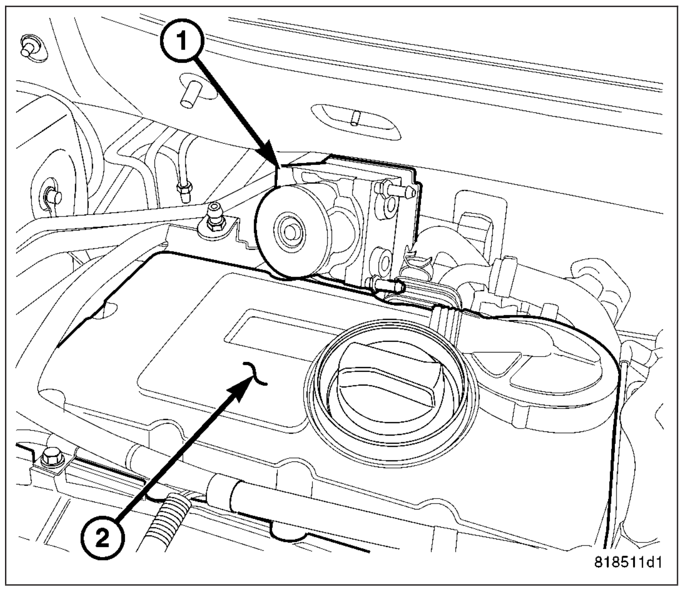


4. Install the four chassis brake tubes (2, 3, 5, 6) brake tubes at the ICU hydraulic control unit (7). Tighten the tube nuts to 17 N·m (150 in. lbs.).
5. Install the primary (4) and secondary (1) brake tubes at the ICU hydraulic control unit (7). Tighten the tube nuts to 17 N·m (150 in. lbs.).

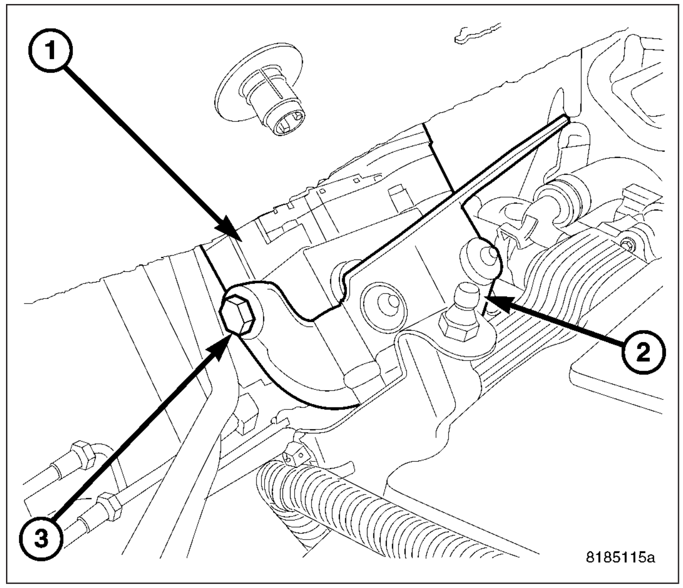


6. Position the power steering pressure hose routing clamp (2) on the exhaust manifold and install the mounting screw (1). Tighten the mounting screw to 9 N·m (80 in. lbs.).
7. Push the brake tube bundle routing clips (with tubes) onto the studs on the dash panel.
8. Install the heat shield on the dash panel and tighten the lower and upper mounting nuts.

9. Remove the brake pedal holding tool.
10. Install the engine appearance cover.
11. Connect the battery negative cable to the battery post. It is important that this be performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

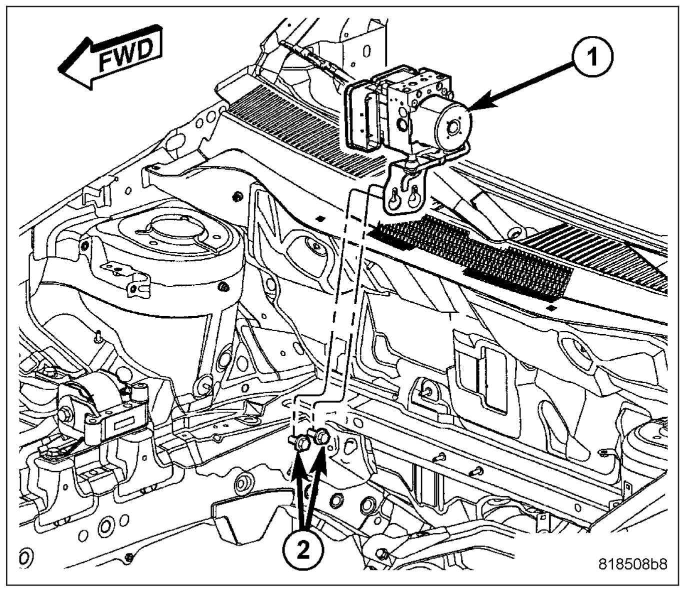


12. Hook up the scan tool to initialize the ABM and perform the following:
    a. Clear any faults.
    b. Fill the master cylinder to the proper fill level and bleed the base and ABS hydraulic systems. (Refer to 5 - BRAKES - ABS - STANDARD PROCEDURE)
    c. Check for leaks.
    d. Perform the ABS Verification Test and road test the vehicle.



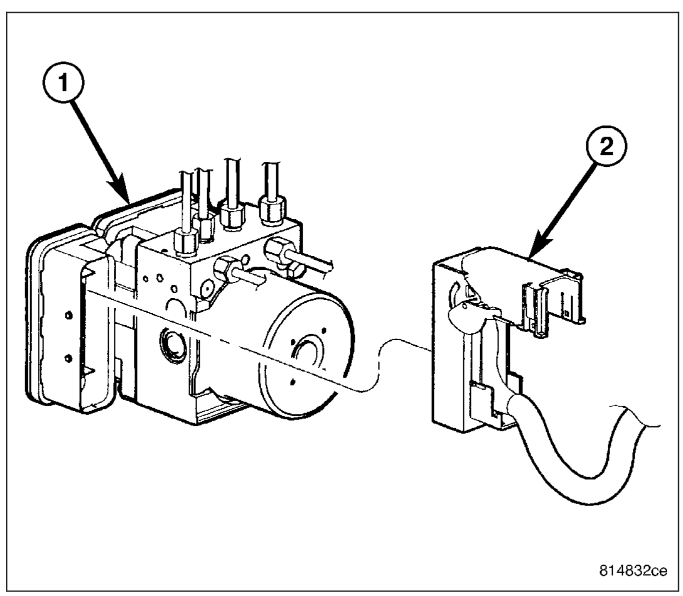
DIESEL ENGINE

NOTE: Before installation, be sure the mounting pins are installed in the ICU block, but do not install the mounting bracket.

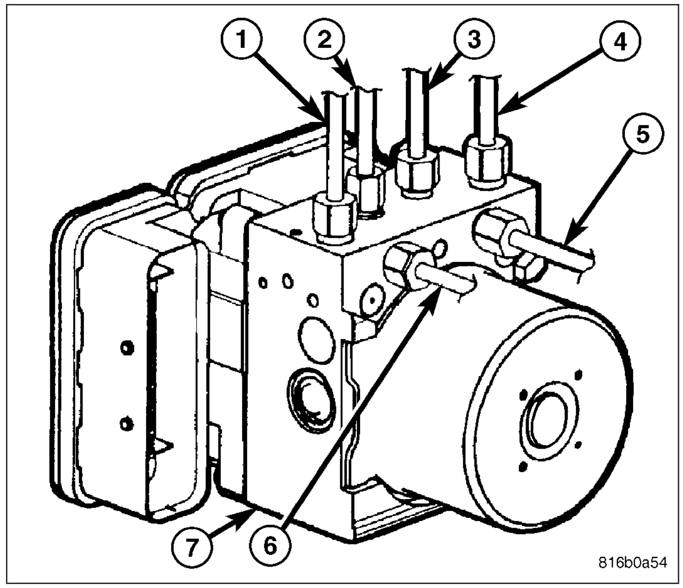


1. Install the ICU (1) into the engine compartment over the top of the engine cylinder head cover (2) as shown.

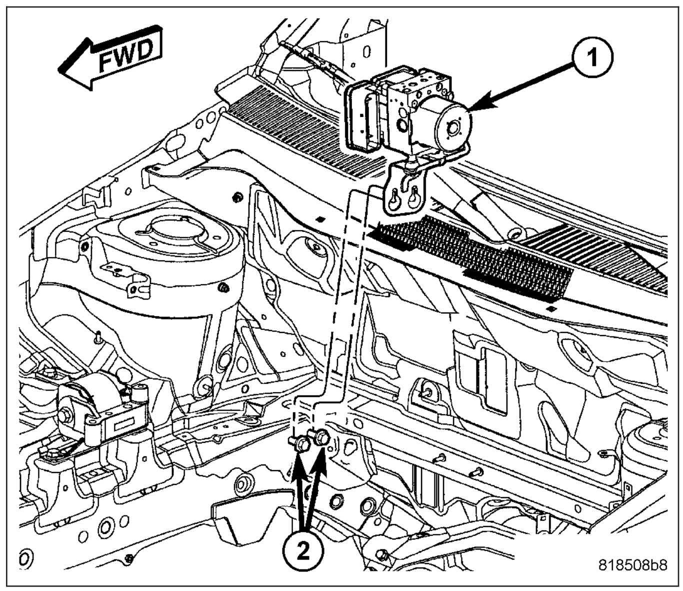
2. Rotate the ICU (1) around behind the engine until the mounting bracket (2) can be installed.
3. Install the mounting bracket (2) onto the ICU (1). Push the bracket mounting grommets onto the mounting pins of the ICU. Install the single mounting bolt (3). Tighten the mounting bolt to 11 N·m (97 in. lbs.).



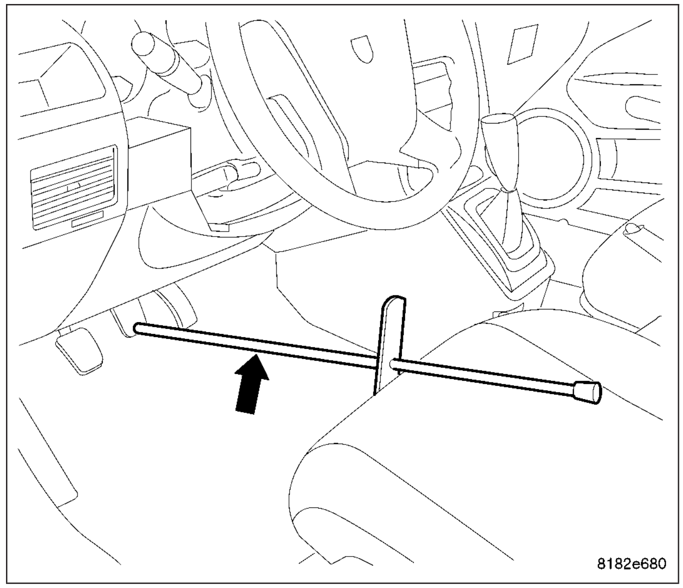
4. Place mounting bracket for the ICU (1) over the mounting screws (2) and hang the assembly in place.



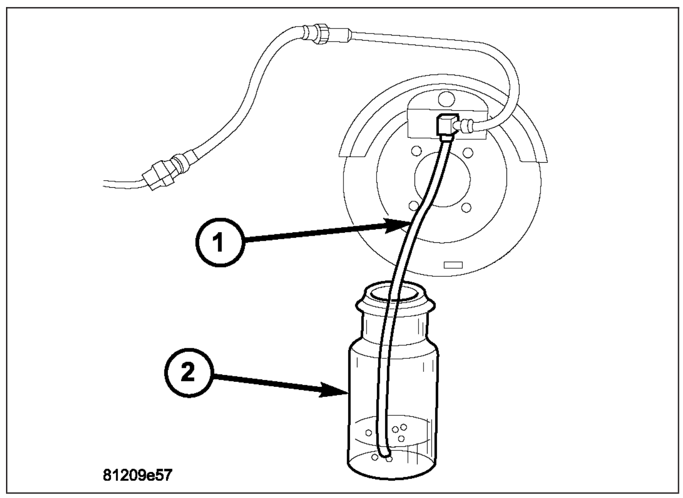
CAUTION: Before installing the ABM harness connector on the ABM, be sure the seal is properly installed in the connector.



5. Insert the ABM wiring harness connector (2) into the socket of the ABM (1) and close the cover, locking the connector in place.



6. Install the four chassis brake tubes (2, 3, 5, 6) brake tubes at the ICU hydraulic control unit (7). Tighten the tube nuts to 17 N·m (150 in. lbs.).
7. Install the primary (4) and secondary (1) brake tubes at the ICU hydraulic control unit (7). Tighten the tube nuts to 17 N·m (150 in. lbs.).
8. Push the brake tube bundle routing clips (with tubes) onto the studs on the dash panel.
9. Install the heat shield on the dash panel and tighten the lower and upper mounting nuts.
10. Install the air inlet tube at the air cleaner and engine cylinder head cover.



11. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
12. Tighten the two mounting screws (2) attaching the ICU (1) mounting bracket to the body. Tighten the mounting screws to 23 N·m (17 ft. lbs.).
13. Tighten the air inlet tube at the turbocharger.
14. Lower the vehicle.

15. Remove brake pedal holding tool.

16. Install the engine appearance cover.
17. Connect the battery negative cable to the battery post. It is important that this be performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
18. Hook up the scan tool to initialize the ABM and perform the following:
    a. Clear any faults.
    b. Fill the master cylinder to the proper fill level and bleed the base and ABS hydraulic systems. (Refer to 5 - BRAKES - ABS - STANDARD PROCEDURE)
    c. Perform the ABS Verification Test and road test the vehicle.

CLUTCH

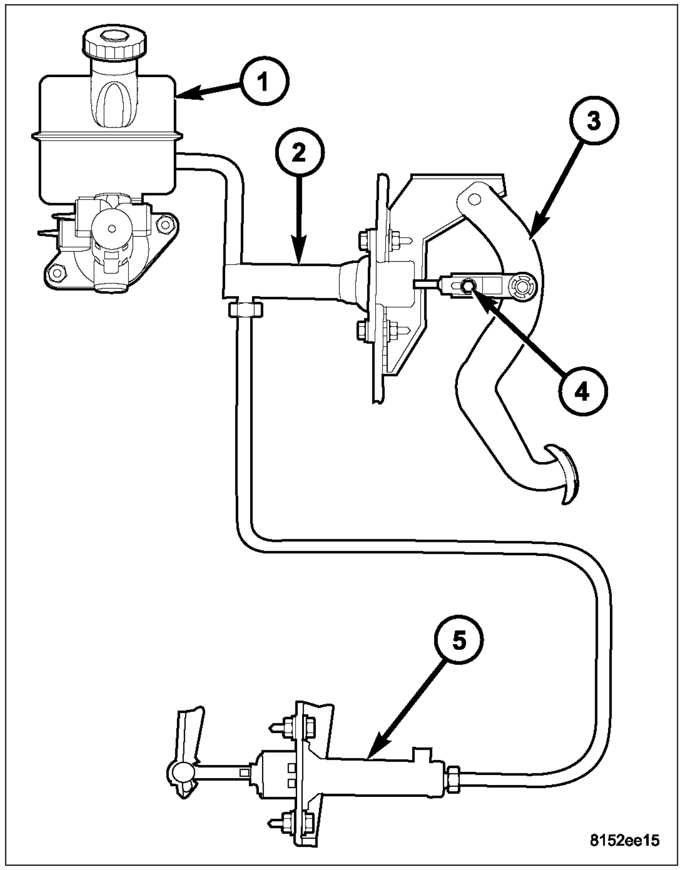


TABLE OF CONTENTS

CLUTCH

DESCRIPTION

The typical clutch hydraulic system consists of a clutch master cylinder (2), slave cylinder (5), and an interconnecting fluid line. Clutch hydraulic fluid is supplied by the brake system via the brake master cylinder reservoir (1). The clutch pedal pushrod (4) is adjustable.

On some models, the slave cylinder is integrated with the clutch release bearing.

FLUID

CAUTION: Never use any type of petroleum-based fluid (engine oil, transmission oil, power steering fluid, etc.) in the clutch hydraulic system. Use of such fluids will result in master/slave cylinder seal damage, and cause a failure of the hydraulic clutch release system.

NOTE: Under normal operating conditions, the clutch hydraulic system does not require additional fluid for the life of the vehicle. Since the clutch shares the brake reservoir, the fluid level will be maintained whenever the brake system is checked.

The fluid required for use in the clutch hydraulic system is brake fluid conforming to DOT 3 specifications and J1703 standards. No other type of fluid is recommended or approved for use in the clutch hydraulic system. Use only MOPAR® brake fluid or equivalent from a tightly sealed container.

OPERATION

The clutch hydraulic system is responsible for engaging and disengaging the clutch. Depressing the clutch pedal develops fluid pressure in the clutch master cylinder. This pressure is transmitted to the slave cylinder through a connecting line.

Slave cylinder force transmits through the integral release bearing, which is in contact with the pressure plate diaphragm spring. As additional force is applied, the bearing depresses the diaphragm spring fingers inward on the fulcrums. The action moves the pressure plate rearward, relieving clamping force on the clutch disc.

DIAGNOSIS AND TESTING

CLUTCH SYSTEM

Clutch problem diagnosis will generally require a road test to determine the type of fault. Component inspection will then determine the problem after road testing.

Drive the vehicle at normal speeds during road test. Shift the transaxle through all gear ranges and observe clutch action. If chatter, grab, slip, or improper release is experienced, remove and inspect the clutch components. If the problem is noise or hard shifting, further diagnosis may be needed. The transaxle or other driveline components may actually be at fault.

CLUTCH GRAB/CHATTER

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH DISC FACING COVERED WITH OIL OR GREASE	Oil leak at engine rear main or transaxle input shaft seal.	T355 equipped- Correct leak and replace modular clutch assembly. BG6 equipped - Clean pressure plate, flywheel, and replace clutch disc.
	Too much grease applied to splines of disc and input shaft.	Apply lighter coating of grease to splines.
NO FAULT FOUND WITH CLUTCH COMPONENTS	Problem actually related to suspension or driveline component.	Further diagnosis required. Check engine/transmission mounts, suspension attaching parts and other driveline components as needed.
	Engine related problems.	Check EFI and ignition systems.
PARTIAL ENGAGEMENT OF CLUTCH DISC	Clutch cover, spring, or release fingers bent, distorted (rough handling, improper assembly).	Replace clutch assembly.
	Clutch disc damaged or distorted.	Replace clutch assembly.
	Clutch misalignment.	T355 equipped - Verify modular clutch pilot plate alignment to crankshaft. Replace the modular clutch assembly if the pilot plate is loose or bent. BG6 equipped - Check alignment and runout of flywheel, disc, or cover. Check clutch housing to engine dowels and dowel holes for damage. Correct as necessary.

CLUTCH SLIPS

CONDITION	POSSIBLE CAUSES	CORRECTION
DISC FACING WORN OUT	Normal wear.	Replace clutch assembly.
	Driver frequently rides (slips) clutch, results in rapid wear, overheating.	Replace clutch assembly.
	Insufficient clutch cover diaphragm spring tension	Replace clutch assembly.
CLUTCH DISC FACING CONTAMINATED WITH OIL OR GREASE	Leak at rear main oil seal or transaxle input shaft seal	T355 equipped - Replace leaking seals. Replace clutch assembly. BG6 equipped - Replace leaking seals. Clean the pressure plate and flywheel surface and replace clutch disc.

CONDITION	POSSIBLE CAUSES	CORRECTION
	Excessive amount of grease applied to input shaft splines	T355 equipped - Apply less grease to input shaft. Replace clutch assembly. BG6 equipped - Apply less grease to input shaft. Clean the pressure plate and flywheel surface and replace clutch disc.
	Road splash, water entering housing	Seal housing. Inspect clutch assembly.
	Concentric Slave Cylinder leaking hydraulic fluid	Replace Concentric Slave Cylinder (CSC)
CLUTCH IS RUNNING PARTIALLY DISENGAGED	Release bearing sticking or binding, does not return to normal running position.	Verify that bearing is actually binding. Then, replace bearing and transmission front bearing retainer if sleeve surface is damaged.
	Clutch master cylinder pushrod not adjusted properly (LHD Models), causing high preload.	Verify that pushrod adjustment is correct (LHD Models).
	Slave cylinder binding	Replace slave cylinder
CLUTCH DISC FACINGS HAVE FRACTURED INTO SMALL PIECES	Driver performs a 5-1 downshift at vehicle speed in excess of 60 miles per hour	Alert driver to problem cause. Replace clutch assembly. Inspect slave cylinder, fork, and bearing for damage.
	Leak at rear main or transaxle input shaft seal	T355 equipped - Replace seal. Replace clutch assembly. BG6 equipped - Replace seal. Clean the pressure plate and flywheel surface and replace clutch disc.
	Excessive heat from slippage	Replace Clutch Assembly

IMPROPER CLUTCH RELEASE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH DISC BINDS ON INPUT SHAFT SPLINES	Clutch disc hub splines damaged during installation	Clean, smooth, and lubricate disc and shaft splines. Replace modular clutch assembly, or clutch disc, and/or input shaft if splines are severely damaged.
	Input shaft splines rough, damaged.	Clean input shaft splines. Then lube.
	Corrosion or rust formations on splines of input shaft and disc	Clean input shaft splines and disc splines, then lube
CLUTCH DISC RUSTED TO FLYWHEEL AND/OR PRESSURE PLATE	Occurs in vehicles stored or not driven for extended period of time. Also occurs after steam cleaning if vehicle is not used for extended period.	Replace clutch assembly.
CLUTCH WILL NOT DISENGAGE PROPERLY	Disc bent, distorted during transaxle installation	Replace clutch assembly.
	Clutch cover diaphragm spring damaged during transaxle installation	Replace clutch assembly.
	Release lever bent, loose, or damaged	Replace release lever if worn or damaged
	Air in clutch hydraulic system.	Bleed clutch hydraulic system to purge air.
	Clutch master cylinder or slave cylinder leaking	Check and replace master and/or slave cylinder

CONDITION	POSSIBLE CAUSES	CORRECTION
	Master cylinder adjustable pushrod loose or damaged	Inspect. Tighten adjustment fastener or replace master cylinder.
	Pushrod not retained to clutch pedal pin.	Inspect pushrod & bushing. Replace as necessary.

CLUTCH PEDAL NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH PEDAL SQUEAKS WHEN DEPRESSED TO FLOOR	Pedal bushings worn out or inadequate lubrication	Replace or lubricate bushings
	Clutch pedal return spring worn out	Lubricate or replace return spring

CLUTCH CHATTER COMPLAINTS

For all clutch chatter complaints, perform the following:

1. Check for loose, misaligned, or broken engine and transmission mounts. If present, they should be corrected at this time. Test vehicle for chatter. If chatter is gone, there is no need to go any further.
2. If chatter persists, check hydraulic clutch release system is functioning properly.
3. Check for loose connections in drivetrain. Correct any problems and determine if clutch chatter complaints have been satisfied. If not:
   a. Remove transaxle.
   b. Check to see if the release bearing is sticky or binding. Replace bearing, if needed.
   c. Check clutch assembly for contamination (dirt, oil). Replace clutch assembly, if required.
   d. Check to see if the clutch disc hub splines are damaged. Replace with new clutch assembly, if necessary.
   e. Check input shaft splines for damage. Replace, if necessary.
   f. Check for uneven wear on clutch fingers.
   g. Check for broken clutch cover diaphragm spring fingers. Replace with new clutch assembly, if necessary.

DRIVE PLATE MISALIGNMENT

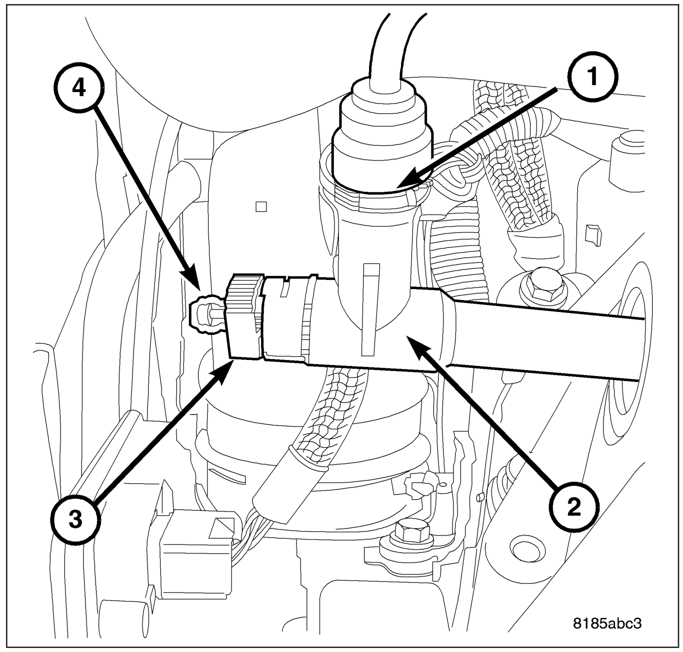
Common causes of misalignment are:

- Heat warping
- Mounting drive plate on a dirty crankshaft flange
- Incorrect bolt tightening
- Improper seating on the crankshaft shoulder
- Loose crankshaft bolts

Clean the crankshaft flange before mounting the drive plate. Dirt and grease on the flange surface may misalignment the flywheel, causing excessive runout. Use new bolts when mounting drive plate to crankshaft. Tighten drive plate bolts to specified torque only. Over-tightening can distort the drive plate hub causing excessive runout.

CLASH-INTO-REVERSE COMPLAINTS

All T355 manual transaxles are equipped with a reverse brake. It prevents clash when shifting into reverse, but only if the vehicle is not moving.



1. Depress clutch pedal to floor and hold. After three seconds, shift to reverse. If clash is present, clutch has excessive spin time, and the reverse brake may not be functioning.
2. Remove transaxle.
3. Check the input shaft spline, clutch disc splines, and release bearing for dry rust. If present, clean rust off and apply a light coat of bearing grease to the input shaft splines. Apply grease on the input shaft splines only where the clutch disc slides. Verify that the clutch disc slides freely along the input shaft spline.

4. Check to see if the clutch disc hub splines are damaged, and replace with new clutch assembly if required.
5. Check the input shaft for damaged splines. Replace as necessary.
6. Check for broken clutch cover diaphragm spring fingers.
7. Install clutch assembly and transaxle.

STANDARD PROCEDURE

GRAVITY BLEEDING CLUTCH HYDRAULIC CIRCUIT

1. Verify fluid level in brake master cylinder. Top off with DOT 3 brake fluid as necessary. Leave cap off.
2. Raise vehicle on hoist.
3. Remove bleed port protective cap and install suitable size and length of clear hose (4) to monitor and divert fluid into suitable container.
4. Open up the bleed circuit by turning the thumb screw (3) counter clockwise this will start the air purge and fluid fill process.
5. Lower vehicle, but only enough to gain access to and fill the brake master cylinder.

NOTE: Do not allow clutch master cylinder to run dry while fluid exits bleed port. If master cylinder runs dry, it is necessary to remove clutch master cylinder, position vertically (with push rod down) for 10 seconds, and reinstall.

6. Top off brake master cylinder fluid level while air is purged and fluid drains from bleed port. Continue this until no air bubbles are seen and a solid column of fluid exists.
7. Close hydraulic bleed circuit, remove drain hose and replace dust cap on bleed port.
8. From driver's seat, actuate clutch pedal 60-100 times.
9. **Apply parking brake.** Start engine and verify clutch operation and pedal feel. If pedal feels fine and clutch operates as designed, stop here. If pedal still feels spongy or clutch does not fully disengage, excessive air is still trapped within the system, most likely at the master cylinder.
10. Top off brake master cylinder fluid level with DOT 3 brake fluid as necessary.

POWER BLEEDING CLUTCH HYDRAULIC CIRCUIT

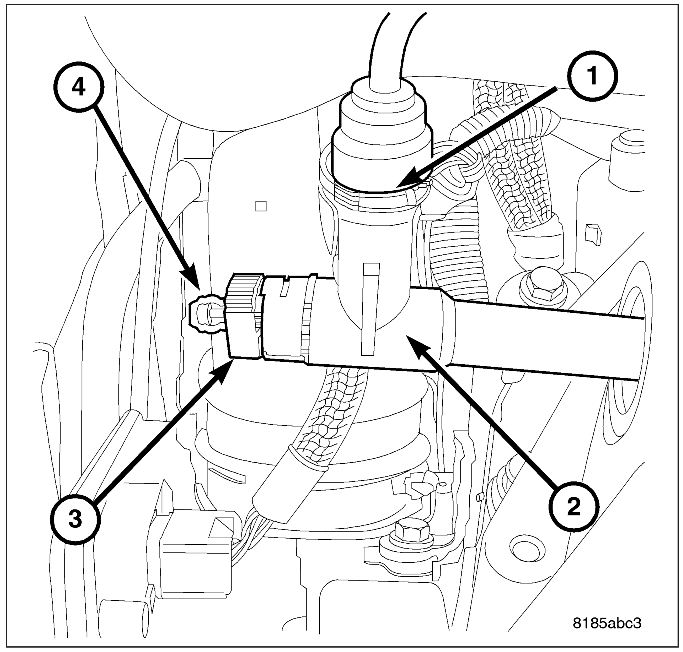
1. Remove reservoir cap and connect bleeder cap to reservoir.

NOTE: Use Bleeder Cap/Modified reservoir cap adapter Snap-on #901-059 or equivalent

2. Connect service filling machine to bleeder cap.

NOTE: Use Service Filling Machine/Brake power bleeder Brake power bleeder or equivalent

3. Service filling machine should be pressurized to at least 2.5 bar (36 PSI).
4. Remove dust cap from bleeder valve and connect the transparent bleeder hose to bleeder valve.
5. Place the other end of hose in the bleeder container to capture the used fluid. The end of the hose MUST be submerged in the DOT 3 brake fluid.



NOTE: Use Bleeder Container To capture hydraulic fluid and Transparent Bleeder Hose To route fluid to container

6. Turn on the service filling machine.

7. Crack open the bleeder valve (3).
8. Allow fluid to flow out of bleed port until no more air bubbles can be seen in the transparent bleeder hose.
9. Once fluid is free of air bubbles; make 15 quick actuations between clutch pedal stop positions.
10. Close the bleeder valve and disconnect the service filling machine.
11. To remove remaining air, actuate pedal 10 times slowly between pedal stop positions.

NOTE: Pedal load should be approximately 25 lbs. For gas vehicles, reserve should not be below 30 mm.For diesel vehicles, reserve should not be below 40 mm.

12. Check clutch pedal to see if vehicle is properly bled.
13. If vehicle is not properly bled, repeat procedure.
14. Remove bleeder cap from reservoir and replace reservoir cap.
15. Disconnect transparent bleeder hose from bleeder valve and replace dust cap.

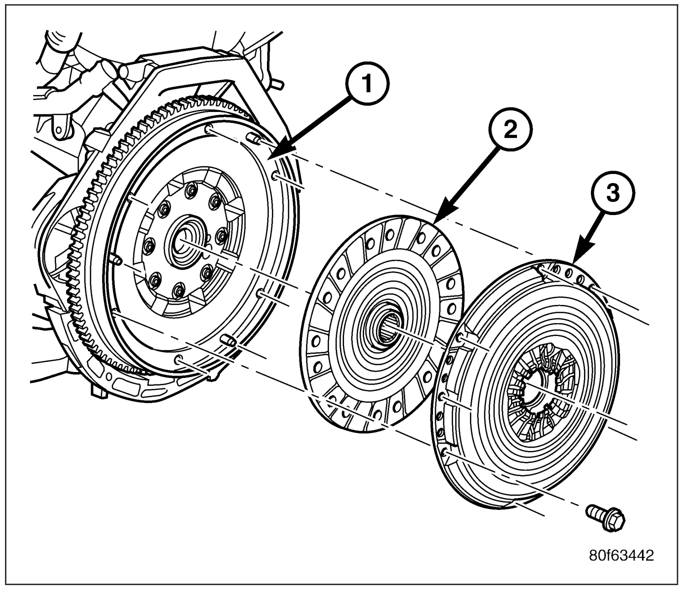
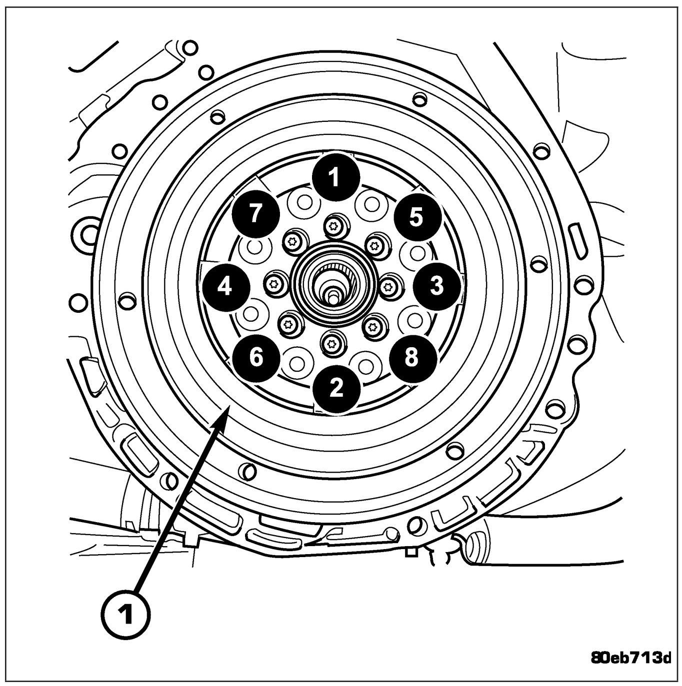
SPECIAL TOOLS

HYDRAULIC CLUTCH



Clutch Disc Alignment Tool - 6724

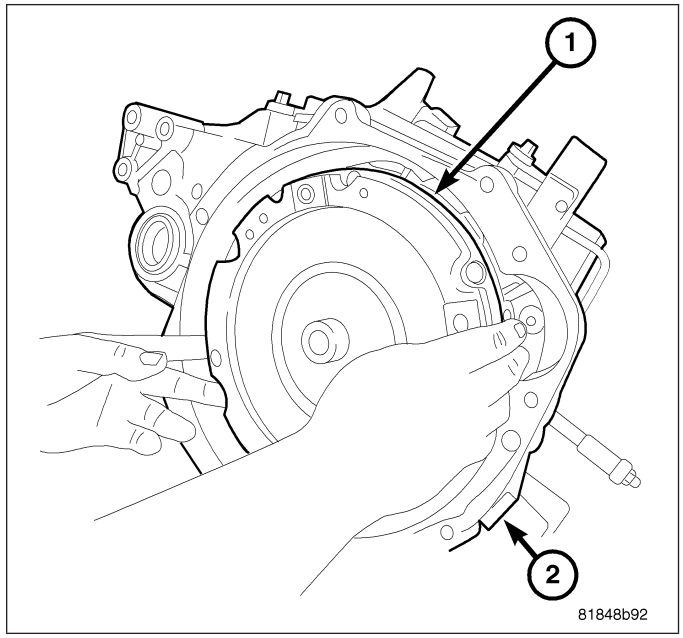
PLATE-CLUTCH DISC AND PRESSURE



REMOVAL

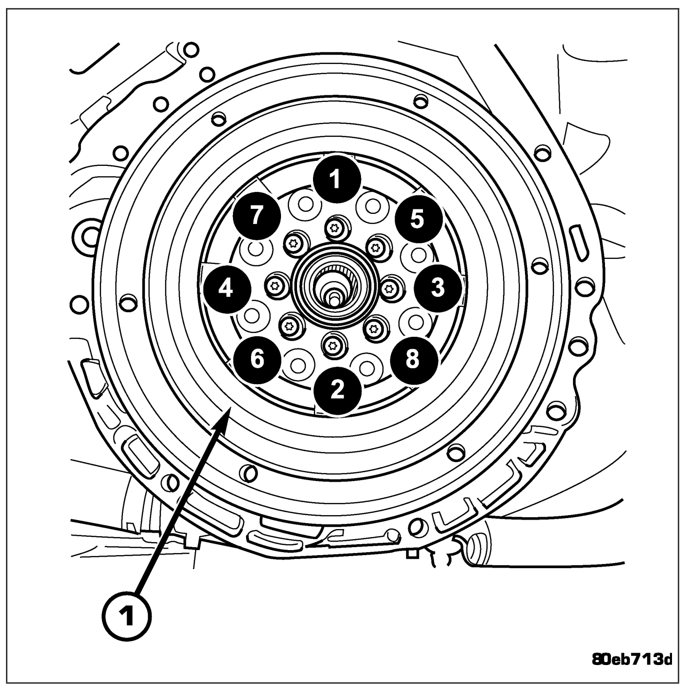
DIESEL

1. Remove transaxle assembly (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL).
2. Mark position of pressure plate (3) on flywheel (1) with paint or scribe for assembly reference.
3. Loosen and remove six pressure plate-to-flywheel bolts. Remove pressure plate (3) and clutch disc (2).

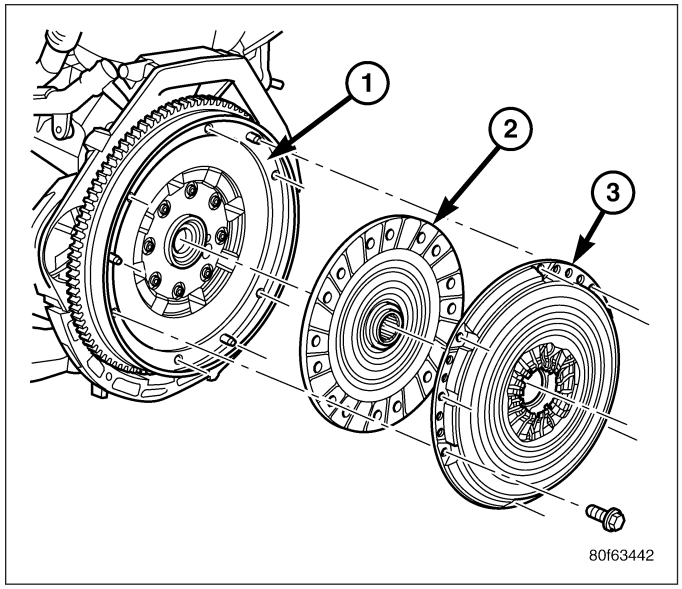


4. Remove eight flywheel-to-crankshaft bolts and remove flywheel assembly (1).

GAS

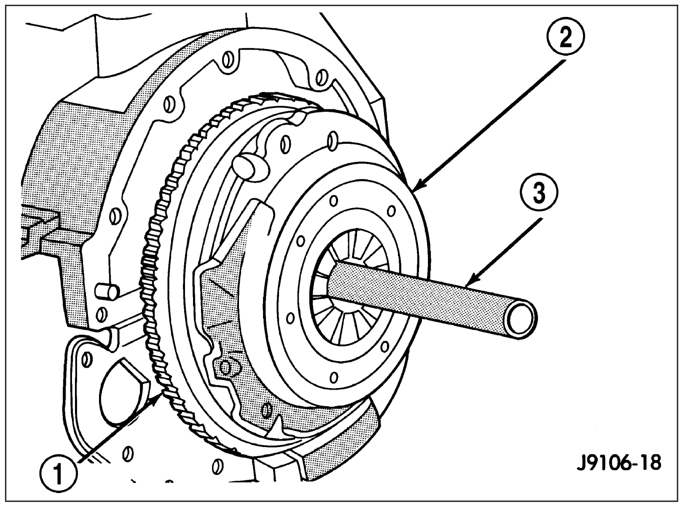


1. Remove transaxle assembly (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL).
2. Remove the modular clutch assembly (1).



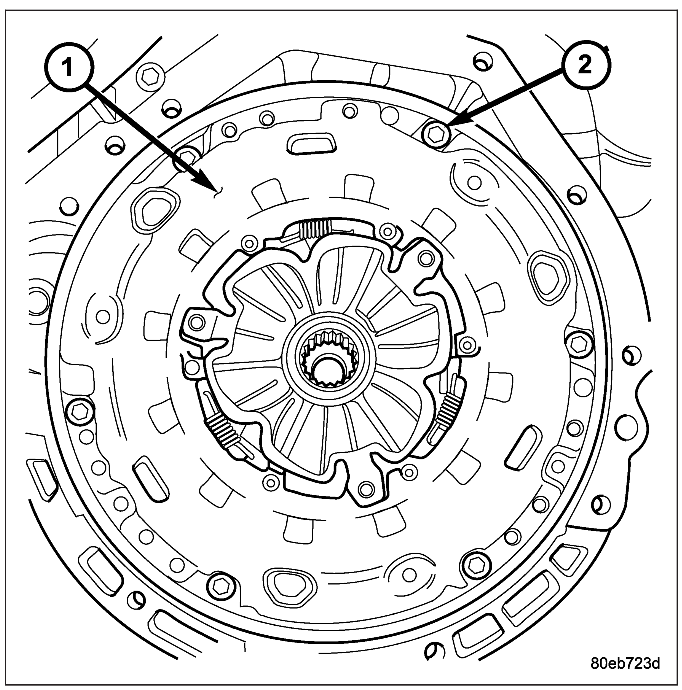
INSTALLATION

DIESEL



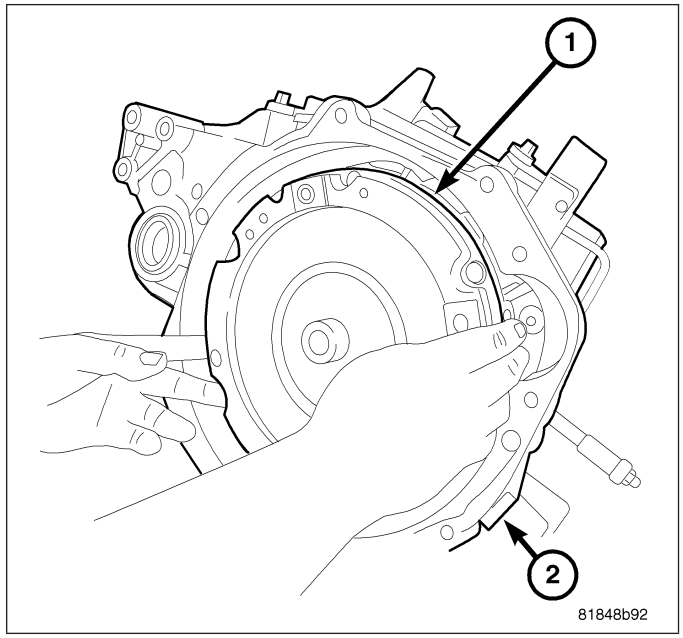
1. Inspect clutch release bearing and lever for excessive wear and replace as necessary. The release bearing is integral to the Concentric Slave Cylinder (CSC).
2. Clean the surfaces of the flywheel (1) and pressure plate to make certain that all oil, grease, and rust have been removed.
3. Verify the crankshaft mounting flange is free of debris, oil, grease, etc. Position the flywheel (1) onto the engine crankshaft.
4. Install flywheel to crankshaft. Install eight (8) flywheel-to-crankshaft bolts and torque to 45 N·m (33 ft. lbs.) plus an additional ¼ turn (90°).

5. Apply a very light coating of grease to the splines in the clutch disc hub.
6. Position the clutch disc (2) to the flywheel (1). Make sure the side marked “FLYWHEEL SIDE” faces the flywheel (1).
7. Install the clutch pressure plate (1) to the flywheel and clutch disc. Finger tighten the six pressure plate-to-flywheel bolts.



8. Use Clutch Alignment Tool 6724 (3) to position the clutch disc (2) to the center of the flywheel (1).

9. Tighten pressure plate bolts (2) evenly and in rotation a few threads at a time **The bolts must be tightened evenly and to specified torque to avoid distorting the pressure plate.**
10. Using a “criss-cross” pattern, torque pressure plate bolts (2) to 31 N·m (23 ft. lbs.). Remove the clutch disc alignment tool.
11. Apply light coat of MOPAR® High Temperature Bearing Grease or equivalent to clutch disc hub and splines of transmission input shaft.



CAUTION: Do not over lubricate shaft splines. This will result in grease contamination of disc.

12. Install transaxle (Refer to 21 - TRANSMISSION/ TRANSAXLE/MANUAL - INSTALLATION).

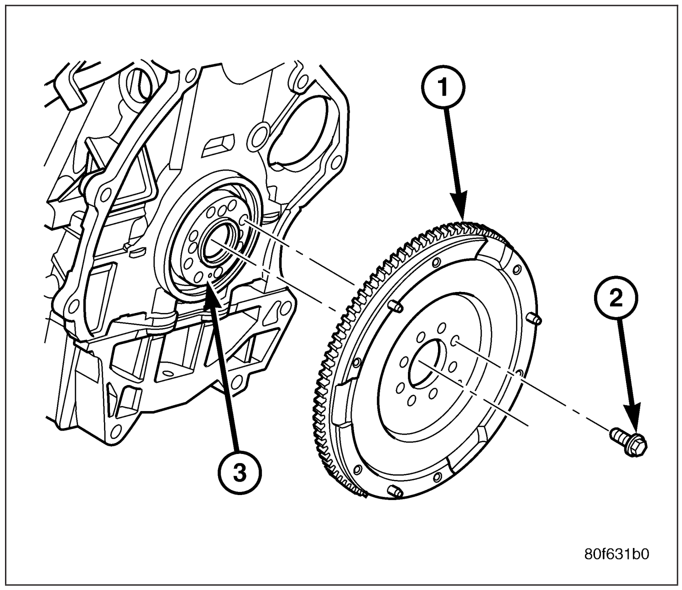
GAS

1. Install new modular clutch assembly onto input shaft of transmission.
2. Install the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION)

.

FLYWHEEL

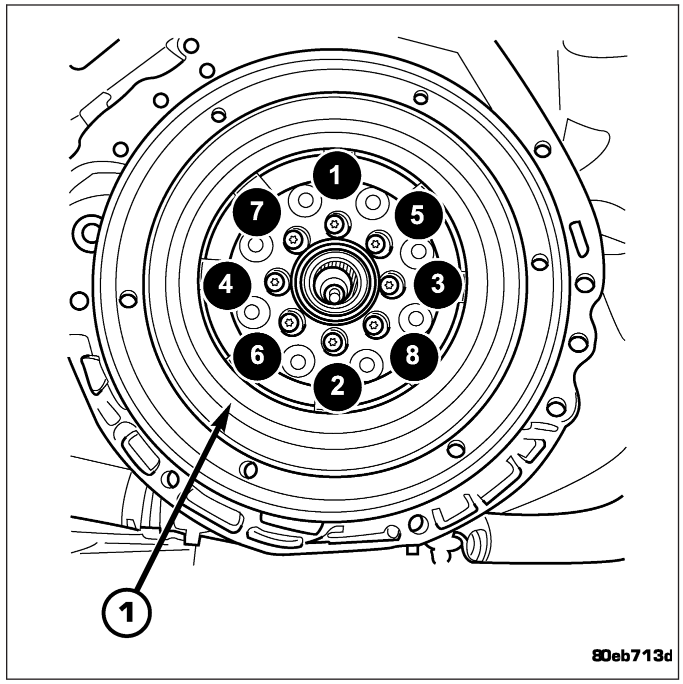
OPERATION



The flywheel serves to dampen the engine firing pulses. The heavy weight of the flywheel relative to the rotating mass of the engine components serves to stabilize the flow of power to the remainder of the drivetrain. The crankshaft has the tendency to attempt to speed up and slow down in response to the cylinder firing pulses. The flywheel dampens these impulses by absorbing energy when the crankshaft speeds and releasing the energy back into the system when the crankshaft slows down.

On a Dual Mass Flywheel, the additional secondary mass coupled to the transmission lowers the natural frequency of the transmission rotating elements. This decreases the transmission gear rattle. The damper springs between the two flywheel masses replace the clutch disc damper springs and assist in a smooth transfer of torque to the transmission.

CAUTION: The Dual Mass Flywheel is serviced as an assembly only and should never be disassembled.

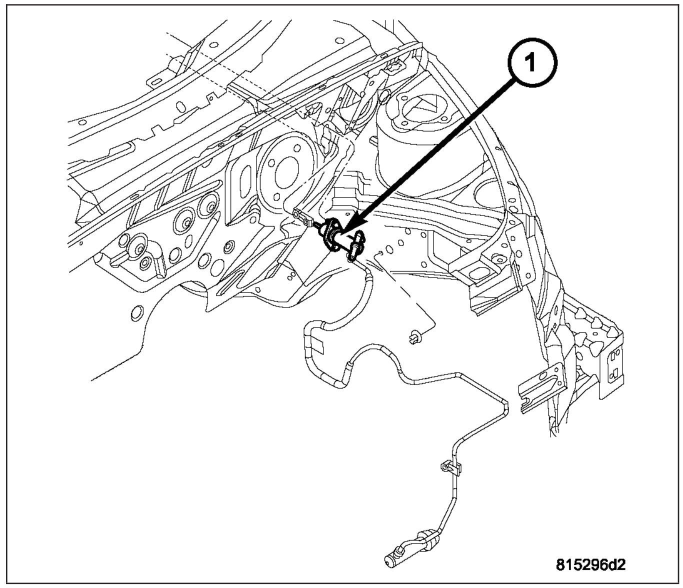


REMOVAL

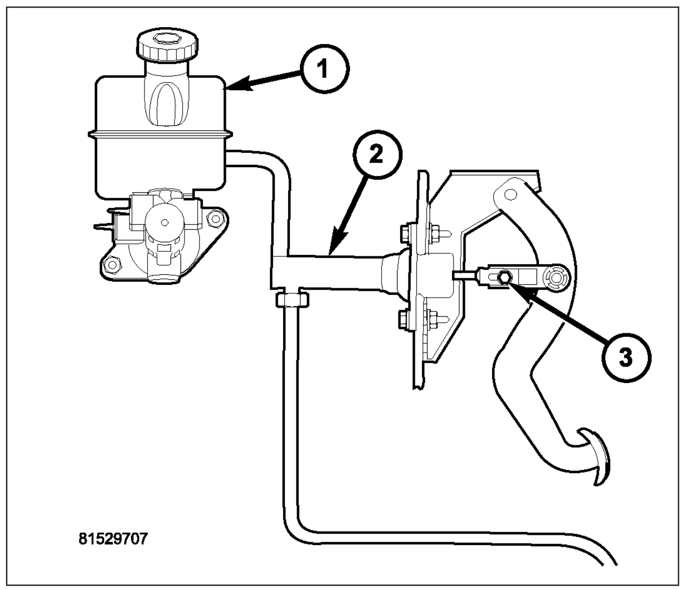
1. Remove transaxle (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL).
2. Remove clutch pressure plate and disc (Refer to 6 - CLUTCH/CLUTCH DISC - REMOVAL).
3. Remove eight (8) flywheel-to-crankshaft bolts (2) and remove flywheel assembly (1).

INSTALLATION

1. Clean the surfaces of the flywheel and pressure plate to make certain that all oil, grease, and rust have been removed.
2. Install and torque the flywheel-to-crankshaft bolts to 95 N·m (70 ft.lbs.).
3. Install clutch pressure plate and disc (Refer to 6 - CLUTCH/CLUTCH DISC - INSTALLATION).
4. Install transaxle assembly (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION).



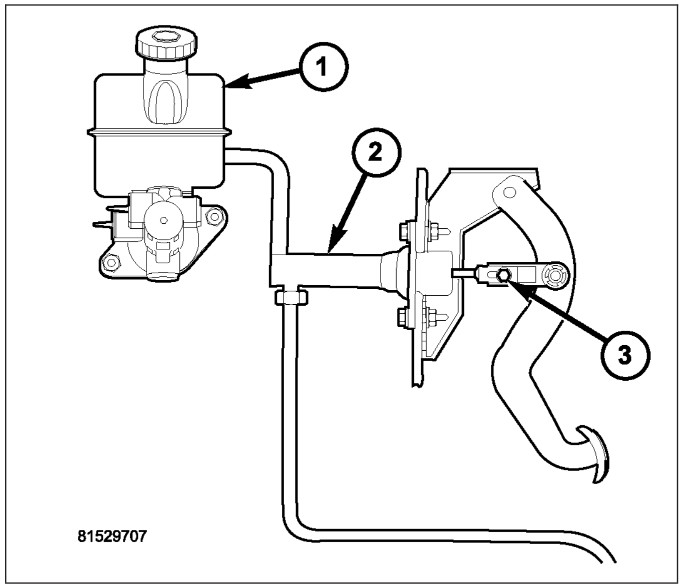
CYLINDER-MASTER-LHD



DESCRIPTION

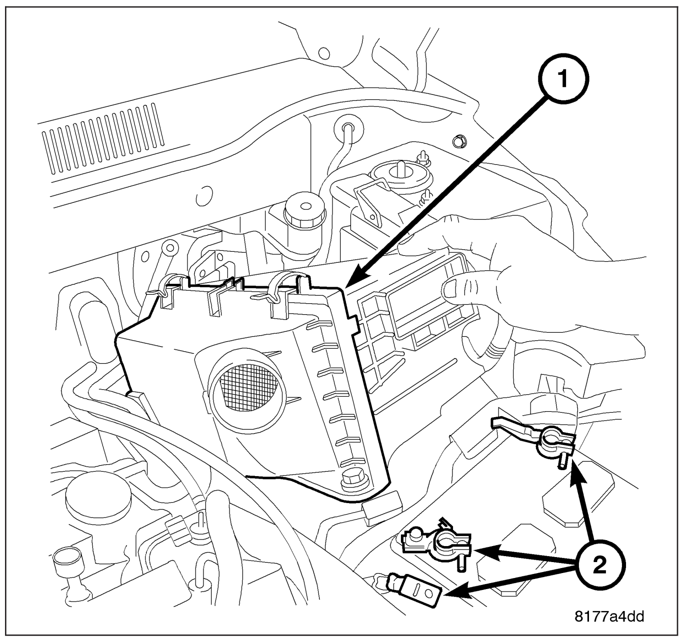
CAUTION: The clutch master cylinder (1) pushrod adjustment must not be used to change pedal freeplay or pedal height. Using the adjustable pushrod for these reasons will result in premature clutch wear or system over/undertravel.

NOTE: The clutch master cylinder/hydraulic release system does not have its own reservoir. This system is supplied fluid from the brake master cylinder reservoir.



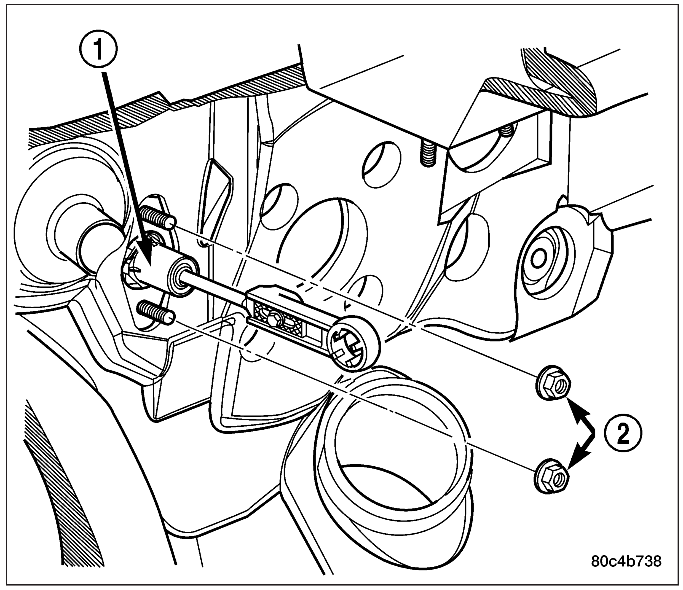
The clutch master cylinder (1) mounts to the dash panel and consists of a push rod (adjustable (3) on LHD models), a piston and cylinder housing, an interconnecting hydraulic tube and a supply hose which connects to the brake master cylinder reservoir (1) for fluid supply.

OPERATION

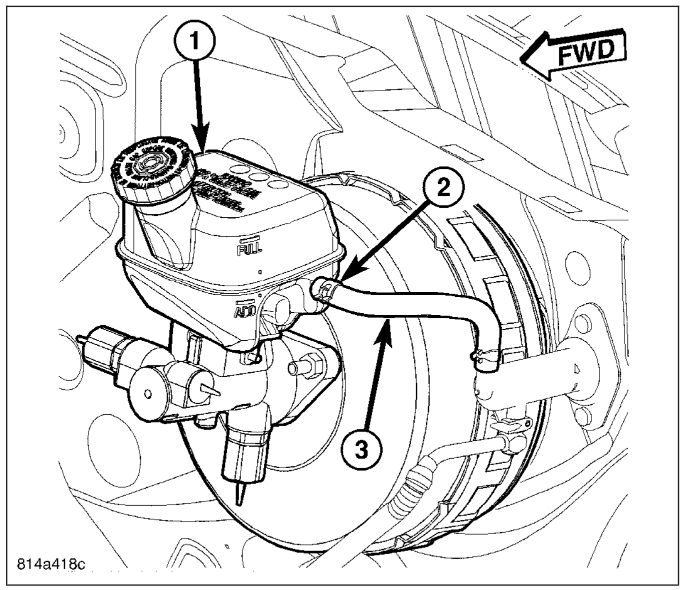


When the clutch pedal is depressed, the push rod moves the piston in the master cylinder (2), displacing fluid through the hydraulic line and into the slave cylinder. As the slave cylinder extends, the release bearing is forced into the fingers of the clutch diaphragm springs. As the fingers move, they release the clamping pressure on the clutch disc between the clutch pressure plate and the flywheel. The clutch becomes disengaged as this pressure is released.

When the clutch pedal is released, the system hydraulic pressure is released. This allows the force of the clutch diaphragm springs to return to their original position, re-clamping the clutch disc between the flywheel and the clutch pressure plate. Also, the release bearing and lever are forced to return, which reverses the movement of the hydraulic system and returns the pedal to its original position against the up-stop.

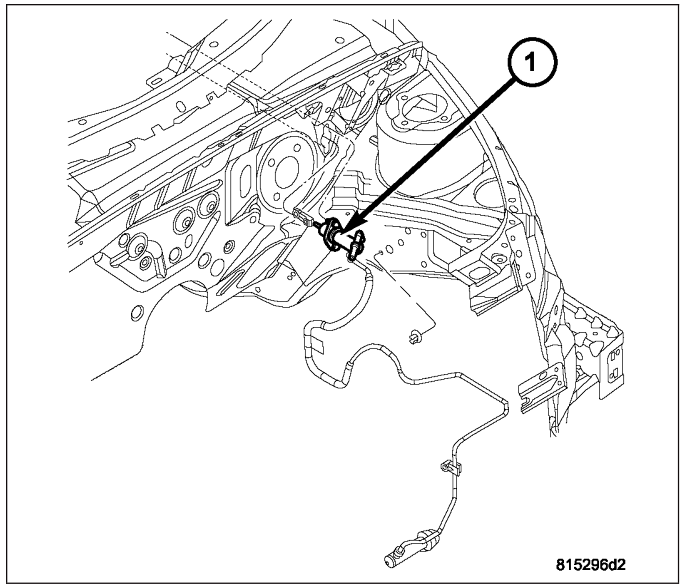


REMOVAL



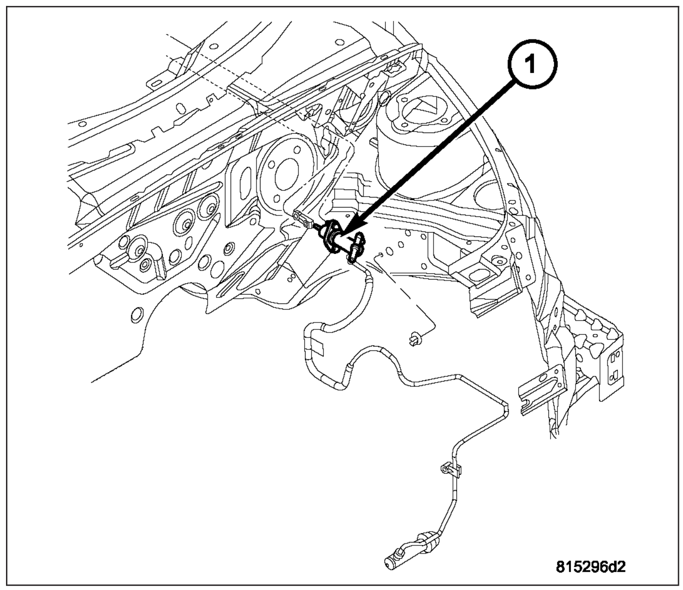
1. Remove the engine cover.
2. Remove air cleaner assembly (1).
3. Disconnect battery negative cable (2).
4. Remove lower instrument panel bezel.

5. Remove two clutch master cylinder retaining nuts (2).
6. Disconnect hydraulic supply tube at clutch slave cylinder. To completely drain clutch master cylinder and tubing, remove brake master cylinder cap.
   a. Disconnect tube and drain fluid into suitable container.
   b. Lower vehicle.



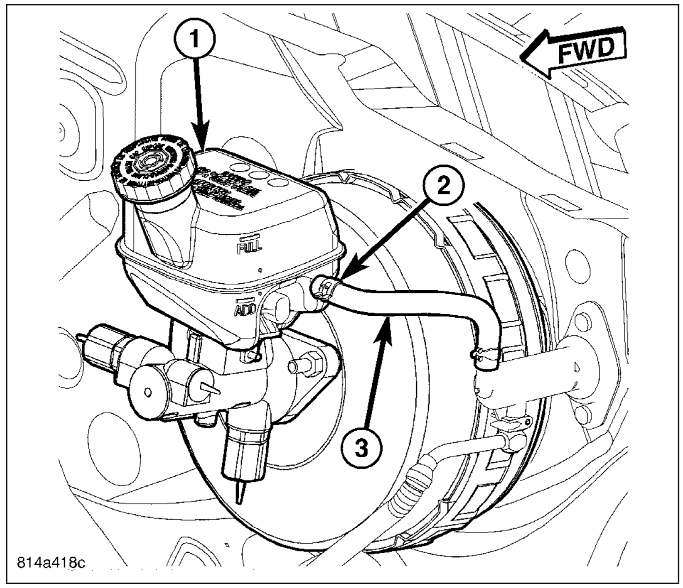
7. Disconnect clutch master cylinder supply line from brake master cylinder reservoir (1). Cap off or collect fluid spillage from reservoir port.

CAUTION: Use care when removing clutch master cylinder from engine compartment. Aggressive handling can result in a damaged hydraulic tube and improper clutch release operation upon reassembly.

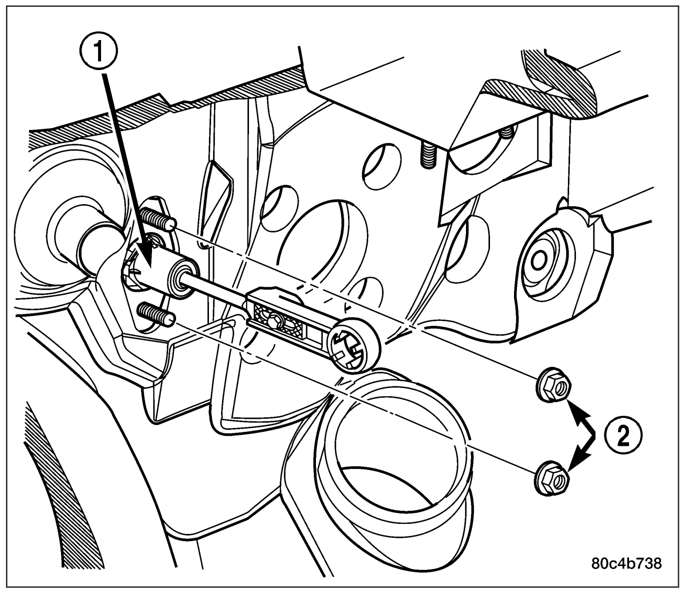


CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.

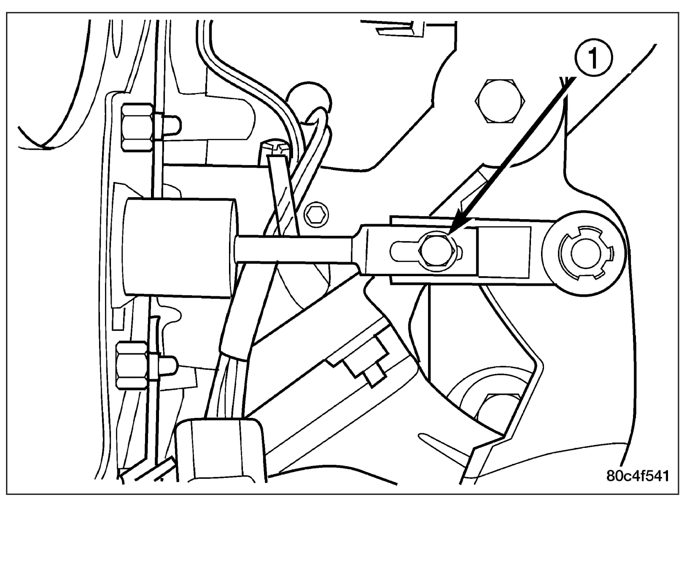
8. Remove master cylinder assembly (1) from mounting position and carefully work hydraulic pipe from out of left rail retainer and engine compartment.



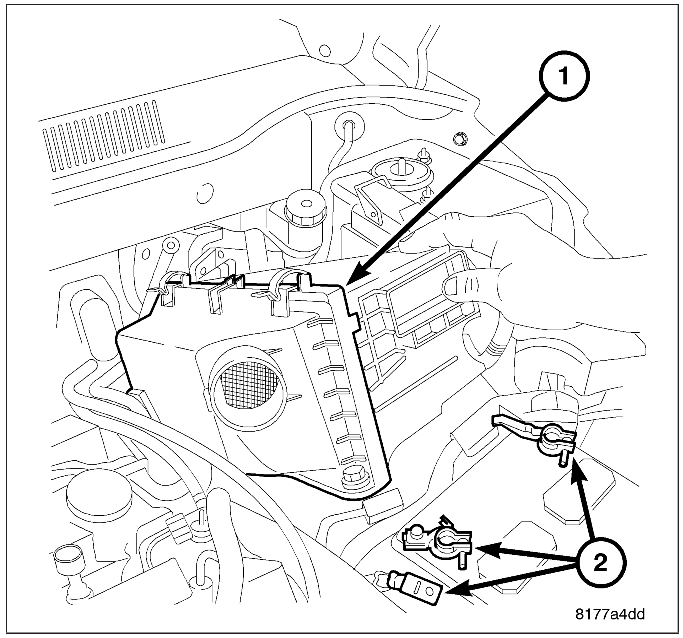
INSTALLATION



1. Install clutch master cylinder (1)
2. Insert tube into slave cylinder port and verify connection by pulling outward.

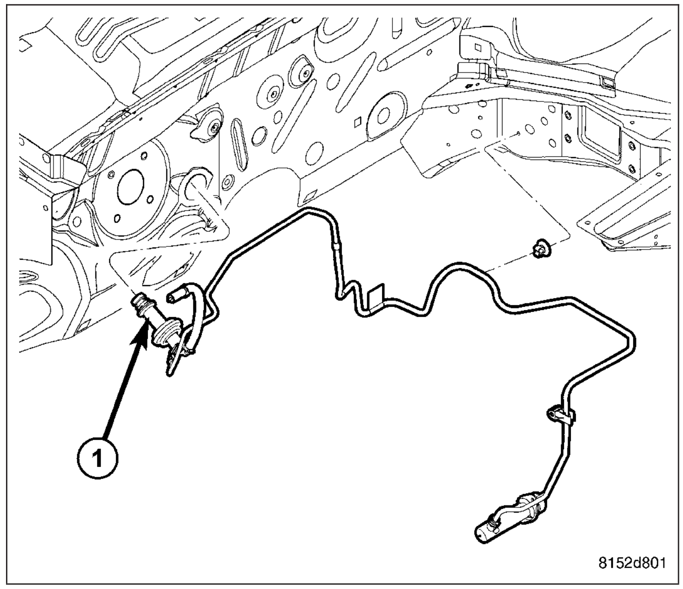


3. Connect clutch master cylinder supply hose to brake master cylinder reservoir.



CAUTION: Due to clutch master cylinder design and placement, the master cylinder body traps a significant amount of air which does not purge by means of normal methods. It is necessary to position master cylinder body vertical, with pushrod pointing down, for about ten seconds to purge air trapped from end of cylinder. Failure to perform this step upon assembly will result in inadequate system bleeding and poor release system functionality.

4. Verify that brake master cylinder reservoir is full and cap is off.
5. Position clutch master cylinder body vertically, with pushrod pointing down, for about ten seconds to purge air trapped from end of cylinder.
6. Install clutch master cylinder body to dash panel. From inside vehicle, install and torque two clutch master cylinder-to-dash panel retaining nuts (2) to 15 N·m (130 in. lbs.) torque.
7. Loosen master cylinder pushrod adjustment screw (1).
8. Connect clutch master cylinder rod to clutch pedal pin. An audible “click” should be heard. If damaged, replace nylon retainer.
9. Adjust clutch pedal position. Gently lift upward on clutch pedal. Tighten adjustment screw to 6 N·m (55 in. lbs.) torque.
10. Install lower instrument panel bezel (2).



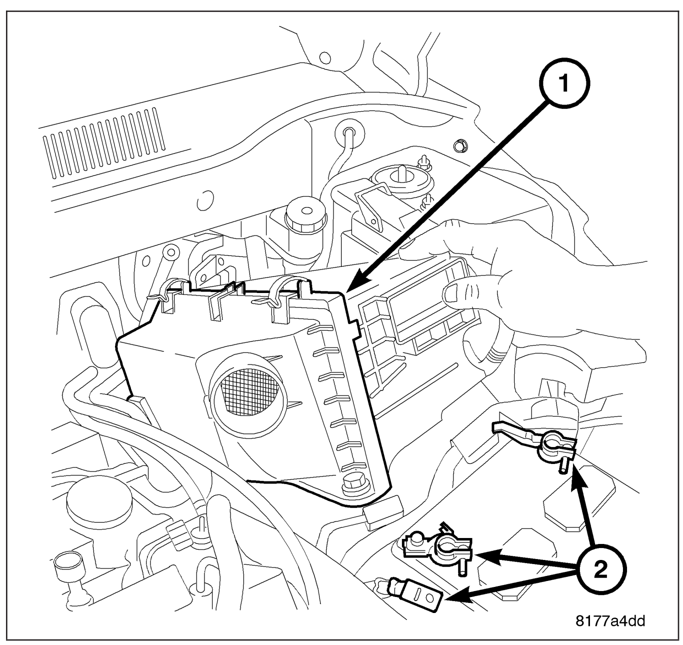
11. Connect battery negative cable.
12. Install air cleaner assembly (1).
13. Verify that brake master cylinder reservoir is full. Top off with DOT 3 brake fluid if necessary.
14. Bleed clutch system (Refer to 6 - CLUTCH - STANDARD PROCEDURE).
15. Actuate clutch pedal a minimum of fifty times to allow any air ingested into the system to vent to the master cylinder reservoir. If residual air becomes trapped in the system, it is necessary to bleed the clutch hydraulic system.
16. Verify proper clutch release system operation.

CYLINDER-MASTER-RHD

DESCRIPTION

The clutch master cylinder (1) mounts to the dash panel and consists of a piston and cylinder housing, an actuating push rod, and an interconnecting hydraulic tube. Fluid is supplied to the clutch master cylinder via the brake master cylinder reservoir.

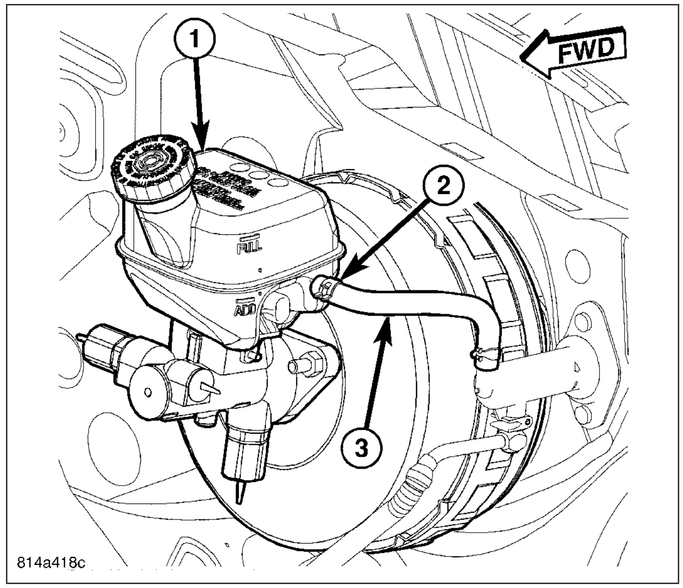
OPERATION



When the clutch pedal is depressed, the push rod moves the piston in the master cylinder, displacing fluid through the hydraulic line and into the slave cylinder. As the slave cylinder extends, actuating the clutch release lever, the release bearing is forced into the fingers of the clutch diaphragm springs. As the fingers move, they release the clamping pressure on the clutch disc between the clutch pressure plate and the flywheel. The clutch becomes disengaged as this pressure is released.

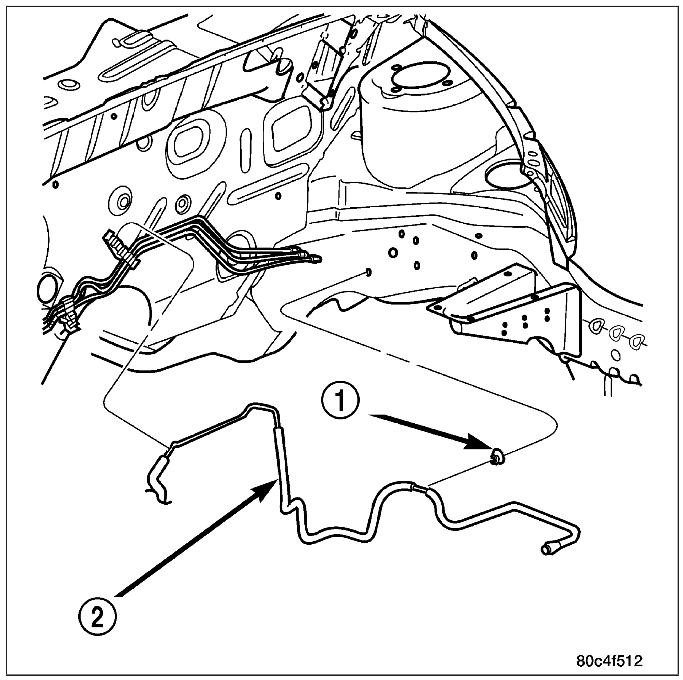
When the clutch pedal is released, the system hydraulic pressure is released. This allows the force of the clutch diaphragm springs to return themselves to their original position, re-clamping the clutch disc between the flywheel and the clutch pressure plate. Also, the release bearing and lever are forced to return, which reverses the movement of the hydraulic system and returns the pedal to its original position against the upstop.

REMOVAL



1. Remove the engine cover.
2. Remove air cleaner assembly (1).
3. Disconnect battery negative cable.

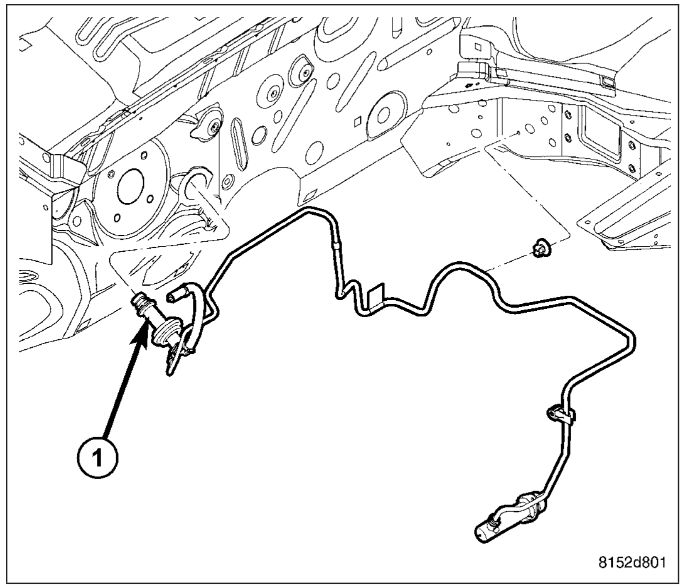
CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.



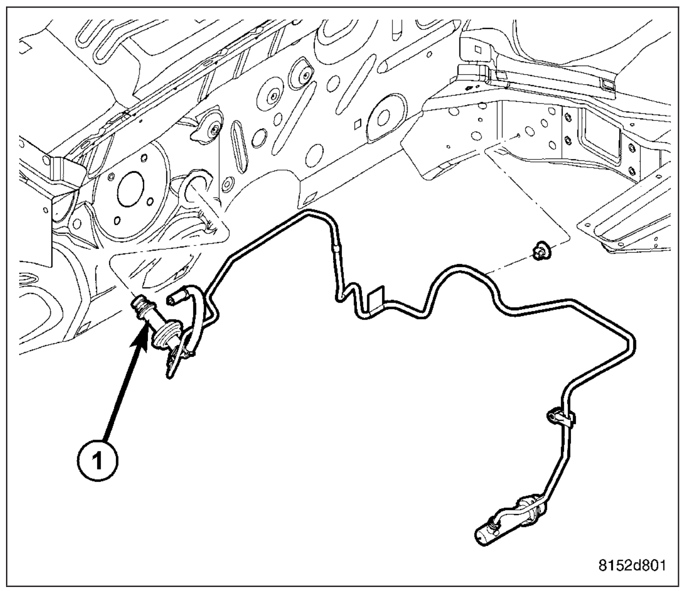
4. Disconnect hydraulic supply tube at clutch slave cylinder. To completely drain clutch master cylinder and tubing, remove brake master cylinder cap.
5. Disconnect hydraulic tube and drain fluid into suitable container. Lower vehicle.
6. Remove instrument panel bezel.
7. Disconnect clutch master cylinder pushrod from clutch pedal. **Inspect retainer bushing and replace if damaged in any way.**

8. Disconnect clutch master cylinder supply line from brake master cylinder reservoir, Cap off or collect reservoir fluid spillage.

9. Remove hydraulic tube from left rail retainer.



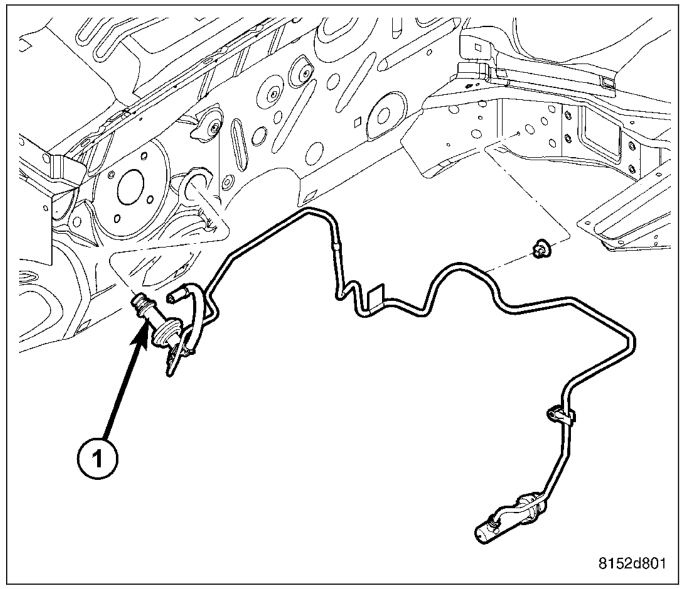
CAUTION: Use care when removing clutch master cylinder from engine compartment. Aggressive handling can result in a damaged hydraulic tube and improper clutch release operation upon reassembly.



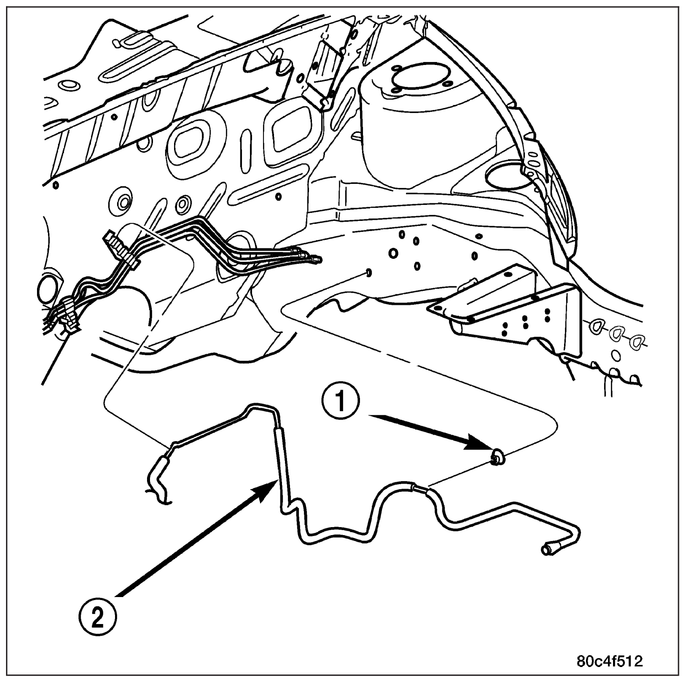
10. Disengage master cylinder grommet and slide back.
11. Release master cylinder by rotating to disengage from pedal bracket assembly.

CAUTION: Use care when removing clutch master cylinder from engine compartment. Aggressive handling can result in a damaged hydraulic tube and improper clutch release operation upon reassembly.

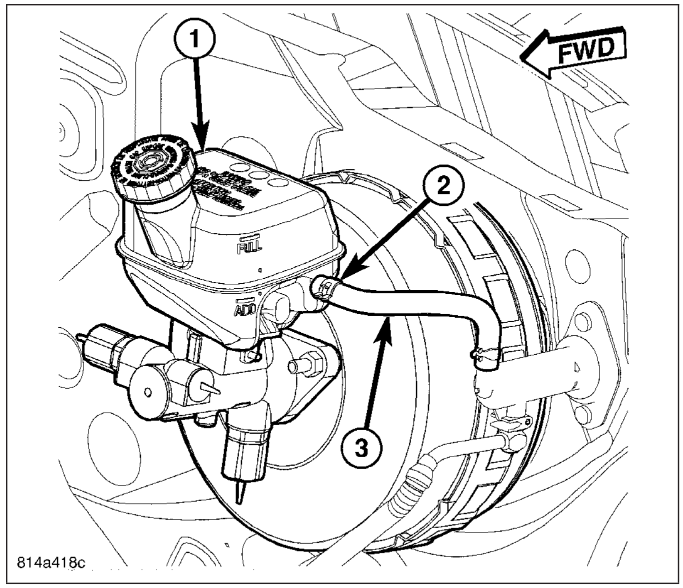
CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.



12. Remove master cylinder assembly from mounting position and carefully work hydraulic pipe from out of engine compartment.

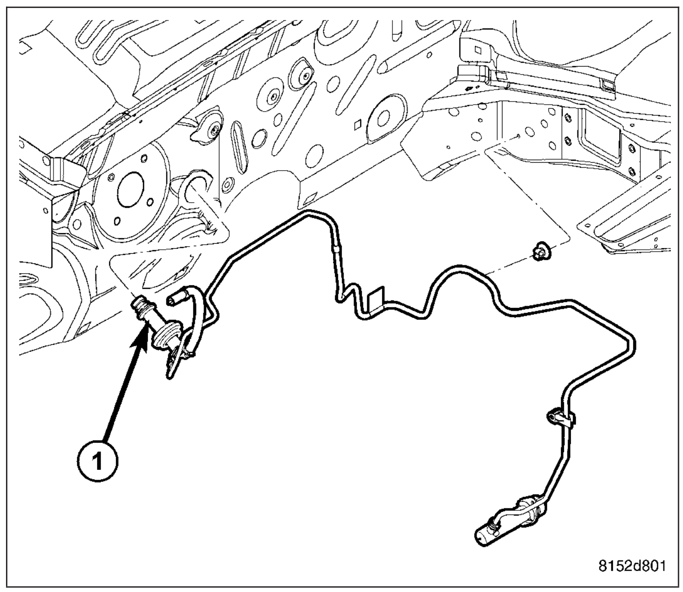


INSTALLATION

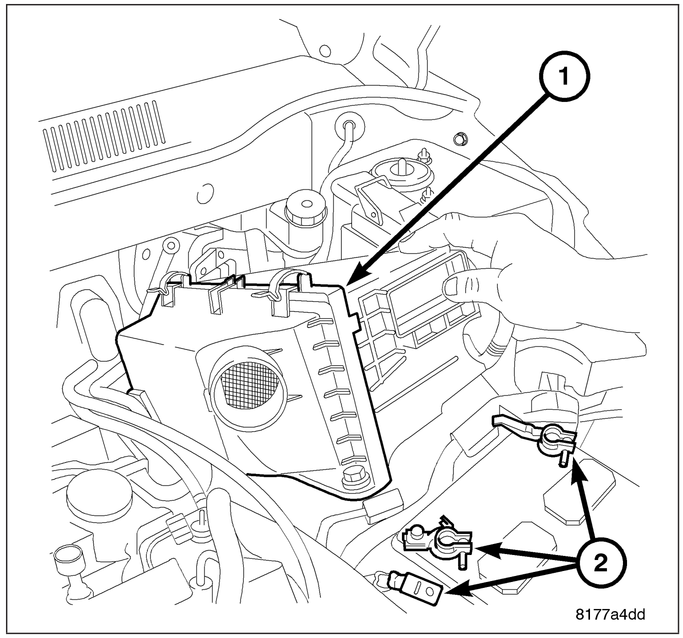


1. Install clutch master cylinder (1) into position **but do not fasten to brake pedal bracket at this time.** Carefully route hydraulic pipe into position as removed.

2. Fasten hydraulic supply tube to retainer (1) at left rail.
3. Connect hydraulic supply tube to clutch slave cylinder:
4. Raise vehicle on hoist. Insert tube into slave cylinder port.
5. Lower vehicle.



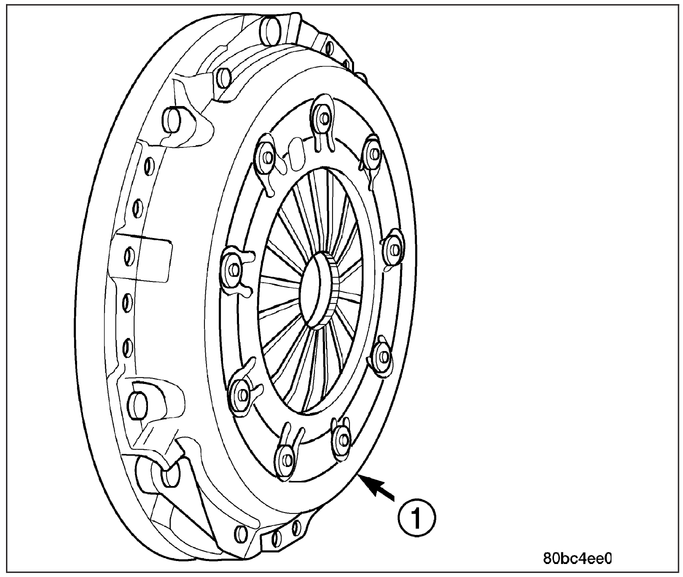
6. Connect clutch master cylinder supply hose (3) to brake master cylinder reservoir (1) and secure with clamp (2).
7. Fill brake master cylinder to the top with suitable DOT 3 fluid. Leave cap off. Raise vehicle on hoist.
8. Remove bleed port protective cap, and install suitable size and length of clear hose to monitor and divert fluid into suitable container.



CAUTION: Due to clutch master cylinder design and placement, the master cylinder body traps a significant amount of air which does not purge by means of normal methods. It is necessary to position master cylinder body vertical, with pushrod pointing down, for about ten seconds to purge air trapped from end of cylinder. Failure to perform this step upon assembly will result in inadequate system bleeding and poor release system functionality.

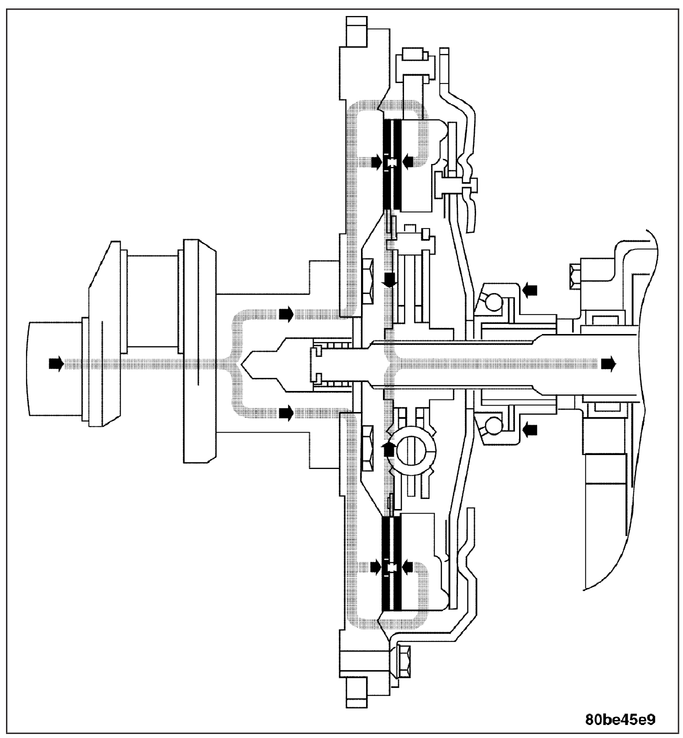
9. Verify that brake master cylinder reservoir is full and cap is off.
10. Remove clutch master cylinder body from dash panel. Position master cylinder body vertically, with pushrod pointing down, for about ten seconds to purge air trapped from end of cylinder. Install brake master cylinder cap.
11. Install clutch master cylinder body.
12. From inside vehicle, connect clutch master cylinder rod to clutch pedal pin. An audible “click” should be heard. If damaged, replace nylon retainer.
13. Install and torque clutch master cylinder-to-dash panel nuts to 34 N·m (300 in.lbs.). Install push rod retaining clip (1).
14. Install lower instrument panel bezel.
15. Install PDC bracket into position.
16. Raise vehicle on hoist.
17. Connect battery negative cable.

18. Install air cleaner assembly (1).
19. Verify that brake master cylinder reservoir is full. Top off with DOT 3 brake fluid if necessary.
20. Actuate clutch pedal a minimum of fifty times to allow any air ingested into the system to vent to the master cylinder reservoir. If residual air becomes trapped in the system, it is necessary to bleed the clutch hydraulic system (Refer to 6 - CLUTCH - STANDARD PROCEDURE).
21. Verify proper clutch release system operation.



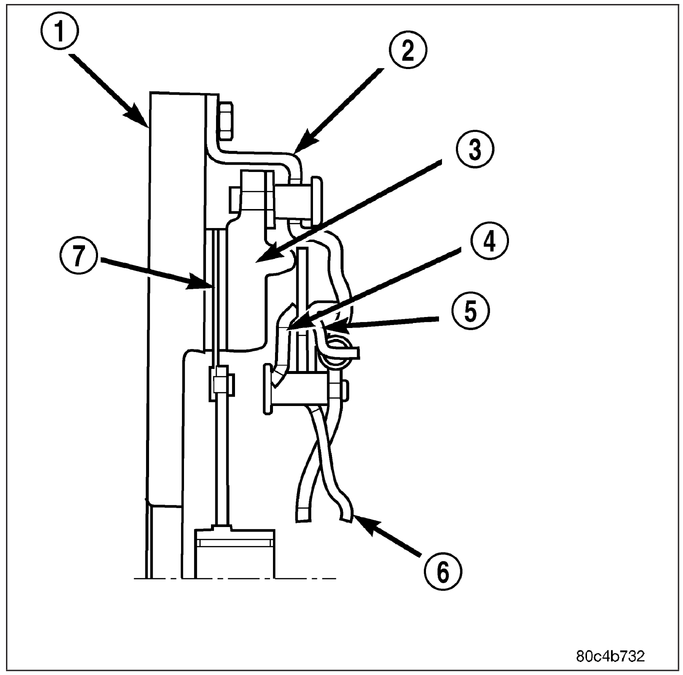
CLUTCH-MODULAR

DESCRIPTION

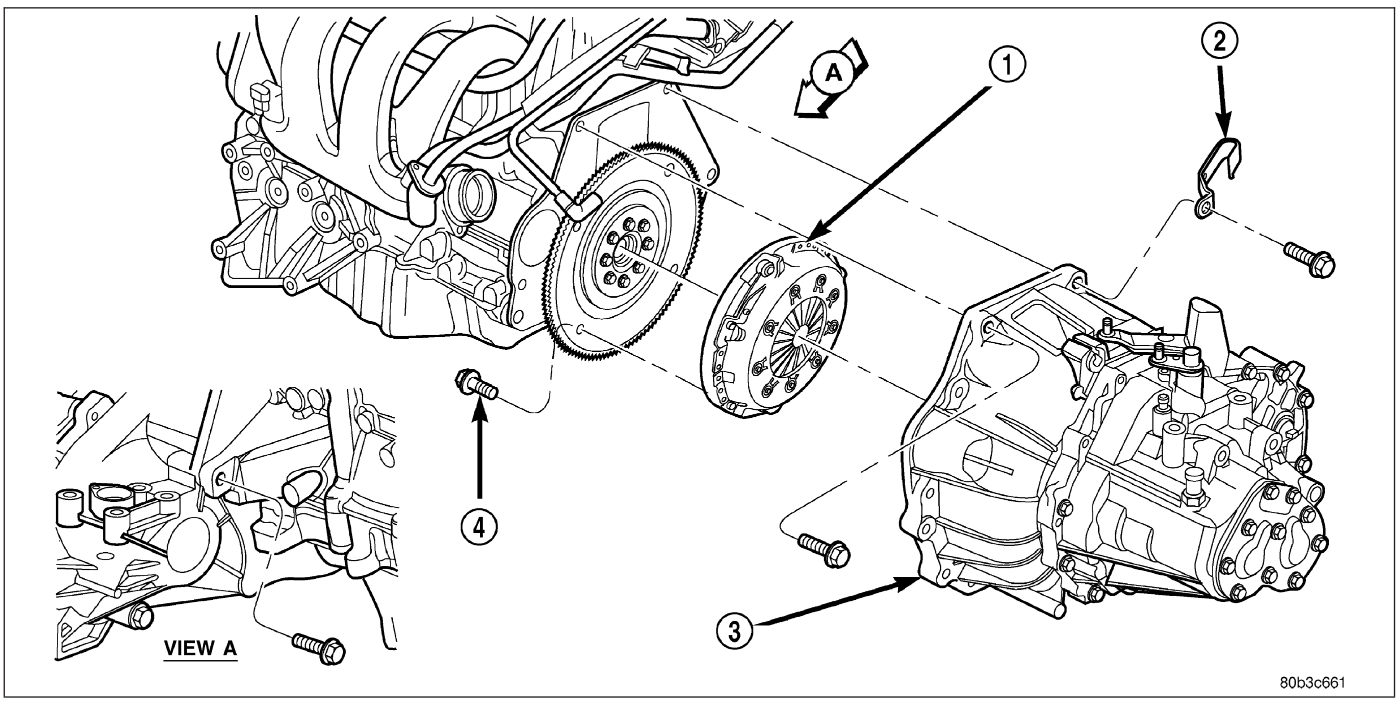


The modular clutch assembly (1) is located between the engine and manual transaxle in the transaxle bell-housing, and is responsible for transmitting engine power to the transaxle. The modular clutch is an assembly which incorporates a self-adjusting design and consists of the following components:

- Flywheel
- Clutch Disc
- Pressure Plate
- Diaphragm Spring
- Adjusting Ring
- Sensor
- Cover

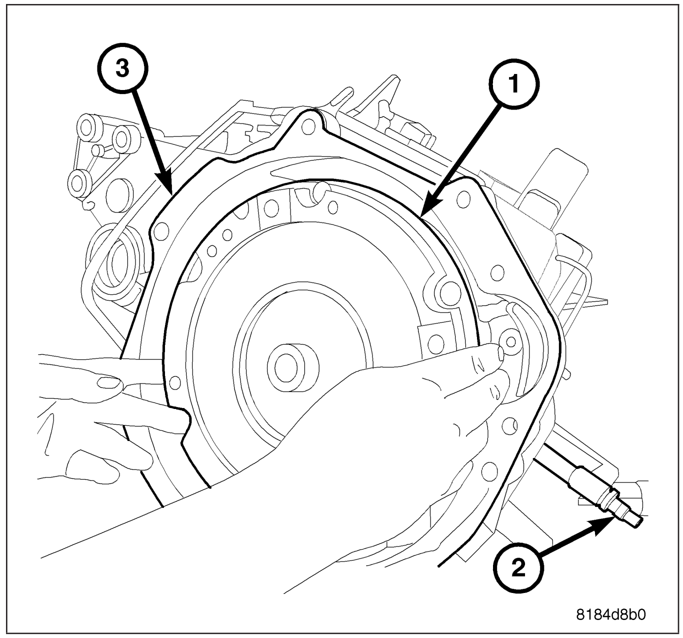


OPERATION

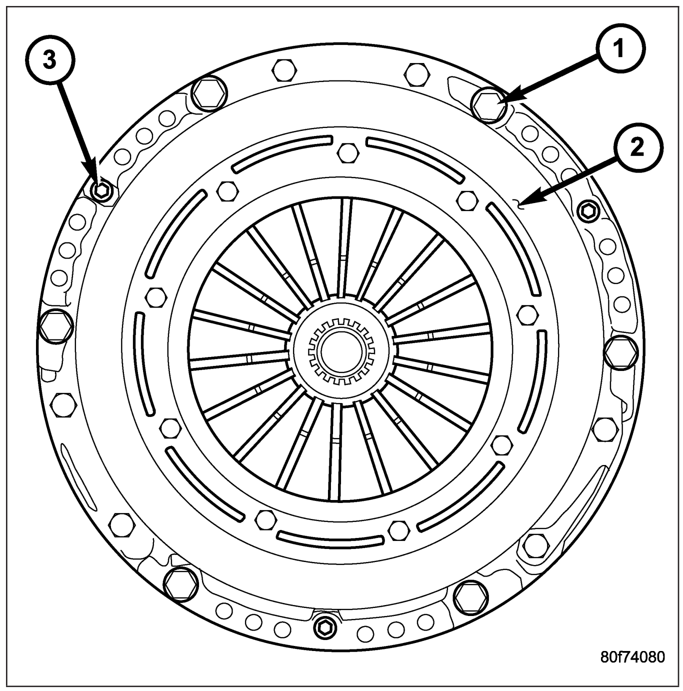


The modular clutch assembly is designed to transmit power from the engine to the manual transaxle. This is accomplished by the friction and clamping force generated when the spring loaded pressure plate locks the clutch disc to the flywheel. The clutch disc, which is splined to the transaxle input shaft, transmits power until the center of the diaphragm spring is depressed, and the clamp force is removed from the disc.

The self-adjusting feature of this clutch assembly relies on the sensor ring (4) and the adjuster ring (5), which works its way around a ramped clutch cover (2), taking up clearance as the clutch disc wears and maintaining diaphragm spring force throughout the life of the clutch. The primary benefits of this design are reduced pedal effort, constant release load over clutch life, and extended clutch life.



REMOVAL



1. Remove transaxle (3) from vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL).

2. Remove modular clutch assembly (1) from transaxle input shaft.

3. Disassemble modular clutch assembly (If individual parts are available). Remove six pressure plate-to-flywheel bolts (1).Remove pressure plate (2) and disc from flywheel.

INSPECTION

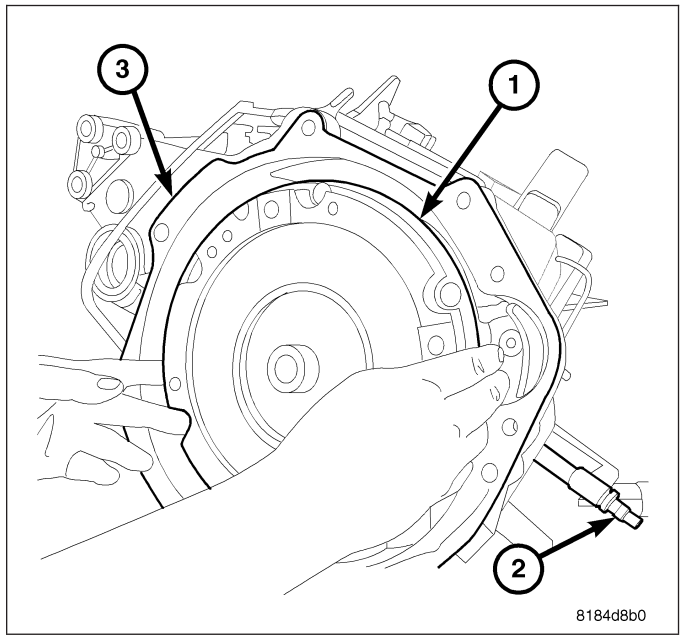
Fluid contamination is a frequent cause of clutch malfunctions. Oil, grease, water, or other fluids on the clutch contact surfaces will cause faulty operation.

During inspection, note if any components are contaminated. Look for evidence of oil, grease, or water/road splash on clutch components.

OIL CONTAMINATION

Oil contamination indicates a leak at the rear main seal and/or transaxle input shaft. Oil leaks produce a residue of oil on the transaxle housing interior, clutch cover and flywheel. Heat buildup caused by slippage can bake the oil residue onto the components. This glaze-like residue ranges in color from amber to black.

GREASE CONTAMINATION

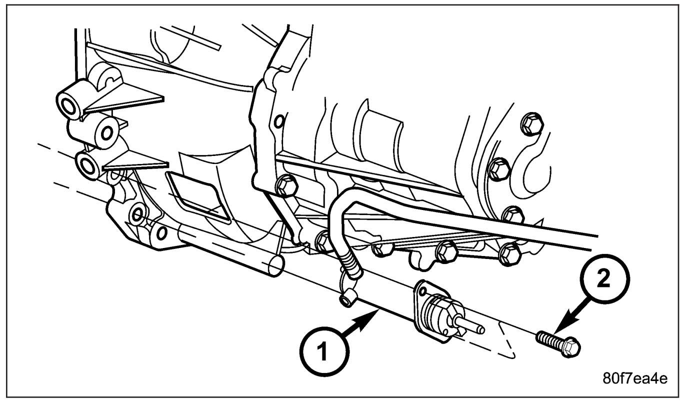


Grease contamination is usually a product of over-lubrication. During clutch service, apply only a small amount of grease to the input shaft splines. Excess grease may be thrown off during operation, contaminating the disc.

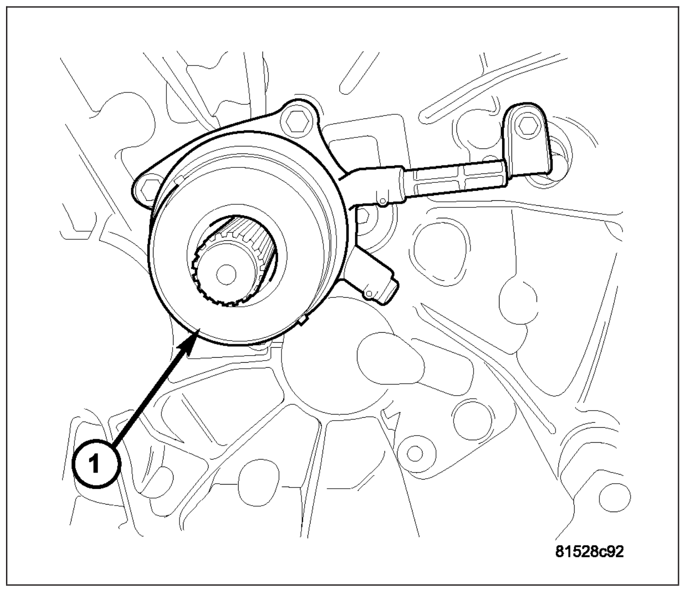
ROAD SPLASH/WATER CONTAMINATION

Road splash contamination is usually caused by driving the vehicle through deep water puddles. Water can be forced into the clutch housing, causing clutch components to become contaminated. Facing of disc will absorb moisture and bond to the flywheel and/or, pressure plate, if vehicle is allowed to stand for some time before use. If this condition occurs, replacement of clutch assembly may be required. Drive the vehicle until normal clutch operating temperature has been obtained. This will dry off disc assembly, pressure plate, and flywheel.

INSTALLATION

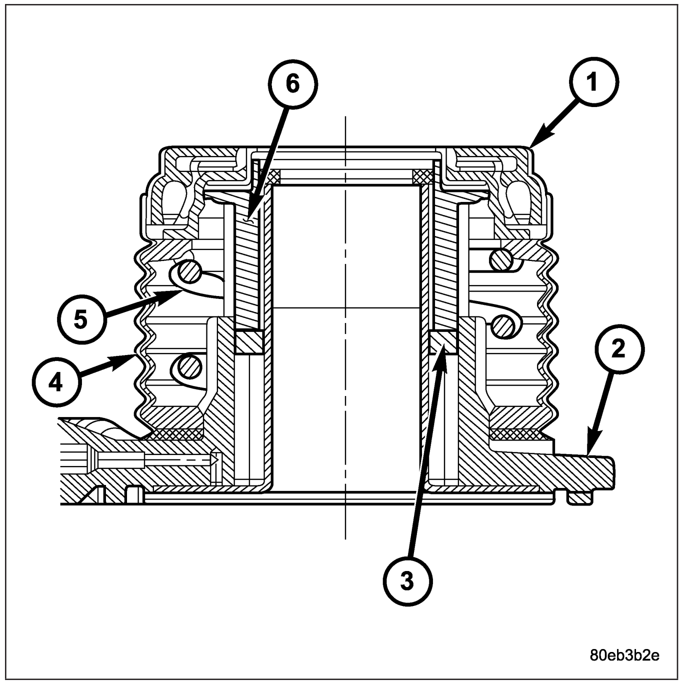


1. Install clutch module onto input shaft.
2. Install transaxle into vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION).



CYLINDER-SLAVE

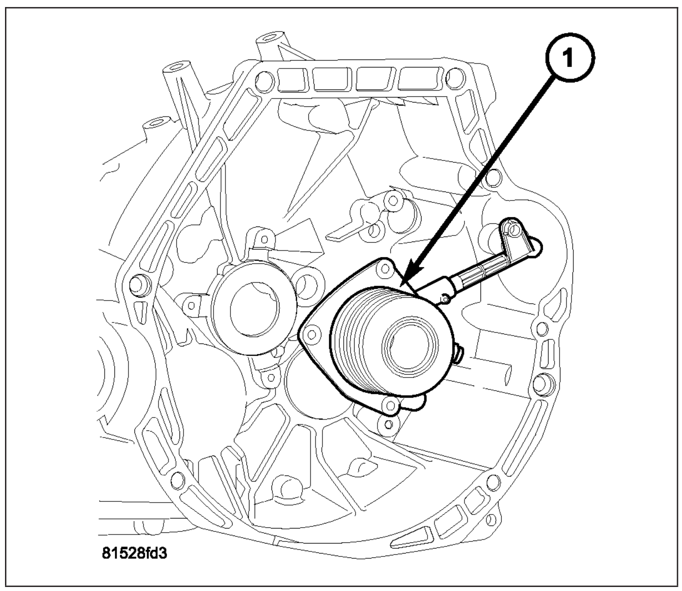
DESCRIPTION



The clutch slave cylinder (1) consists of a hydraulic piston and cylinder, seal and return spring. It is fastened to the transaxle bellhousing. The slave cylinder is connected to the clutch master cylinder hydraulic pipe, which is retained to the cylinder by a pair of retainer clips, and has a bleed port to facilitate the removal of air from the system.

The clutch release system (1) utilizes a slave cylinder of a concentric design, having all components fixed about the same axis. The concentric slave cylinder (CSC) is mounted to the inside of the clutch bellhousing and is serviced only as an assembly.

The concentric design permits high efficiency, resulting in low and consistent pedal effort, as well as automatic adjustment to compensate for clutch disc wear. The CSC is a self-contained unit, consisting of a main body (2) and piston (6), spring (5), integrated release bearing (1), and a rubber boot (4).

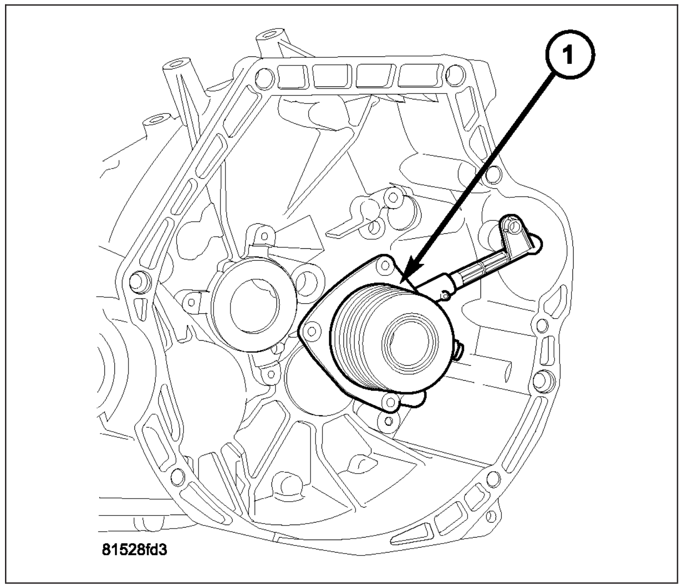


REMOVAL

Removal

NOTE: To prevent drainage of clutch master cylinder assembly upon slave cylinder removal, it is necessary to make sure brake master cylinder fluid level is full and reservoir cap is installed tight.

1. Remove transaxle from vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL).
2. Remove bolts to slave cylinder-to-clutch bellhousing bolts and remove slave cylinder (1) from transaxle.

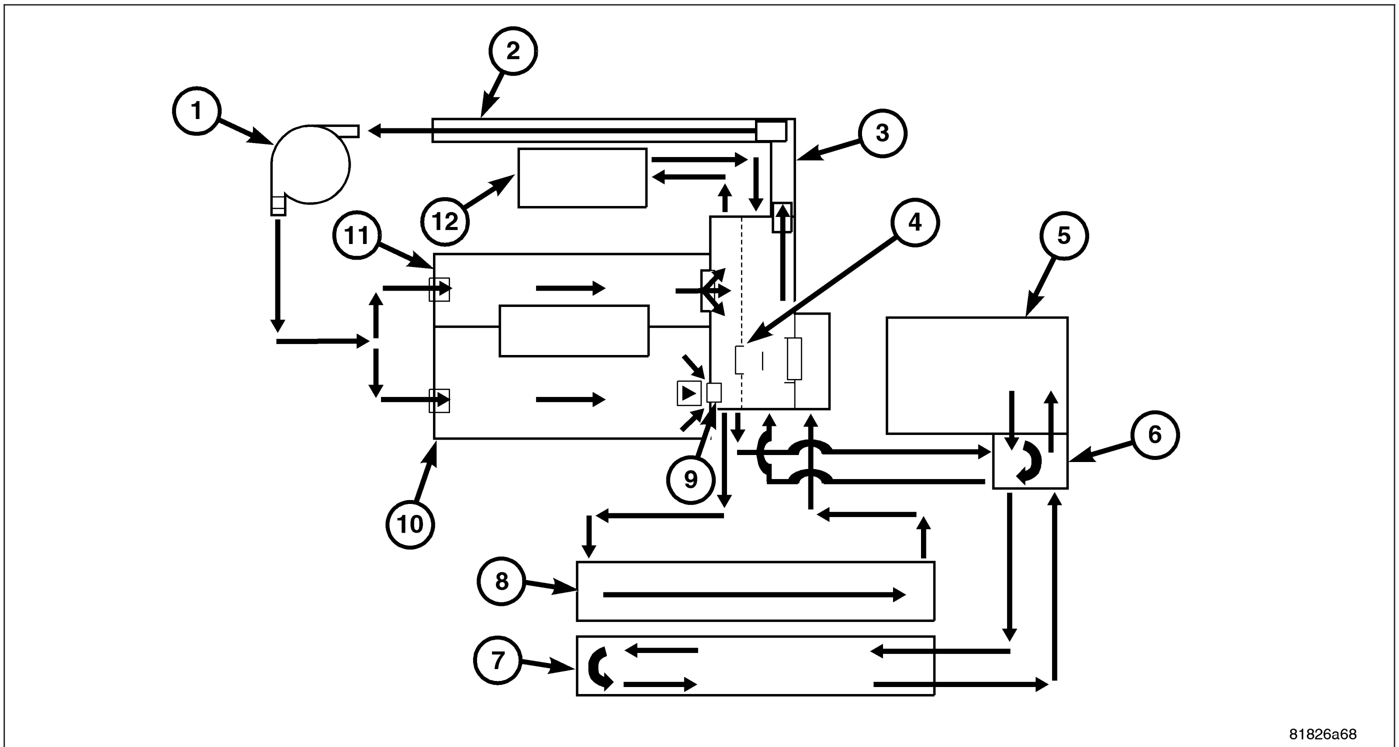


INSTALLATION

1. Install slave cylinder (1) to transaxle using new bolts.

NOTE: Torque three CSC body screws first, then torque the fluid tube attachment.

2. Torque slave cylinder-to-case bolts in three steps:
   1. 2 N·m (18 in. lbs.)
   2. 5 N·m (44 in. lbs.)
   3. 8.4 N·m (74 in. lbs.)
3. Install transaxle (Refer to 21 - TRANSMISSION/ TRANSAXLE/MANUAL - INSTALLATION).
4. Bleed clutch hydraulic system. (Refer to 6 - CLUTCH - STANDARD PROCEDURE)



COOLING

TABLE OF CONTENTS

COOLING

DESCRIPTION

1 - WATER PUMP
2 - RETURN TUBE
3 - WATER PLENUM
4 - PRIMARY THERMOSTAT
5 - TRANSMISSION
6 - INTERNAL TRANSMISSION COOLER
7 - COMBINATION COOLER
8 - RADIATOR
9 - SECONDARY THERMOSTAT
10 - CYLINDER BLOCK
11 - CYLINDER HEAD
12 - HEATER CORE

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. Gas engines use a separate and remotely mounted, ambient pressure coolant recovery bottle using a pressure/vent cap. Diesel engine use a separate and remotely mounted, pressurized coolant tank using a pressure/vent cap.

The cooling system consists:

- Radiator
- Coolant
- Electric Cooling Fans
- Water pump
- Dual Thermostats (Gas Engines)

- Charge air cooler (Turbocharged vehicles only)
- Hoses and clamps
- Transmission oil cooler
- Coolant pressure bottle/overflow system

OPERATION

The primary purpose of a cooling system is to maintain engine temperature in a range that will provide satisfactory engine performance and emission levels under all expected driving conditions. It also provides hot water (coolant) for heater performance and cooling for automatic transmission oil. It does this by transferring heat from engine metal to coolant, moving this heated coolant to the radiator, and then transferring this heat to the ambient air.

- When the Engine is cold and both the primary and secondary thermostats are closed. The coolant will circulate through the engine, heater system, which also serves as the bypass, and the internal automatic transmission oil cooler. The cooling system has no flow through the radiator
- As the engine warms up, the primary thermostat will start to open at 82 °C (179 °F). Coolant will start to flow through the radiator. The primary thermostat will fully open at 95 °C (203 °F).
- The secondary thermostat will start to open at 95 °C (203 °F). This will increase the coolant flow through the cylinder block and cylinder head and the radiator. The secondary thermostat will fully open at 110 °C (230 °F).

WARNING

COOLING SYSTEM WARNINGS

WARNING: Antifreeze is an ethylene glycol based coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area, seek medical attention immediately. Do not store in opened or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children and pets. Dispose of glycol based coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLING SYSTEM AERATION

If coolant level drops below a certain point, aeration will occur drawing air into the water pump resulting in the following:

- High reading shown on the temperature gauge.
- Loss of coolant flow through the heater core.
- Corrosion in the cooling system.
- Transmission oil will become hotter (automatic transmission equipped vehicles).
- Water pump seal may run dry, increasing the risk of premature seal failure.
- Combustion gas leaks into the coolant can also cause the above problems.

DIAGNOSIS AND TESTING - COOLING SYSTEM DEAERATION

As air is removed from the cooling system, it gathers in the coolant recovery container. This pressure is released into the atmosphere through the pressure valve located in the radiator pressure cap when pressure reaches 96 - 124 kPa (14 - 18 psi). This air is replaced with coolant from the coolant recovery container.

NOTE: Deaeration does not occur at engine idle, higher engine speeds are required. Normal driving will deaerate cooling system.

To effectively deaerate the system, multiple thermal cycles of the system may be required.

DIAGNOSIS AND TESTING - COOLING SYSTEM FLOW CHECK

WARNING: Do not remove the cooling system pressure cap with the system hot and under pressure because serious burns from coolant can occur.

To determine whether coolant is flowing through the cooling system, use one of the following procedures:

- If engine is cold, idle engine until normal operating temperature is reached. Then feel the upper radiator hose. If it is hot, coolant is circulating.
- Remove pressure cap when engine is cold, remove small amount of coolant. Idle engine until thermostat opens, you should observe coolant flow while looking down the filler neck. Once flow is detected install the pressure cap.

COOLING SYSTEM LEAK TESTING

WARNING: If vehicle has been run recently, wait 15 minutes before removing pressure cap. Place a shop towel over the cap, and without pushing down, rotate it counterclockwise to the first stop. Allow fluids to escape through the overflow tube. When the system stops pushing coolant and steam into the coolant recovery container and pressure drops, push down on the cap and remove it completely. Squeezing the radiator inlet hose with a shop towel (to check pressure) before and after turning to the first stop is recommended.

With engine not running, wipe the coolant filler neck sealing seat clean. The radiator should be full.

Attach Tool 7700 or equivalent cooling system pressure tester to the coolant filler neck. Apply 104 kPa (15 psi) pressure. If the pressure drops more than 13 kPa (2 psi) in 2 minutes inspect all points for external leaks.

All hoses, radiator and heater, should be moved while at 104 kPa (15 psi) since some leaks occur while driving due to engine movement, etc.

If there are no external leaks after the gauge dial shows a drop in pressure, detach the tester. Start engine and run the engine to normal operating temperature in order to open the thermostat and allow the coolant to expand. Reattach the tester. If the needle on the dial fluctuates, it indicates a combustion leak and is usually a head gasket leak.

WARNING: WITH TOOL IN PLACE PRESSURE BUILDS UP FAST. ANY EXCESSIVE AMOUNT OF PRESSURE BUILT UP BY CONTINUOUS ENGINE OPERATION MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

If the needle on the dial does not fluctuate, race the engine a few times. If an abnormal amount of coolant or steam is emitted from the tailpipe, it may indicate a damaged head gasket, cracked engine block or cylinder head.

There may be internal leaks which can be determined by removing the oil dipstick. If water globules appear intermixed with the oil, it will indicate an internal leak in the engine. If there is an internal leak, the engine must be disassembled for repair.

COOLING SYSTEM

CONDITION	POSSIBLE CAUSE	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Diagnostic Trouble Code (DTC) has been set indicating a stuck open engine thermostat.	1. Replace thermostat, if necessary. If a (DTC) has not been set, the problem may be with the temperature gauge.
	2. Engine Coolant Temperature Sensor.	2. Check connector at Engine Coolant Temperature Sensor. Repair as necessary.
	3. Inoperative temperature gauge.	3. Check gauge operation (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

CONDITION	POSSIBLE CAUSE	CORRECTION
	4. Coolant level low during cold ambient temperature, accompanied by poor heater performance.	4. Check coolant level in the coolant recovery/reserve container and the radiator. Inspect the system for leaks. Repair as necessary. Refer to WARNINGS in this section before removing pressure cap.
TEMPERATURE GAUGE READS HIGH OR ENGINE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST FROM SYSTEM.	1. Trailer being towed, a steep hill being climbed, vehicle being operated in slow moving traffic, or engine idling during high ambient (outside) temperatures with air conditioning on. High altitudes could also cause these conditions.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause of the overheating and repair. Refer to POSSIBLE CAUSES in this section.
	2. Inoperative temperature gauge.	2. Check gauge operation (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).
	3. Is temperature warning lamp (if equipped) illuminating unnecessarily?	3. Check warning lamp operation (Refer to 8 - ELECTRICAL/ INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).
	4. Coolant low in recovery/reserve bottle and radiator?	4. Check for coolant leaks and repair as necessary.
	5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following step 6.	5. Tighten cap.
	6. Poor seals at pressure cap.	6. (a) Check condition of cap and cap seals (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace cap if necessary. (b) Check condition of filler neck. If neck is warped or damaged, replace neck.
	7. Coolant level low in radiator, but not in coolant recovery/reserve bottle. This indicates the radiator is not drawing coolant from the coolant recovery/reserve bottle as the engine cools. As the engine cools, a vacuum is formed inside the cooling system. If the pressure cap seals are defective, or the cooling system has a leak, a vacuum cannot be formed.	7. (a) Check condition of pressure cap and cap seals. Replace cap if necessary. (b) Check condition of filler neck. Replace if damaged. (c) Check condition of hose from filler neck to coolant container. It should be tight at both ends without any kinks or tears. Replace hose as necessary. (d) Check coolant recovery/reserve bottle and hose for blockage. Repair as necessary.

CONDITION	POSSIBLE CAUSE	CORRECTION
	8. Freeze point of coolant not correct. Mixture ratio may be too rich.	8. Check coolant concentration (Refer to 7 - COOLING/ENGINE/ COOLANT - DIAGNOSIS AND TESTING). Adjust glycol-to-water ratio as required.
	9. Coolant not flowing through system.	9. Check for coolant flow at filler neck with some coolant removed, engine warm, and thermostat open. Coolant should be observed flowing through filler neck. If flow is not observed, determine reason for lack of flow and repair as necessary.
	10. Radiator air seals missing or improperly installed.	10. Inspect air seals. Correct as necessary.
	11. Radiator or A/C condenser fins are dirty or clogged.	11. Clean obstruction from fins.
	12. Radiator core is plugged or corroded.	12. Replace or clean radiator.
	13. Fuel or ignition system problems.	13. Refer to the appropriate Powertrain Diagnostic Procedure manual.
	14. Dragging Brakes.	14. Inspect brake system and repair as necessary (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).
	15. Bug screen or other aftermarket accessory is being used causing reduced air flow.	15. Remove bug screen or accessory.
	16. Thermostat partially or completely closed.	16. Check thermostat operation and replace as necessary (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - DIAGNOSIS AND TESTING).
	17. Cooling fan not operating properly.	17. Check electric fan operation and repair as necessary.
	18. Cylinder head gasket leaking.	18. Check cylinder head gasket for leaks (Refer to 7 - COOLING/ ENGINE - DIAGNOSIS AND TESTING - COOLING SYSTEM LEAK TESTING).
	19. Heater core leaking.	19. Check heater core for leaks.
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	1. The gauge may cycle up and down. This is due to the cycling of the electric radiator fan.	1. A normal condition. No correction is necessary. If gauge cycling is the hot zone, check electric fan operation and repair as necessary.
	2. During cold weather operation with the heater blower in the high position, the gauge reading may drop slightly.	2. A normal condition. No correction is necessary.
	3. Temperature gauge or Engine Coolant Temperature Sensor is defective or shorted.	3. Check gauge operation (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

CONDITION	POSSIBLE CAUSE	CORRECTION
	4. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running).	4. A normal condition. No correction is necessary. The gauge should return to normal range after vehicle is driven.
	5. Gauge reading high after restarting a warmed-up (hot) engine.	5. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.
	6. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).	6. Check and correct coolant leaks.
	7. Cylinder head gasket leaking allowing exhaust gas to enter cooling system. This will cause thermostat to open late.	7. (a) Check for cylinder head gasket leaks using Tool C-3685-A Block Leak Tester or the equivalent. Repair as necessary.
		(b) Check for coolant in the engine oil. Inspect for white steam emitting from exhaust system. Repair as necessary.
	8. Water pump impeller loose on shaft.	8. Check water pump and replace as necessary.
	9. Air leak on the suction side of water pump allows air to build up in cooling system. This will cause the thermostat to open late.	9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT FLOWING INTO RECOVERY BOTTLE. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL, BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN RECOVERY BOTTLE.	1. Pressure relief valve in pressure cap is defective.	1. Check condition of pressure cap and seals (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace as necessary.
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE IS READING HIGH OR HOT.	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test cooling system and repair as necessary.
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH.	1. Engine overheating.	1. Check reason for overheating and repair as necessary.
	2. Freeze point of coolant not correct.	2. Check the freeze point of the coolant (Refer to 7 - COOLING/ ENGINE/COOLANT - DIAGNOSIS AND TESTING). Adjust glycol-to-water ratio as required.

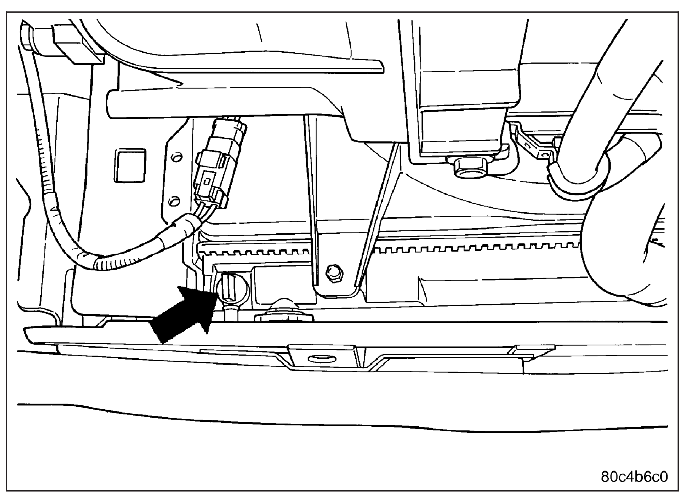
CONDITION	POSSIBLE CAUSE	CORRECTION
HOSE OR HOSES COLLAPSE WHEN ENGINE IS COOLING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant recovery/reserve system.	1. (a) Pressure cap relief valve stuck (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace as necessary. (b) Hose between coolant recovery/reserve bottle and outlet connector is kinked. Repair as necessary. (c) Vent at coolant recovery/reserve bottle is plugged. Clean vent and repair as necessary. (d) Recovery/reserve bottle is internally blocked or plugged. Check for blockage and repair as necessary.
RADIATOR FAN OPERATES ALL THE TIME	1. Malfunctioning electrical component or circuit.	1. Refer to appropriate Powertrain Diagnostic Procedures. Repair as necessary.
	2. Check for low coolant level.	2. Repair as necessary.
RADIATOR FAN WILL NOT OPERATE, GAUGE READING HIGH OR HOT	1. Fan motor defective.	1. Refer to appropriate Powertrain Diagnostic Procedures manual for operation of the DRB III® scan tool. Repair as necessary.
	2. Fan relay, powertrain control module (PCM) or engine coolant temperature sensor defective.	2. Refer to appropriate Powertrain Diagnostic Procedures manual for operation of the DRB III® scan tool. Repair as necessary.
	3. Blown fuse in power distribution center (PDC).	3. Determine cause for blown fuse and repair as necessary.
NOISY FAN	1. Fan blade loose.	1. Replace radiator fan assembly.
	2. Fan blade striking a surrounding object.	2. Locate point of fan blade contact and repair as necessary.
	3. Air obstructions at radiator or A/C condenser.	3. Remove obstructions and/or clean debris from radiator and/or A/C condenser.
	4. Electric fan motor defective.	4. Replace radiator fan assembly.

CONDITION	POSSIBLE CAUSE	CORRECTION
INADEQUATE AIR CONDITIONER PERFORMANCE (COOLING SYSTEM SUSPECTED)	1. Electric radiator fan not operating when A/C is on.	1. Refer to appropriate Powertrain Diagnostic Procedures manual for operation of the DRB III® scan tool. Repair as necessary.
	2. Radiator and/or air conditioning condenser is restricted, obstructed or dirty.	2. Remove restriction and/or clean as necessary.
	3. Radiator air seals missing or improperly installed.	3. Inspect air seals. Repair as necessary.
	4. Engine is overheating (heat may be transferred from radiator to A/C condenser). High underhood temperature due to engine overheating may also transfer heat to A/C components.	4. Correct overheating condition. Refer to this section.
INADEQUATE HEATER PERFORMANCE	1. Has a diagnostic trouble code (DTC) been set?	1. Refer to Powertrain Diagnostic Procedures.
	2. Coolant level low.	2. Check cooling system for leaks. Repair as necessary.
	3. Obstructions in heater hose fittings at engine.	3. Remove heater hoses at both ends and check for obstructions. Repair as necessary.
	4. Heater hose kinked.	4. Locate kinked area and repair as necessary.
	5. Water pump is not pumping coolant to heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch.	5. (Refer to 7 - COOLING/ENGINE/ WATER PUMP - DIAGNOSIS AND TESTING). Repair as necessary.
HEAT ODOR	1. Various heat shields are used at certain components. One or more of these shields may be missing.	1. Locate missing shields and replace or repair as necessary.
	2. Is temperature gauge reading above the normal range?	2. Refer to the previous Temperature Gauge Reads High in these Diagnostic Charts. Repair as necessary.
	3. Is cooling fan operating correctly?	3. Repair as necessary.
	4. Has undercoating been applied to any unnecessary component.	4. Clean undercoating as necessary.
	5. Engine may be running rich causing the catalytic converter to overheat.	5. Refer to appropriate Powertrain Diagnostic Procedures manual for operation of the DRB III® scan tool. Repair as necessary.
POOR DRIVEABILITY (THERMOSTAT POSSIBLY STUCK OPEN). GAUGE MAY BE READING LOW	1. Has a diagnostic trouble code (DTC) been set?	1. Refer to the Powertrain Diagnostic Procedure manual for checking a DTC related to the thermostat.

CONDITION	POSSIBLE CAUSE	CORRECTION
STEAM IS COMING FROM FRONT OF VEHICLE NEAR GRILLE AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP, RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE.	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. Check the freeze point of the coolant (Refer to 7 - COOLING/ ENGINE/COOLANT - DIAGNOSIS AND TESTING). Adjust the glycol-to-water ratio as required.
COOLANT LEVEL CHANGES IN COOLANT RECOVERY/RESERVE BOTTLE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the bottle was between the FULL HOT and ADD marks at normal engine operating temperature, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.

STANDARD PROCEDURE

ROUTINE COOLANT LEVEL CHECK



NOTE: Do not remove pressure cap for routine coolant level inspections.

The coolant recovery/reserve system provides a quick visual method for determining the coolant level without removing the radiator cap. Simply observe, with the engine idling and warmed up to normal operating temperature, that the level of the coolant in the recovery/reserve container is between the FULL HOT and ADD marks.

DRAINING COOLING SYSTEM

WARNING: DO NOT OPEN THE RADIATOR DRAIN-COCK WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

NOTE: Drain, flush, and fill the cooling system at the mileage or time intervals specified in the MAINTENANCE SCHEDULE (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). If the solution is dirty, rusty, or contains a considerable amount of sediment; clean and flush with a reliable cooling system cleaner. Care should be taken in disposing of the used engine coolant from your vehicle. Check governmental regulations for disposal of used engine coolant.

1. Position a clean collecting container under draincock location.
2. Without removing the pressure cap and with system not under pressure, turn draincock counterclockwise to open.
3. The coolant reserve bottle should empty first, then remove the pressure cap.
4. If coolant reserve bottle does not empty first:
    a. Check condition of the pressure cap and cap seals.
    b. Check for kinked/torn overflow hose from filler neck to reserve bottle.
5. Allow cooling system to drain completely.

FILLING COOLING SYSTEM

WARNING: MAKE SURE ENGINE COOLING SYSTEM IS COOL BEFORE REMOVING PRESSURE CAP OR ANY HOSE. THE COOLING SYSTEM IS PRESSURIZED WHEN HOT. SEVERE PERSONAL INJURY MAY RESULT FROM ESCAPING HOT COOLANT.

CAUTION: Do not use well water, or suspect water supply in cooling system. A 50/50 mixture of the recommended ethylene glycol and distilled water is recommended. For recommended coolant usage, (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

NOTE: For cooling system capacity (Refer to LUBRICATION & MAINTENANCE/SPECIFICATIONS - FLUID CAPACITIES).

1. Close radiator draincock. **Hand tighten only.**
2. Remove cooling system pressure cap. Install
3. Use the supplied clip to pinch overflow hose that connects between the radiator and the coolant recovery container.

NOTE: While filling the cooling system, pour coolant into the larger section of the Filling Aid Funnel, Tool 8195.

4. Remove clip from overflow hose and remove Filling Aid Funnel, Tool 8195.
5. Install cooling system pressure cap.
6. Slowly fill the coolant recovery container to the FULL HOT mark with the recommended coolant. It may be necessary to add coolant to the recovery container after one warm-up/cool down cycle in order to maintain the coolant level between the FULL HOT and ADD marks. This is due to the removal of trapped air from the system.

COOLING SYSTEM CLEANING/REVERSE FLUSHING

CLEANING

Drain the cooling system and refill with water. Run the engine with the radiator cap installed until the upper radiator hose is hot. Stop the engine and drain the water from system. If the water is dirty, fill the system with water, run the engine and drain the system. Repeat this procedure until the water drains clean.

REVERSE FLUSHING

Reverse flushing of the cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

REVERSE FLUSHING RADIATOR

Disconnect the radiator hoses from the radiator inlet and outlet. Attach a section of the radiator hose to the radiator bottom outlet fitting and insert the flushing gun. Connect a water supply hose and air supply hose to the flushing gun.

CAUTION: Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.

Allow the radiator to fill with water. When the radiator is filled, apply air in short blasts. Allow the radiator to refill between blasts. Continue this reverse flushing until clean water flows out through the rear of the radiator cooling tube passages.

REVERSE FLUSHING ENGINE

Drain the cooling system. Remove the thermostat housing and thermostat. Install the thermostat housing. Disconnect the radiator upper hose from the radiator and attach the flushing gun to the hose. Disconnect the radiator lower hose from the water pump and attach a lead-away hose to the water pump inlet fitting.

CAUTION: On vehicles equipped with a heater water control valve, be sure the heater control valve is closed (heat off). This will prevent coolant flow with scale and other deposits from entering the heater core.

Connect the water supply hose and air supply hose to flushing gun. Allow the engine to fill with water. When the engine is filled, apply air in short blasts, allowing the system to fill between air blasts. Continue until clean water flows through the lead away hose.

Remove the lead away hose, flushing gun, water supply hose and air supply hose. Remove the thermostat housing and install the thermostat. Install the thermostat housing with a replacement gasket. Refer to Thermostat Replacement. Connect the radiator hoses. Refill the cooling system with the correct antifreeze/water mixture (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). Refer to Refilling the Cooling System.

CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar® Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

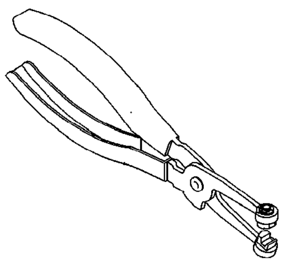
CAUTION: Follow manufacturers instructions when using these products.

INSPECTION

After performing a cleaning/flush procedure, inspect all hoses, clamps and connections for deterioration and leaks. Inspect radiator and heater core for leaks.

SPECIFICATIONS

TORQUE



DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Bolts, A/C Condenser to Radiator	5.1	–	45
Bolt, Automatic Belt Tensioner Pulley	27	20	–
Bolt Automatic Belt Tension Assembly	54	40	–

BELT ACCESSORY DRIVE

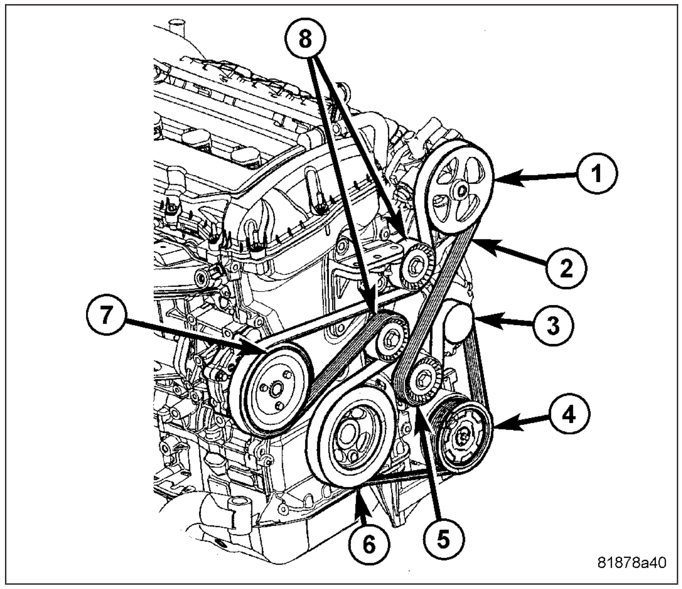

TABLE OF CONTENTS

ACCESSORY DRIVE BELT

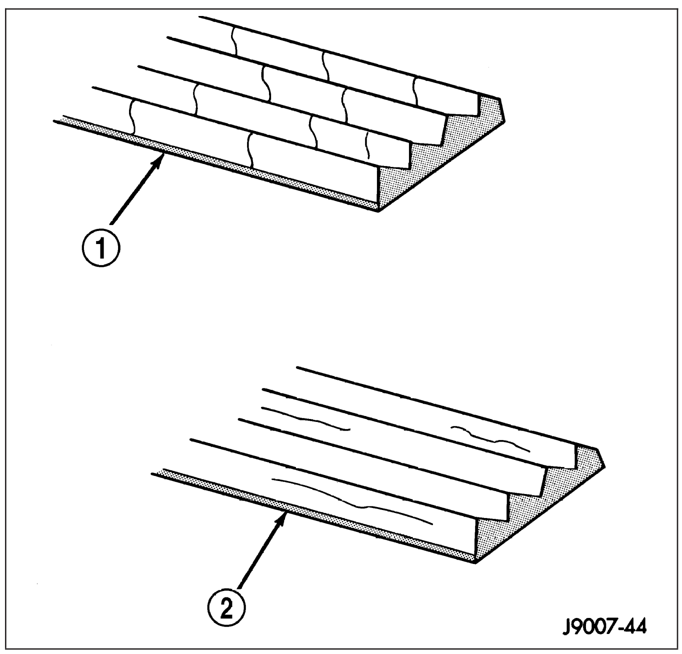
DESCRIPTION

The accessory drive belt is a serpentine type belt that is driven by the crankshaft.

The belt drives the A/C compressor, power steering pump and water pump. Belt tension is maintained by an automatic belt tensioner.

DIAGNOSIS AND TESTING

ACCESSORY DRIVE BELT



VISUAL DIAGNOSIS

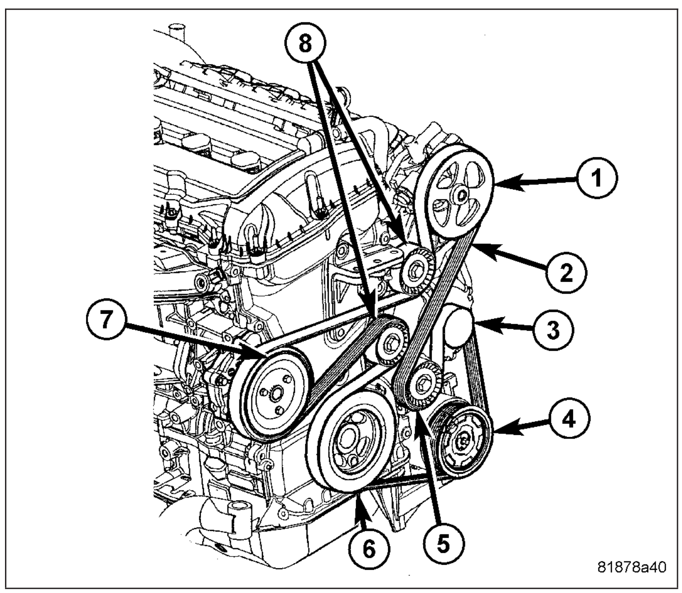
When diagnosing serpentine accessory drive belts, small cracks that run across the ribbed surface of the belt from rib to rib, are considered normal. These are not a reason to replace the belt. However, cracks running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace the belt if it has excessive wear, frayed cords or severe glazing.

Refer to ACCESSORY DRIVE BELT DIAGNOSIS CHART for further belt diagnosis.

NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for contamination, alignment, glazing, or excessive end play.

ACCESSORY DRIVE BELT DIAGNOSIS CHART



CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (One or more ribs has separated from belt body)	1. Foreign objects imbedded in pulley grooves. 2. Installation damage	1. Remove foreign objects from pulley grooves. Replace belt. 2. Replace belt
RIB OR BELT WEAR	1. Pulley misaligned 2. Abrasive environment 3. Rusted pulley(s) 4. Sharp or jagged pulley groove tips 5. Belt rubber deteriorated	1. Align pulley(s) 2. Clean pulley(s). Replace belt if necessary 3. Clean rust from pulley(s) 4. Replace pulley. Inspect belt. 5. Replace belt
BELT SLIPS	1. Belt slipping because of insufficient tension 2. Belt or pulley exposed to substance that has reduced friction (belt dressing, oil, ethylene glycol) 3. Driven component bearing failure (seizure) 4. Belt glazed or hardened from heat and excessive slippage	1. Inspect/Replace tensioner if necessary 2. Replace belt and clean pulleys 3. Replace component or bearing 4. Replace belt.
LONGITUDAL BELT CRACKING	1. Belt has mistracked from pulley groove 2. Pulley groove tip has worn away rubber to tensile member	1. Replace belt 2. Replace belt
GROOVE JUMPING (Belt does not maintain correct position on pulley)	1. Incorrect belt tension 2. Pulley(s) not within design tolerance 3. Foreign object(s) in grooves 4. Pulley misalignment 5. Belt cordline is broken	1. Inspect/Replace tensioner if necessary 2. Replace pulley(s) 3. Remove foreign objects from grooves 4. Align component 5. Replace belt
BELT BROKEN (Note: Identify and correct problem before new belt is installed)	1. Incorrect belt tension 2. Tensile member damaged during belt installation 3. Severe misalignment 4. Bracket, pulley, or bearing failure	1. Replace Inspect/Replace tensioner if necessary 2. Replace belt 3. Align pulley(s) 4. Replace defective component and belt

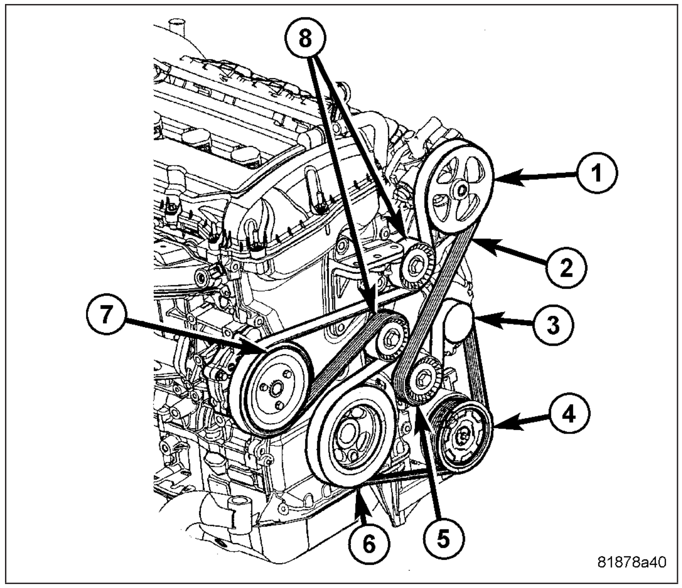
CONDITION	POSSIBLE CAUSES	CORRECTION
NOISE (Objectional squeal, squeek, or rumble is heard or felt while drive belt is in operation)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Bearing noise	2. Locate and repair
	3. Belt misalignment	3. Align belt/pulley(s)
	4. Belt to pulley mismatch	4. Install correct belt
	5. Driven component induced vibration	5. Locate defective driven component and repair
	6. System resonent frequency induced vibration	6. Vary belt tension within specifications
TENSION SHEETING FABRIC FAILURE (Woven fabric on outside, circumference of belt has cracked or separated from body of belt)	1. Tension sheeting contacting stationary object	1. Correct rubbing condition
	2. Excessive heat causing woven fabric to age	2. Replace belt
	3. Tension sheeting splice has fractured	3. Replace belt
CORD EDGE FAILURE (Tensile member exposed at edges of belt or separated from belt body)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Belt contacting stationary object	2. Replace belt
	3. Pulley(s) out of tolerance	3. Replace pulley
	4. Insufficient adhesion between tensile member and rubber matrix	4. Replace belt

REMOVAL

WORLD ENGINE

1. Insert a 1/2 in.drive breaker bar into the square opening of the accessory drive belt tensioner (5).
2. Rotate accessory drive belt tensioner (5) counter-clockwise until accessory drive belt (2) can be removed from pulleys. Remove accessory drive belt (2).

CLEANING



Clean all foreign debris from belt pulley grooves. The belt pulleys must be free of oil, grease, and coolants before installing the drive belt.

INSTALLATION

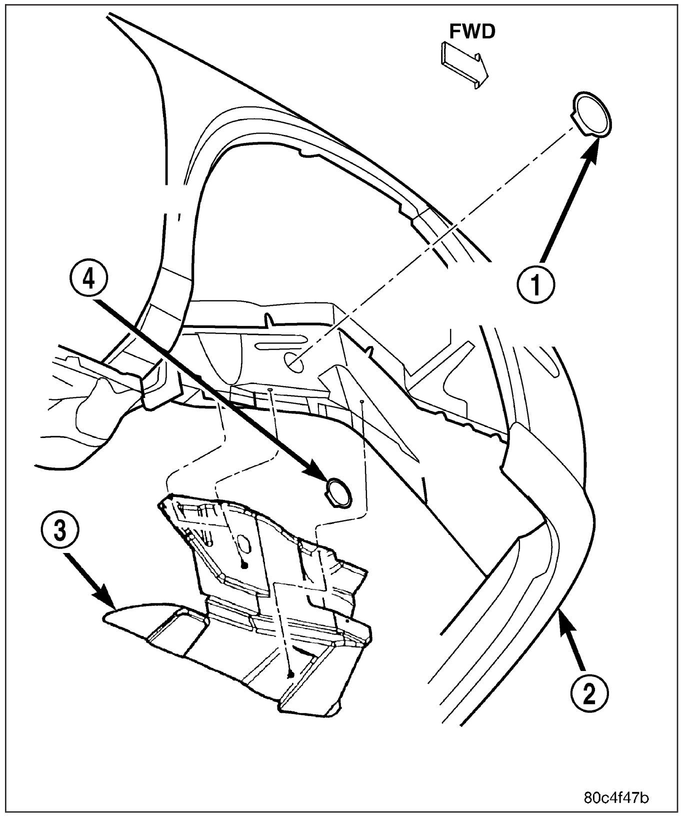
WORLD ENGINE

NOTE: When installing drive belt on the pulleys, make sure that belt is properly routed and all V-grooves make proper contact with pulley grooves.

1. Install the accessory drive belt (2) around all the pulleys except for the generator pulley (3).
2. Using a 1/2 in. breaker bar, rotate accessory drive belt tensioner (5) counterclockwise until accessory drive belt (2) can be installed on the generator pulley (3). Release spring tension onto belt.
3. Remove breaker bar from accessory drive belt tensioner (5).

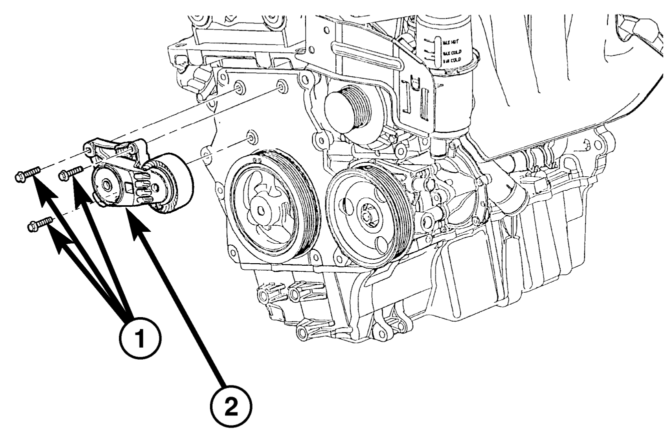
ACCESSORY DRIVE BELT TENSIONER

DESCRIPTION



The automatic belt tensioner maintains proper tension on the power steering and air conditioning belt. The tensioner pulley can be serviced separately.

NOTE: Tensioner arm should move freely and maintain 14.9 – 20.8 kg. (33 - 46 lb). tension on belt.

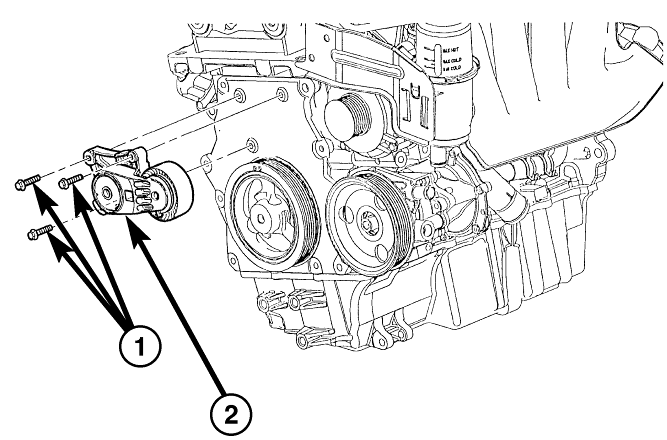


REMOVAL

WORLD ENGINE

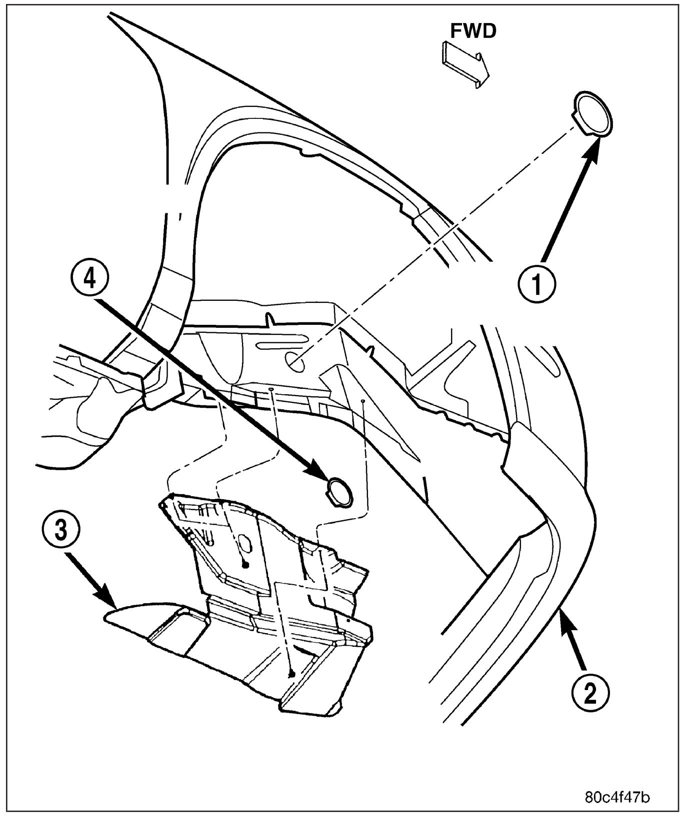
1. Raise vehicle on hoist.
2. Remove belt splash shield.

3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove accessory drive belt tensioner mounting bolt. Remove accessory drive belt tensioner.



80c0b5ac

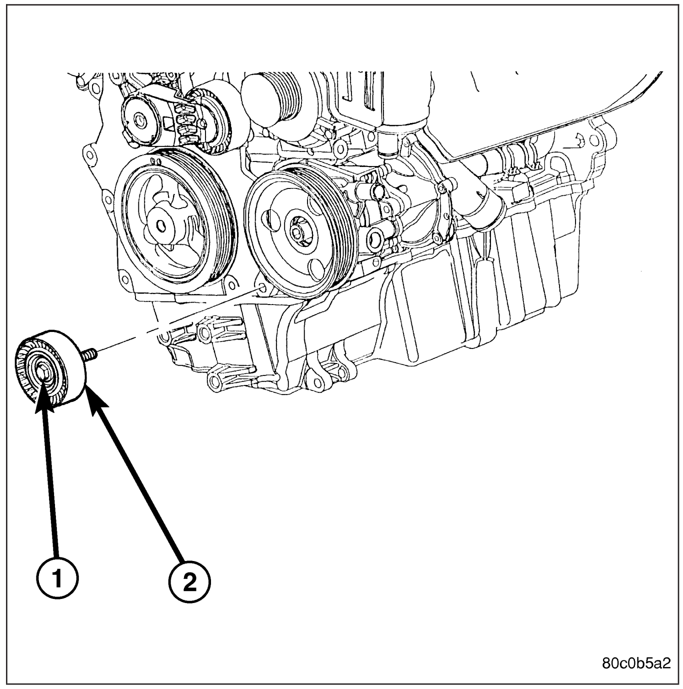
INSTALLATION



WORLD ENGINE

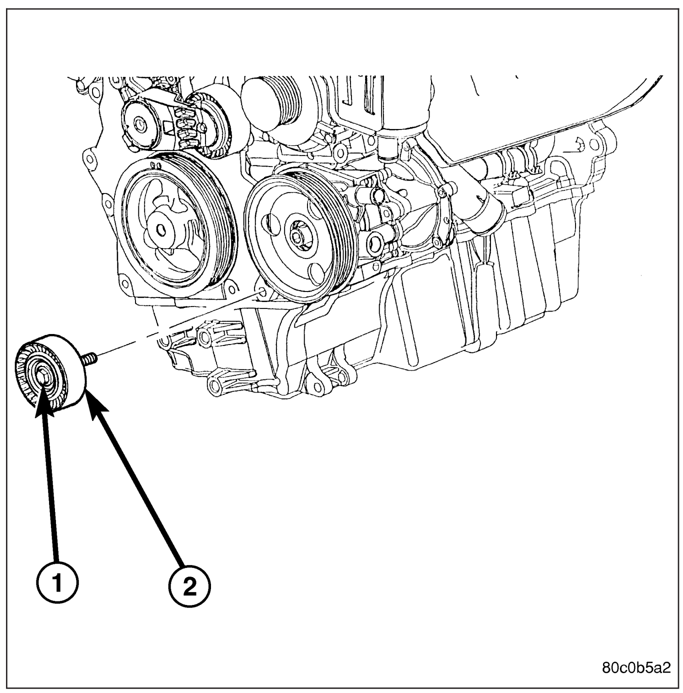
1. Position accessory drive belt tensioner and install mounting bolt. Tighten bolt to 12 N·m (105 in. lbs.).
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

80c0b5ac



3. Install belt splash shield.
4. Lower vehicle.

IDLER PULLEY



REMOVAL

1. Raise vehicle on hoist.
2. Remove belt splash shield.
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove idler pulley mounting bolt. Remove idler pulley.

INSTALLATION

1. Position pulley in mounting position. Install idler pulley mounting bolt. Tighten bolt to 28 N·m (250 in. lbs.).
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
3. Install belt splash shield.
4. Lower vehicle.

ENGINE

TABLE OF CONTENTS

COOLANT

DESCRIPTION

ENGINE COOLANT

WARNING: Antifreeze is an ethylene glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area, seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

ETHYLENE-GLYCOL MIXTURES

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 year/100,000 Mile Formula (ethylene-glycol base coolant with corrosion inhibitors called HOAT, (Hybrid Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain a freeze point of -37°C (-35°F).

The required ethylene-glycol (antifreeze) and water mixture depends upon the climate and vehicle operating conditions. The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. **If percentage is lower than 44 percent, engine parts may be eroded by cavitation, and cooling system components may be severely damaged by corrosion.** Maximum protection against freezing is provided with a 68% antifreeze concentration, which prevents freezing down to -67.7° C (-90° F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because the specific heat of antifreeze is lower than that of water.

Use of 100 percent ethylene-glycol will cause formation of additive deposits in the system, as the corrosion inhibitive additives in ethylene-glycol require the presence of water to dissolve. The deposits act as insulation, causing temperatures to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at 22°C (-8°F).

PROPYLENE-GLYCOL MIXTURES

It’s overall effective temperature range is smaller than that of ethylene-glycol. The freeze point of 50/50 propylene-glycol and water is -32°C (-26°F). 5°C higher than ethylene-glycol’s freeze point. The boiling point (protection against summer boil-over) of propylene-glycol is 125°C (257°F) at 96.5 kPa (14 psi), compared to 128°C (263°F) for ethylene-glycol. Use of propylene-glycol can result in boil-over or freeze-up on a cooling system designed for ethylene-glycol. Propylene glycol also has poorer heat transfer characteristics than ethylene glycol. This can increase cylinder head temperatures under certain conditions.

Propylene-glycol/ethylene-glycol Mixtures can cause the destabilization of various corrosion inhibitors, causing damage to the various cooling system components. Also, once ethylene-glycol and propylene-glycol based coolants are mixed in the vehicle, conventional methods of determining freeze point will not be accurate. Both the refractive index and specific gravity differ between ethylene glycol and propylene glycol.

HOAT COOLANT

WARNING: Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene-Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

COOLANT SELECTION AND ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

OPERATION

Coolant flows through the engine block absorbing the heat from the engine, then flows to the radiator where the cooling fins in the radiator transfers the heat from the coolant to the atmosphere. During cold weather the ethylene-glycol or propylene-glycol coolant prevents water present in the cooling system from freezing within temperatures indicated by mixture ratio of coolant to water.

DIAGNOSIS AND TESTING

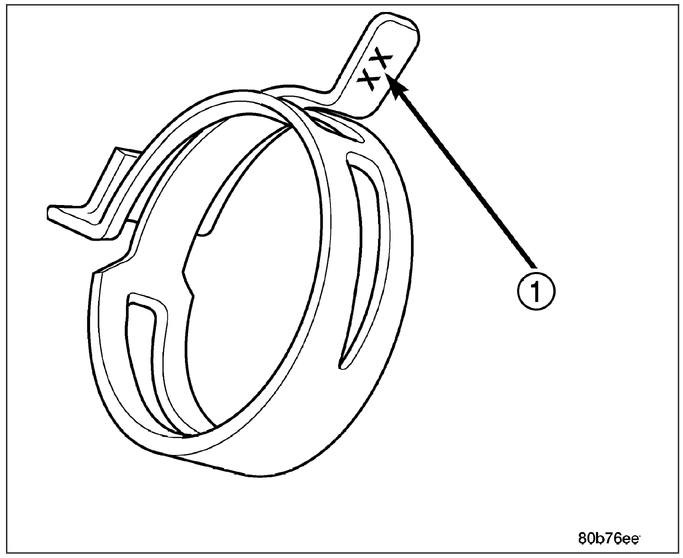
COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C (-34°F) to -46°C (-50°F). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

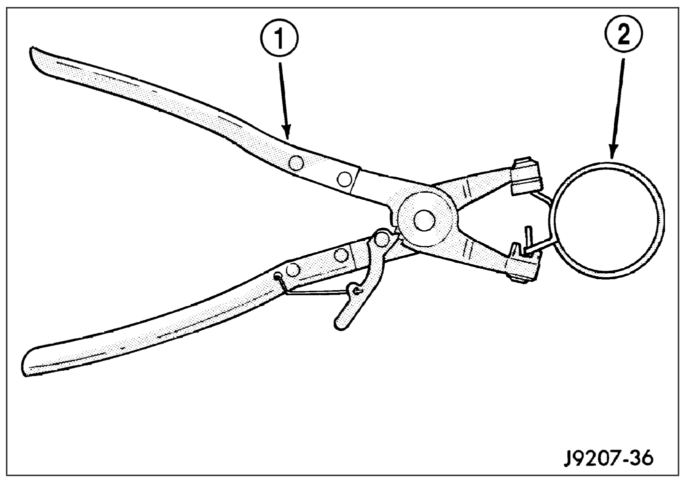
A refractometer Tool 8286 (Refer to 7 - COOLING - SPECIAL TOOLS) will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.



CAUTION: Do not mix types of coolant corrosion protection will be severely reduced.

CLAMPS HOSE



DESCRIPTION

The cooling system uses spring type hose clamps. If a spring type clamp replacement is necessary, replace with the original Mopar® equipment spring type clamp.

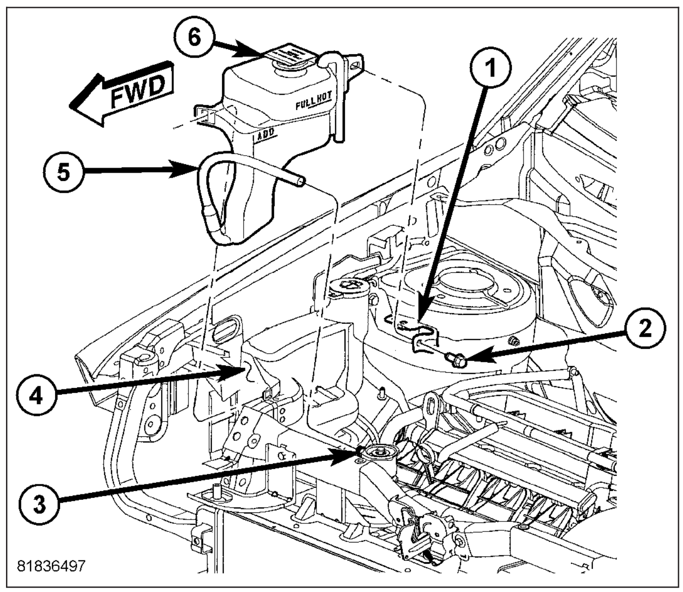
CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with matching number or letter.

The spring type hose clamp applies constant tension on a hose connection. To remove a spring type hose clamp, use Hose clamp Tool 6094 or 8495 (or equivalent), to compress the hose clamp.

CONTAINER COOLANT RECOVERY

DESCRIPTION

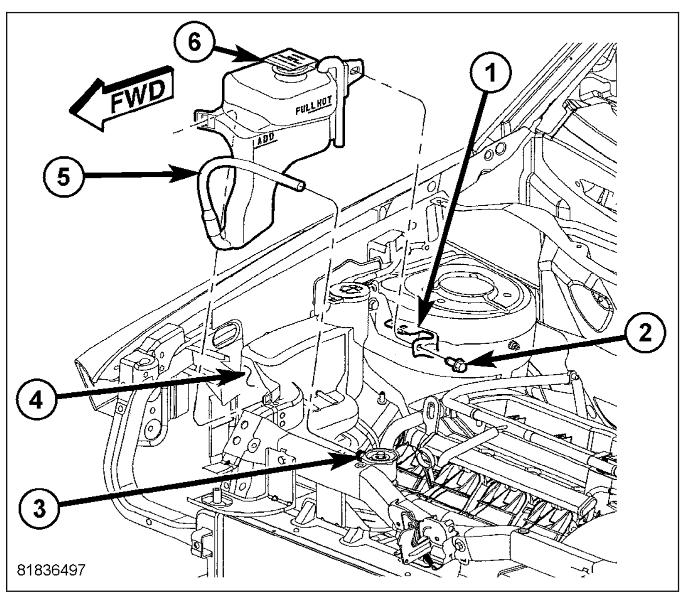
WORLD ENGINE



The coolant recovery system consists of a coolant recovery container mounted to the dash panel, a vent hose for the coolant recovery container, a hose connecting the container to the radiator neck, and a pressure cap.

OPERATION - WORLD ENGINE

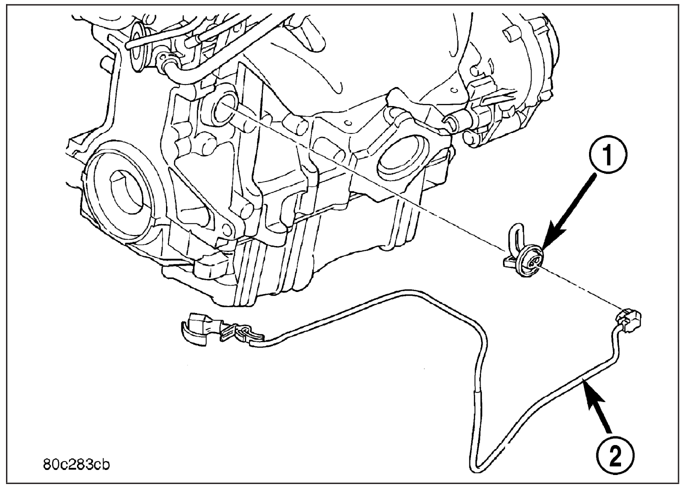
The system works in conjunction with the cooling system pressure cap to utilize thermal expansion and contraction of the coolant to keep the coolant free of trapped air. The system provides space for expansion and contraction. Also, the system provides a convenient and safe method for checking and adjusting the coolant level at atmospheric pressure without removing the pressure cap. It also provides some reserve coolant to compensate for minor leaks and evaporation or boiling losses.



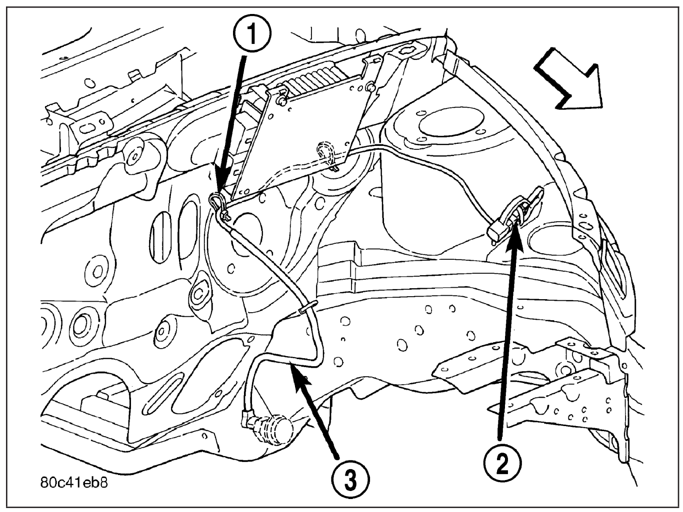
REMOVAL - WORLD ENGINE

1. Siphon coolant from coolant recovery container.
2. Remove return hose (5) from upper radiator hose tee (3).
3. Remove coolant recovery bottle mount bolt (2).
4. Disengage coolant recovery container (6) from washer reservoir bottle (4).
5. Remove coolant recovery container and drain.

INSTALLATION - WORLD ENGINE



1. Engage coolant recovery container (6) into washer fluid reservoir (4).
2. Install coolant recovery container mounting bolt (2) and tighten to 4 N·m (35 in. lbs.).
3. Connect hose (5) at upper radiator Tee (3).
4. Fill coolant recovery container to proper level.



HEATER ENGINE BLOCK

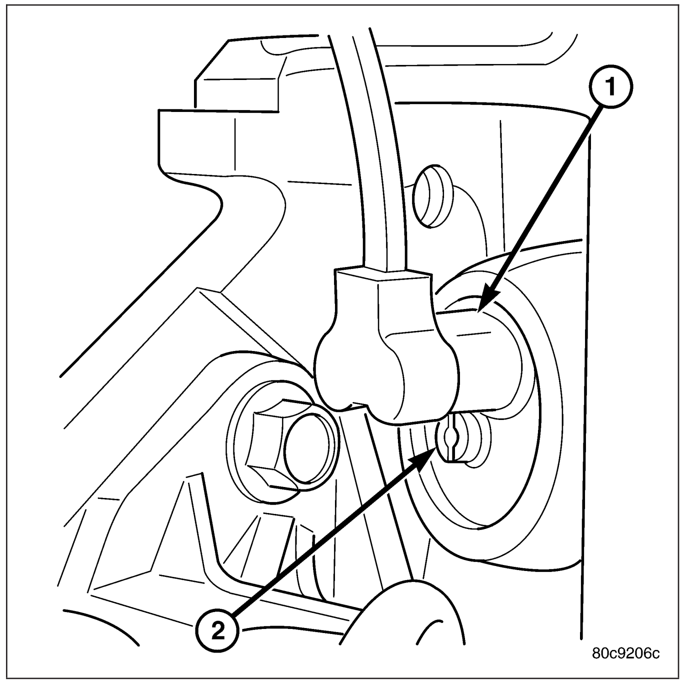
DESCRIPTION

The heater is mounted in a core hole (in place of a core hole plug) in the engine block, with the heating element immersed in coolant.

The engine block heater is available as an optional accessory. The heater is powered by ordinary house current (110 Volt AC) through a power cord and connector.

OPERATION

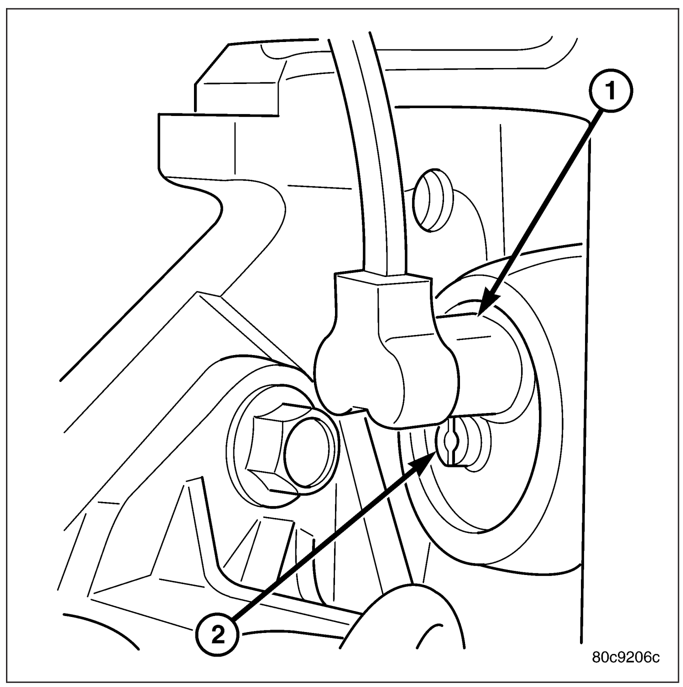
The block heater element is submerged in the cooling system's coolant. When electrical power (110 volt A.C.) is applied to the element, it creates heat. This heat is transferred to the engine coolant. This provides easier engine starting and faster warm-up when vehicle is operated in areas having extremely low temperatures.



DIAGNOSIS AND TESTING

ENGINE BLOCK HEATER TESTING

If unit does not operate, trouble can be in either the power cord or the heater element. Test power cord for continuity with a 110-volt voltmeter or 110-volt test light; test heater element continuity with an ohmmeter or 12-volt test light.

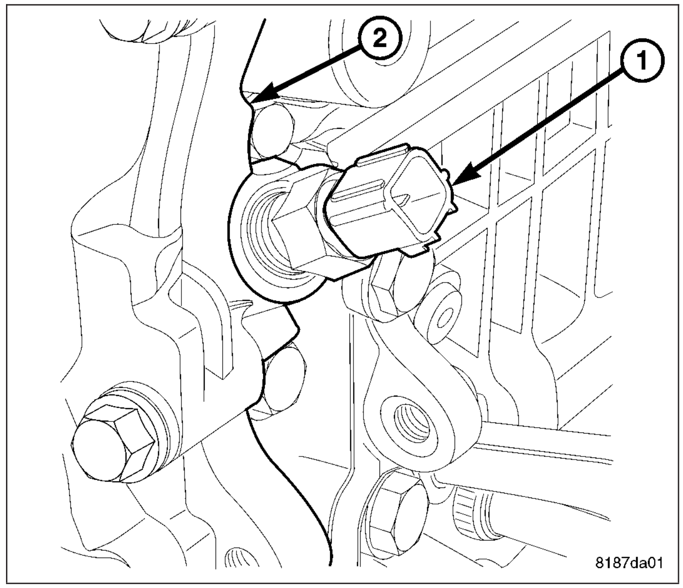


REMOVAL

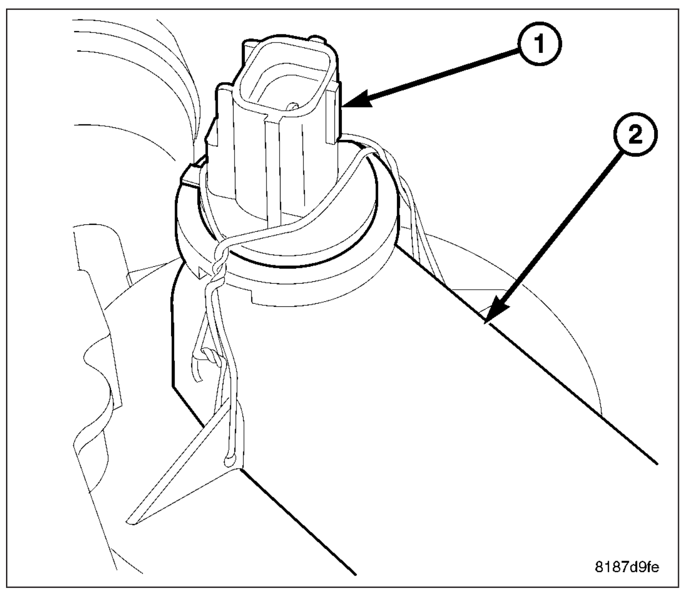
1. Drain the cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).
2. Raise vehicle on hoist.
3. Detach power cord plug from heater (1).
4. Loosen screw (2) in center of heater. Remove heater assembly (1).

INSTALLATION

1. Thoroughly clean core hole and heater seat.
2. Insert heater (1) assembly with element loop positioned **upward**.
3. With heater (1) seated, tighten center screw (2) securely to assure a positive seal.
4. Connect power cord to block heater.
5. Lower vehicle.
6. Fill the cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).



SENSOR ENGINE COOLANT TEMP

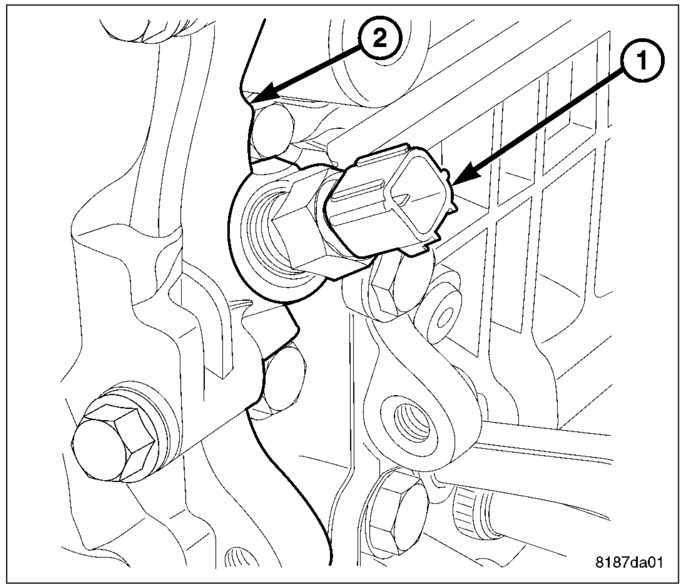


DESCRIPTION

WORLD ENGINE

There are two engine coolant sensors (ETC). One ETC is located in the coolant adapter and one is (ECT) sensor (1) threads into the cylinder head (1). New sensors have sealant applied to the threads.

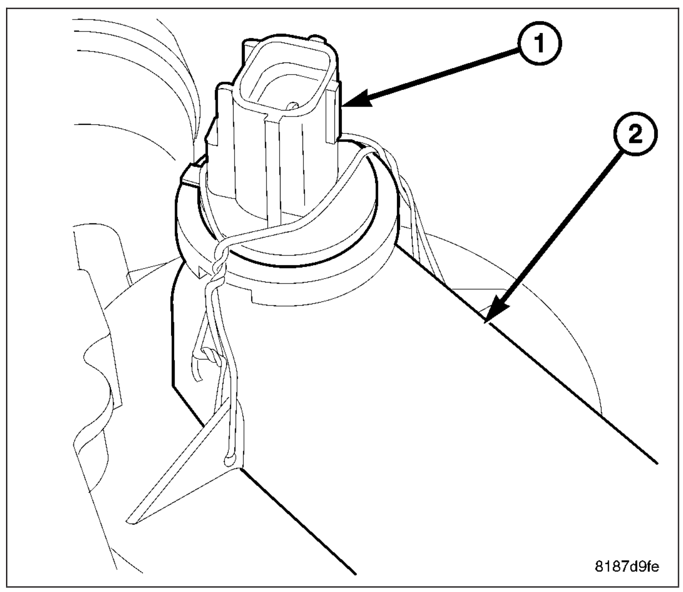
The ECT Sensor is a Negative Thermal Coefficient (NTC) Sensor. The resistance of the ECT Sensor changes as coolant temperature changes. This results in different input voltages to the PCM. The PCM also uses the ECT Sensor input to operate the radiator cooling fan(s), and send a message over the PCI bus to the instrument cluster for temperature gauge operation.



OPERATION

The ECT sensor provides an input to the PCM. As temperature increases, resistance of the sensor decreases. As coolant temperature varies, the ECT sensor resistance changes resulting in a different voltage value at the PCM ECT sensor signal circuit. The ECT sensor provides input for various PCM operations. The PCM uses the input to control air-fuel mixture, timing, and radiator fan on/off times. The ECT sensor input is also used for temperature gauge operation.

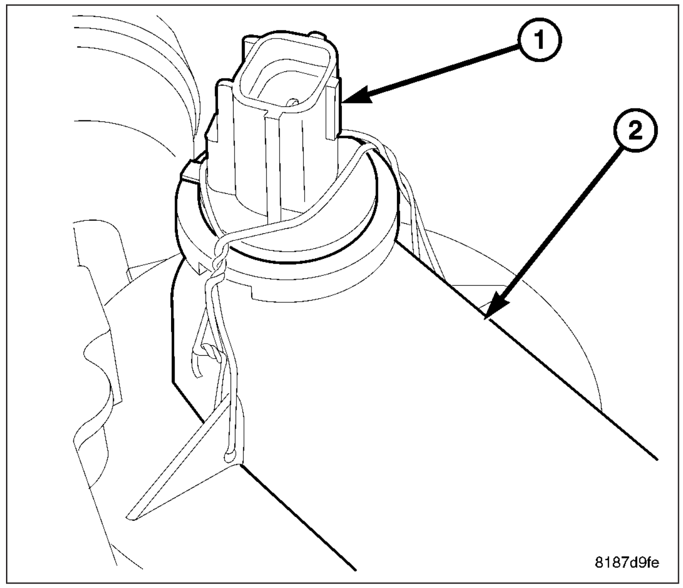
REMOVAL



CYLINDER HEAD MOUNTED

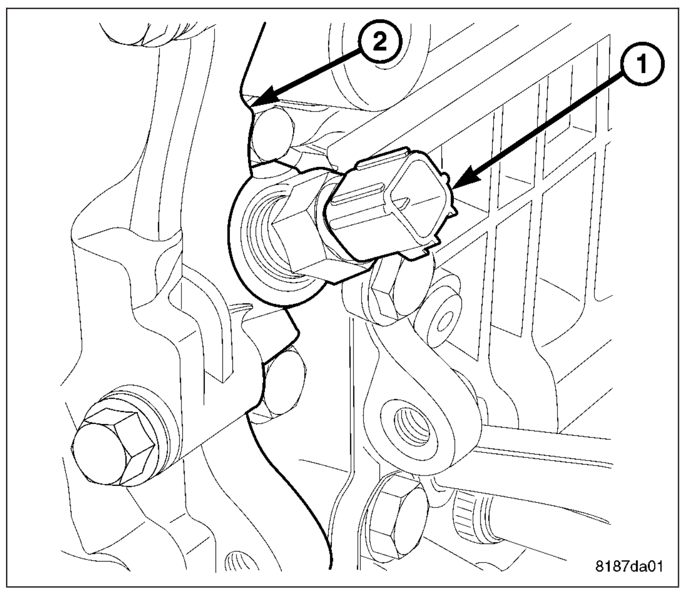
1. Disconnect negative battery cable.
2. Partially drain cooling system below level of ECT Sensor (1).
3. Disconnect ECT Sensor electrical connector.
4. Remove ECT Sensor (1).

COOLANT ADAPTER MOUNTED



1. Disconnect negative battery cable.
2. Partially drain cooling system below level of ECT Sensor (1).
3. Disconnect ECT Sensor electrical connector.
4. Remove ECT Sensor (1).

INSTALLATION

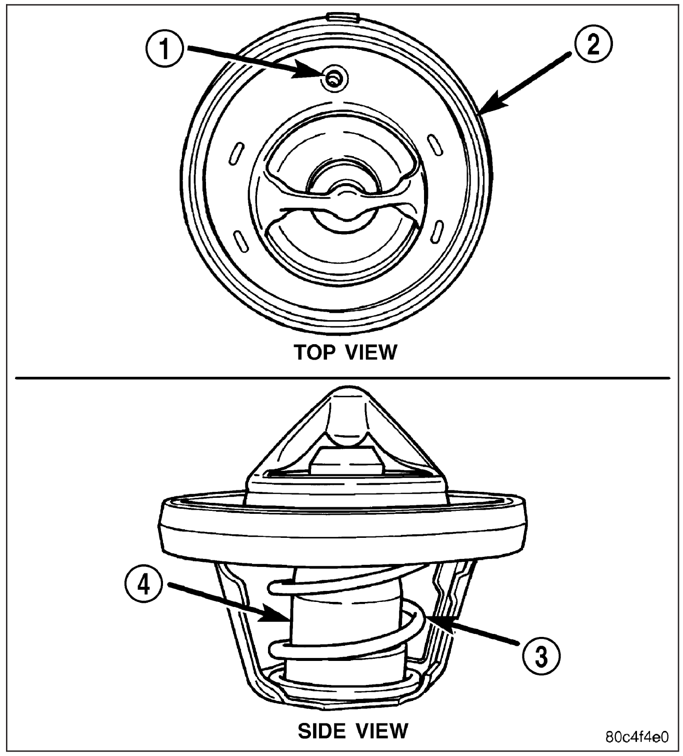


COOLANT ADAPTER MOUNTED

1. Install ECT Sensor (1). Make sure coolant sensor is locked in place
2. Reconnect ECT Sensor electrical connector.
3. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
4. Connect negative battery cable.

CYLINDER HEAD MOUNTED

1. Install ECT Sensor (1). Tighten sensor to 19 N·m (168 in. lbs.).
2. Reconnect ECT Sensor electrical connector.
3. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
4. Connect negative battery cable.



THERMOSTAT ENGINE COOLANT

DESCRIPTION

The primary thermostat is located on the front of the water plenum in the thermostat housing/coolant inlet. The thermostat has an air bleed vent located on its flange. The air bleed vent (1) and the locator dimple on thermostat seal provide for proper positioning of thermostat in inlet housing.

The secondary thermostat is located in the cylinder head under the water plenum.

OPERATION

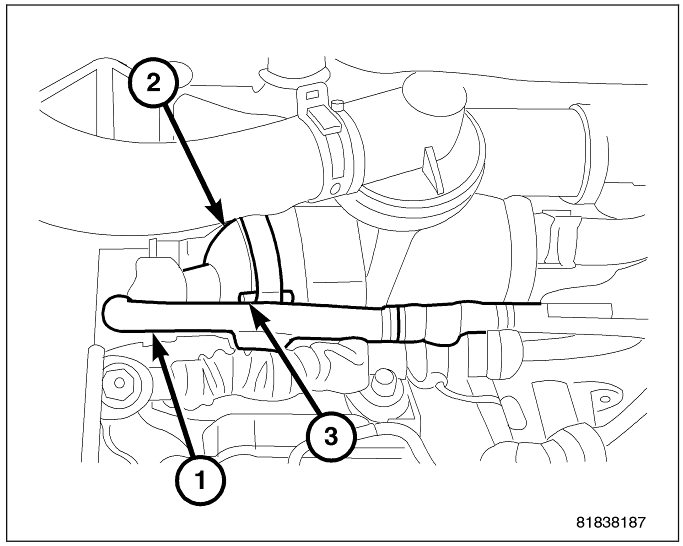
The engine cooling thermostat is a wax pellet driven, reverse poppet choke type. The thermostat is designed to provide the fastest warm up possible by preventing leakage through it and to guarantee a minimum engine operating temperature of 88 to 93°C (192 to 199°F).

The primary thermostat starts to open at 77° C (171° F) and is fully open at 89° C (193° F). The secondary thermostat starts to open at 95° C (203°F) and is fully open at 108° C (226° F).

The thermostat is operated by a wax filled chamber (pellet) which is sealed. When coolant reaches a predetermined temperature, the wax expands enough to overcome the closing spring and water pump pressure, which forces the thermostat to open. Coolant leakage into the wax pellet will cause a thermostat to fail in the open position. Do not attempt to free-up a stuck open thermostat.

If the thermostat is stuck open or allows coolant leakage through it, the engine will not operate at the proper temperature for obtaining engine fuel efficiency, performance and emissions levels. If this condition occurs, a diagnostic trouble code will be set and a MIL light will be turned on. Refer to the Powertrain Diagnostic Procedures manual for further information and diagnostics provided.

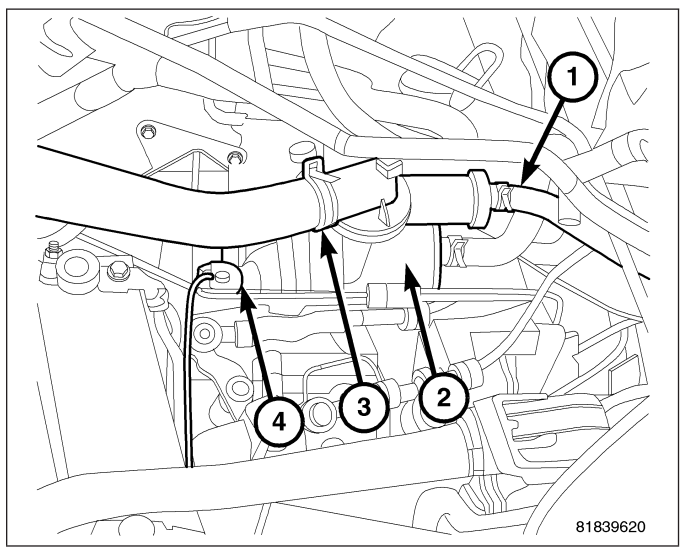
DIAGNOSIS AND TESTING - ENGINE COOLANT THERMOSTAT



The thermostat is operated by a wax filled chamber (pellet) which is sealed. When heated coolant reaches a predetermined temperature the wax pellet expands enough to overcome the closing spring and water pump pressure, which forces the valve to open. Coolant leakage into the pellet will cause a thermostat to fail open. Do not attempt to free up a thermostat with a screwdriver.

Thermostat diagnostics is included in powertrain control module’s (PCM) programing for on-board diagnosis. The malfunction indicator light (MIL) will illuminate and a diagnostic trouble code (DTC) will be set when an “open too soon” condition occurs. Do not change a thermostat for lack of heater performance or temperature gauge position, unless a DTC is present. For other probable causes, (Refer to 7 - COOLING/ENGINE - DIAGNOSIS AND TESTING). Thermostat failing shut is the normal long term mode of failure, and normally, only on high mileage vehicles. The temperature gauge will indicate this (Refer to 7 - COOLING/ENGINE - DIAGNOSIS AND TESTING).

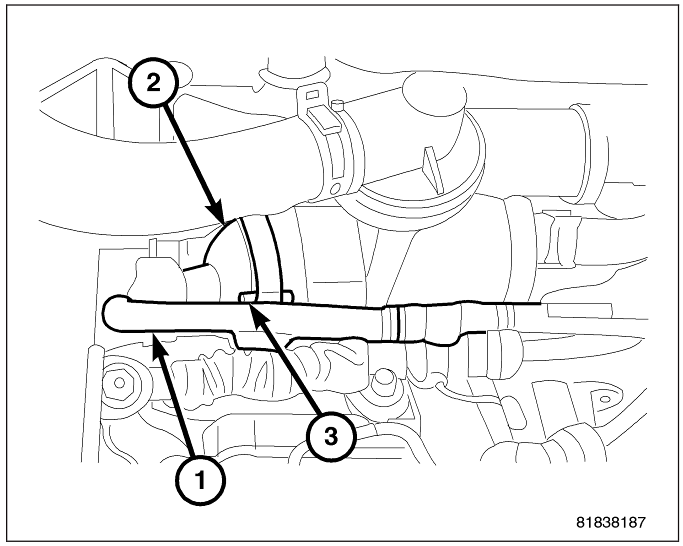
REMOVAL



PRIMARY THERMOSTAT

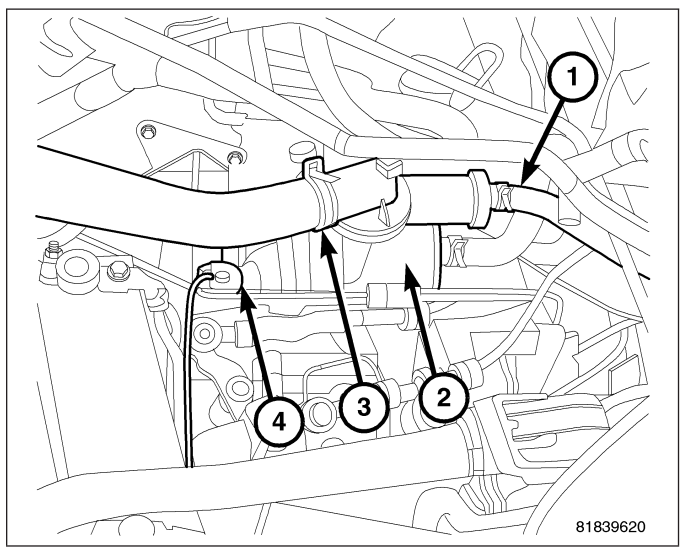
1. Partially drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove air filter housing.
3. Disconnect coolant hose (1) from inlet housing (2).
4. Remove inlet housing bolts (3).
5. Remove thermostat assembly, and clean sealing surfaces.

SECONDARY THERMOSTAT



1. Partially drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove air filter housing.
3. Disconnect coolant hoses (1) from rear of coolant adapter (2).
4. Remove radiator hose (3).
5. Remove coolant hose (4) from front of coolant adapter (2).
6. Remove coolant adapter mounting bolts.
7. Carefully slide coolant adapter off water pump inlet tube and remove coolant adapter (2) and secondary thermostat.

INSTALLATION

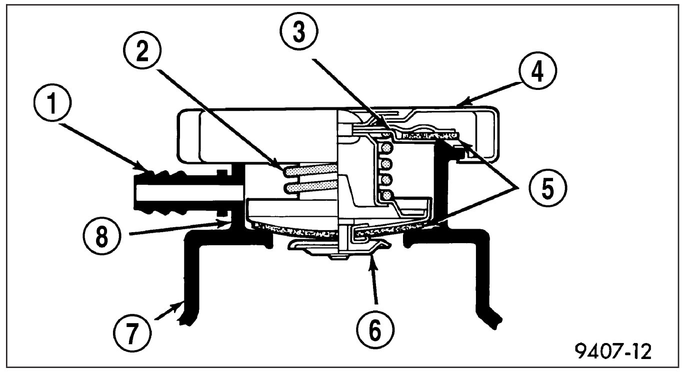


PRIMARY THERMOSTAT

1. Position thermostat into the water plenum, aligning air bleed with the location notch on inlet housing (2).
2. Install inlet housing (2) onto coolant adapter. Tighten bolts to 12.5 N·m (110 in. lbs.).
3. Connect coolant hose (1).
4. Install air filter housing.
5. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

SECONDARY THERMOSTAT

1. Position thermostat into the cylinder head.
2. Inspect the water pump inlet tube O-rings for damage before installing the tube in the coolant adapter. Replace O-ring as necessary.
3. Lubricate O-rings with soapy water.
4. Position coolant adapter on water pump inlet tube and cylinder head.
5. Install coolant adapter mounting bolts. Tighten bolts to 12.5 N·m (110 in. lbs.).
6. Connect front coolant hose (1).
7. Connect two rear coolant hoses (1).
8. Connect radiator hose (3).
9. Install air filter housing.
10. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).



CAP RADIATOR PRESSURE

DESCRIPTION

GAS ENGINES

The cooling system is equipped with a pressure cap that releases built up pressure, maintaining a range of 97-124 kPa (14-18 psi).

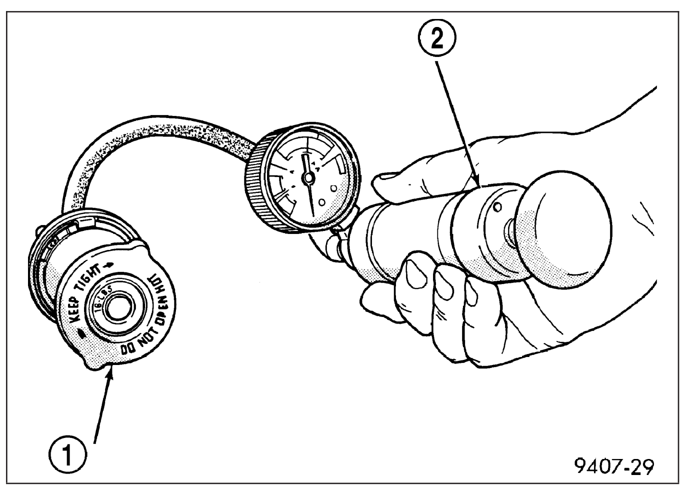
There is also a vent valve (6) in the center of the cap. This valve also opens when coolant is cooling and contracting, allowing coolant to return to radiator from coolant recovery container by vacuum through connecting hose. **If valve is stuck shut, the radiator hoses will be collapsed on cool down. Clean the vent valve to ensure proper sealing when boiling point is reached.**

OPERATION

GAS ENGINES

The pressure cap allows the cooling system to operate at higher than atmospheric pressure. The higher pressure raises the coolant boiling point; this allows increased radiator cooling capacity.

The secondary gasket in the cap seals the filler neck and the primary gasket seals the cooling system so that vacuum can be maintained, allowing coolant to be drawn back into the radiator from the reserve container.



A vent valve in the center of the cap will remain shut as long as the cooling system is pressurized. As the coolant cools, it contracts and creates a vacuum in cooling system. This causes the vacuum valve to open and coolant in reserve/overflow tank to be drawn through connecting hose into radiator. If the vacuum valve is stuck shut, or overflow hose is kinked, radiator hoses will collapse on cool-down.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLING SYSTEM PRESSURE CAP TESTING

Dip the pressure cap in water. Clean any deposits off the vent valve or its seat and apply cap to end of the Pressure Cap Test Adaptor that is included with the Cooling System Tester 7700. Working the plunger, bring the pressure to 104 kPa (15 psi) on the gauge. If the pressure cap fails to hold pressure of at least 97 kPa (14 psi), replace the pressure cap.

CAUTION: The Cooling System Tester Tool is very sensitive to small air leaks that will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to the tool. Turn tool upside down and recheck pressure cap to confirm that cap is bad.

If the pressure cap tests properly while positioned on Cooling System Tester 7700, but will not hold pressure or vacuum when positioned on the filler neck. Inspect the filler neck and cap top gasket for irregularities that may prevent the cap from sealing properly.

DIAGNOSIS AND TESTING - COOLING SYSTEM PRESSURE RELIEF TESTING

WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT 15 MINUTES BEFORE REMOVING CAP. PLACE A SHOP TOWEL OVER THE CAP, AND WITHOUT PUSHING DOWN, ROTATE IT COUNTERCLOCKWISE TO THE FIRST STOP. ALLOW FLUIDS TO ESCAPE THROUGH THE OVERFLOW TUBE. WHEN THE SYSTEM STOPS PUSHING COOLANT AND STEAM INTO THE COOLANT RECOVERY CONTAINER AND PRESSURE DROPS, PUSH DOWN ON THE CAP AND REMOVE IT COMPLETELY. SQUEEZING THE RADIATOR INLET HOSE WITH A SHOP TOWEL (TO CHECK PRESSURE) BEFORE AND AFTER TURNING TO THE FIRST STOP IS RECOMMENDED.

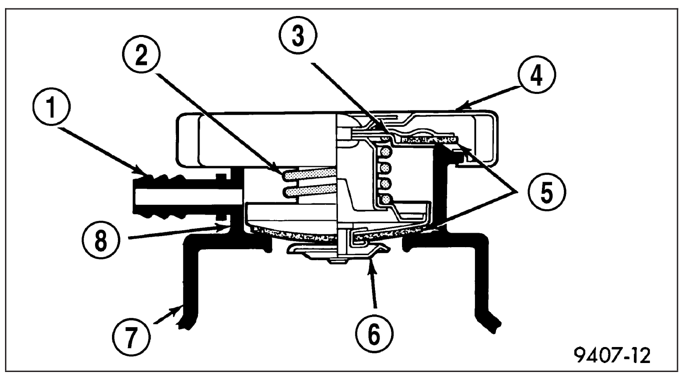
WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON THE PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, THE COOLING SYSTEM BUILDS UP PRESSURE. TO PREVENT SCALDING OR OTHER INJURY, THE PRESSURE CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT AND/OR UNDER PRESSURE.

The pressure cap upper gasket to filler neck seal can be checked by removing the overflow hose at the radiator filler neck overflow nipple. Attach the radiator pressure tester to the **filler neck overflow nipple,** and pump air into the system. The pressure cap upper gasket should relieve pressure at 69-124 kPa (10-18 psi), and hold pressure at 55 kPa (8 psi) minimum.

There is no need to remove the pressure cap at any time **except** for the following purposes:

- Check and adjust coolant freeze point
- Refill system with new coolant
- Conducting service procedures
- Checking for leaks

CLEANING



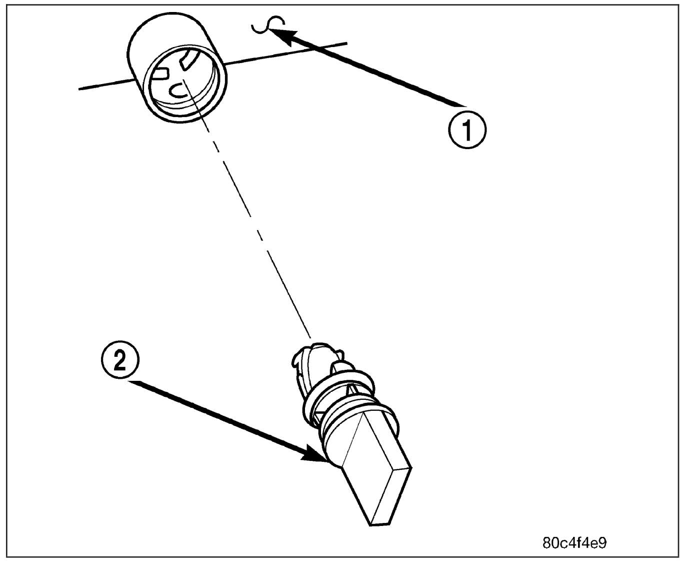
Use only a mild soap to clean the pressure cap.

INSPECTION

Hold the cap in your hand, **top side up**.. The vent valve (6) at the bottom of the cap should open. If the rubber seal (5) has swollen, preventing the valve from opening, replace the cap.

Hold the cleaned cap in your hand, **upside down.** If any light can be seen between vent valve (6) and the rubber seal (5), replace the cap. **Do not use a replacement cap that has a spring to hold the vent shut.**

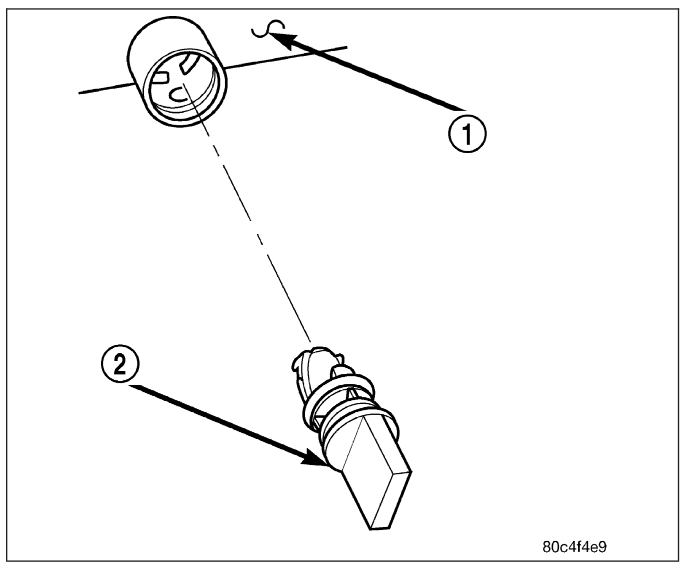
A replacement cap must be of the type designed for a full pressure coolant systems. This design ensures coolant return to the radiator.



DRAINCOCK RADIATOR

REMOVAL

CAUTION: Use of pliers on draincock is not recommended. Damage may occur to radiator or draincock.



NOTE: It is not necessary to remove draincock during a routine coolant drain.

1. Drain the cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).
2. Open the draincock (2) by turning it counterclockwise until it stops.
3. Turn the draincock (2) back (clockwise) 1/8 turn.
4. Pull the draincock (2) from the radiator tank (1).

INSTALLATION

1. Align draincock stem to radiator tank opening.
2. Push draincock (2) into the radiator tank opening.
3. Tighten the draincock (2) by turning clockwise until it stops.
4. Fill the cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

FAN-RADIATOR

DESCRIPTION

The radiator cooling fans are dual-speed electric motor driven fans. The radiator fan assembly includes two electric motors, two five blade fans, and a support shroud that is attached to the radiator. The radiator fans are serviced as an assembly.

OPERATION

Radiator fan operation is controled by the Totally Integrated Power Module (TIPM), with inputs from the temperature of the coolant, which is sensed by the coolant temperature sensor, and vehicle speed which is measured by the vehicle speed sensor. The (TIPM) turns on the fan through either the high or low speed fan relay. The PCM provides a ground to the relay's control circuit. The fan relays are located in the (TIPM). Refer to the label beneath the(TIPM) cover for location of fan relays.

Refer to **Radiator Fan Operation Chart** for fan operation specifications. For fan circuit wiring diagrams, refer to WIRING DIAGRAMS.

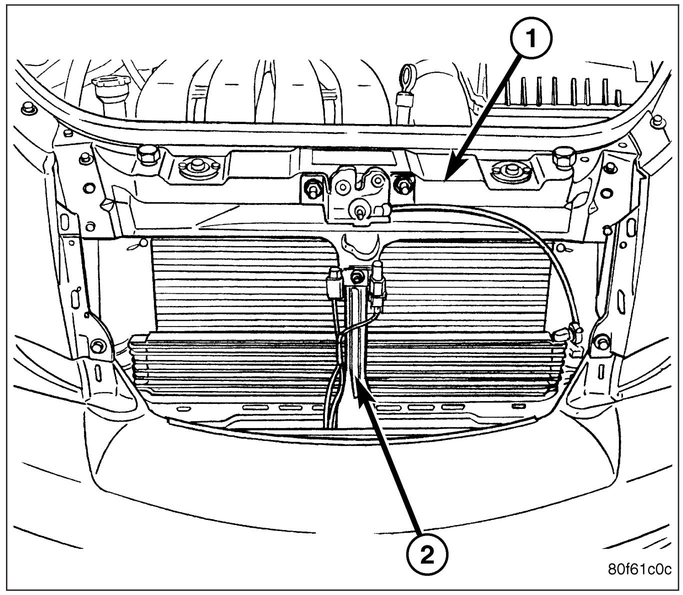
If the cooling fan is inoperative or a Diagnostic Trouble Code (DTC) related to fan control has been set, refer to the appropriate Powertrain Diagnostic Information for diagnostic procedures.

RADIATOR FAN OPERATION CHART

Radiator Fan Control		
	Low Speed	**High Speed**
A/C Off –vehicle speed < 70.8 km/h (44 mph)		
Fan On:	96.6° C (206° F)	103° C (219° F)
Fan Off:	92.7° C (199° F)	98.8° C (210° F)
A/C Off –vehicle speed > 70.8 km/h (44 mph) (until vehicle speed drops below 58 km/h (36 mph)		
Fan On:	Off	103° C (219° F)
Fan Off:		98.8° C (210° F)
A/C On –any vehicle speed		
Fan On:	Off	82.2° C (180° F)
Fan Off:		80° C (176° F)

DIAGNOSIS AND TESTING

RADIATOR FAN



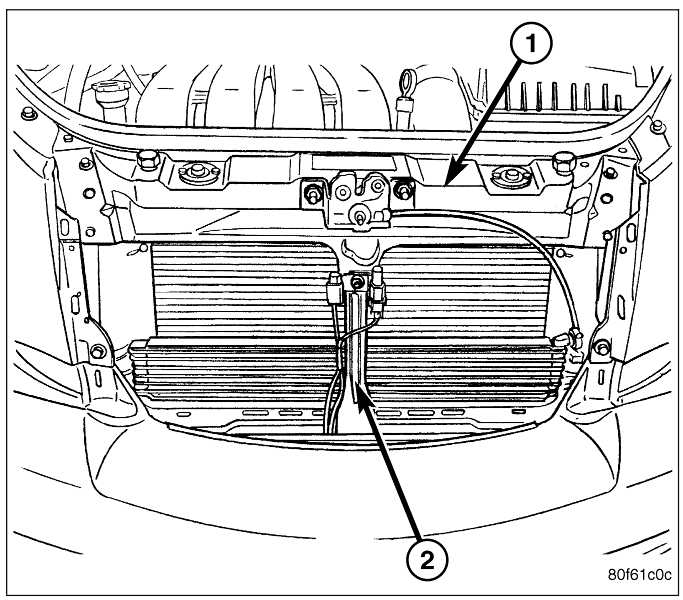
(Refer to Appropriate Diagnostic Information)

REMOVAL - WORLD ENGINE

NOTE: The fan motor, fan, and the shroud are serviced as an assembly.

WARNING: DO NOT OPEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

1. Disconnect negative cable from battery.
2. Drain cooling system below upper radiator hose level (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
3. Remove grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
4. Disconnect upper radiator hose from radiator.
5. Hoist vehicle.
6. Disconnect radiator fan electrical connector.
7. Remove the two lower and left side radiator fan screws.



8. Lower vehicle and remove the remaining radiator fan attaching screws.

CAUTION: Care should be taken not to damage the radiator cooling fins and tubes during fan removal.

9. Remove radiator fan by lifting up from the engine compartment.

INSTALLATION - WORLD ENGINE

1. Install the radiator fan into position on the radiator.
2. Hand start all radiator fan fasteners.
3. Tighten all radiator fan retaining screws to 6 N·m (55 in. lbs.).
4. Connect radiator fan electrical connector.
5. Lower vehicle.
6. Connect the upper radiator hose to radiator. Align hose and position clamp so it will not interfere with the engine or the hood.
7. Install upper radiator closure panel and center brace (Refer to 23 - BODY/EXTERIOR/RADIATOR CLOSURE PANEL - INSTALLATION).
8. Install grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
9. Install battery tray and battery.
10. Connect cables to battery.
11. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

RADIATOR

DESCRIPTION

The radiator is a down-flow type (vertical tubes) with design features that provide greater strength, as well as sufficient heat transfer capabilities to keep the engine coolant within operating temperatures.

The radiator has an aluminum core with plastic tanks. Although stronger than brass, plastic tanks are subject to damage by impact. Always handle radiator with care.

OPERATION

The radiator functions as a heat exchanger, using air flow across the exterior of the radiator tubes. This heat is then transferred from the coolant and into the passing air.

REMOVAL

WARNING: DO NOT OPEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

1. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
2. Remove radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
3. Disconnect lower radiator hose.
4. Remove fasteners attaching AC condenser to radiator. Reposition AC condenser.
5. Remove radiator assembly by lifting it up from the engine compartment. **Care should be taken not to damage the cooling fins and tubes during removal.**

CLEANING

Clean radiator fins are necessary for good heat transfer. The radiator and air conditioning fins should be cleaned when an accumulation of debris has occurred. With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

INSPECTION

Inspect the radiator tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

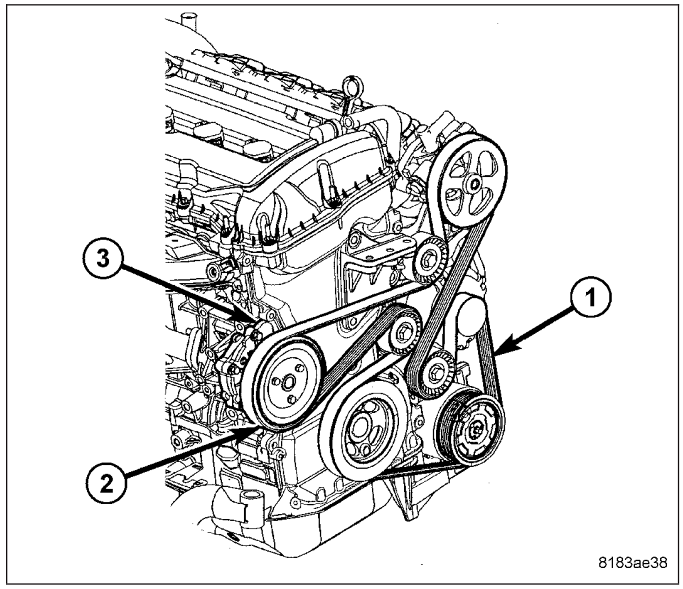
INSTALLATION

1. Install the lower air seal to radiator.

NOTE: Turbocharger Equipped Vehicles: When lowering radiator, make sure lower radiator pins engage properly through Charge Air Cooler locating tabs.

2. Position radiator into mounting position.
3. Position A/C condenser against radiator. Hand start fasteners.
4. Install fasteners attaching Charge Air Cooler to radiator. Tighten fasteners to 8 N·m (70 in. lbs.)
5. Install radiator fan/shroud assembly. Hand start fasteners.
6. Tighten all condenser fasteners to 8 N·m (70 in. lbs.).
7. Tighten all radiator fan fasteners to 6 N·m (55 in. lbs.).
8. Install fasteners attaching transmission oil cooler to radiator. Tighten fasteners to 8 N·m (70 in. lbs.).
9. Raise vehicle on hoist.
10. Connect the lower air seal to the side air seals.
11. Connect lower radiator hose. Align the hose and position the clamp so it will not interfere with engine components.
12. Connect the radiator fan electrical connector.

13. Connect the power steering hoses.
14. Close radiator draincock.
15. Lower vehicle.
16. **Turbocharger equipped vehicles:** Inspect radiator inlet neck o-ring. Replace if necessary. Install radiator inlet neck. Tighten fasteners to 6 N·m (55 in. lbs.).
17. Connect upper radiator hose. Align the hose and position the clamp to prevent interference with the engine or hood.
18. Install upper radiator closure panel and center brace (Refer to 23 - BODY/EXTERIOR/RADIATOR CLOSURE PANEL - INSTALLATION).
19. Install grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
20. Install battery tray and battery.
21. Connect positive battery cable. Connect negative battery cable.
22. Install air cleaner housing assembly.
23. Fill cooling system with coolant (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
24. Operate engine until it reaches normal operating temperature. Check cooling system for correct fluid level.



PUMP-WATER

DESCRIPTION

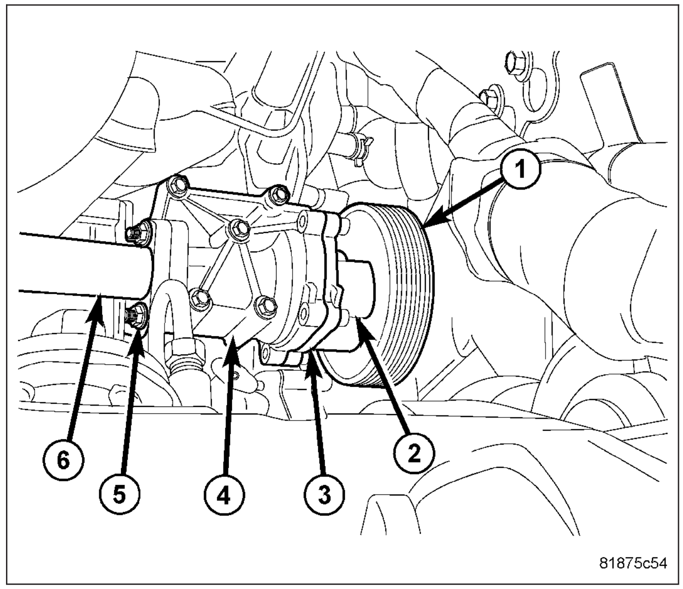
WORLD ENGINE

The water pump (3) on the world engine is attached to the water pump adapter on the front of the cylinder block.

The water pump is driven by the accessory drive belt. The water pump is connected to the water plenum by the return tube.

DIAGNOSIS AND TESTING

WATER PUMP



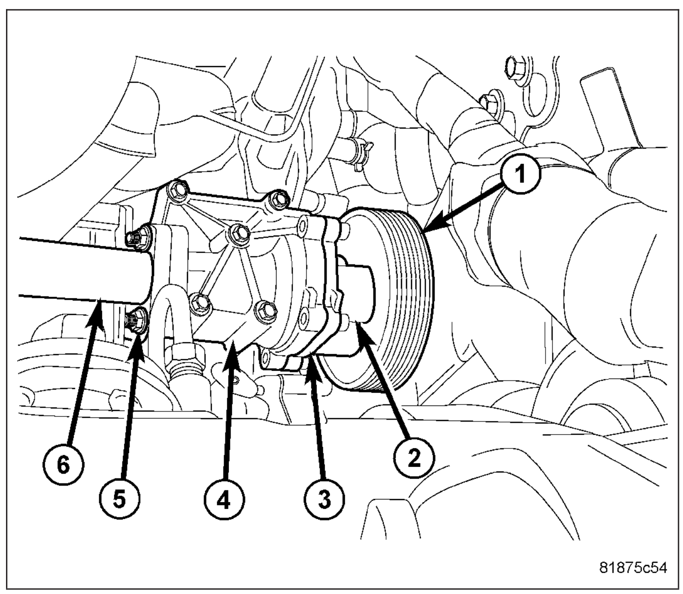
A quick flow test to determine if the water pump is working effectively is to check heater system for proper operation. A defective pump will not provide an adequate flow of heated coolant through the system.

WARNING: DO NOT REMOVE THE COOLING SYSTEM PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Another flow test to help determine water pump operation is as follows:

1. Remove cooling system pressure cap.
2. Remove a small amount of coolant from the system.
3. Start the engine and warm up until thermostat opens.
4. With the thermostat open and coolant level low, visually inspect for coolant flow. If flow is present, the water pump is pumping coolant through the system.

REMOVAL - WORLD ENGINE



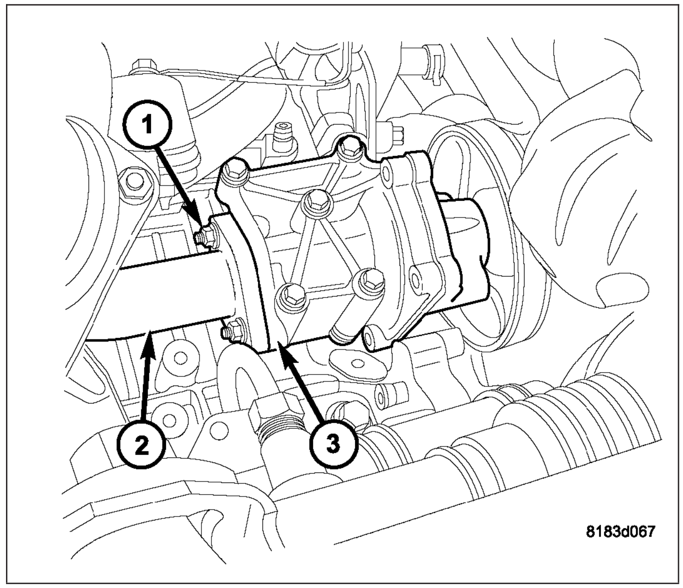
1. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - REMOVAL).
2. Drain engine coolant (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE - DRAIN COOLING SYSTEM).
3. Raise vehicle (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
4. Remove accessory drive belt splash shield.
5. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
6. Remove screws attaching water pump pulley (1). Remove pulley (1).
7. Remove water pump mounting bolts (2).
8. Remove water pump (3).

INSPECTION

Replace water pump body assembly if it has any of these defects:

- Cracks or damage on the body.
- Coolant leaks from the shaft seal, evident by wet coolant traces on the pump body.
- Loose or rough turning bearing.
- Impeller rubs either the pump body or the engine block.
- Impeller loose or damaged.
- Sprocket or sprocket flange loose or damaged.

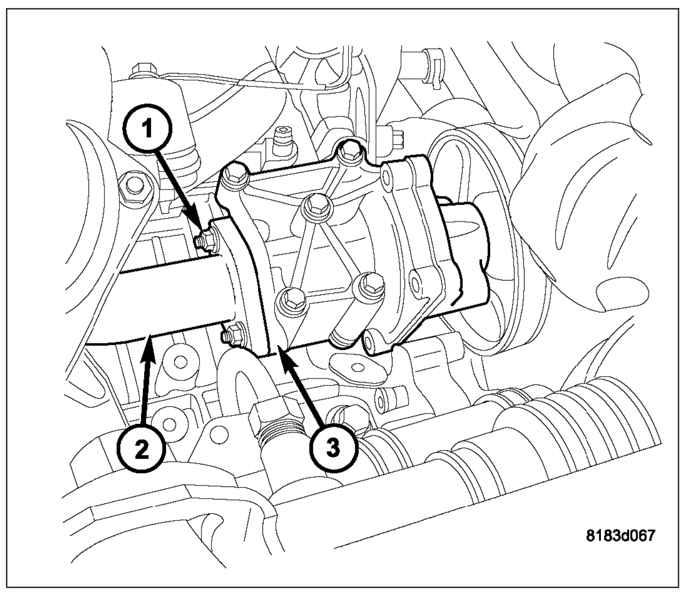
INSTALLATION - WORLD ENGINE



1. Position water pump assembly (3) into water pump housing (4).
2. Install mounting bolts (2). Tighten bolts to 12 N·m (105 in. lbs.).
3. Install water pump pulley (1). Tighten bolts to 28 N·m (21 ft. lbs.).
4. Install drive belt splash shield.
5. Lower vehicle.
6. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - INSTALLATION).
7. Connect battery negative terminal.
8. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - FILLING COOLING SYSTEM).

INLET TUBEWATER PUMP-WORLD ENGINE

REMOVAL



The water pump inlet tube (3) connects the water pump to the coolant adapter. This tube is sealed by an O-ring and held in place by fasteners to the water pump housing.

1. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
2. Remove the coolant adapter and secondary thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).
3. Raise and support vehicle.
4. Remove inlet tube mounting nuts (1).
5. Remove inlet tube (3).

INSTALLATION

1. Inspect the O-ring for damage before installing the tube. Replace O-ring as necessary.
2. Lubricate O-rings with soapy water.
3. Install new water inlet gasket between tube and water pump housing (2).
4. Position water pump inlet tube (3) on water pump housing (2). Hand tighten nuts to aide in tube alignment.
5. Install secondary thermostat and coolant adapter (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION).
6. Tighten coolant tube nuts (1) to 24 N·m (212 in. lbs.).
7. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

TRANSMISSION

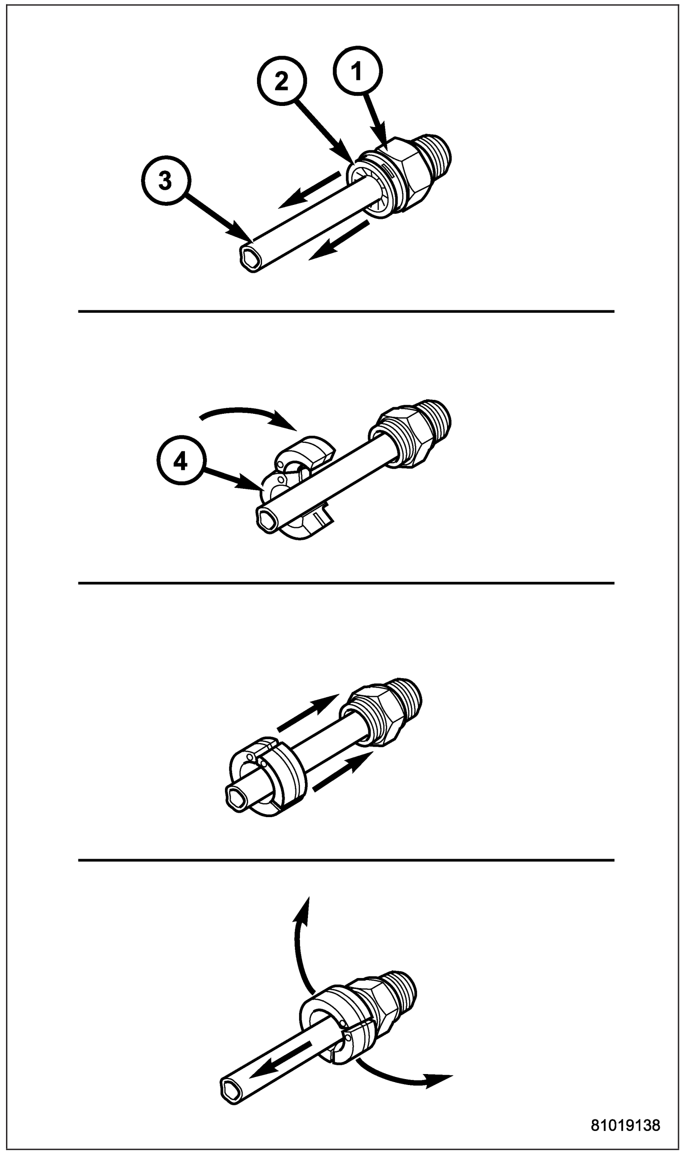


TABLE OF CONTENTS

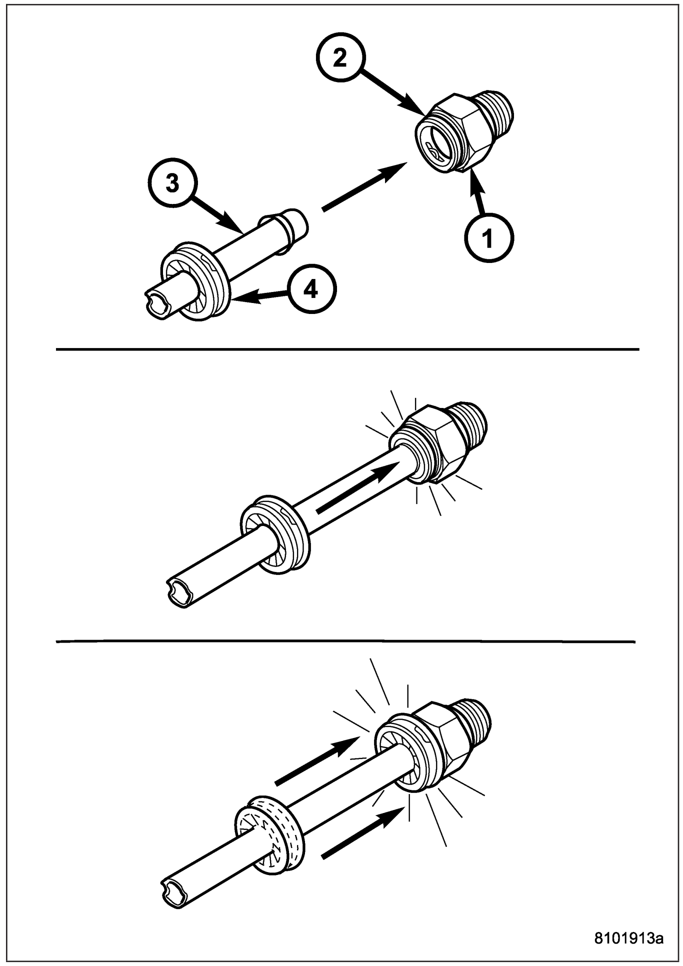
TRANSMISSION

STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING DISASSEMBLY/ASSEMBLY

DISCONNECT

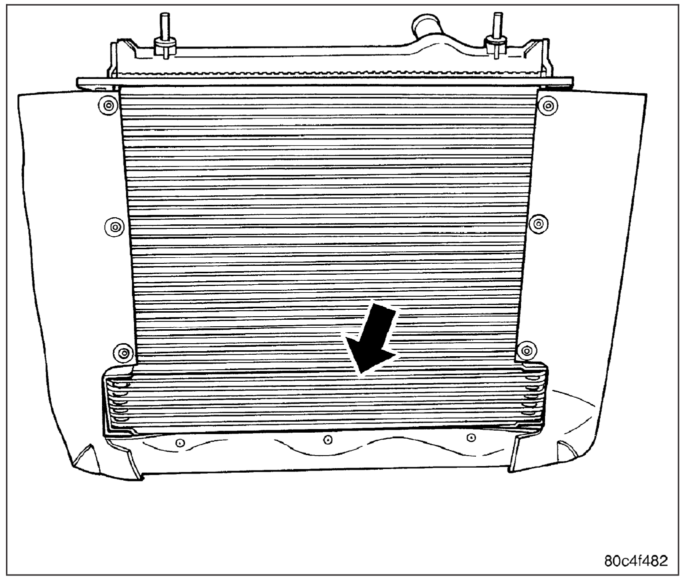


1. Remove dust cap by pulling it straight back off of quick connect fitting (1).
2. Place disconnect tool Release Tool 8875A (4) onto transmission cooler line with the fingers of the tool facing the quick connect fitting.
3. Slide disconnect tool down the transmission line and engage the fingers of the tool into the retaining clip. When properly engaged in the clip, the tool will fit flush against the quick connect fitting.
4. Rotate the disconnect tool 60° to expand the retaining clip.
5. While holding the disconnect tool against the quick connect fitting, pull back on the transmission cooler line to remove.

CONNECT

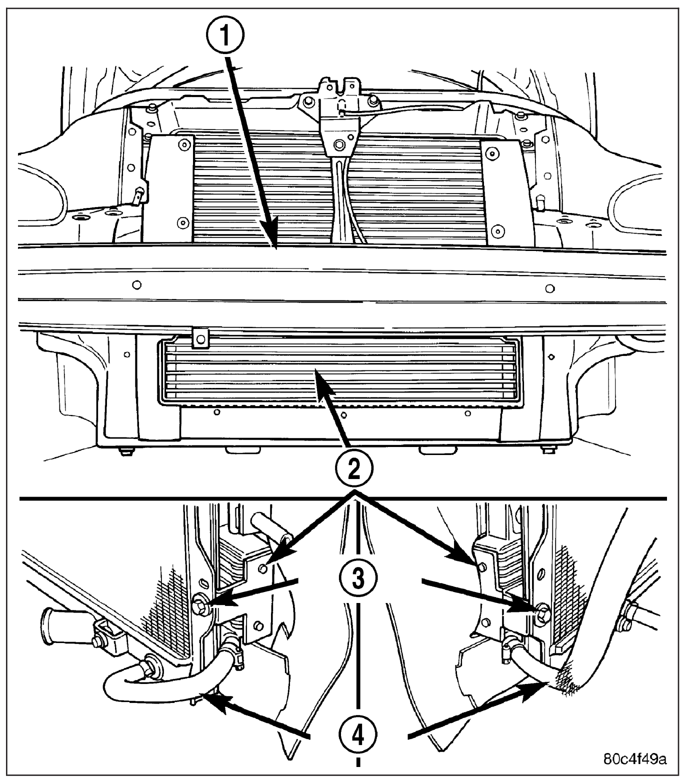
1. Align transmission cooler line (3) with quick connect fitting while pushing straight into the fitting.
2. Push in on transmission cooler line until a “click” is heard or felt.
3. Slide dust cap (4) down the transmission cooler line and snap it over the quick connect fitting until it is fully seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

NOTE: If dust cap will not snap into place, repeat assembly step #2.



COOLER AUTOMATIC TRANSMISSION

DESCRIPTION



The automatic transmission cooler is located in the front of the radiator and behind the front fascia and is combined with the A/C condenser. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

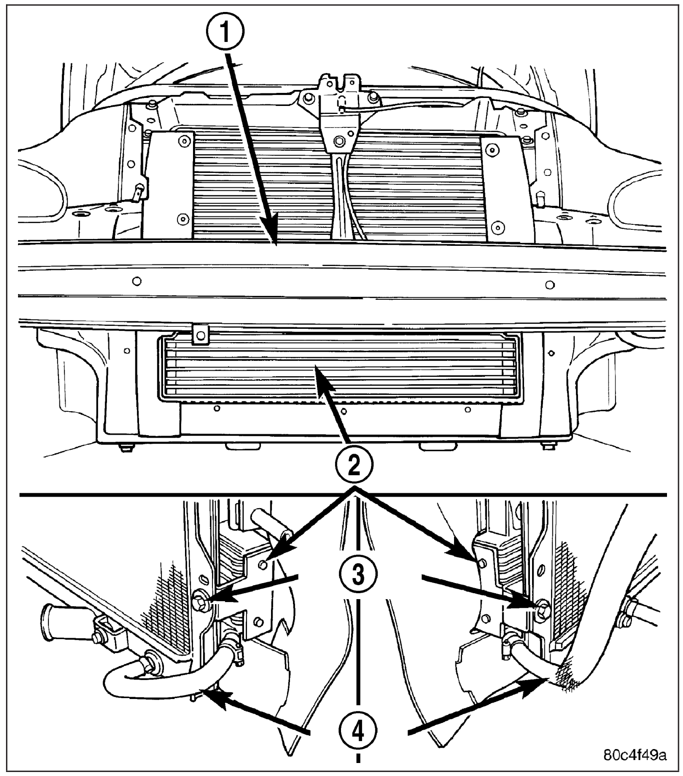
The Transmission oil cooler/A/C condenser assembly is equipped with quick connect fitting for the transmission oil cooler lines.

REMOVAL

1. Remove front fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
2. Recover refrigerant (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
3. Disconnect A/C lines.
4. Using Tool 9586 disconnect cooler line from the combination cooler (Refer to 7 - COOLING/ TRANSMISSION - STANDARD PROCEDURE).
5. Remove combination cooler mounting bolts.
6. Remove combination cooler (2).

CLEANING

Check the external cooler for debris on the cooling fin surfaces. Clean as necessary.



INSPECTION

Inspect all hoses, tubes, clamps and connections for leaks, cracks, or damage. Replace as necessary. Use only approved transmission oil cooler hoses that are molded to fit the space available.

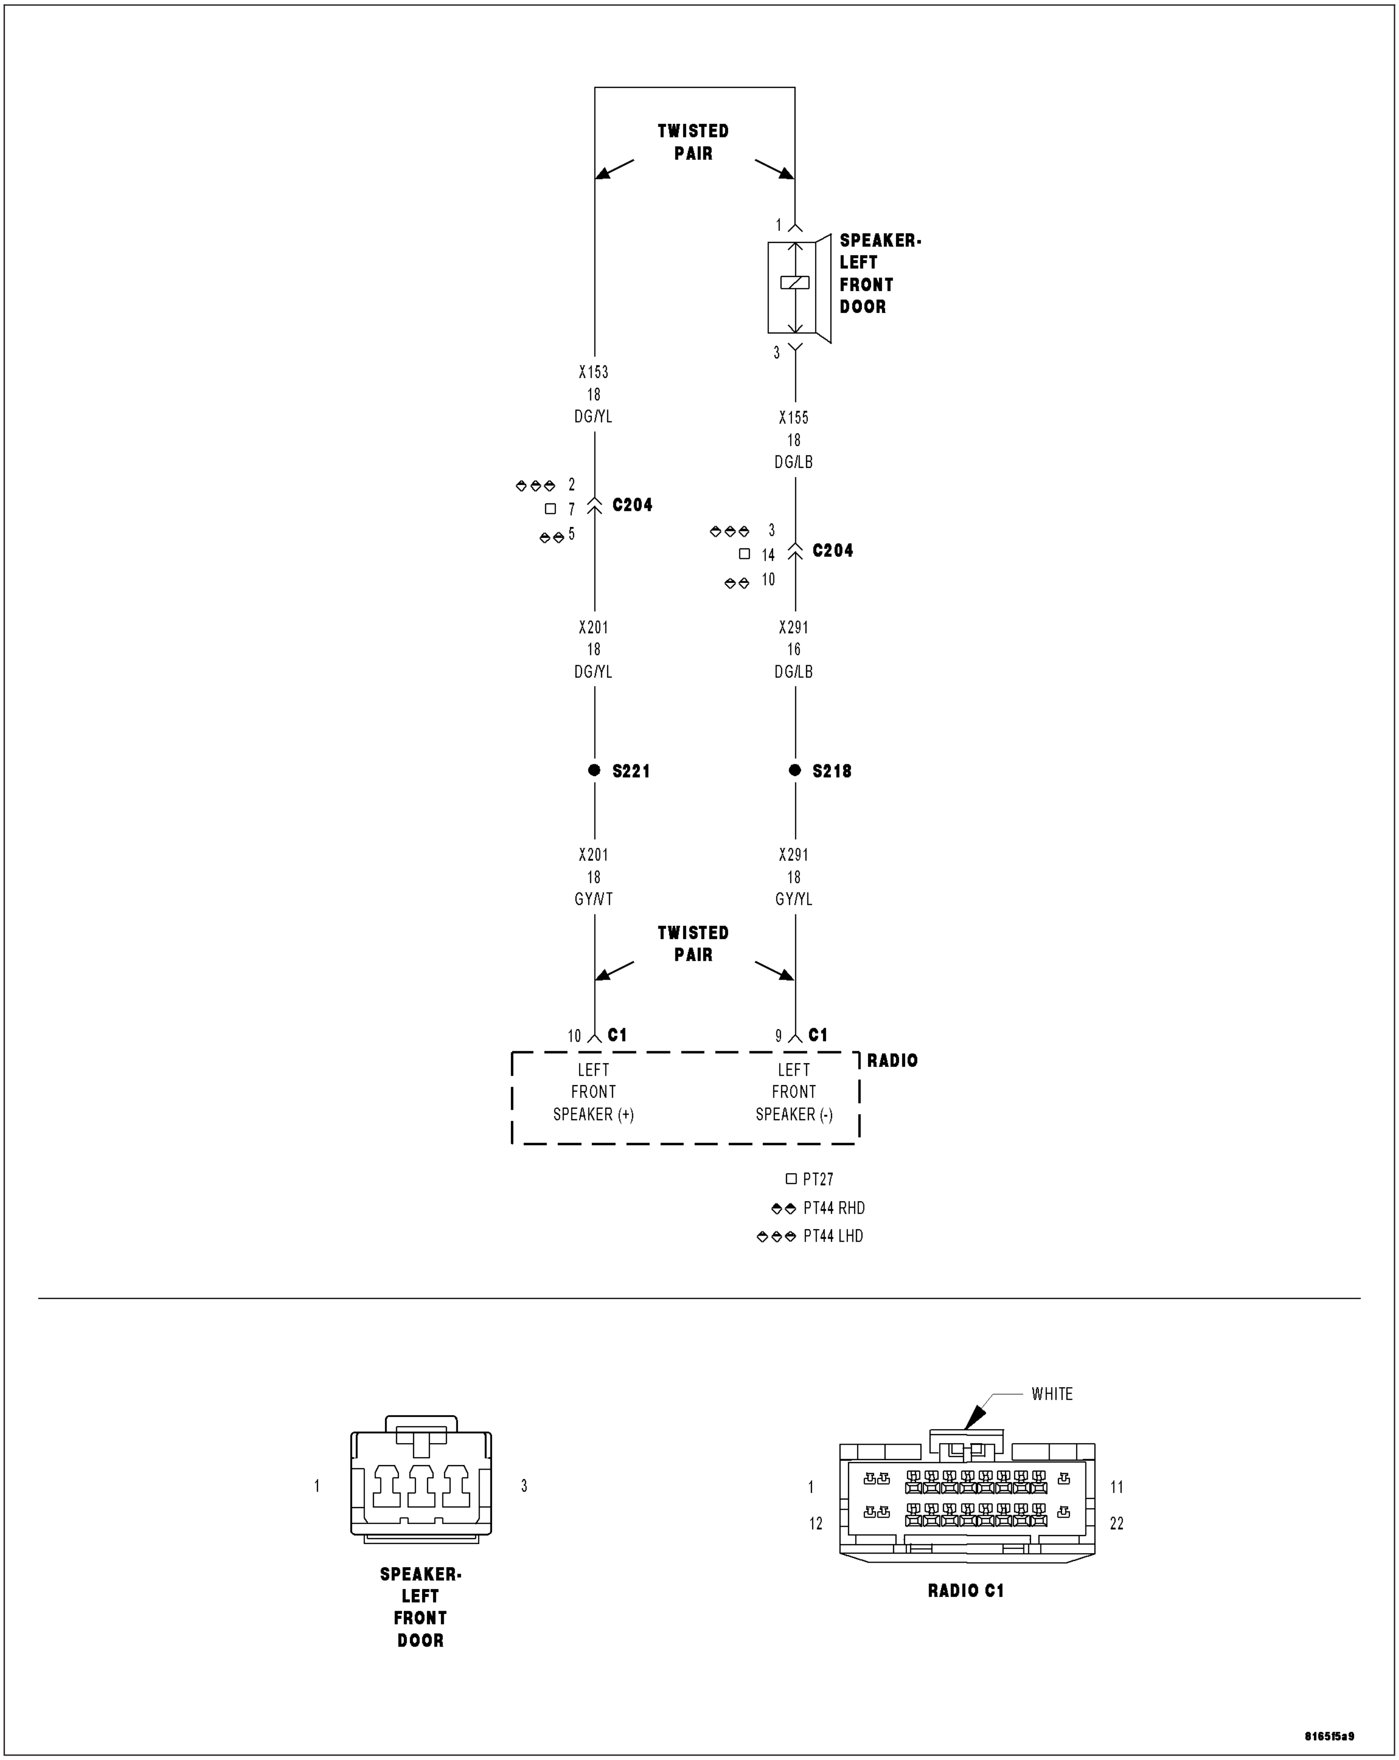
Inspect external coolers for leaks, loose mounts, or damage. Replace as necessary.

INSTALLATION

1. Replace automatic transmission cooler hoses and clamps.
2. Connect hoses to combination cooler (2) (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE).
3. Install combination cooler (2). Tighten screws to 8 N·m (70 in. lbs.).
4. Install radiator closure panel center brace.
5. Install upper radiator closure panel (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - INSTALLATION).
6. Install grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
7. Start engine and check transmission fluid level. Adjust level as necessary.

AUDIO/VIDEO

TABLE OF CONTENTS



AUDIO/VIDEO SYSTEMS- ELECTRICAL DIAGNOSIS

TABLE OF CONTENTS

AUDIO/VIDEO SYSTEMS- ELECTRICAL DIAGNOSIS

DIAGNOSIS AND TESTING

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than three seconds.

Possible Causes
SPEAKER
(X201) (X291) LEFT FRONT SPEAKER OUTPUT CIRCUIT

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, clear all Audio DTC's.
Turn the radio on.
With the scan tool, read the DTC information.

Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

2. (X201) (X291) SPEAKER OUTPUT CIRCUITS

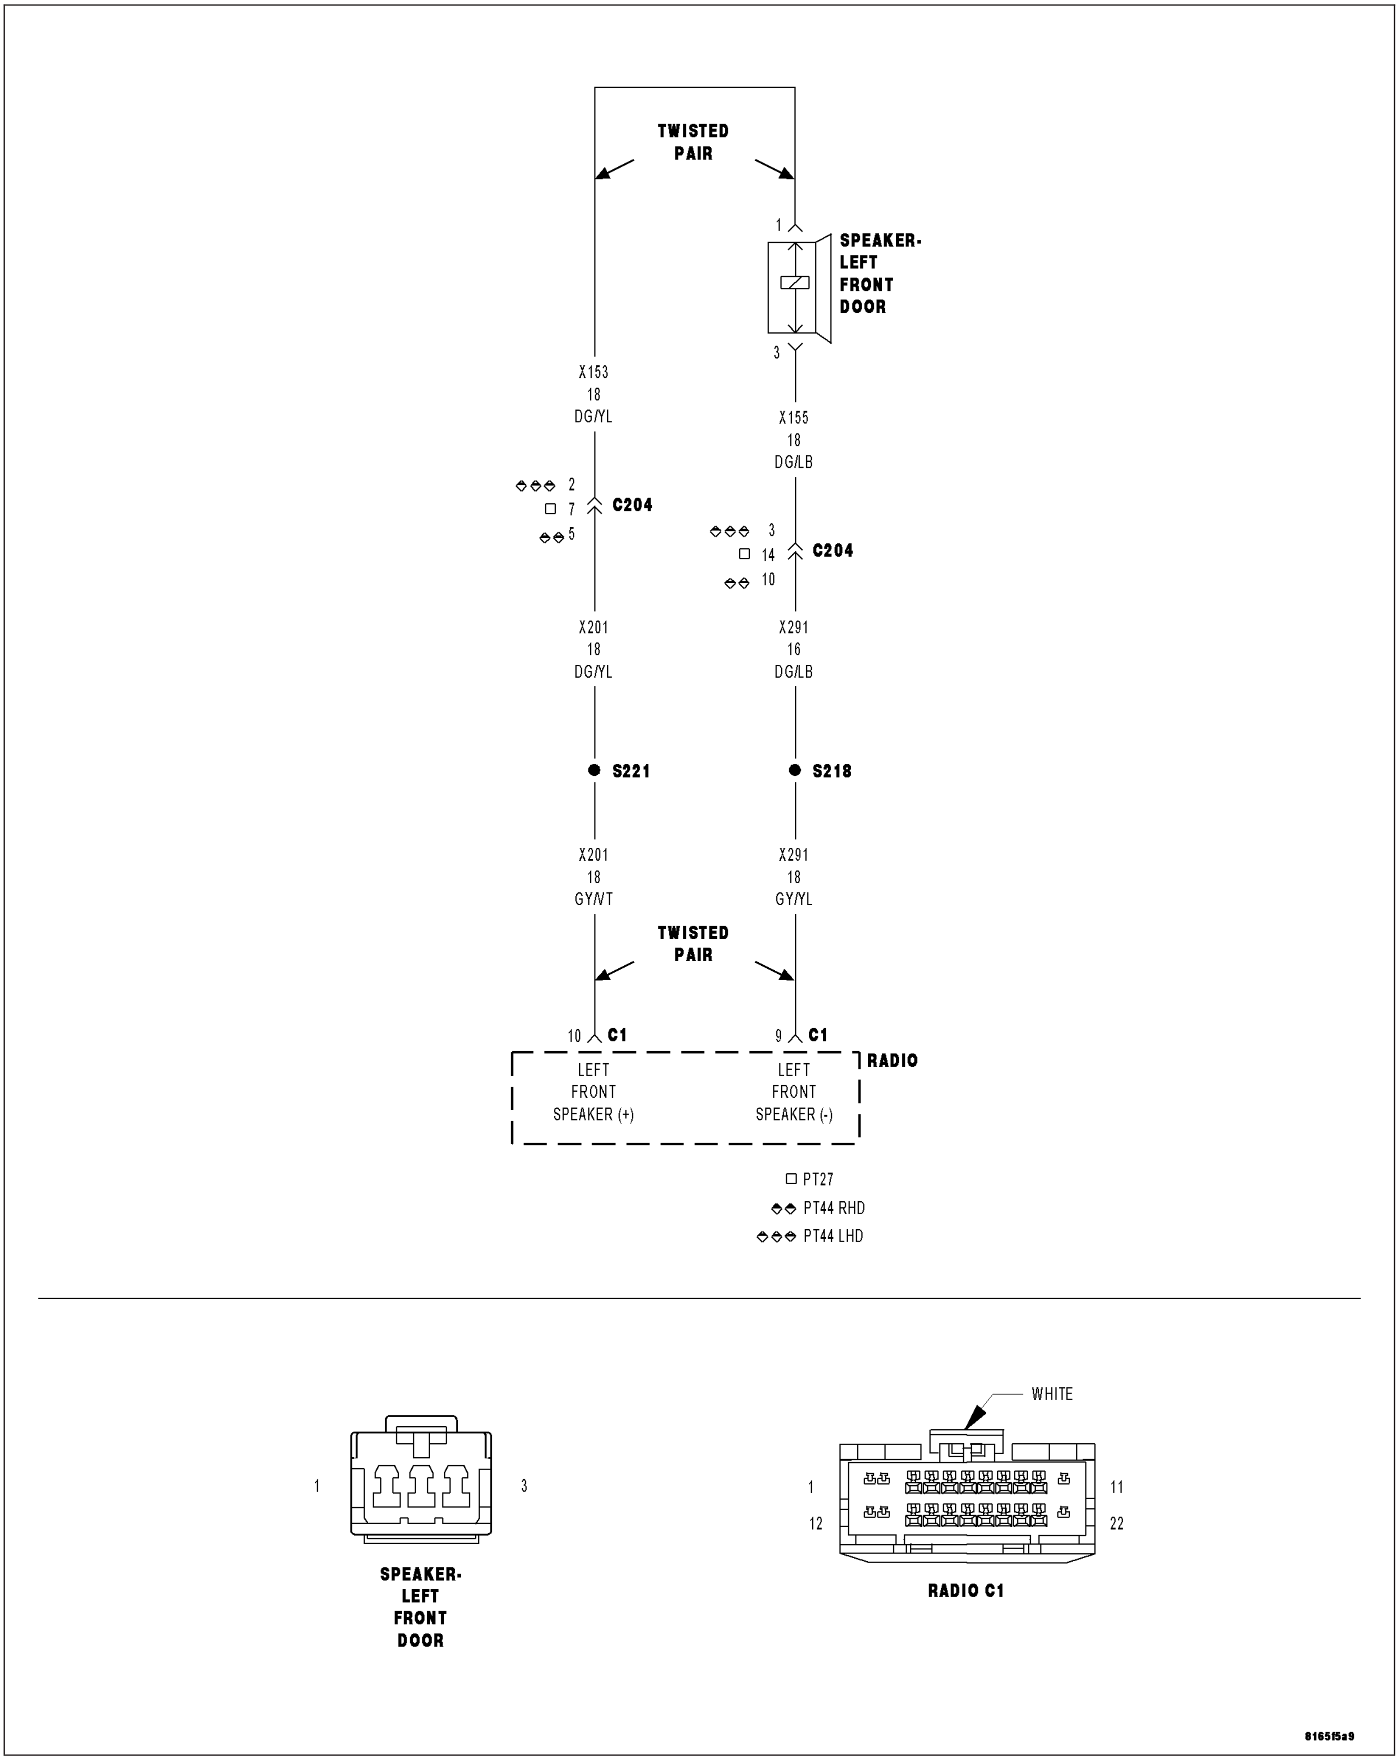
Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Front Left Audio Speaker connector.
Measure the resistance between ground and each speaker (X201)(+) and (X291)(-) circuit.

Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable speaker (+) or (-) output circuit for a short to ground condition.

No >> Go To 3

3. SPEAKER



Turn the ignition off.
Disconnect the Front Left Audio Speaker.
Turn the ignition on.
Turn the radio on.
With the scan tool, clear all Audio DTC's.
With the scan tool, read the DTC information.

Does the scan tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
SPEAKER
(X201) SPEAKER OUTPUT CIRCUIT (+)
(X291) SPEAKER OUTPUT CIRCUIT (-)

Diagnostic Test

1. INTERMITTENT CONDITION

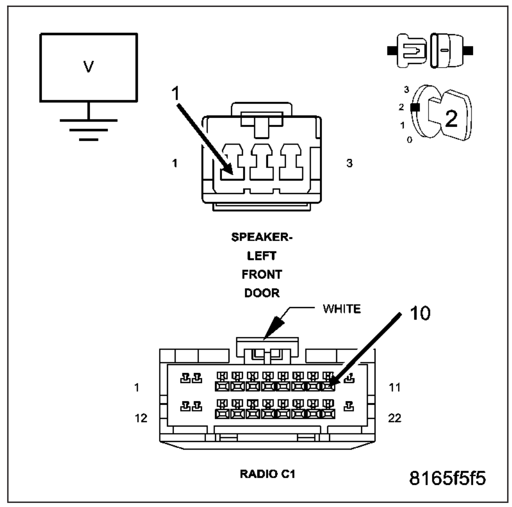
Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



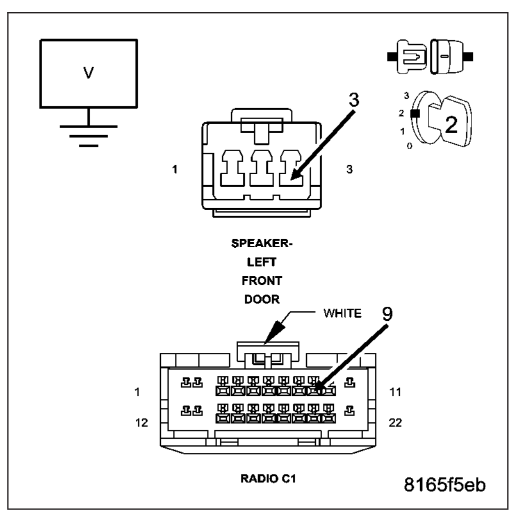
2. CHECK FOR VOLTAGE ON THE (X201) SPEAKER (+) CIRCUIT

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Left Front Speaker harness connector.

Measure for voltage on the (X201) Speaker (+) circuit.



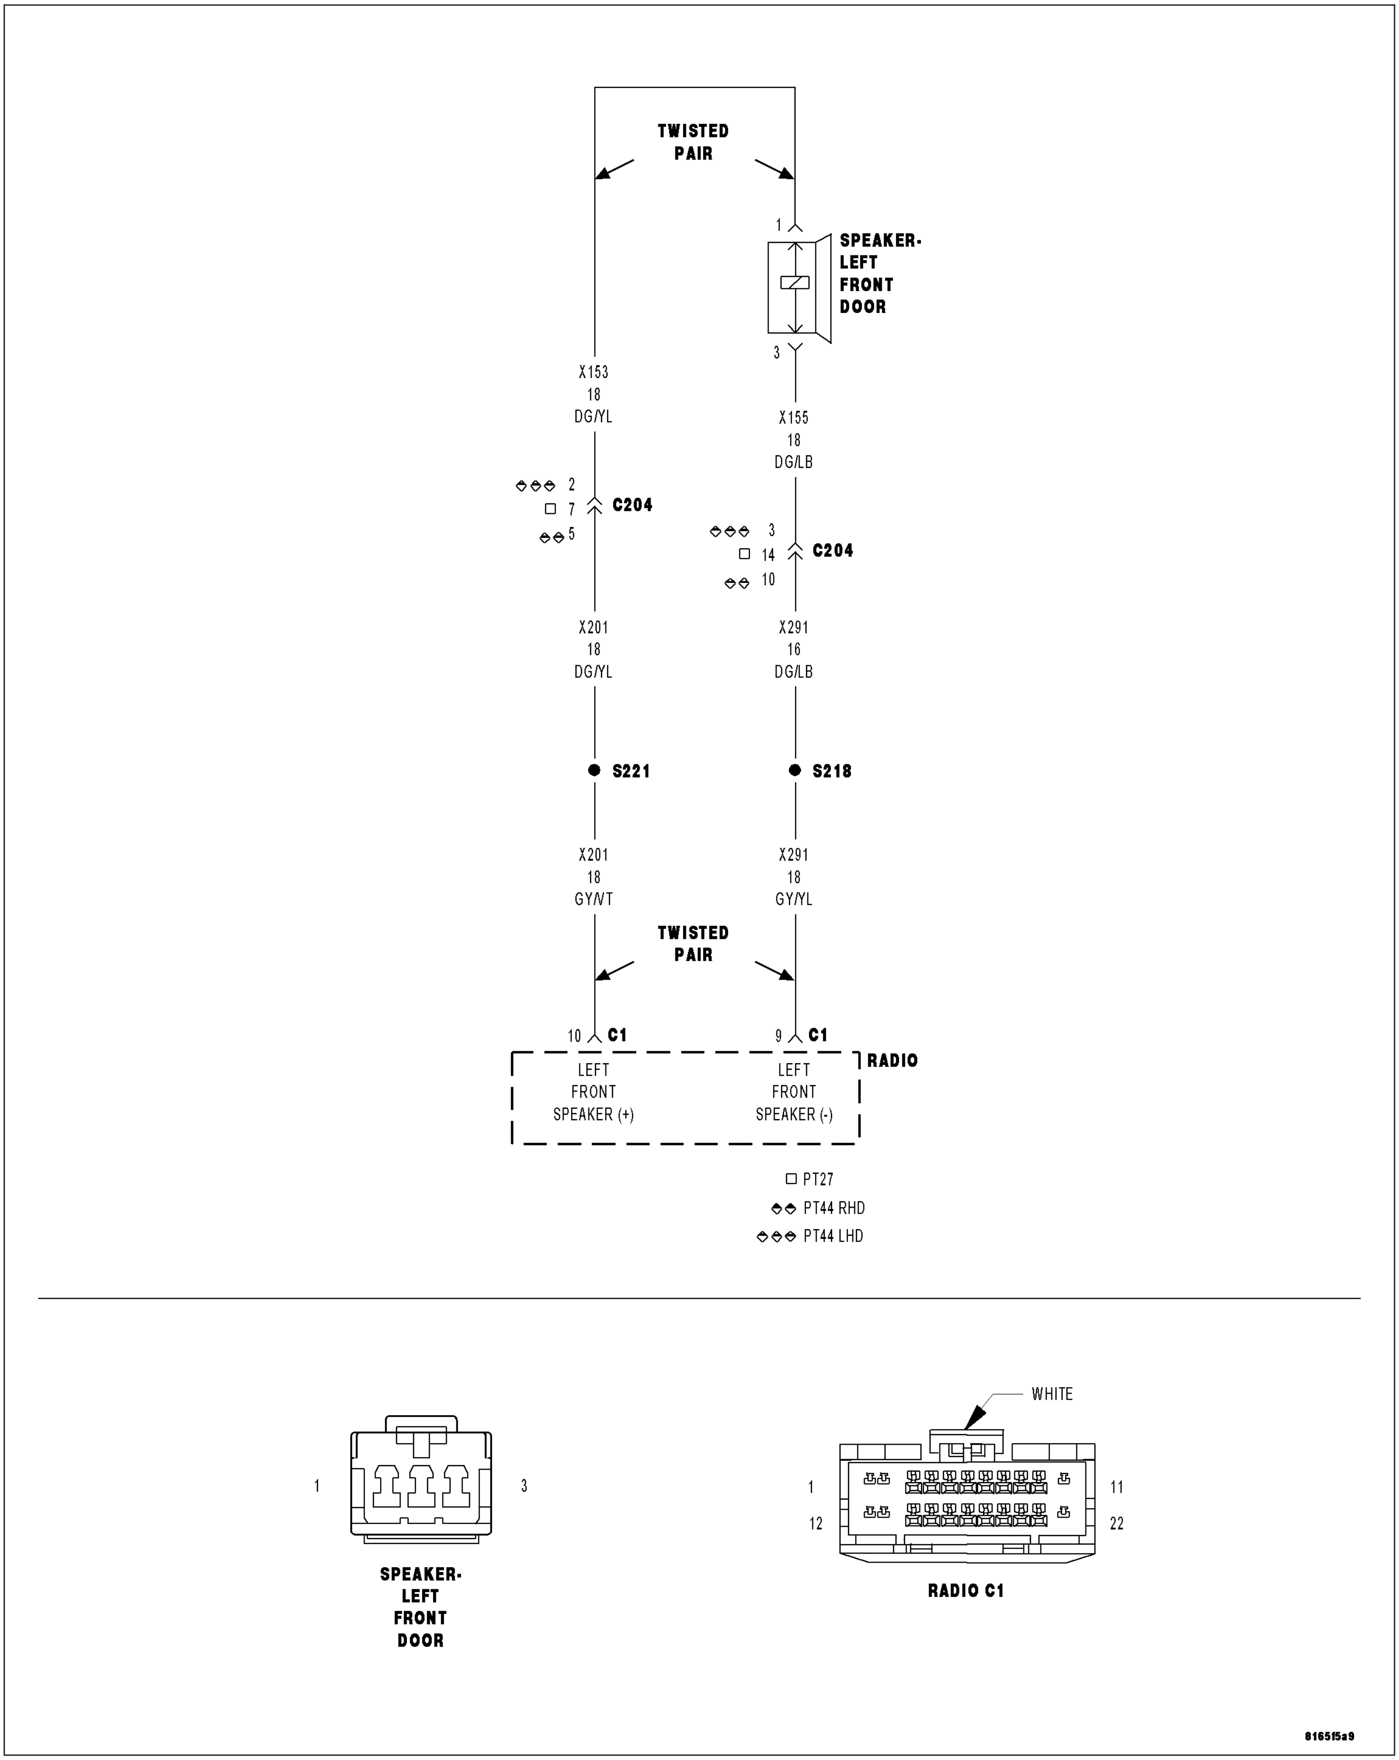
Is the voltage above 10.0 volts?

Yes >> Repair the (X201) Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK FOR VOLTAGE ON THE (X291) SPEAKER (-) CIRCUIT

Measure for voltage on the (X291) Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X291) Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is open for more than three seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER
(X201) (X291) LEFT FRONT SPEAKER OUTPUT CIRCUIT

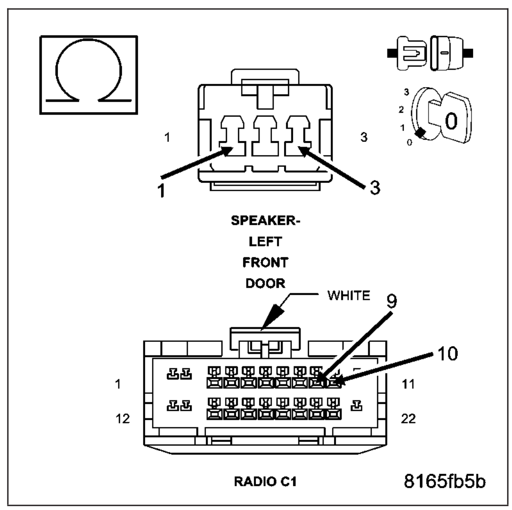
Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, clear all Audio DTC's.
Turn the radio on.
With the scan tool, read the DTC information.

Does the scan tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2



No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

2. (X201) (X291) SPEAKER OUTPUT CIRCUITS

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Front Left Audio Speaker connector.
Measure the resistance of each speaker (X201)(+) and (X291)(-) circuit between the radio and the speaker.

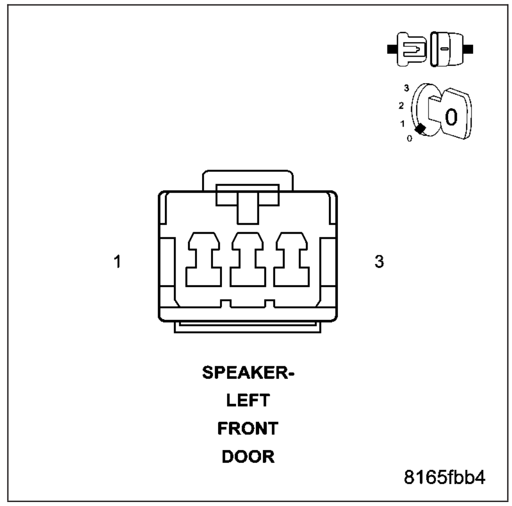
Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable output speaker circuit for an open condition.
Perform the BODY VERIFICATION TEST VER 1.

3. SPEAKER

Turn the ignition off.



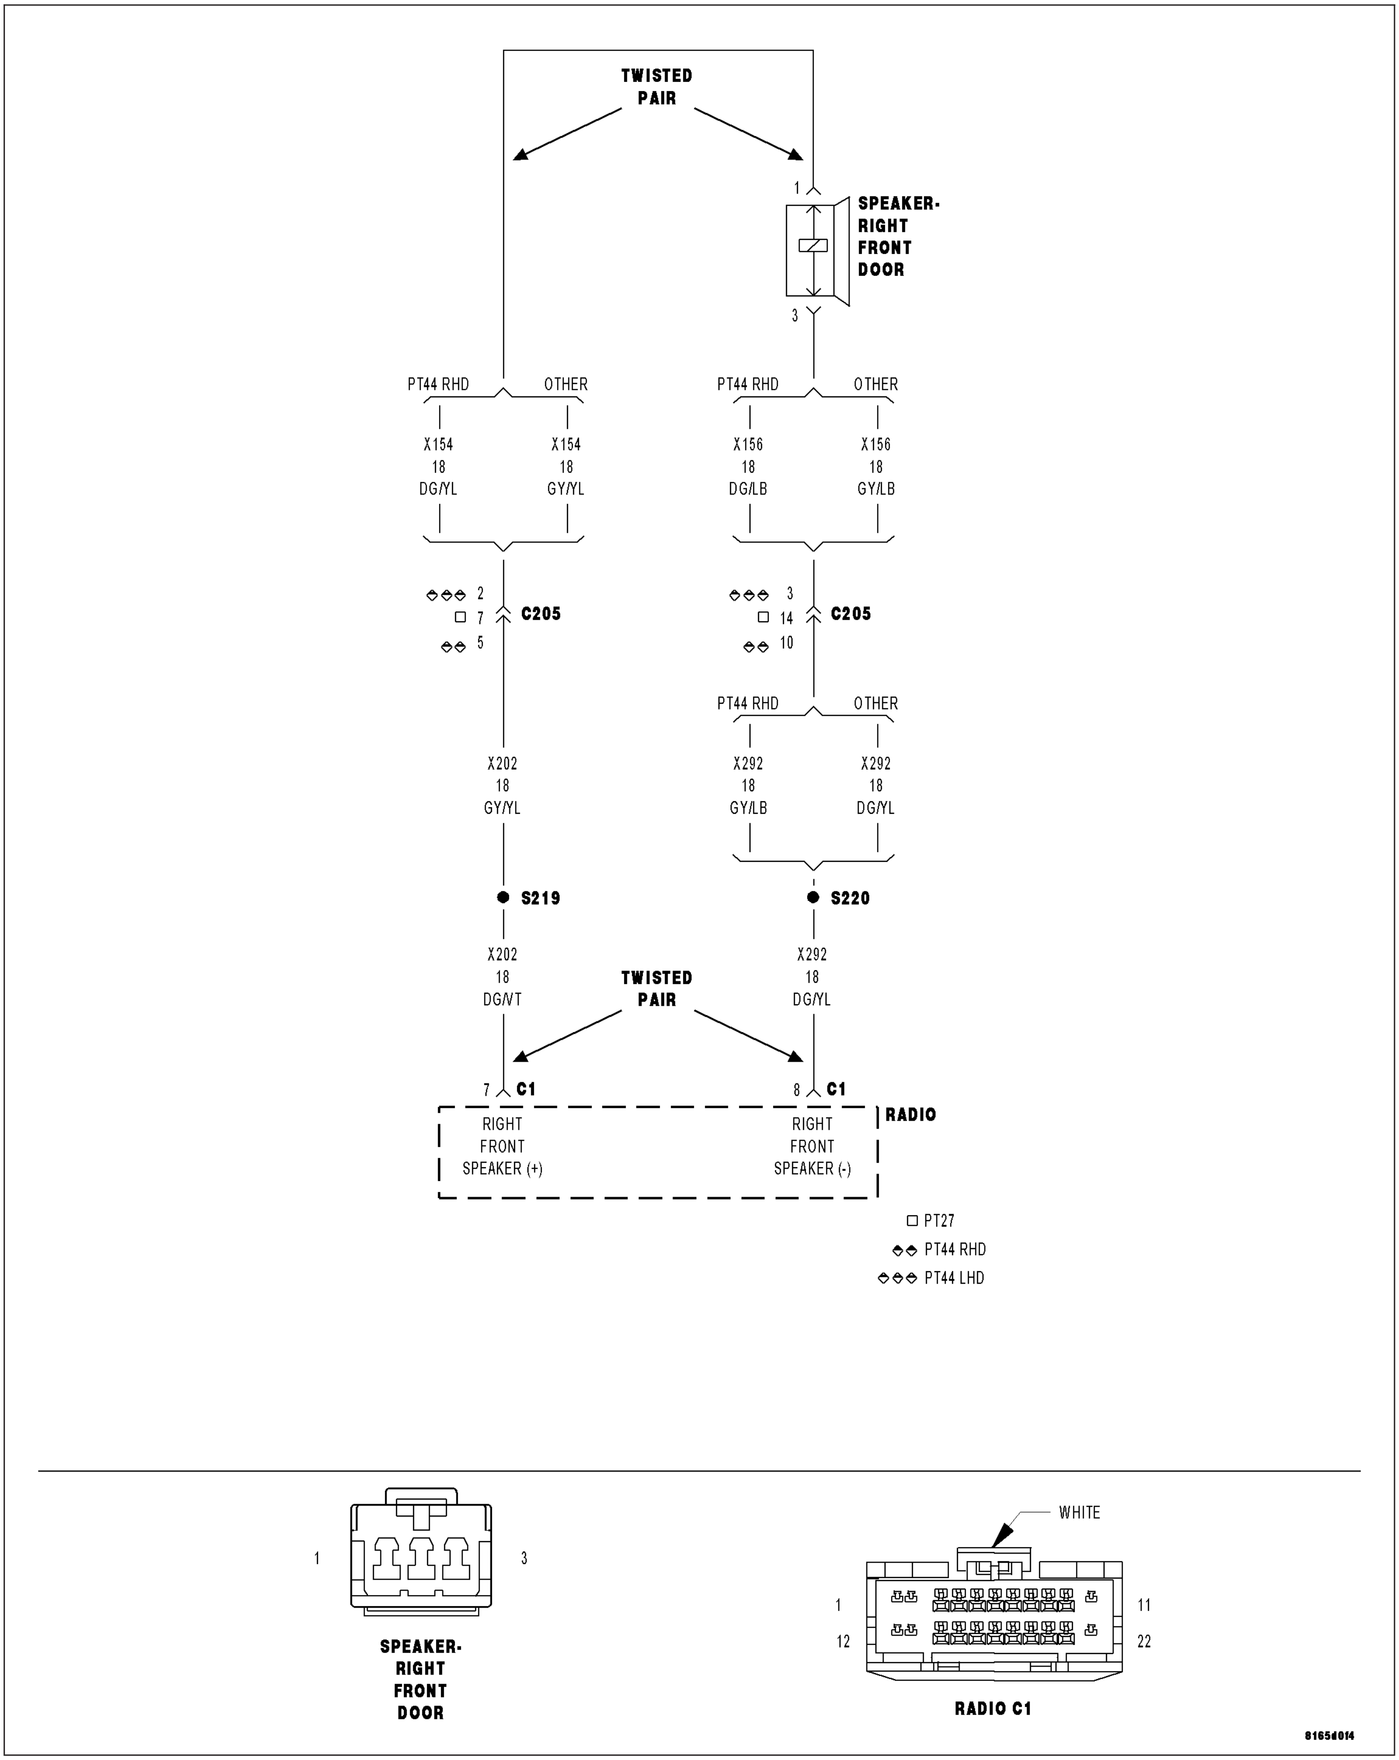
Disconnect the Front Left Audio Speaker.

Turn the ignition on.

Turn the radio on.

With the scan tool, clear all Audio DTC's.

With the scan tool, read the DTC information.



Does the scan tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the speaker in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

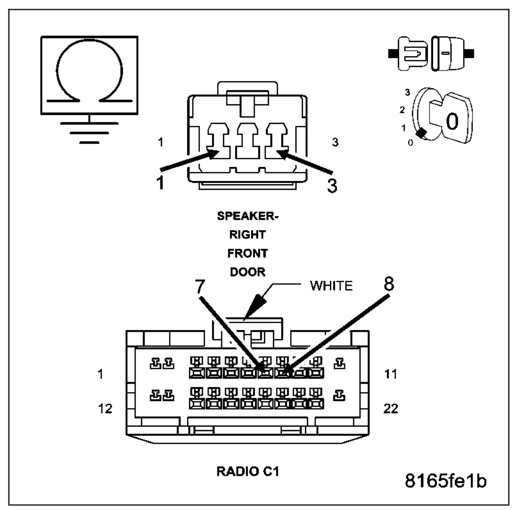
- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes
SPEAKER
(X202) (X292) RIGHT FRONT SPEAKER OUTPUT CIRCUIT

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, clear all Audio DTC's.
Turn the radio on.
With the scan tool, read the DTC information.



Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

2. (X202) (X292) SPEAKER OUTPUT CIRCUITS

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Front Right Audio Speaker connector.
Measure the resistance between ground and each speaker (X202)(+) and (X292)(-) circuit.

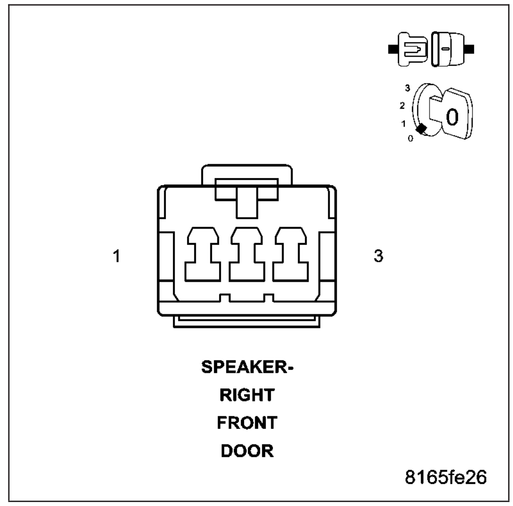
Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable speaker (+) or (-) output circuit for a short to ground condition.

No >> Go To 3

3. SPEAKER

Turn the ignition off.



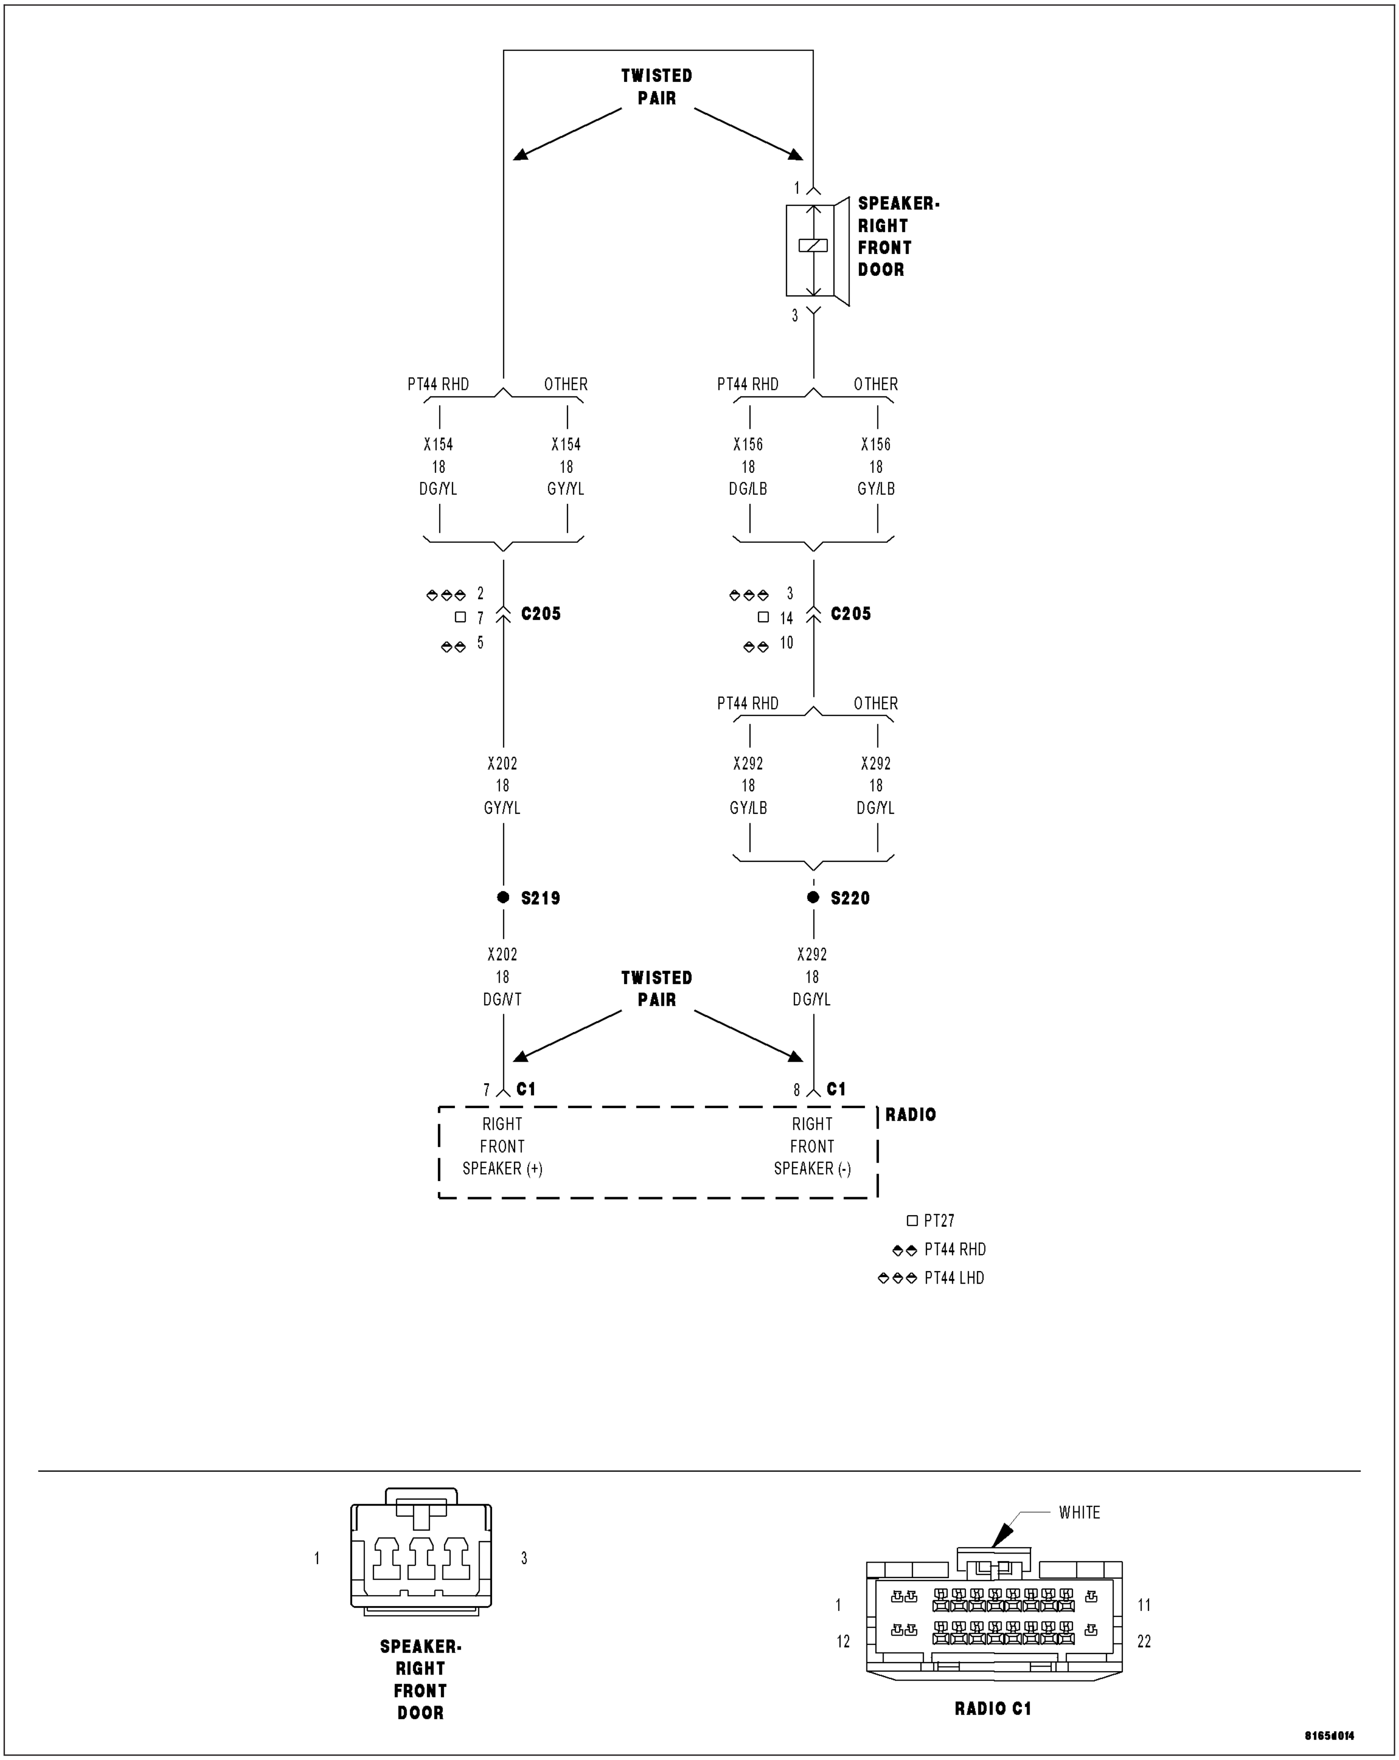
Disconnect the Front Right Audio Speaker.

Turn the ignition on.

Turn the radio on.

With the scan tool, clear all Audio DTC's.

With the scan tool, read the DTC information.



Does the scan tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the speaker in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
SPEAKER
(X202) SPEAKER OUTPUT CIRCUIT (+)
(X292) SPEAKER OUTPUT CIRCUIT (-)

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

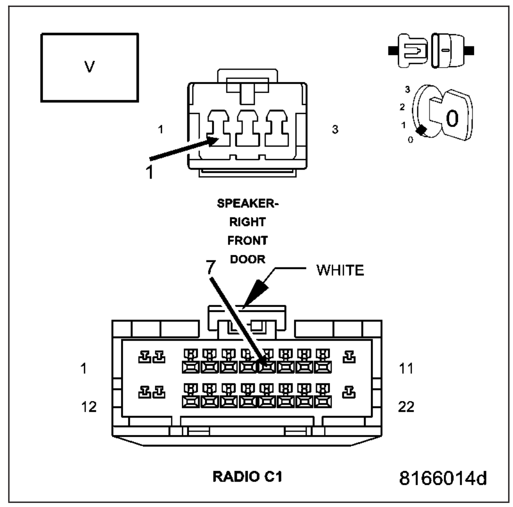
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X202) SPEAKER (+) CIRCUIT

Turn the ignition off.

Disconnect the Radio C1 harness connector.



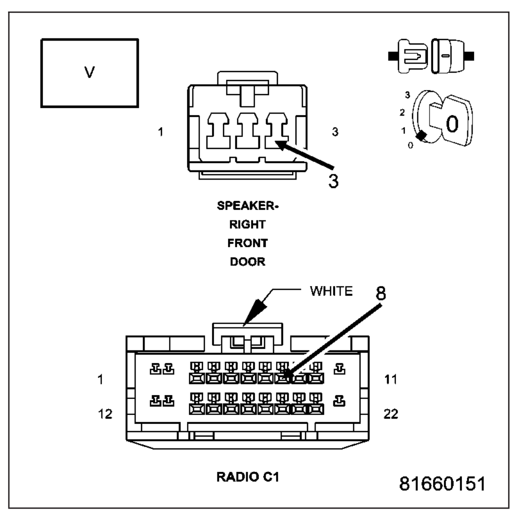
Disconnect the Right Rear Speaker harness connector.

Measure for voltage on the (X202) Speaker (+) circuit.

Is the voltage above 10.0 volts?

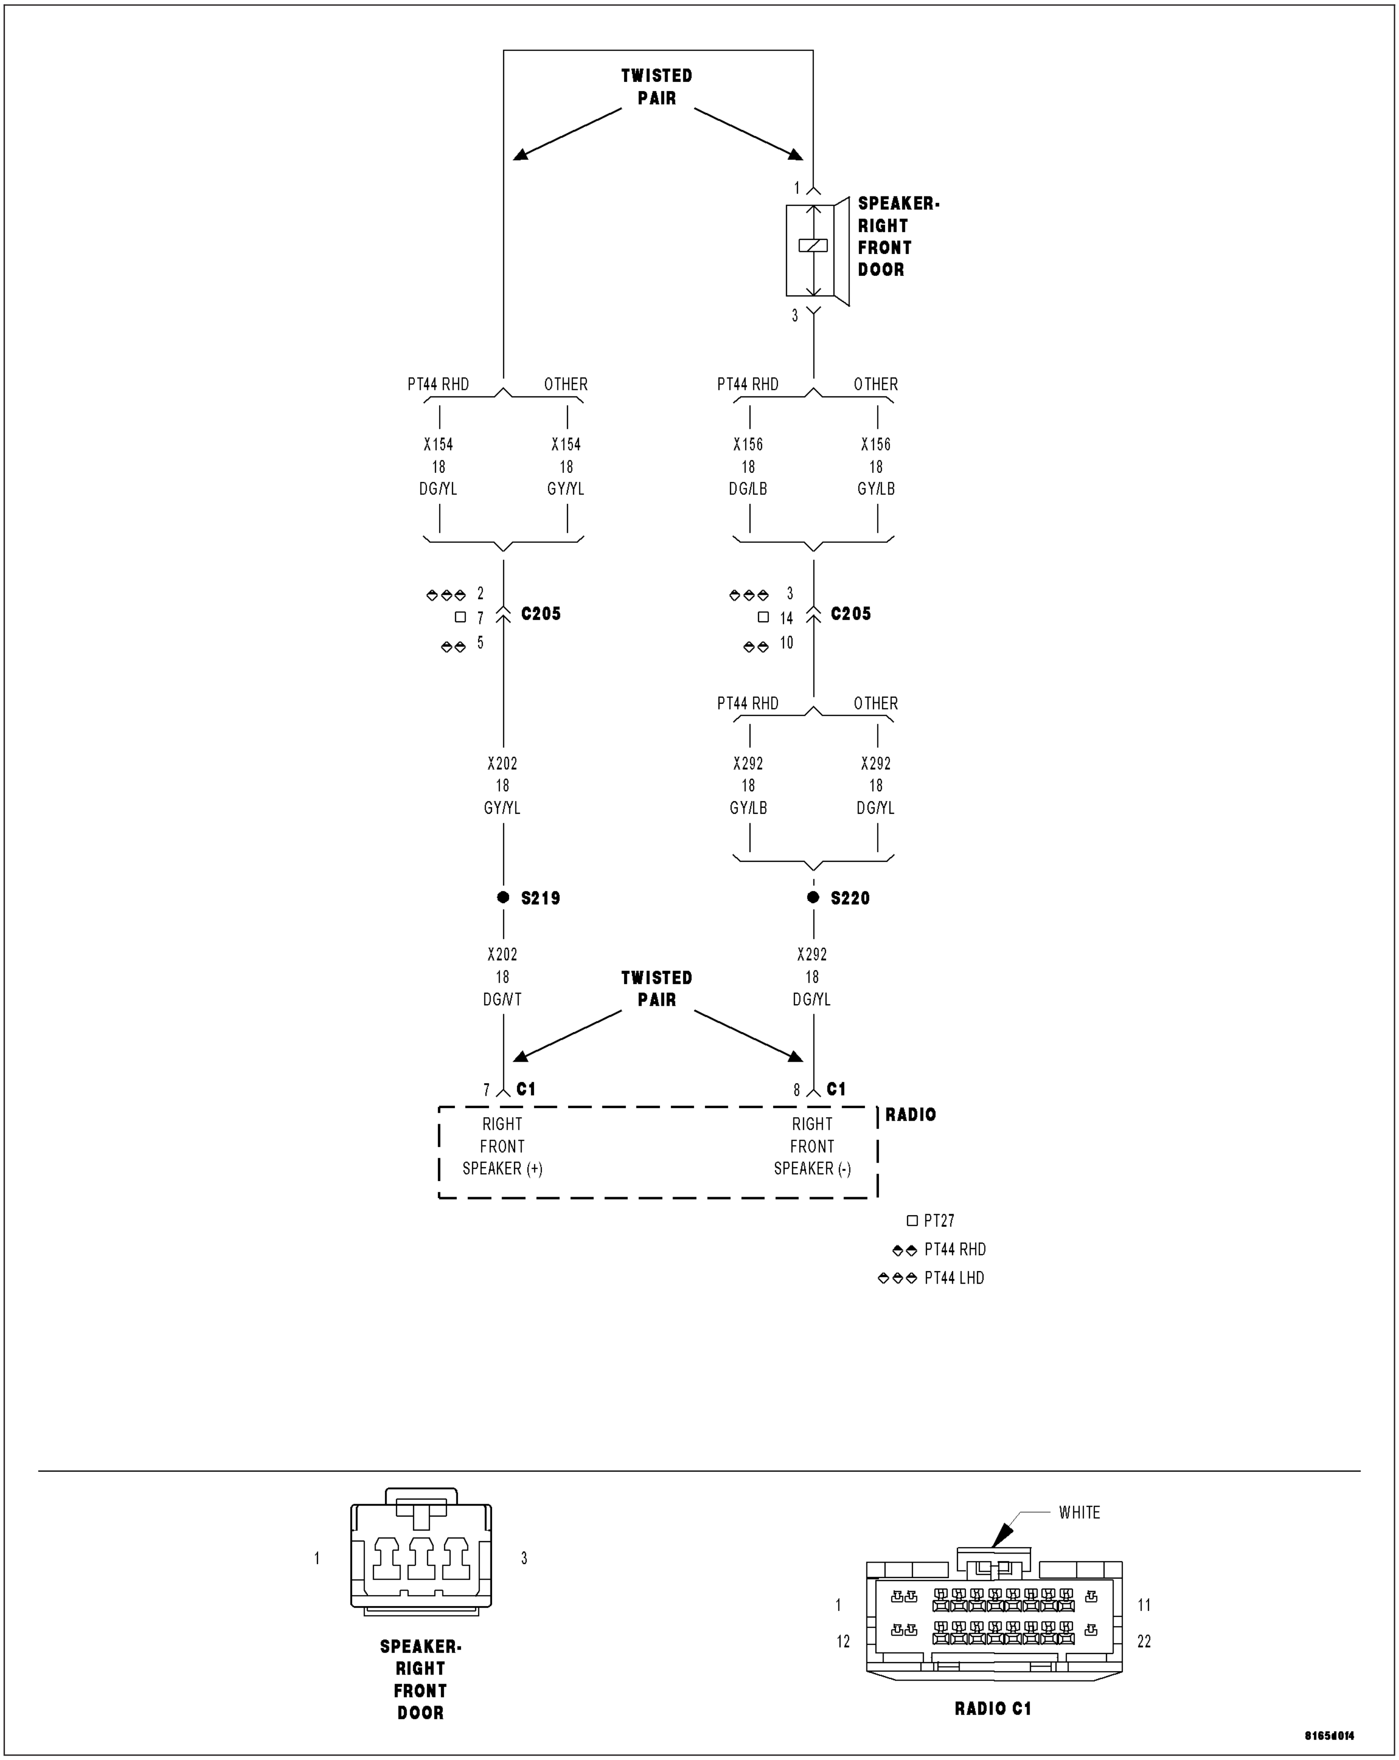
Yes >> Repair the (X202) Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3



3. CHECK FOR VOLTAGE ON THE (X292) SPEAKER (-) CIRCUIT

Measure for voltage on the (X292) Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X292) Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is open for more than three seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER
(X202) (X292) RIGHT FRONT SPEAKER OUTPUT CIRCUIT

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Audio DTC's.

Turn the radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

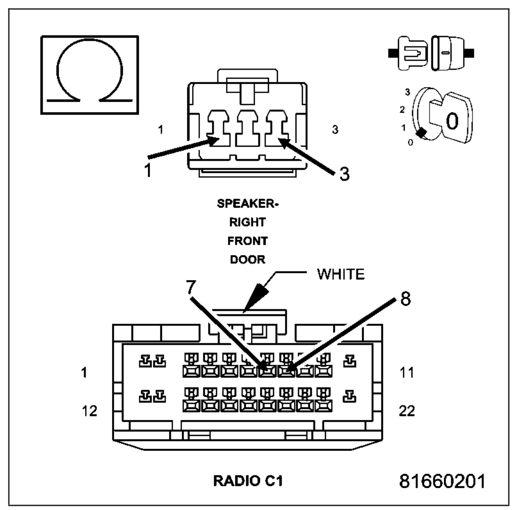
Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

2. (X202) (X292) SPEAKER OUTPUT CIRCUITS

Turn the ignition off.



Disconnect the Radio C1 harness connector.

Disconnect the Front Right Audio Speaker connector.

Measure the resistance of each speaker (X202)(+) and (X292)(-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

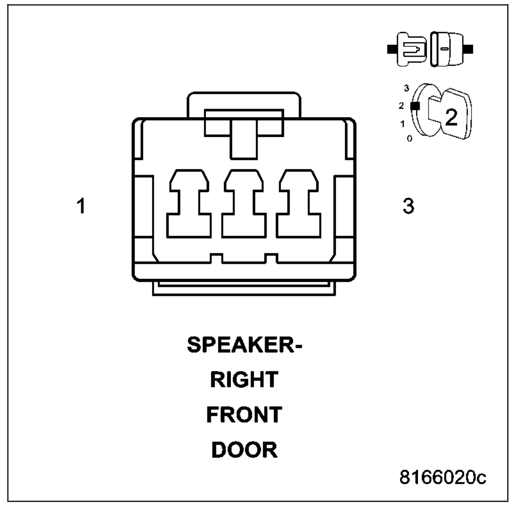
Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.

Perform the BODY VERIFICATION TEST VER 1.

3. SPEAKER

Turn the ignition off.



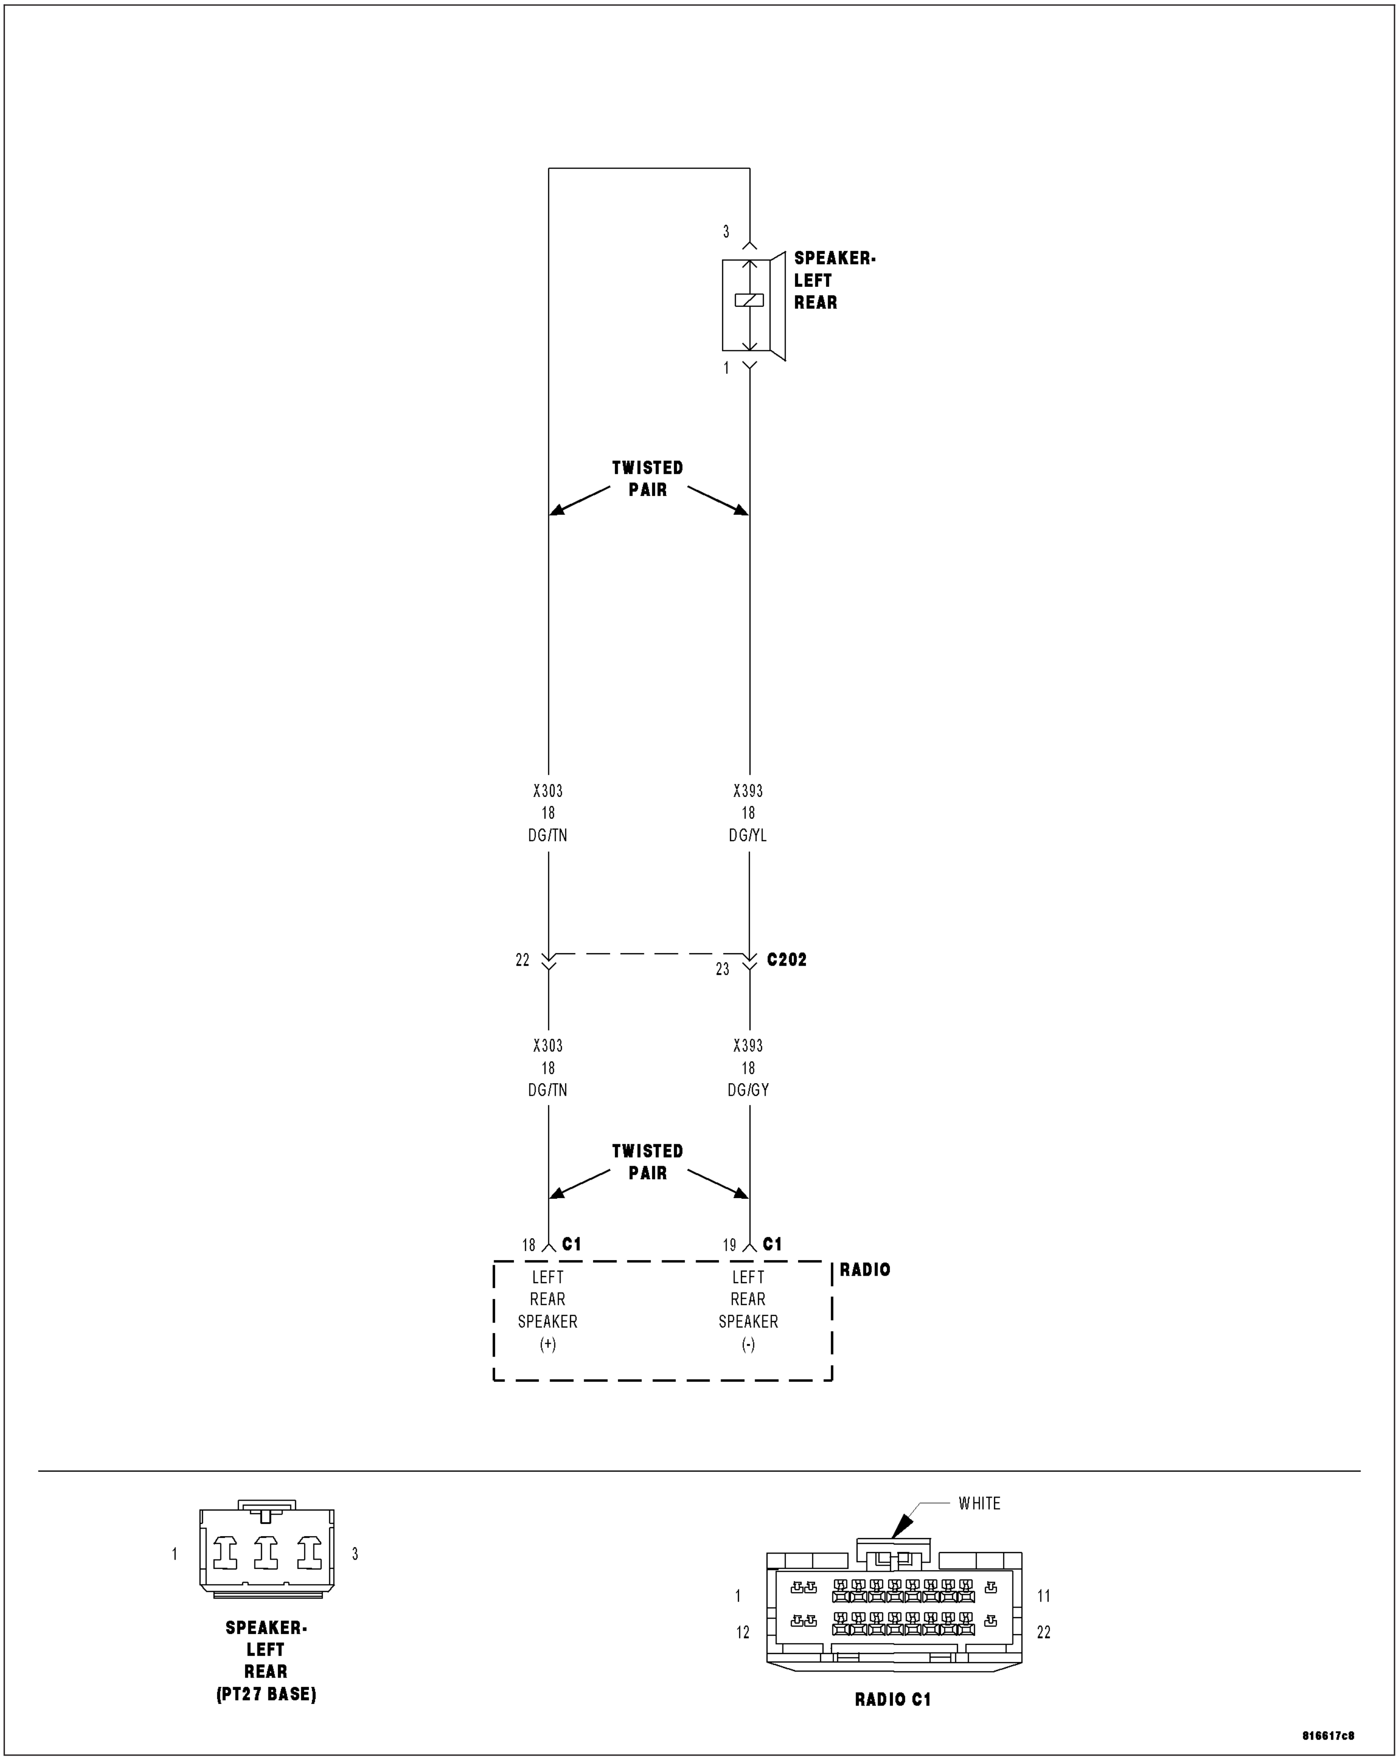
Disconnect the Front Right Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the scan tool, clear all Audio DTC's.

With the scan tool, read the DTC information.



Does the scan tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the Speaker in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes
SPEAKER
(X303) (X393) LEFT REAR SPEAKER OUTPUT CIRCUIT

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Audio DTC's.

Turn the radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

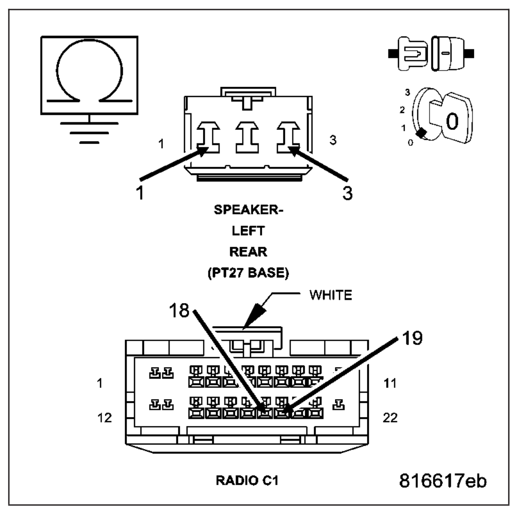
No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

2. (X303) (X393) SPEAKER OUTPUT CIRCUITS

Turn the ignition off.

Disconnect the Radio C1 harness connector.



Disconnect the Rear Left Audio Speaker connector.

Measure the resistance between ground and each speaker (X303)(+) and (X393)(-) circuit.

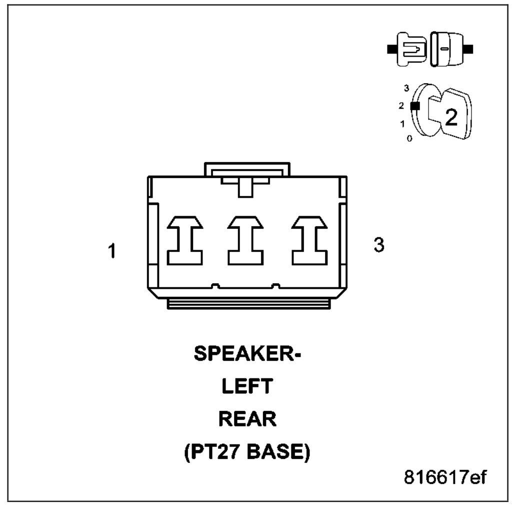
Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable speaker (+) or (-) output circuit for a short to ground condition.

No >> Go To 3

3. SPEAKER

Turn the ignition off.



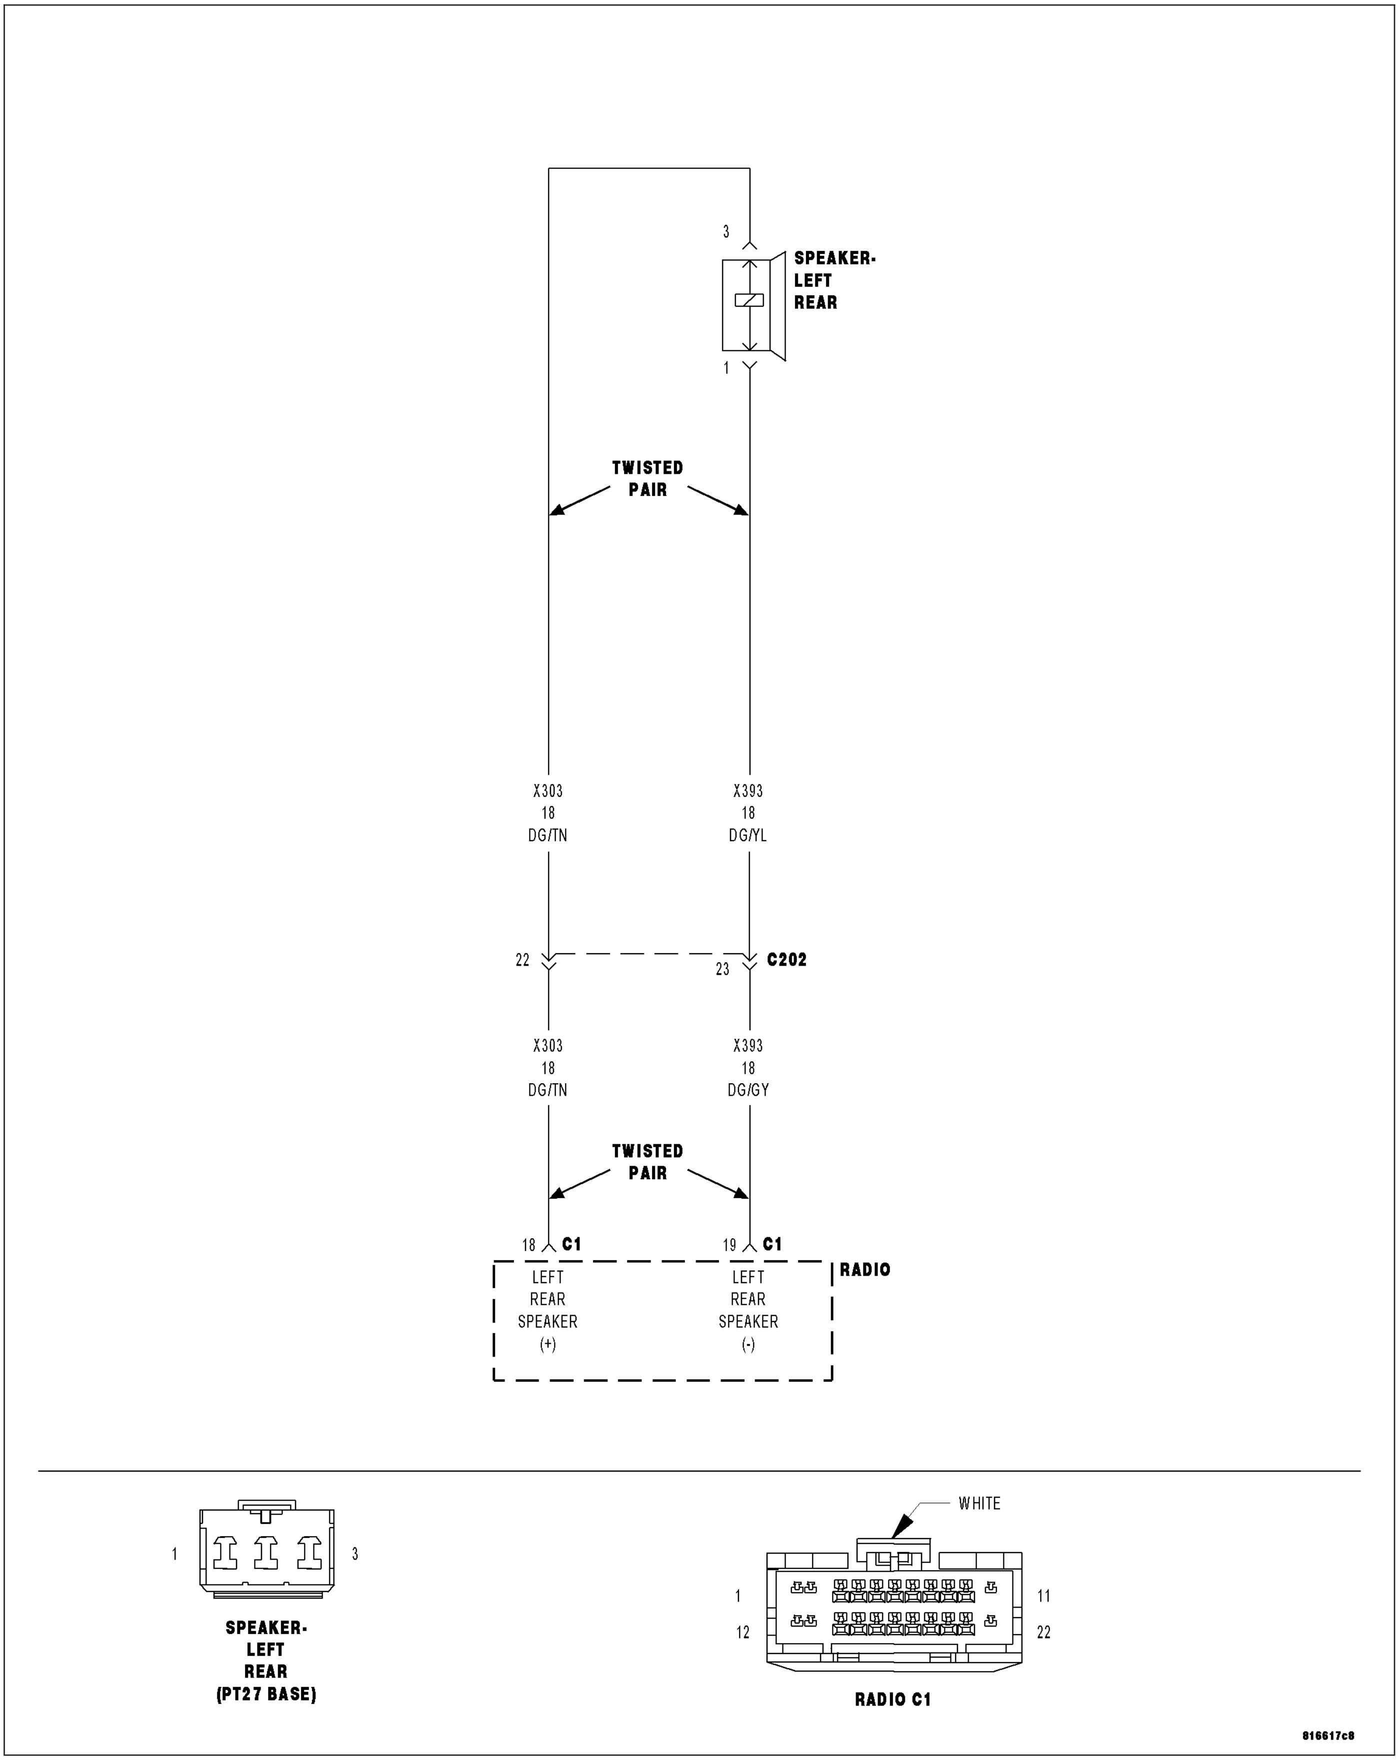
Disconnect the Rear Left Audio Speaker.

Turn the ignition on.

Turn the radio on.

With the scan tool, clear all Audio DTC's.

With the scan tool, read the DTC information.



Does the scan tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the speaker in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
SPEAKER
(X303) SPEAKER OUTPUT CIRCUIT (+)
(X393) SPEAKER OUTPUT CIRCUIT (-)

Diagnostic Test

1. INTERMITTENT CONDITION

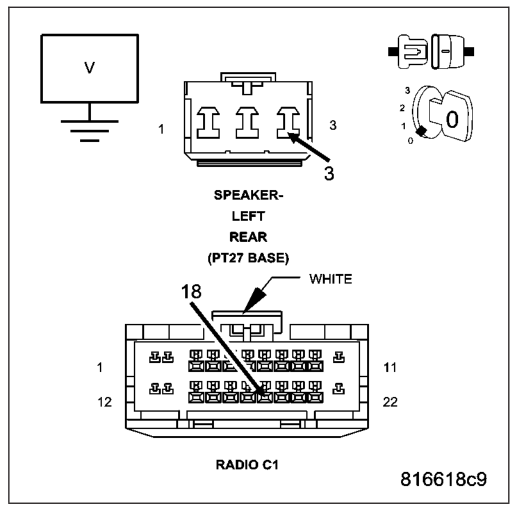
Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



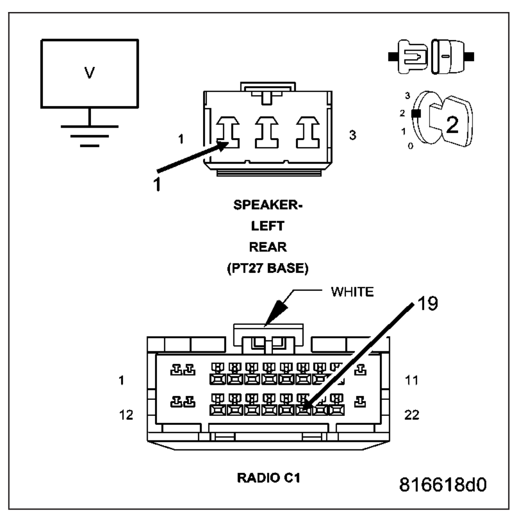
2. CHECK FOR VOLTAGE ON THE (X303) SPEAKER (+) CIRCUIT

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Left Rear Speaker harness connector.

Measure for voltage on the (X303) Speaker (+) circuit.



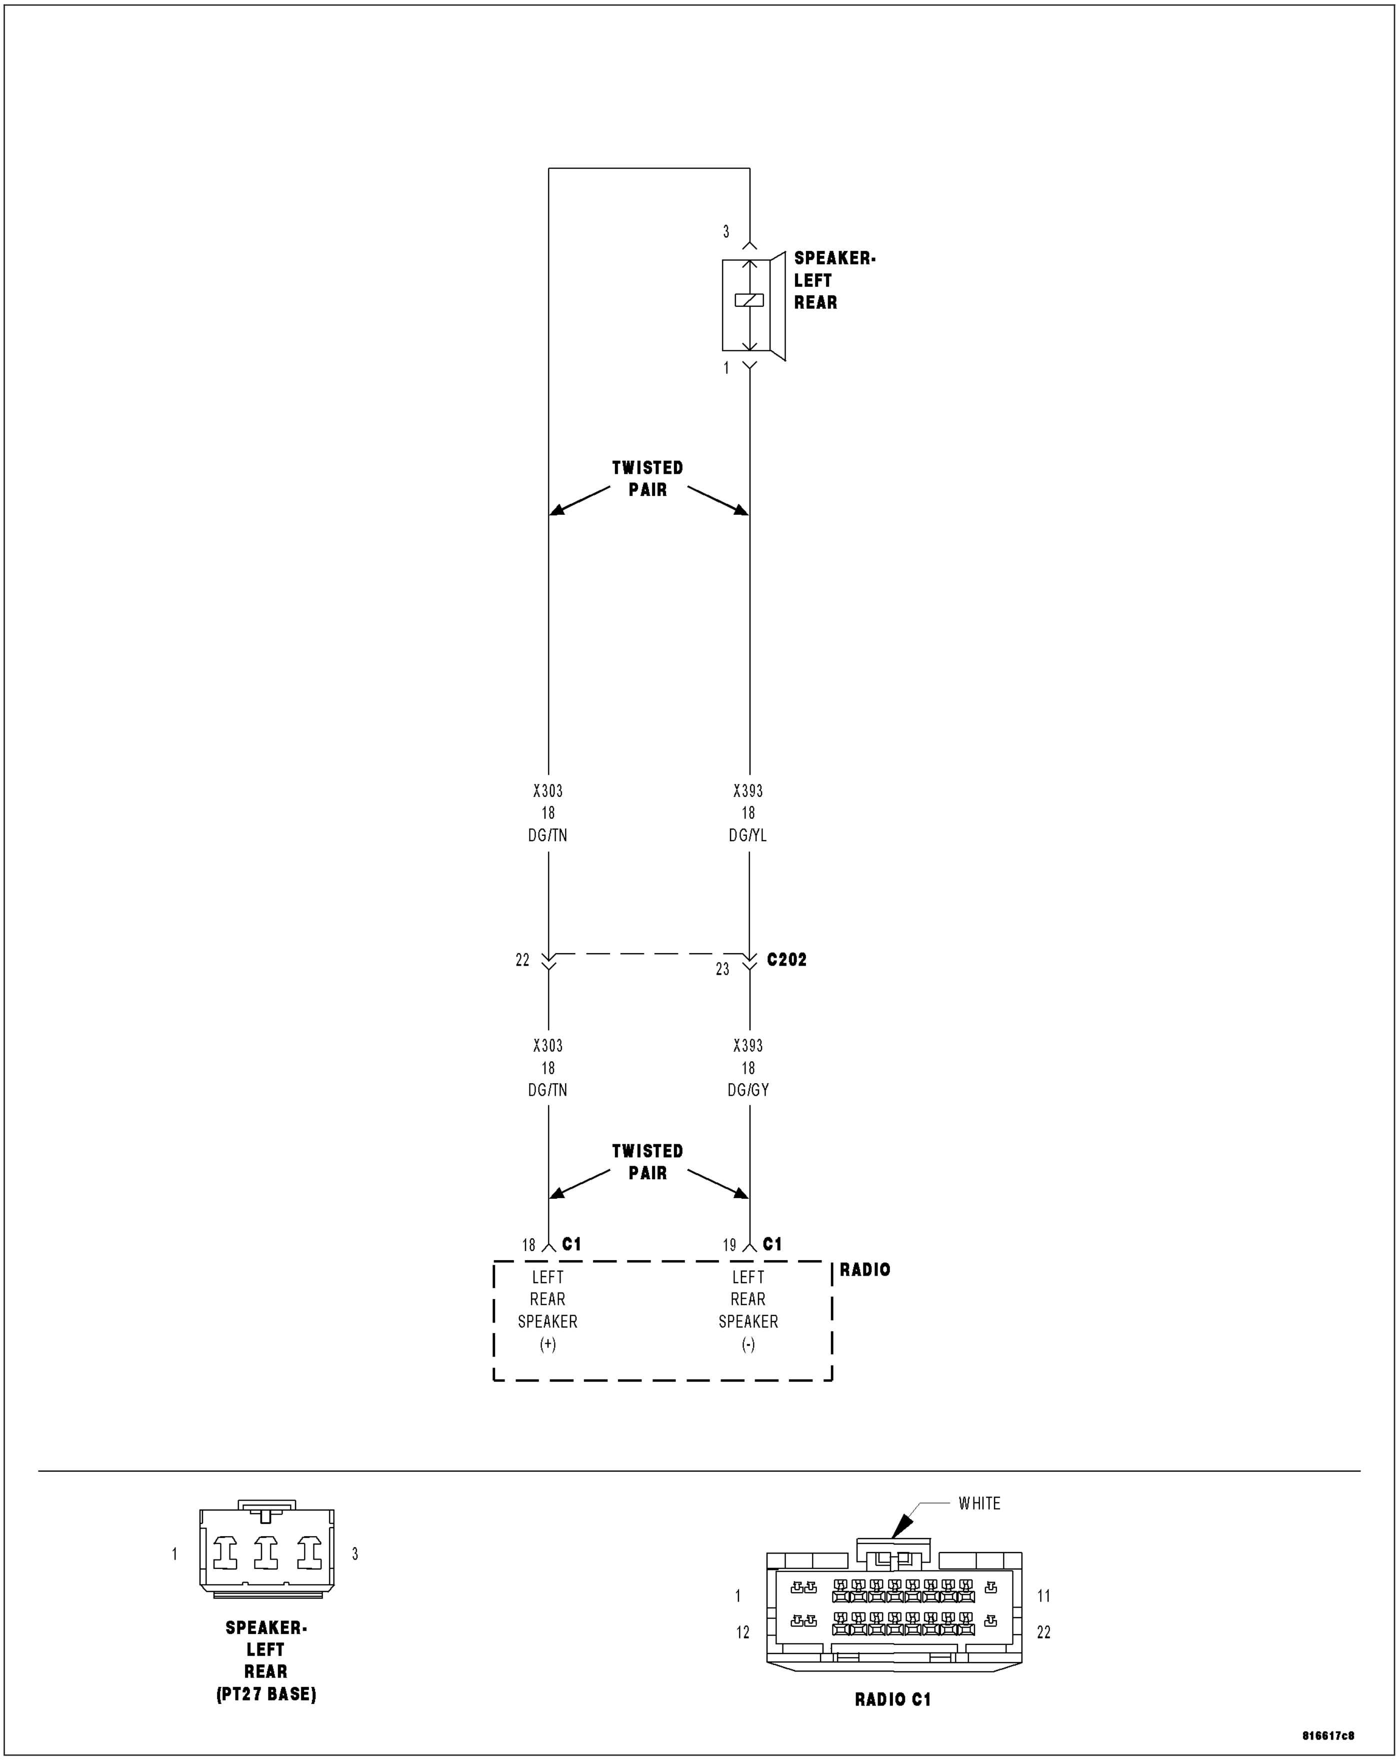
Is the voltage above 10.0 volts?

Yes >> Repair the (X303) Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK FOR VOLTAGE ON THE (X393) SPEAKER (-) CIRCUIT

Measure for voltage on the (X393) Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X393) Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is open for more than three seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER
(X303) (X393) LEFT REAR SPEAKER OUTPUT CIRCUIT

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Audio DTC's.

Turn the radio on.

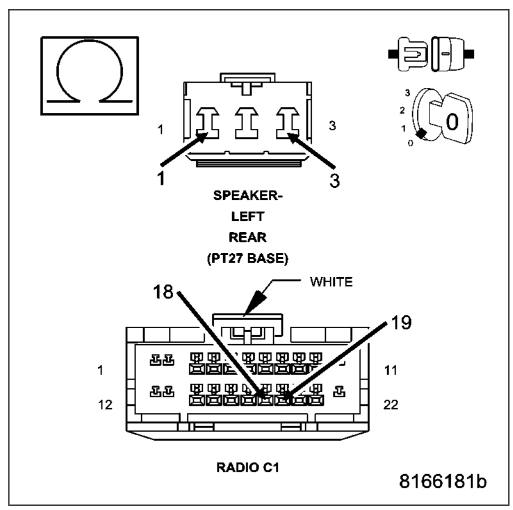
With the scan tool, read the DTC information.

Does the scan tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.



2. (X303) (X393) SPEAKER OUTPUT CIRCUITS

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Rear Left Audio Speaker connector.

Measure the resistance of each speaker (X303)(+) and (X393)(-) circuit between the radio and the speaker.

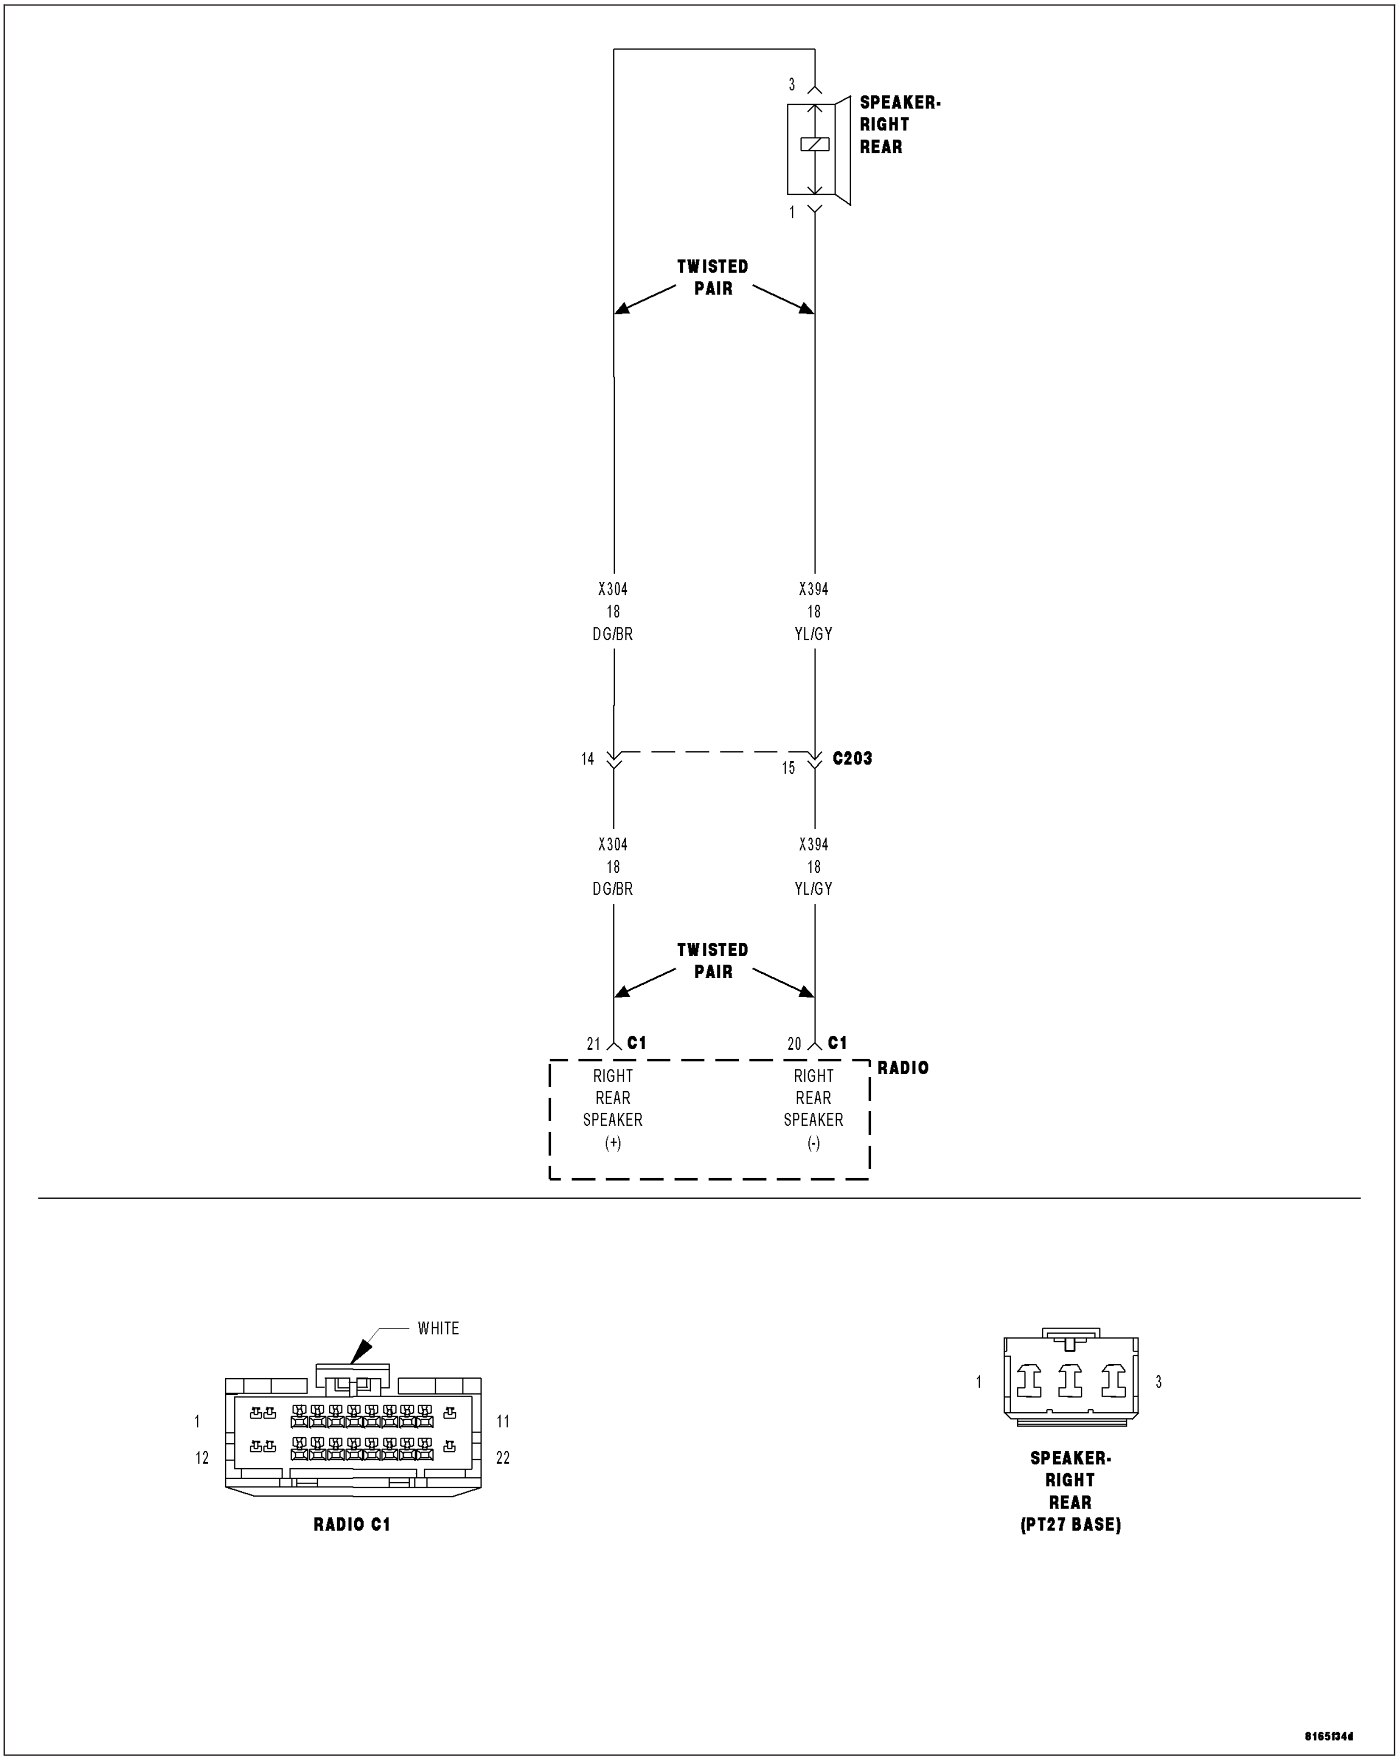
Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable output speaker circuit for an open condition.

Perform the BODY VERIFICATION TEST VER 1.

3. Speaker



Turn the ignition off.
Disconnect the Rear Left Audio Speaker.
Turn the ignition on.
Turn the radio on.
With the scan tool, clear all Audio DTC's.
With the scan tool, read the DTC information.

Does the scan tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is LOW for more than three seconds.

Possible Causes
SPEAKER
(X304) (X394) RIGHT REAR SPEAKER OUTPUT CIRCUIT

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Audio DTC’s.

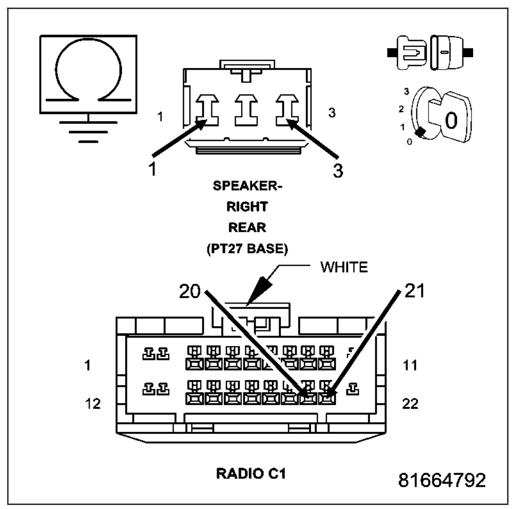
Turn the radio on.

With the scan tool, read the DTC information.

Does the scan tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.



2. (X304) (X394) SPEAKER OUTPUT CIRCUITS

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Rear Right Audio Speaker connector.

Measure the resistance between ground and each speaker (X304)(+) and (X394)(-) circuit.

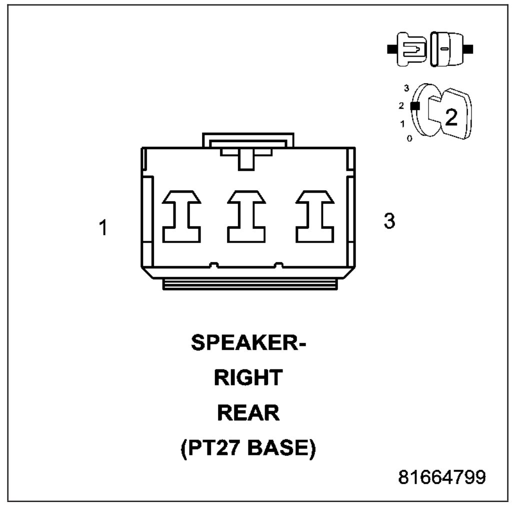
Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable speaker (+) or (-) output circuit for a short to ground condition.

No >> Go To 3

3. SPEAKER

Turn the ignition off.



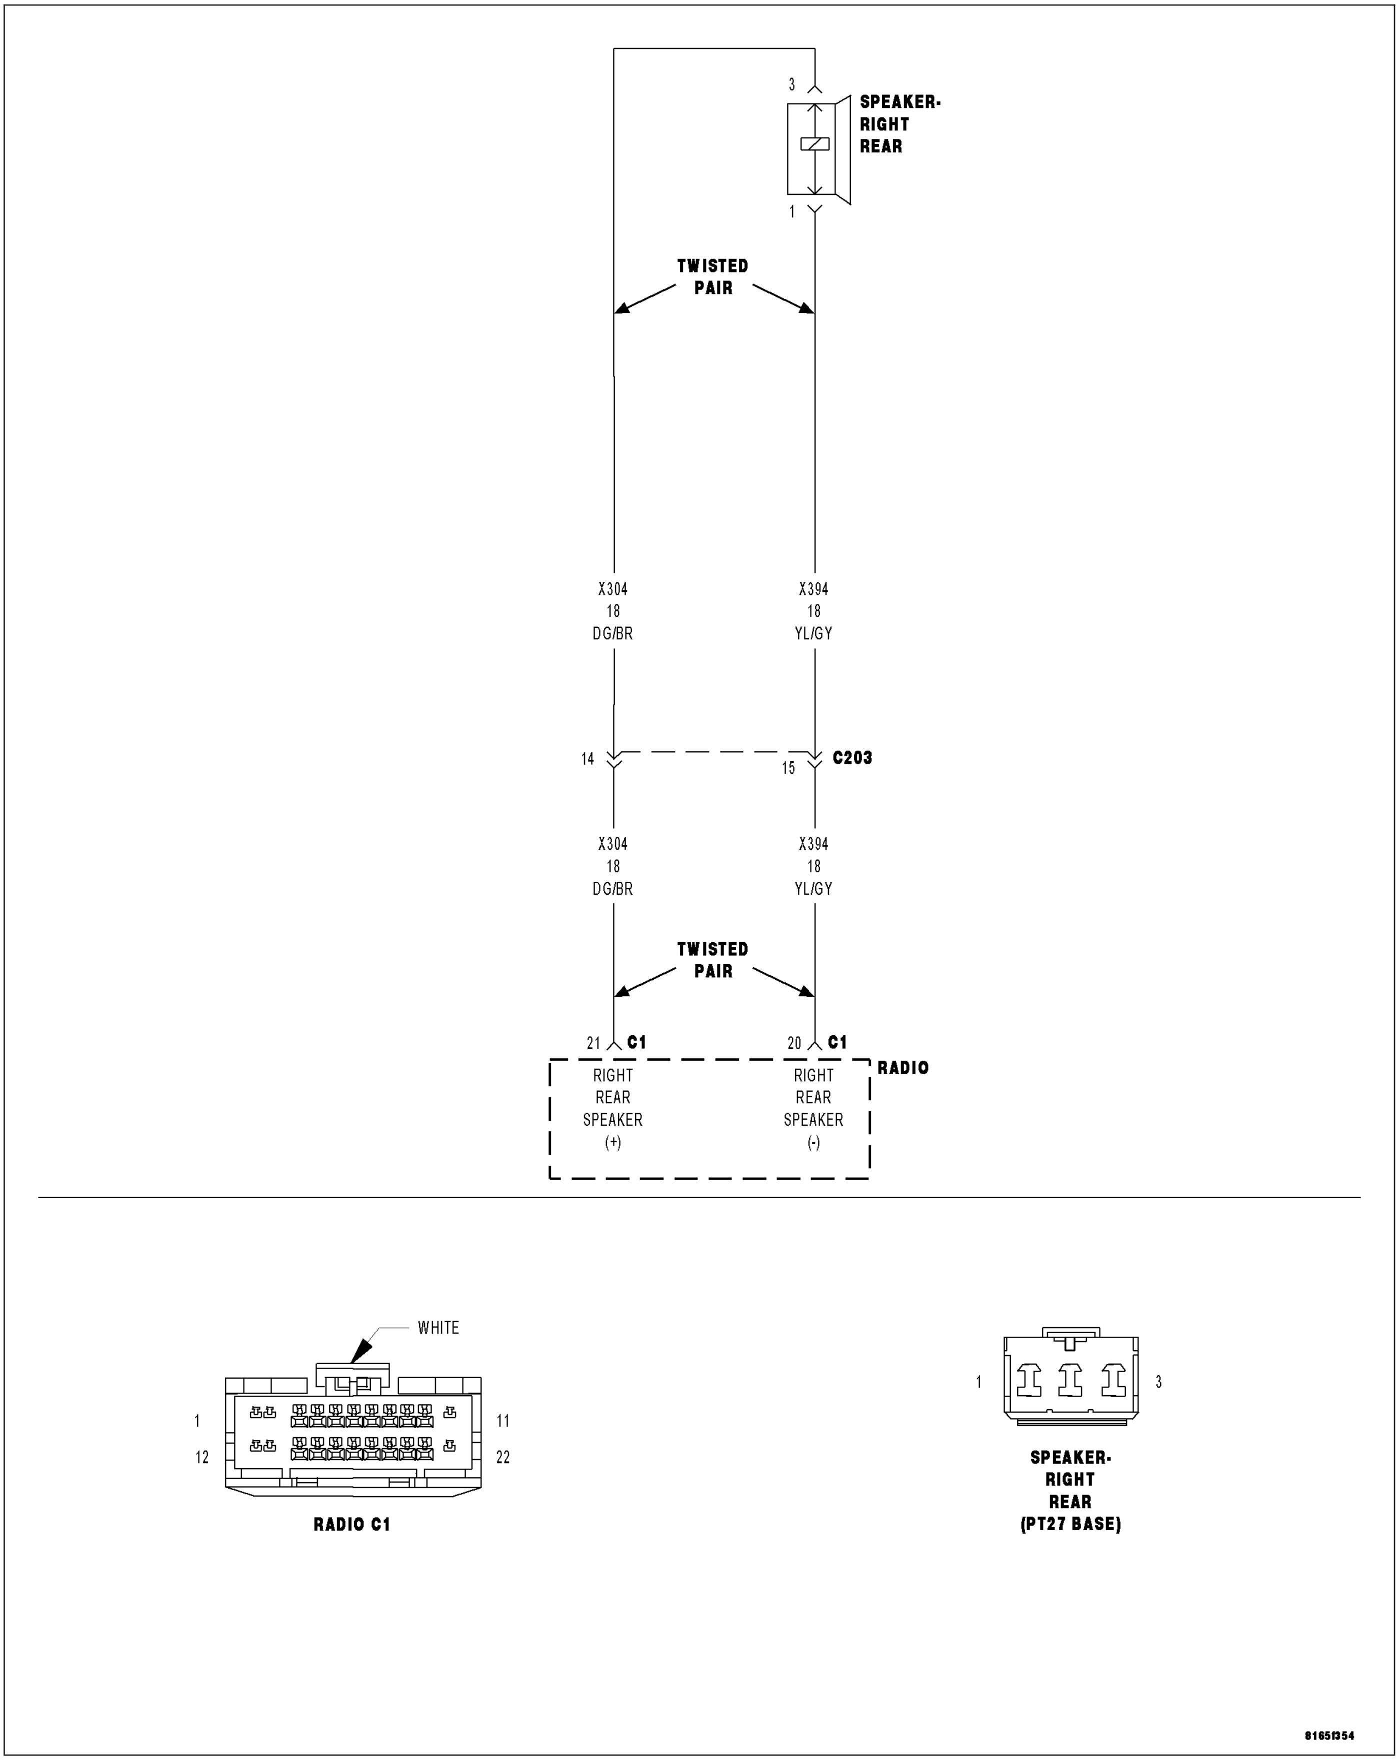
Disconnect the Rear Right Audio Speaker.

Turn the ignition on.

Turn the radio on.

With the scan tool, clear all Audio DTC's.

With the scan tool, read the DTC information.



Does the scan tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the speaker in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

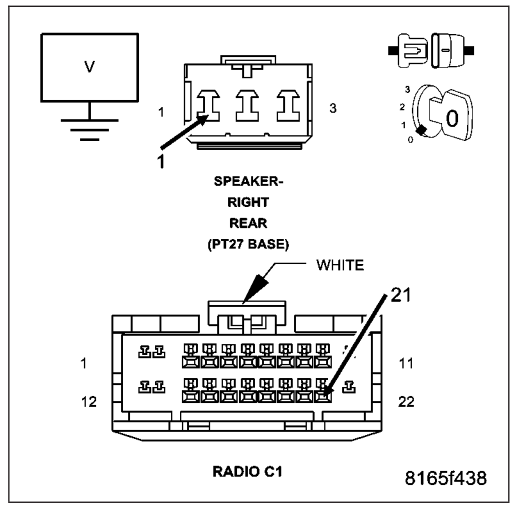
For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
SPEAKER
(X304) SPEAKER OUTPUT CIRCUIT (+)
(X394) SPEAKER OUTPUT CIRCUIT (-)

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Radio DTCs.



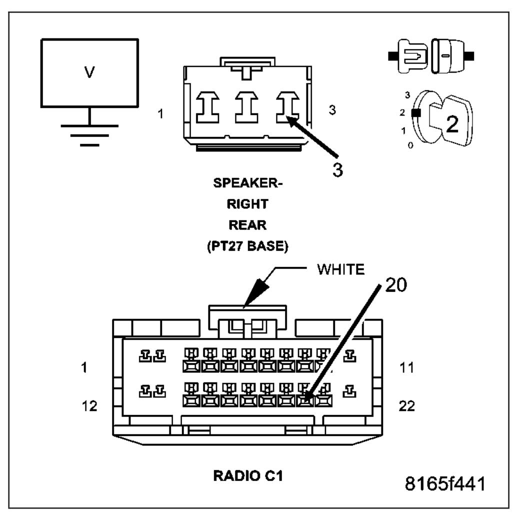
Does the scan tool display active: B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X304) SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Right Rear Speaker harness connector.
Measure for voltage on the (X304) Speaker (+) circuit.



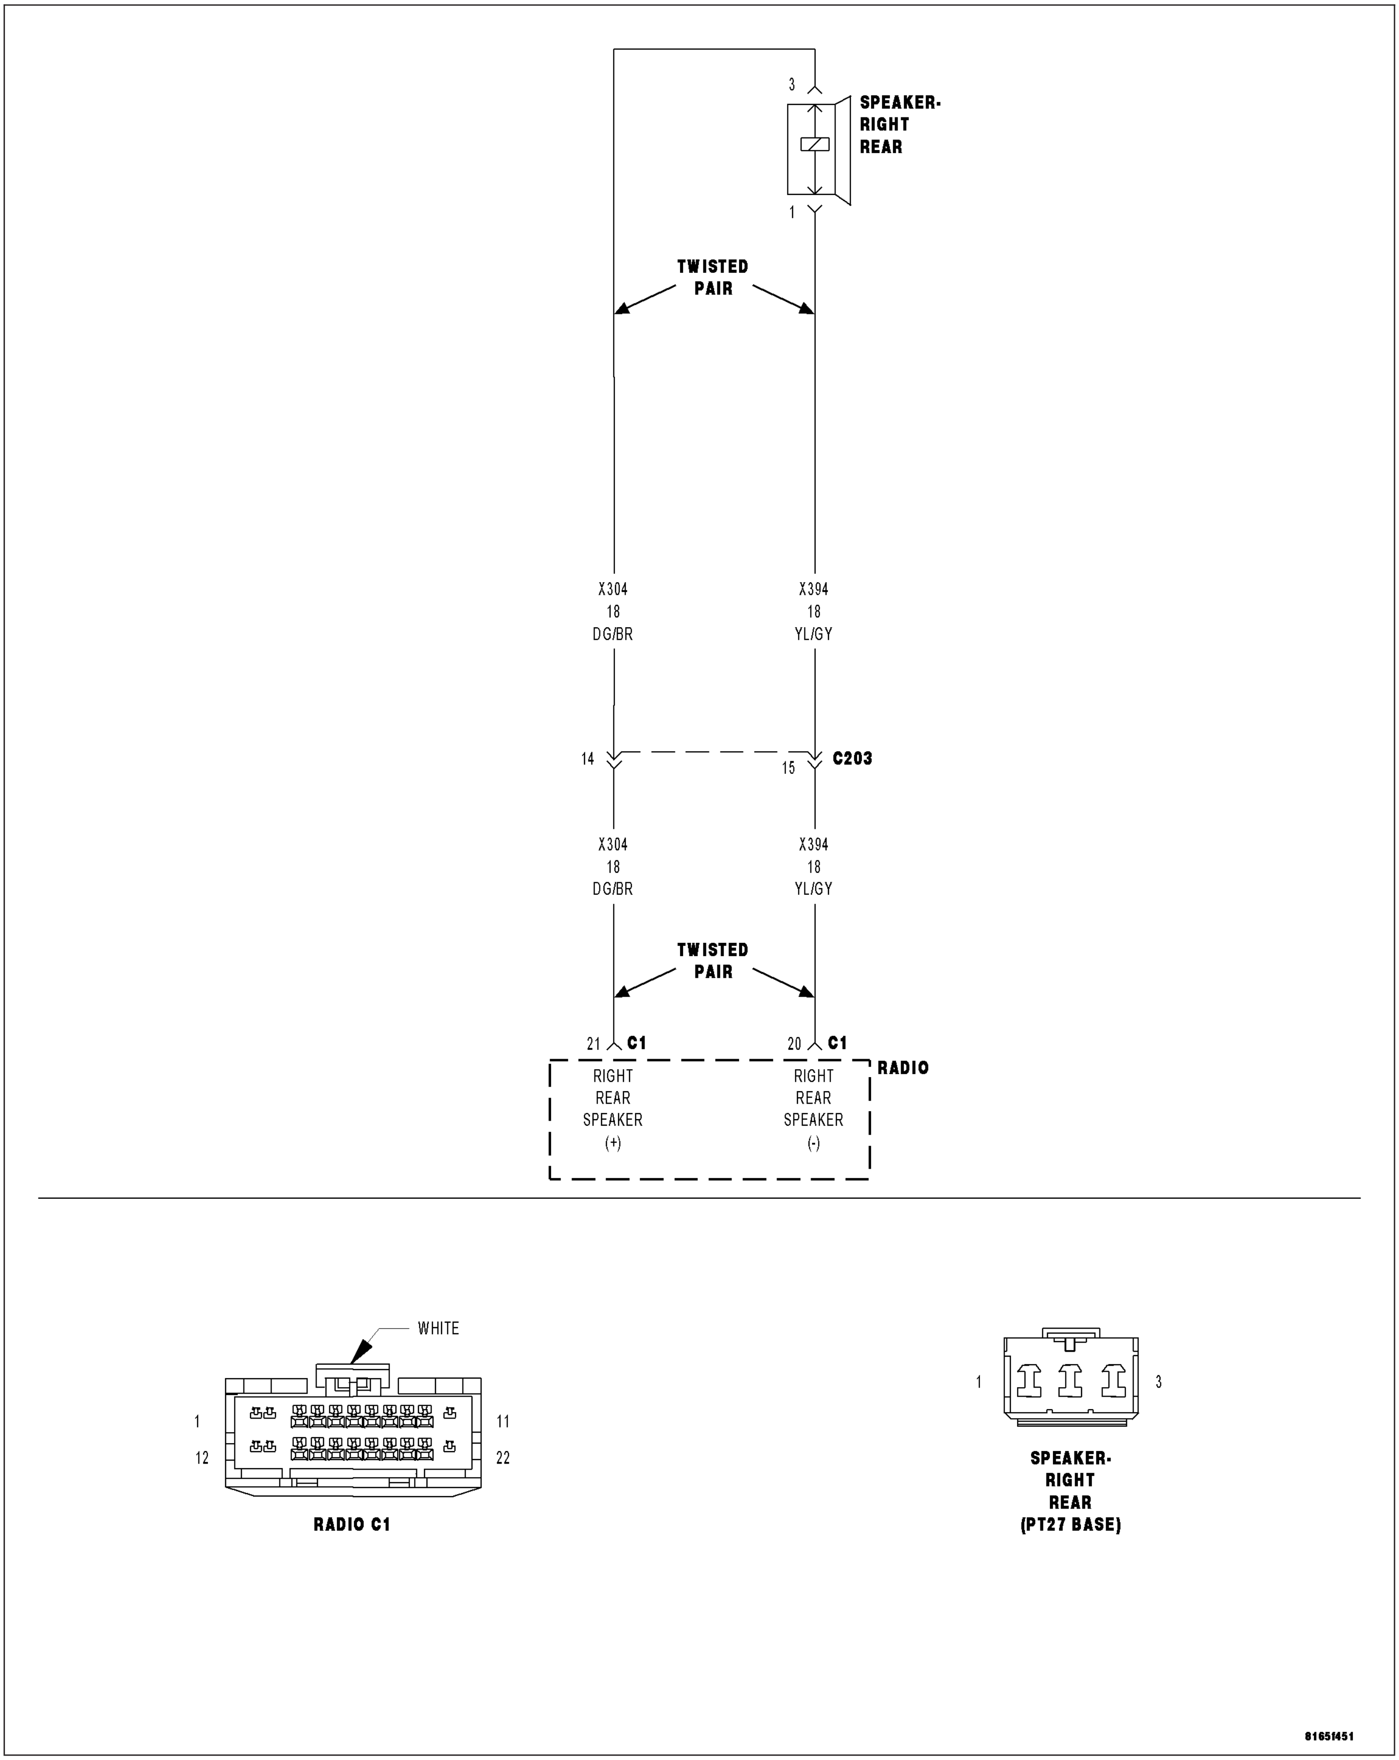
Is the voltage above 10.0 volts?

Yes >> Repair the (X304) Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK FOR VOLTAGE ON THE (X394) SPEAKER (-) CIRCUIT

Measure for voltage on the (X394) Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X394) Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the radio on.
- **Set Condition:**
- When the output circuit is open for more than three seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER
(X304) (X394) RIGHT REAR SPEAKER OUTPUT CIRCUIT

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all Audio DTC's.

Turn the radio on.

With the scan tool, read the DTC information.

Does the Scan Tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

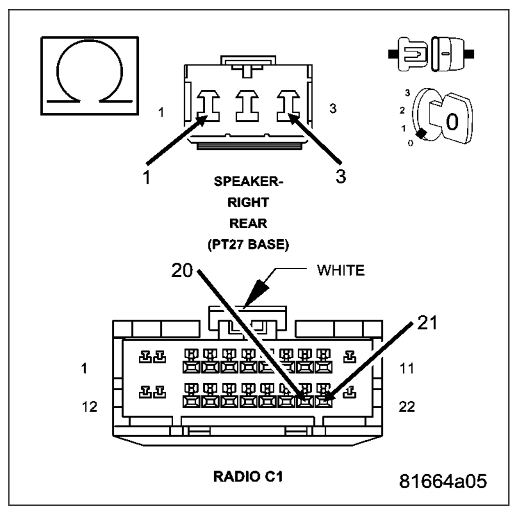
Perform the BODY VERIFICATION TEST VER 1.

2. (X304) (X394) SPEAKER OUTPUT CIRCUITS

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Rear Right Audio Speaker connector.



Measure the resistance of each speaker (X304)(+) and (X394)(-) circuit between the radio and the speaker.

Is the resistance below 5.0 ohms for each circuit?

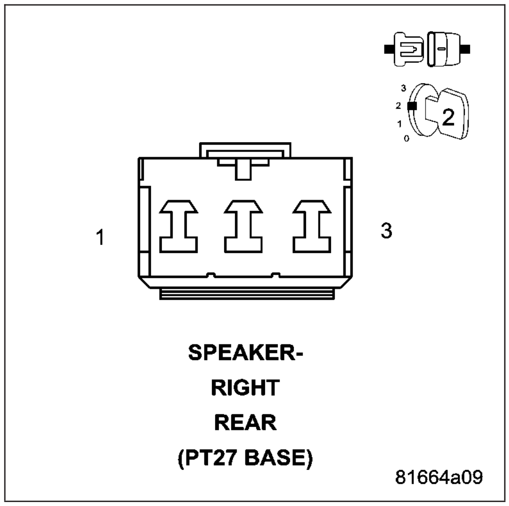
Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.

Perform the BODY VERIFICATION TEST VER 1.

3. SPEAKER

Turn the ignition off.



Disconnect the Rear Right Audio Speaker.

Turn the ignition on.

Turn the radio on.

With the scan tool, clear all Audio DTC's.

With the scan tool, read the DTC information.

Does the scan tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the speaker in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B1421-AUDIO CD READ ERROR/INOPERABLE DISC

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Continuously with the ignition on and the radio CD player turned on.
- **Set Condition:**
- The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

Possible Causes
CD READ FAILURE

Diagnostic Test

1. RADIO

Replace the problem CD with a good, clean, unscratched, music CD.
Turn the radio CD player on.
With the scan tool, read DTC's.

Does the tcan tool display: B1421 AUDIO CD READ ERROR/INOPERABLE DISC?

Yes >> Eject the inoperative CD and replace the CD in accordance with the service information.
Perform the BODY VERIFICATION TEST — VER 1.

No >> Test Complete.

B142F-SATELLITE RADIO ANTENNA NOT CONNECTED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on and the Satellite Radio in seek mode.
- **Set Condition:**
- With the radio in seek mode for two loops around the band. The radio does not detect an antenna connection or does not receive a radio satellite signal.

Possible Causes
BAD ANTENNA CONNECTION
SATELLITE RADIO RECEIVER

Diagnostic Test

1. TEST ANTENNA

Turn the ignition off.

Disconnect the Satellite Radio Antenna connector.

Inspect the Satellite Radio Antenna connection.

Was the Antenna connection clean and secure?

Yes >> Go To 2

No >> Repair the Antenna connection as needed.
Perform the BODY VERIFICATION TEST — VER1.

2. SATELLITE RADIO ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

Yes >> Go To 3

No >> Repair or replace the Antenna assembly as necessary.
Perform the BODY VERIFICATION TEST — VER1.

3. SATELLITE RADIO RECEIVER

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft (9.144m) from any structure.

Turn the ignition and radio on.

With the scan tool, erase the audio DTC's, put the satellite radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the scan tool, read the audio DTC's.

Did this DTC reset?

Yes >> Replace the Satellite Radio Receiver in accordance with the service information.
Perform the BODY VERIFICATION TEST-VER1.

No >> Test Complete.

B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

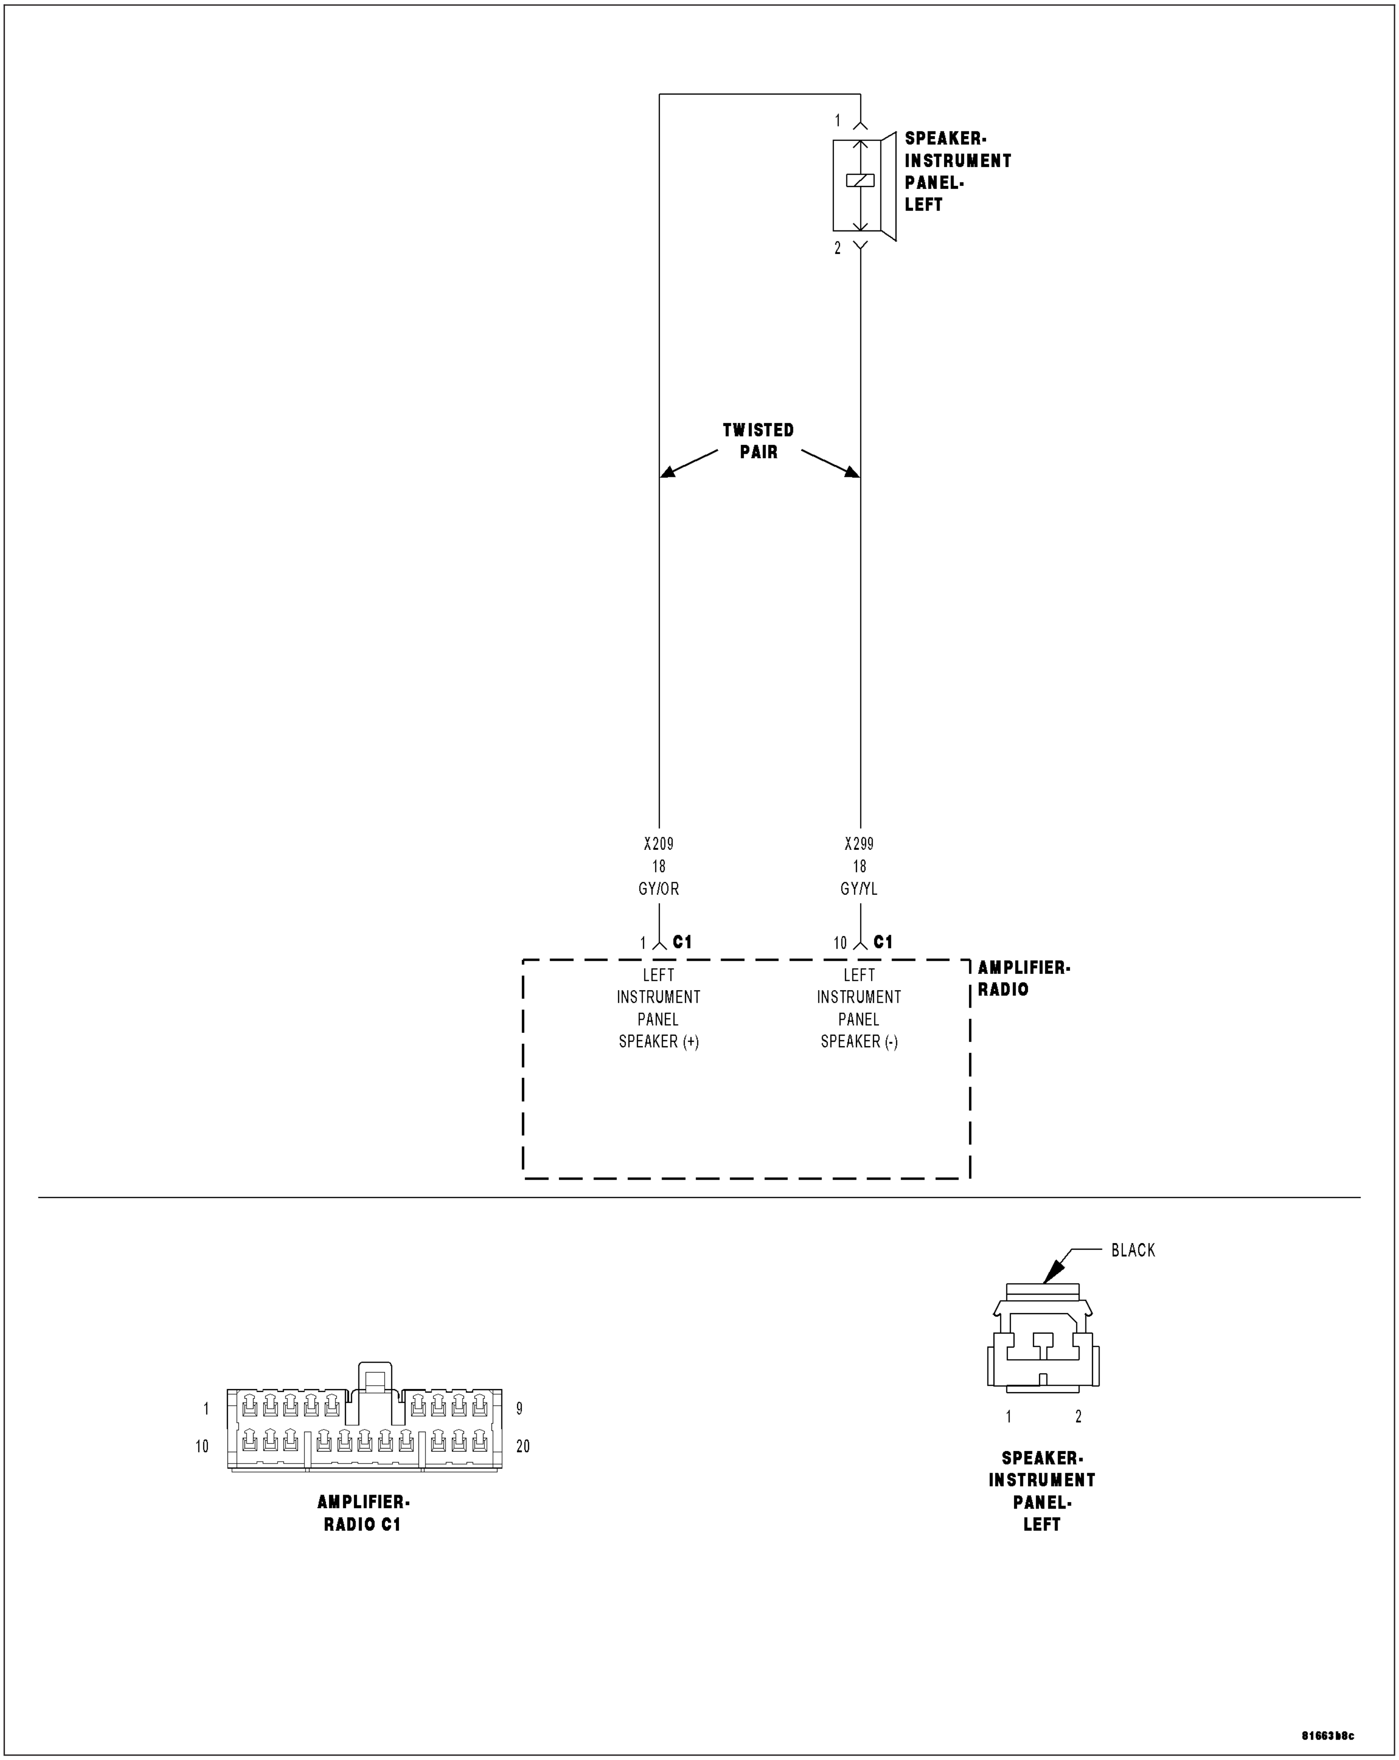
Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?



Yes >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X299) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

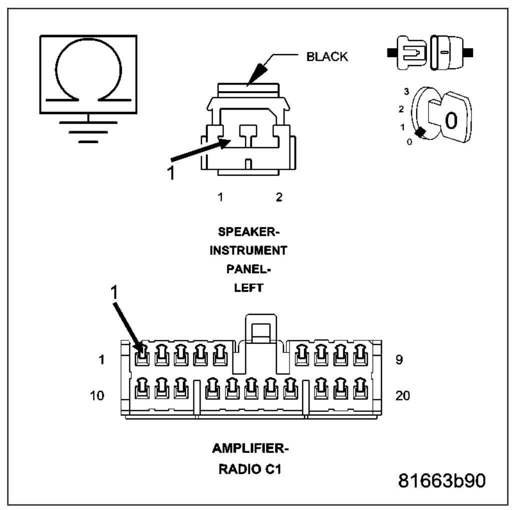
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2



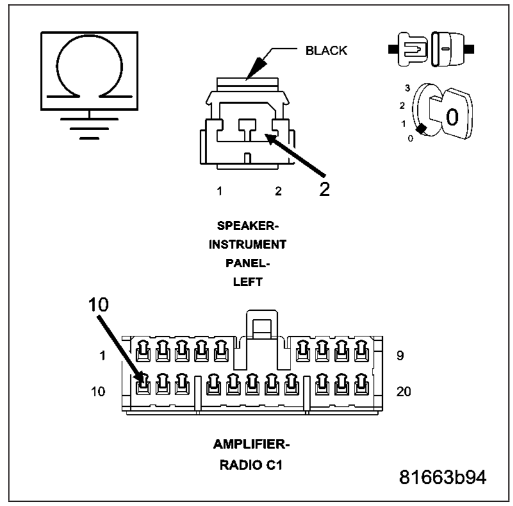
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X209) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C1 harness connector.

Disconnect the Left I/P Speaker harness connector.

Measure the resistance between ground and the (X209) Amplified Left Front I/P Speaker (+) circuit.



Is the resistance below 10K ohms?

Yes >> Repair the (X209) Amplified Left Front I/P Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

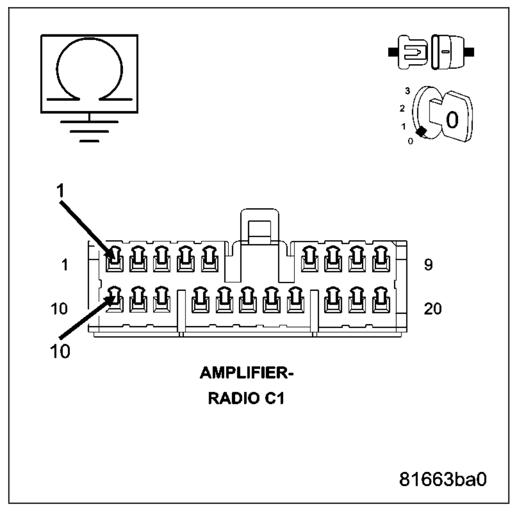
No >> Go To 3

3. CHECK THE (X299) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X299) Amplified Left Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X299) Amplified Left Front I/P Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.



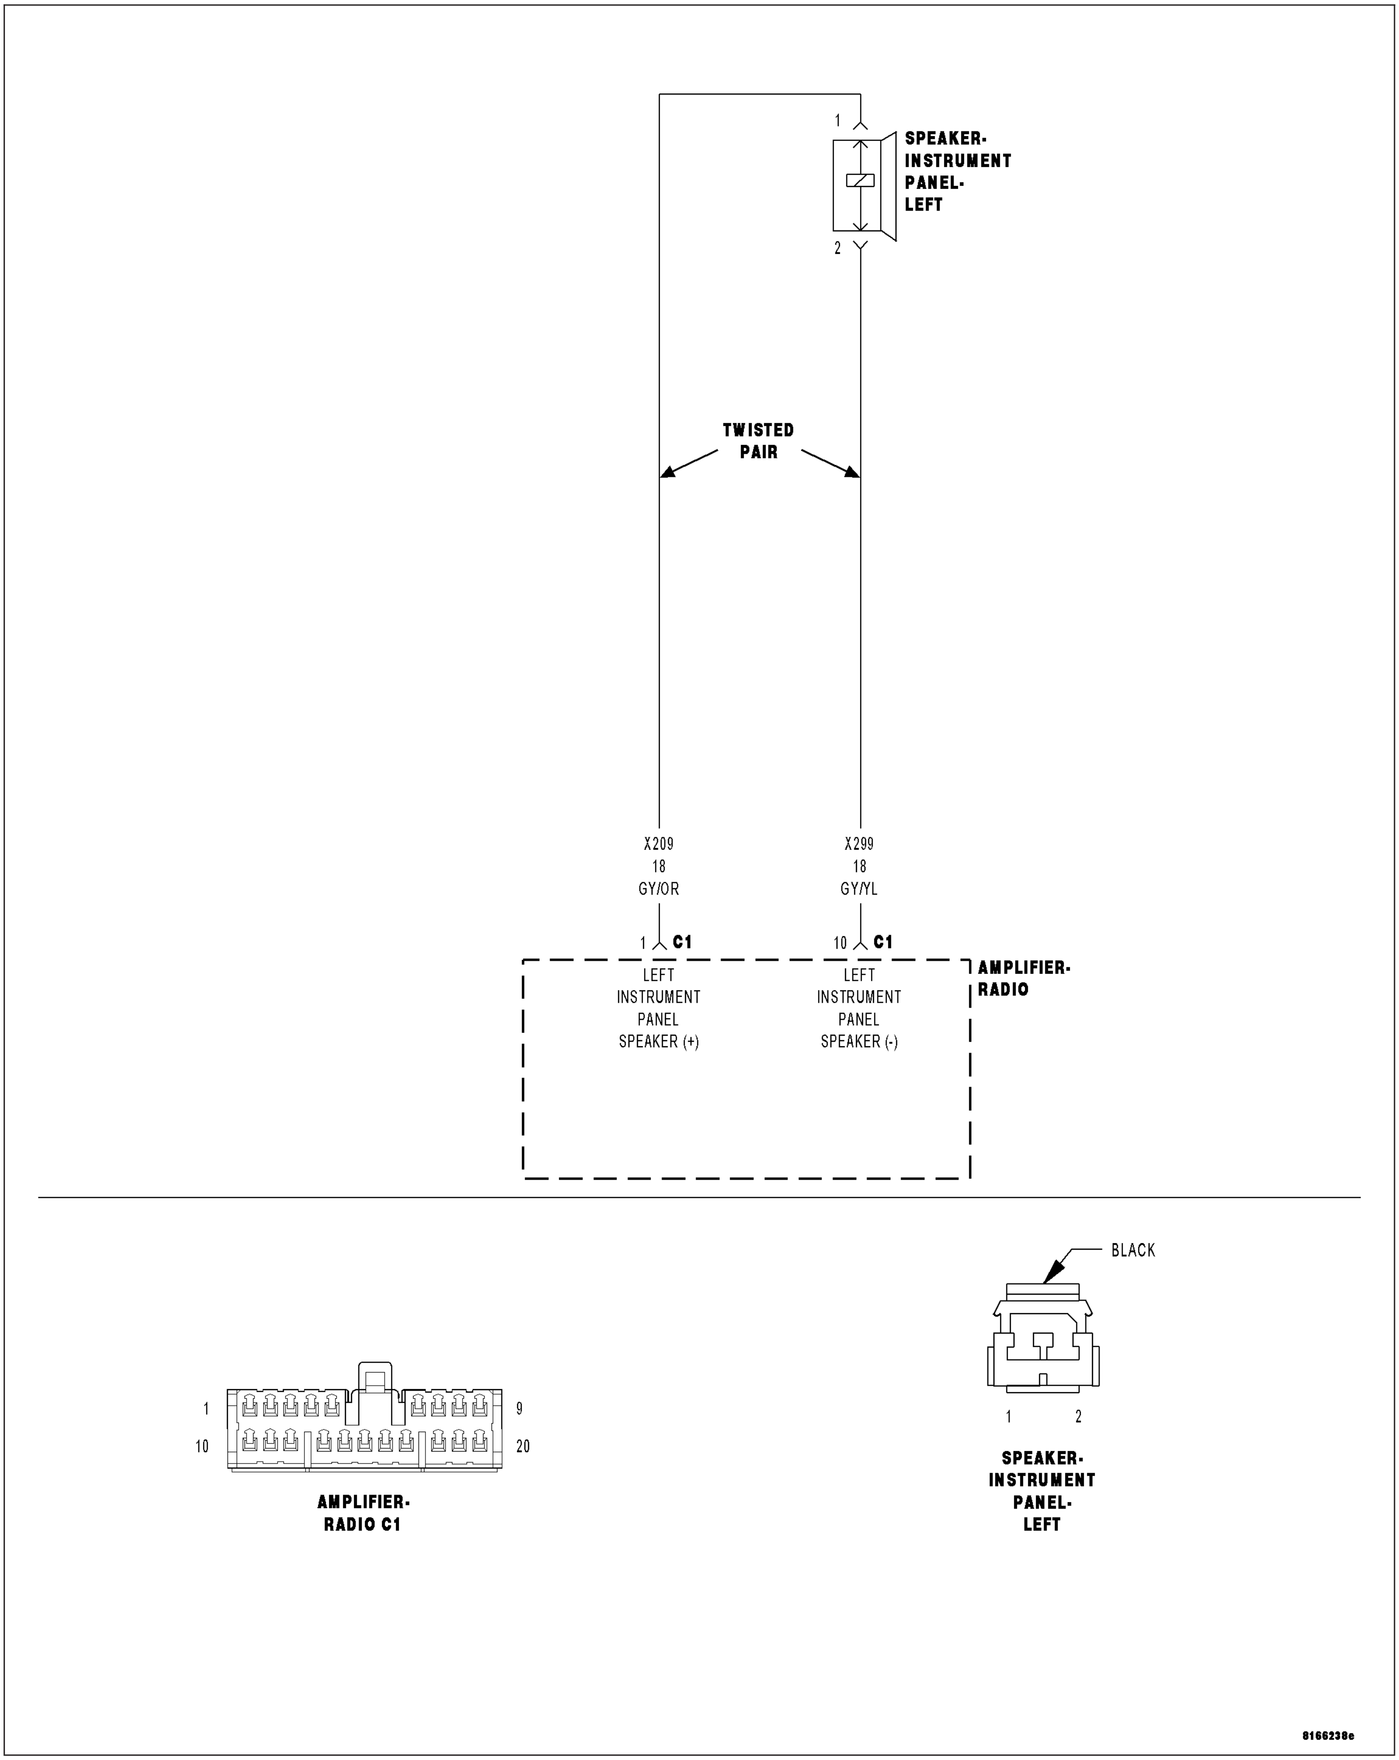
No >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT I/P SPEAKER

Turn the ignition off.

Reconnect and reinstall the Left Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground.



Is the resistance below 10K ohms?

Yes >> Replace the Left Front I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

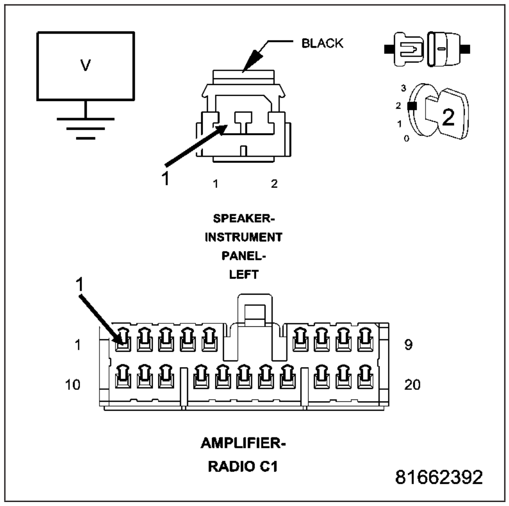
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT



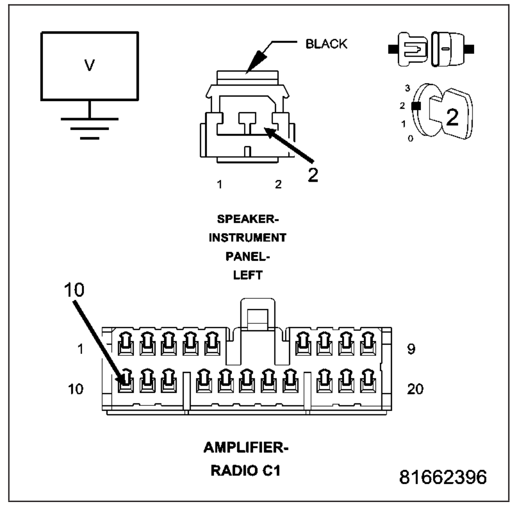
Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Left I/P Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X209) Amplified Left I/P Speaker (+) circuit.



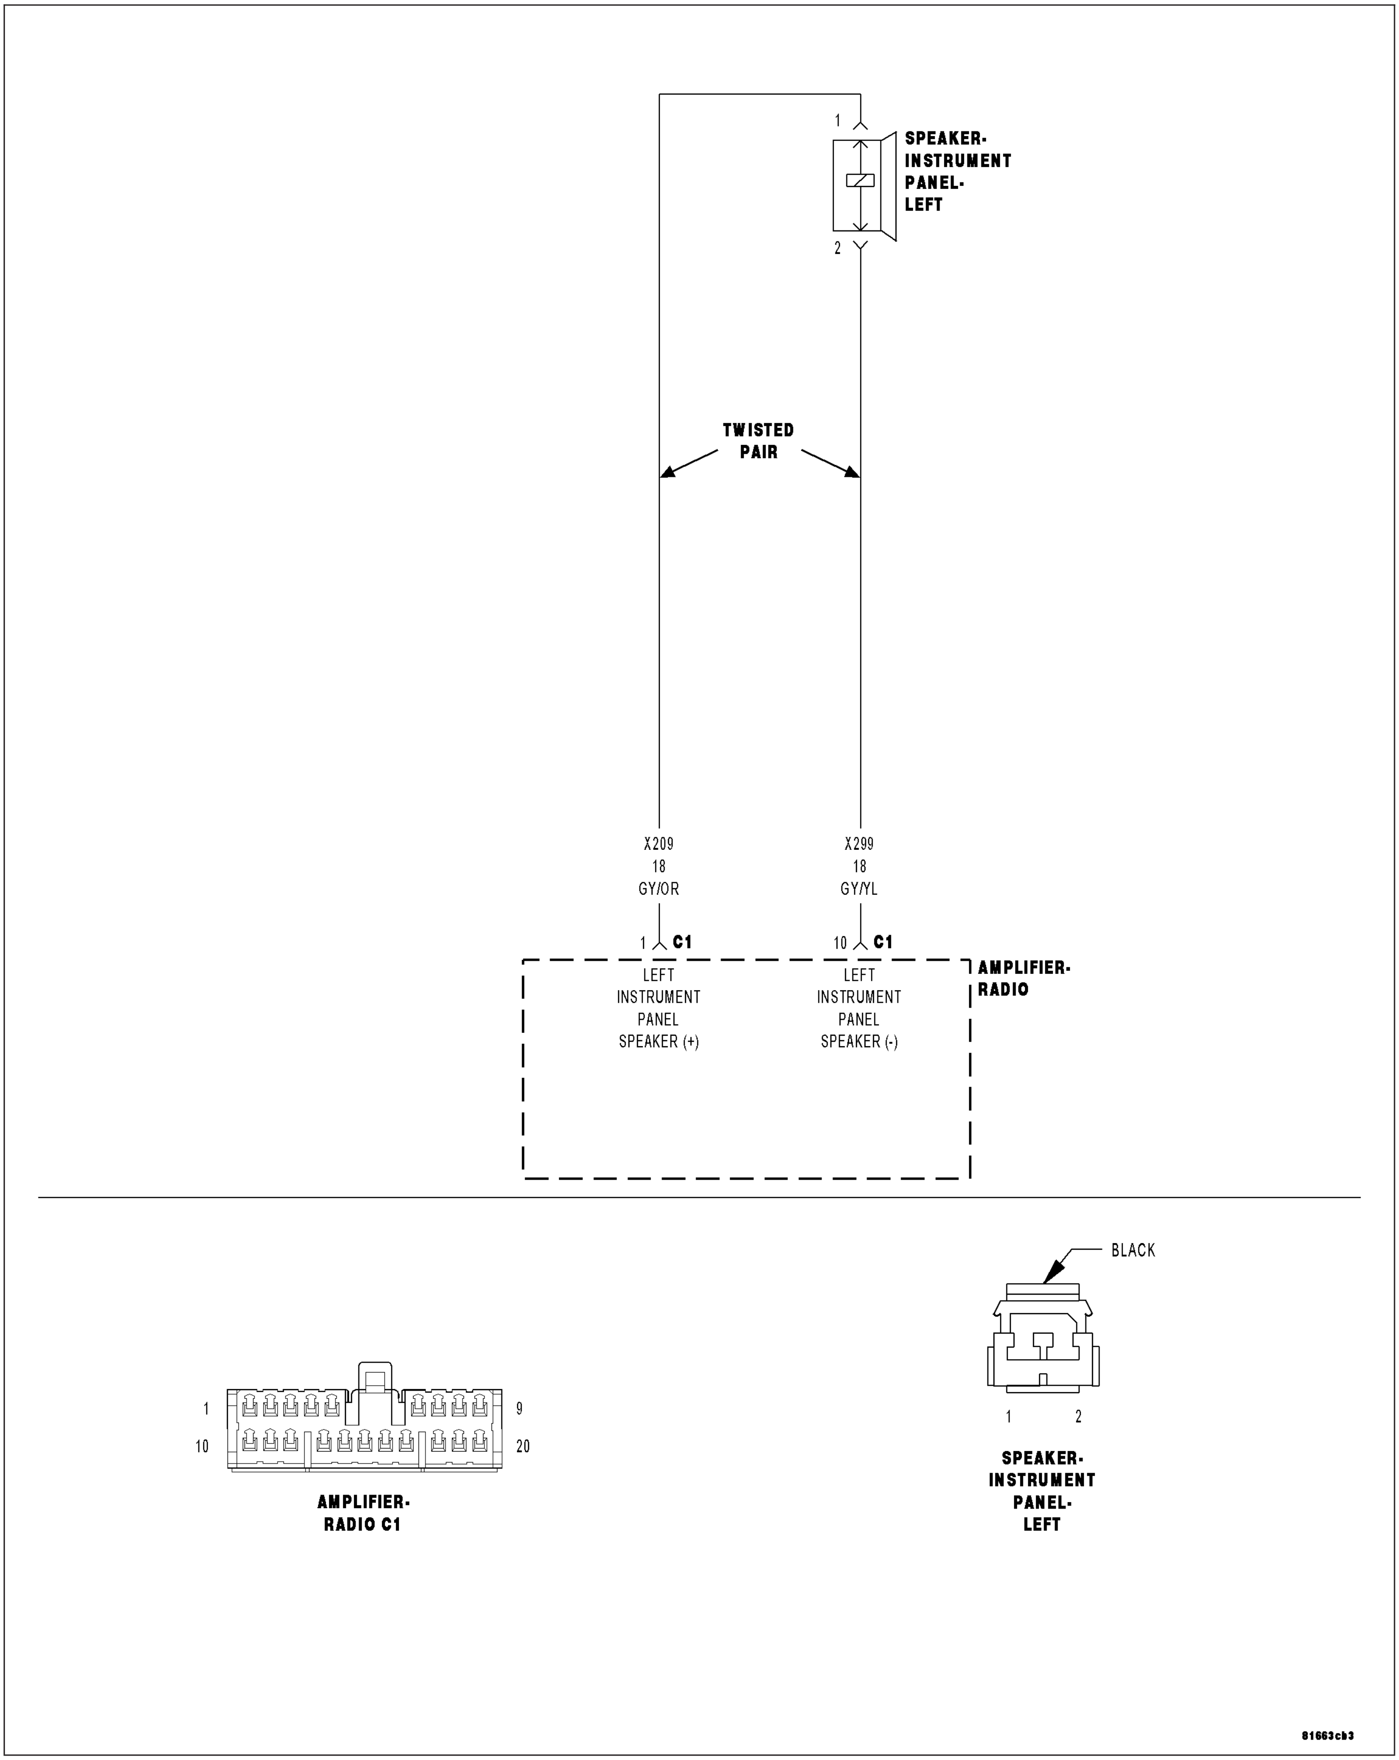
Is the voltage above 10.0 volts?

Yes >> Repair the (X209) Amplified Left I/P Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK FOR VOLTAGE ON THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT

Measure for voltage on the (X299) Amplified Left I/P Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X299) Amplified Left I/P Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.
- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT OPEN
(X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT OPEN
LEFT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

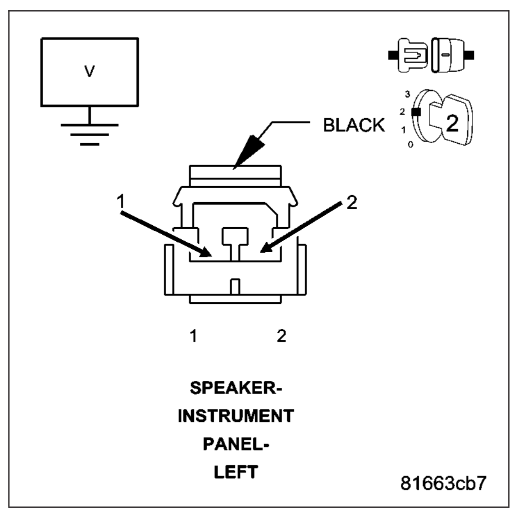
With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.



Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE LEFT FRONT I/P SPEAKER

Disconnect the Left I/P Speaker harness connector.

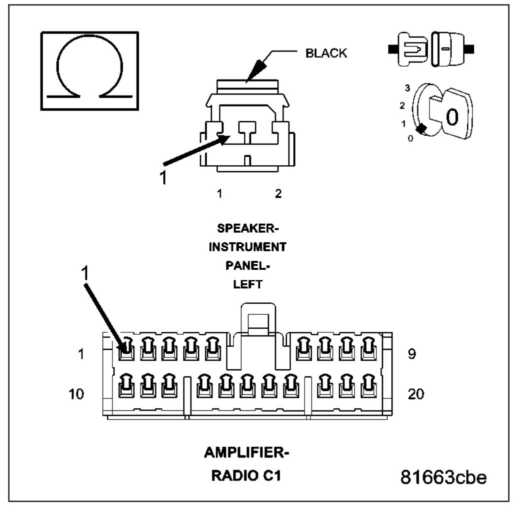
Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left I/P Speaker circuits in the Amplified Left I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Left I/P Speaker in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.



No >> Go To 3

3. CHECK THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

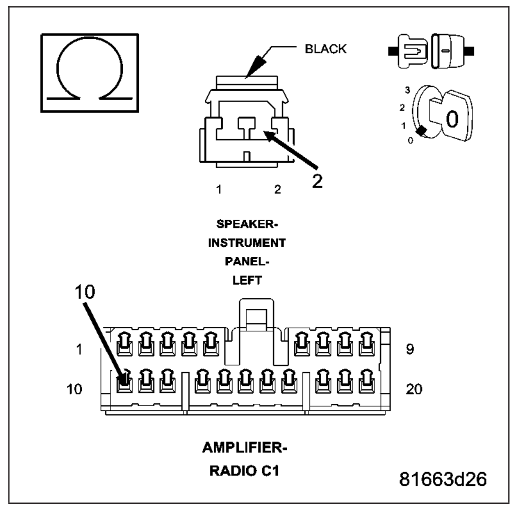
Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X209) Amplified Left I/P Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Left I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X209) Amplified Left I/P Speaker (+) circuit for an open.



Perform BODY VERIFICATION TEST VER-1.

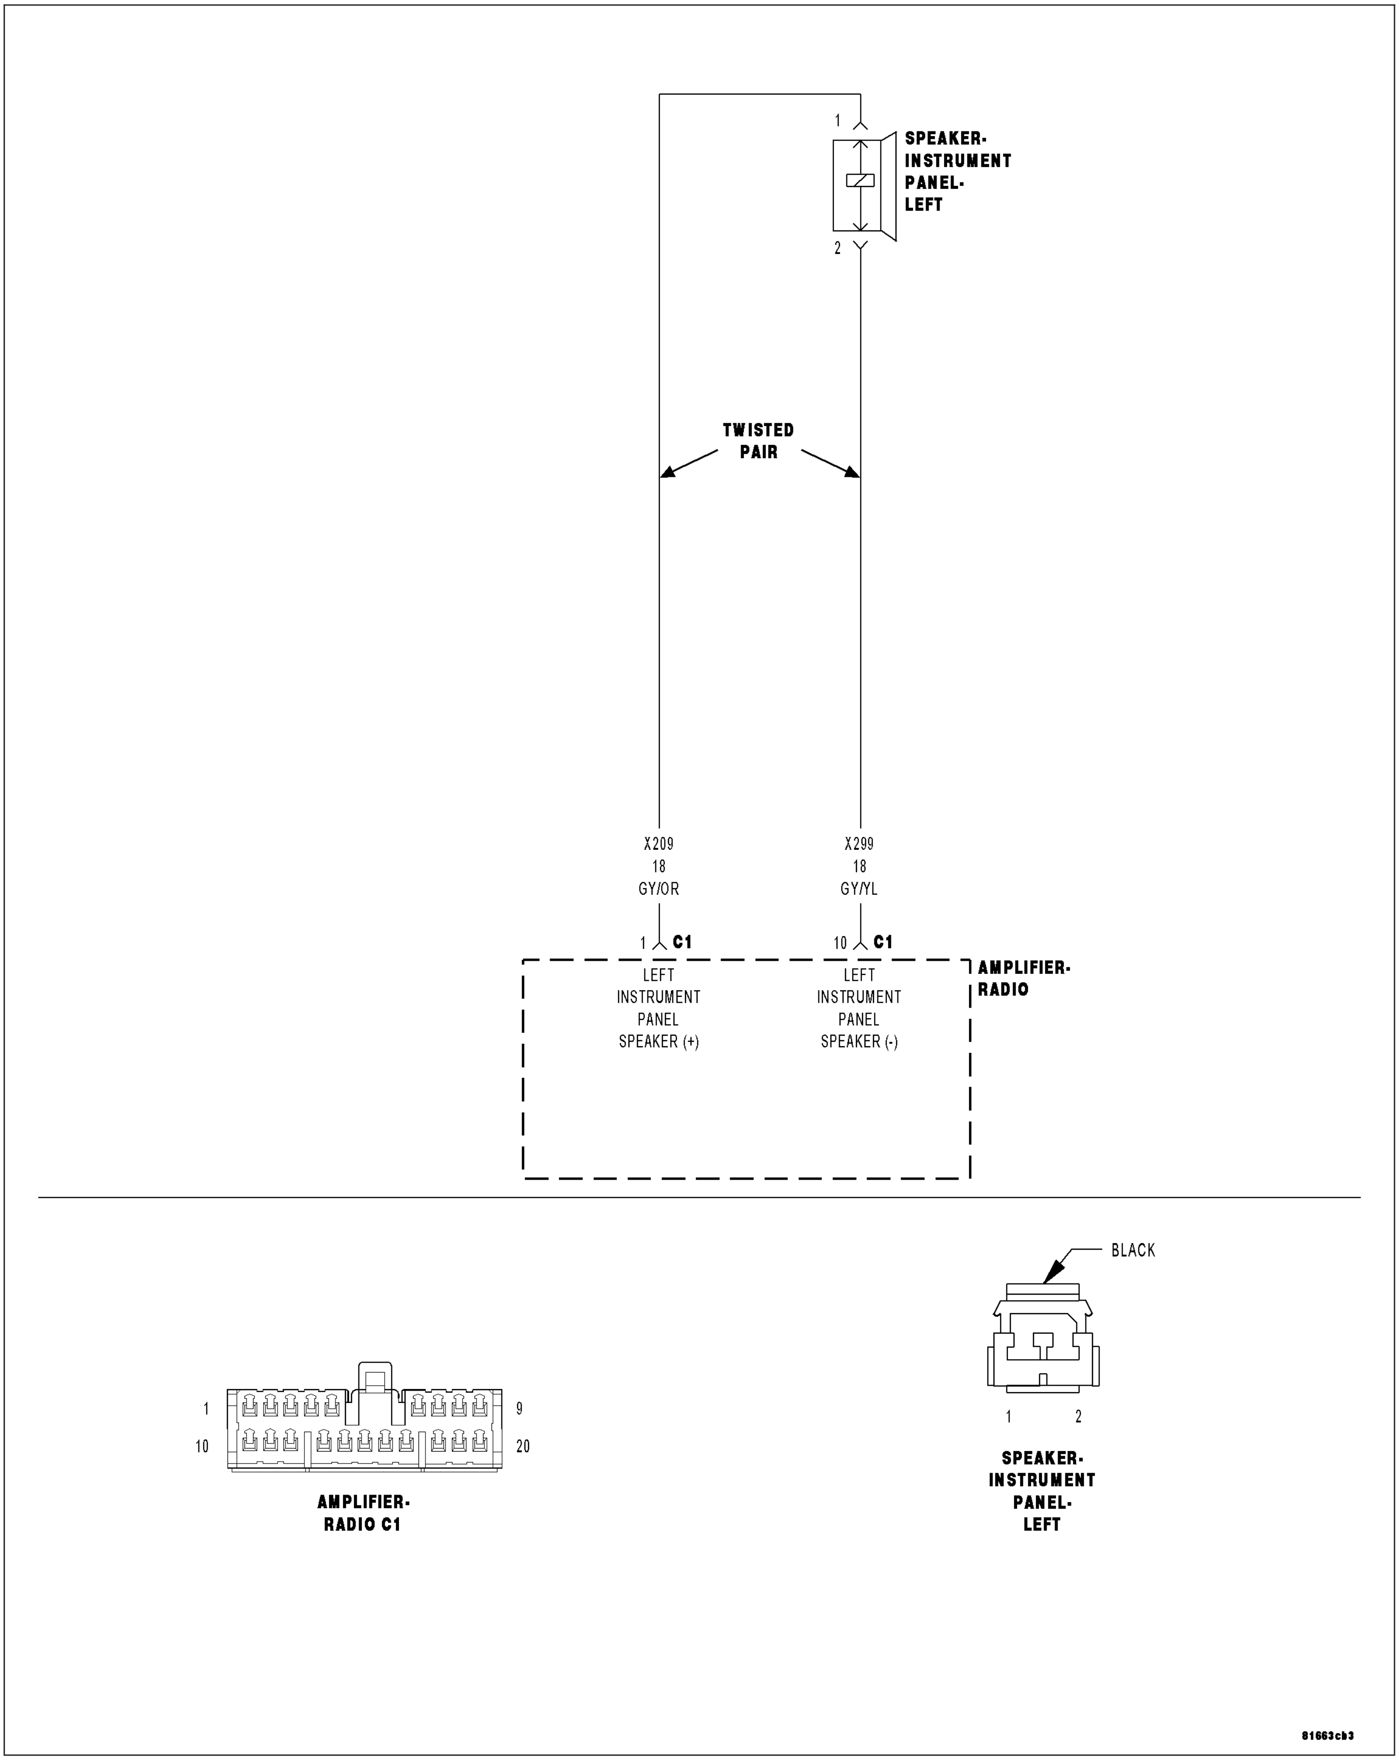
4. CHECK THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X299) amplified Left I/P Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Left I/P Speaker harness connector.

Is the resistance below 5.0 ohms?



Yes >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X299) Amplified Left I/P Speaker (-) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT
AMPLIFIED LEFT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

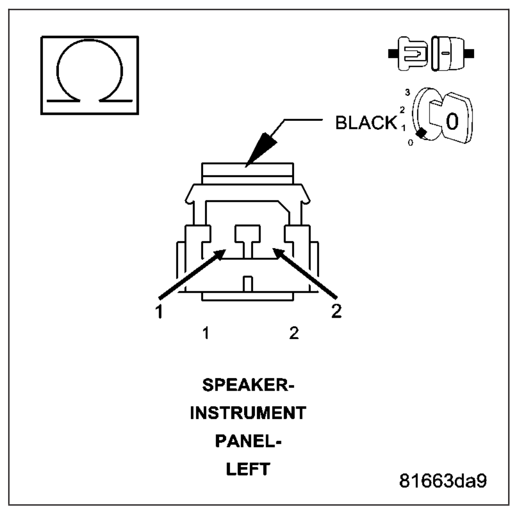
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT I/P SPEAKER



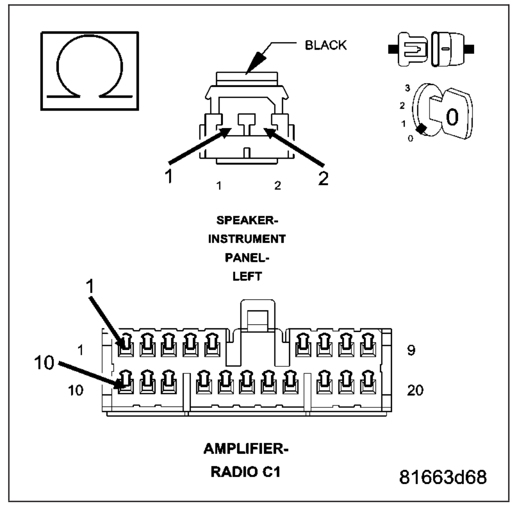
Disconnect the Amplified Left I/P Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Left I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3



3. CHECK THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT, AND THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X209) Amplified Left I/P Speaker (+) circuit, and the (X299) Amplified Left I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X209) Amplified Left I/P Speaker (+) circuit, and the (X299) Amplified Left I/P Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

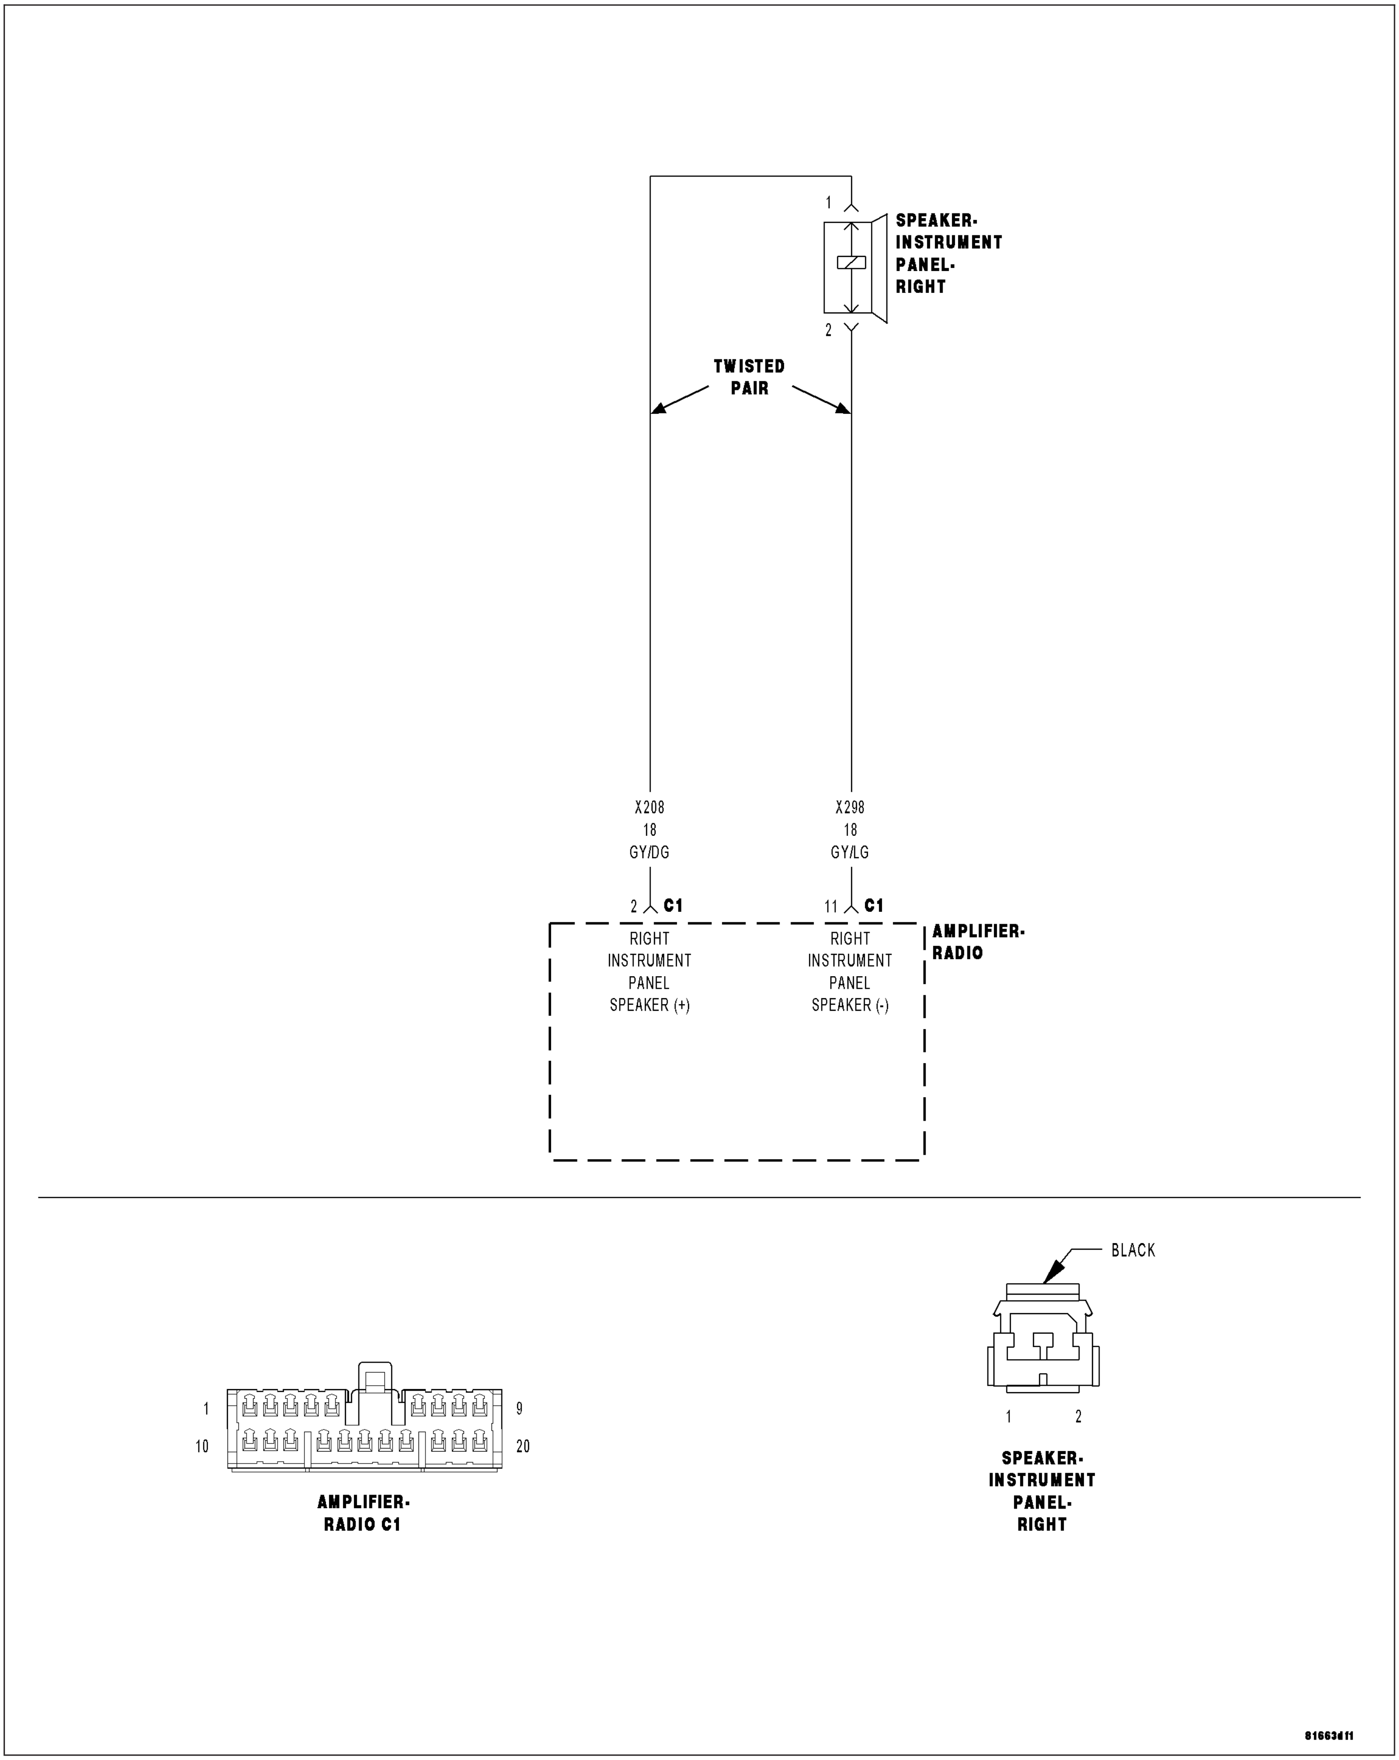
Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read amplifier DTCs.

Does the scan tool display active: B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?



Yes >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X298) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

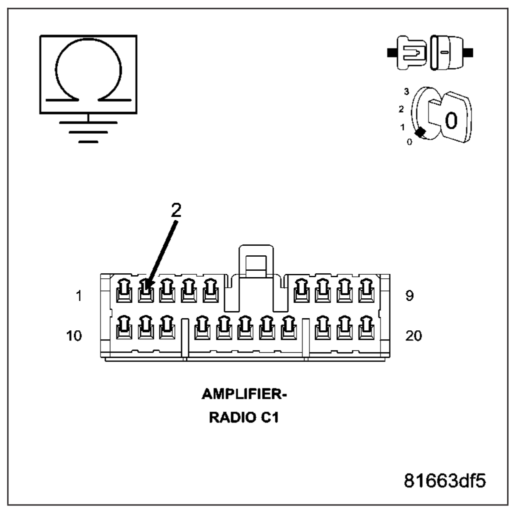
Does the scan tool display active: B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X208) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

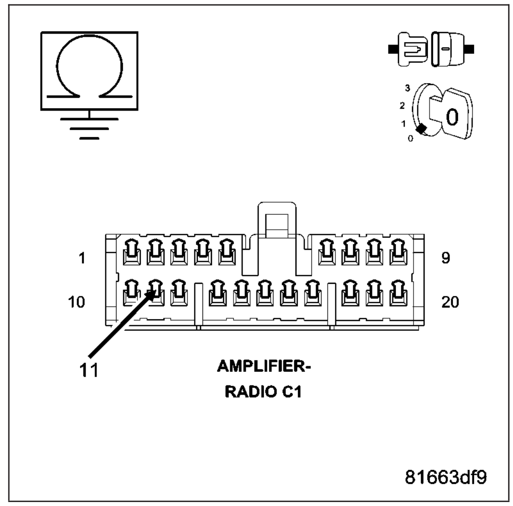
Disconnect the Amplifier C1 harness connector.



Disconnect the Right Front I/P Speaker harness connector.

Measure the resistance between ground and the (X208) Amplified Right Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?



Yes >> Repair the (X208) Amplified Right Front I/P Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

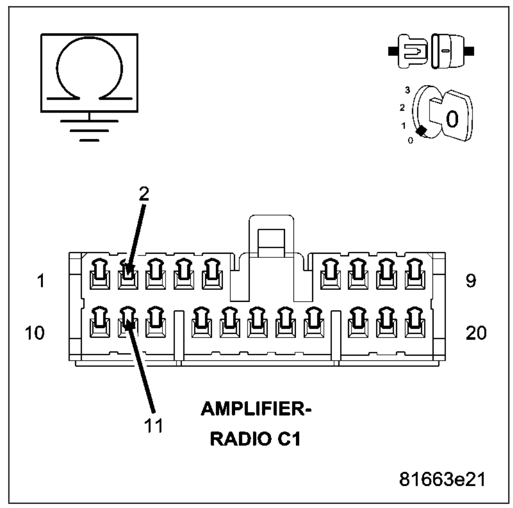
No >> Go To 3

3. CHECK THE (X298) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X298) Amplified Right Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X298) Amplified Right Front I/P Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.



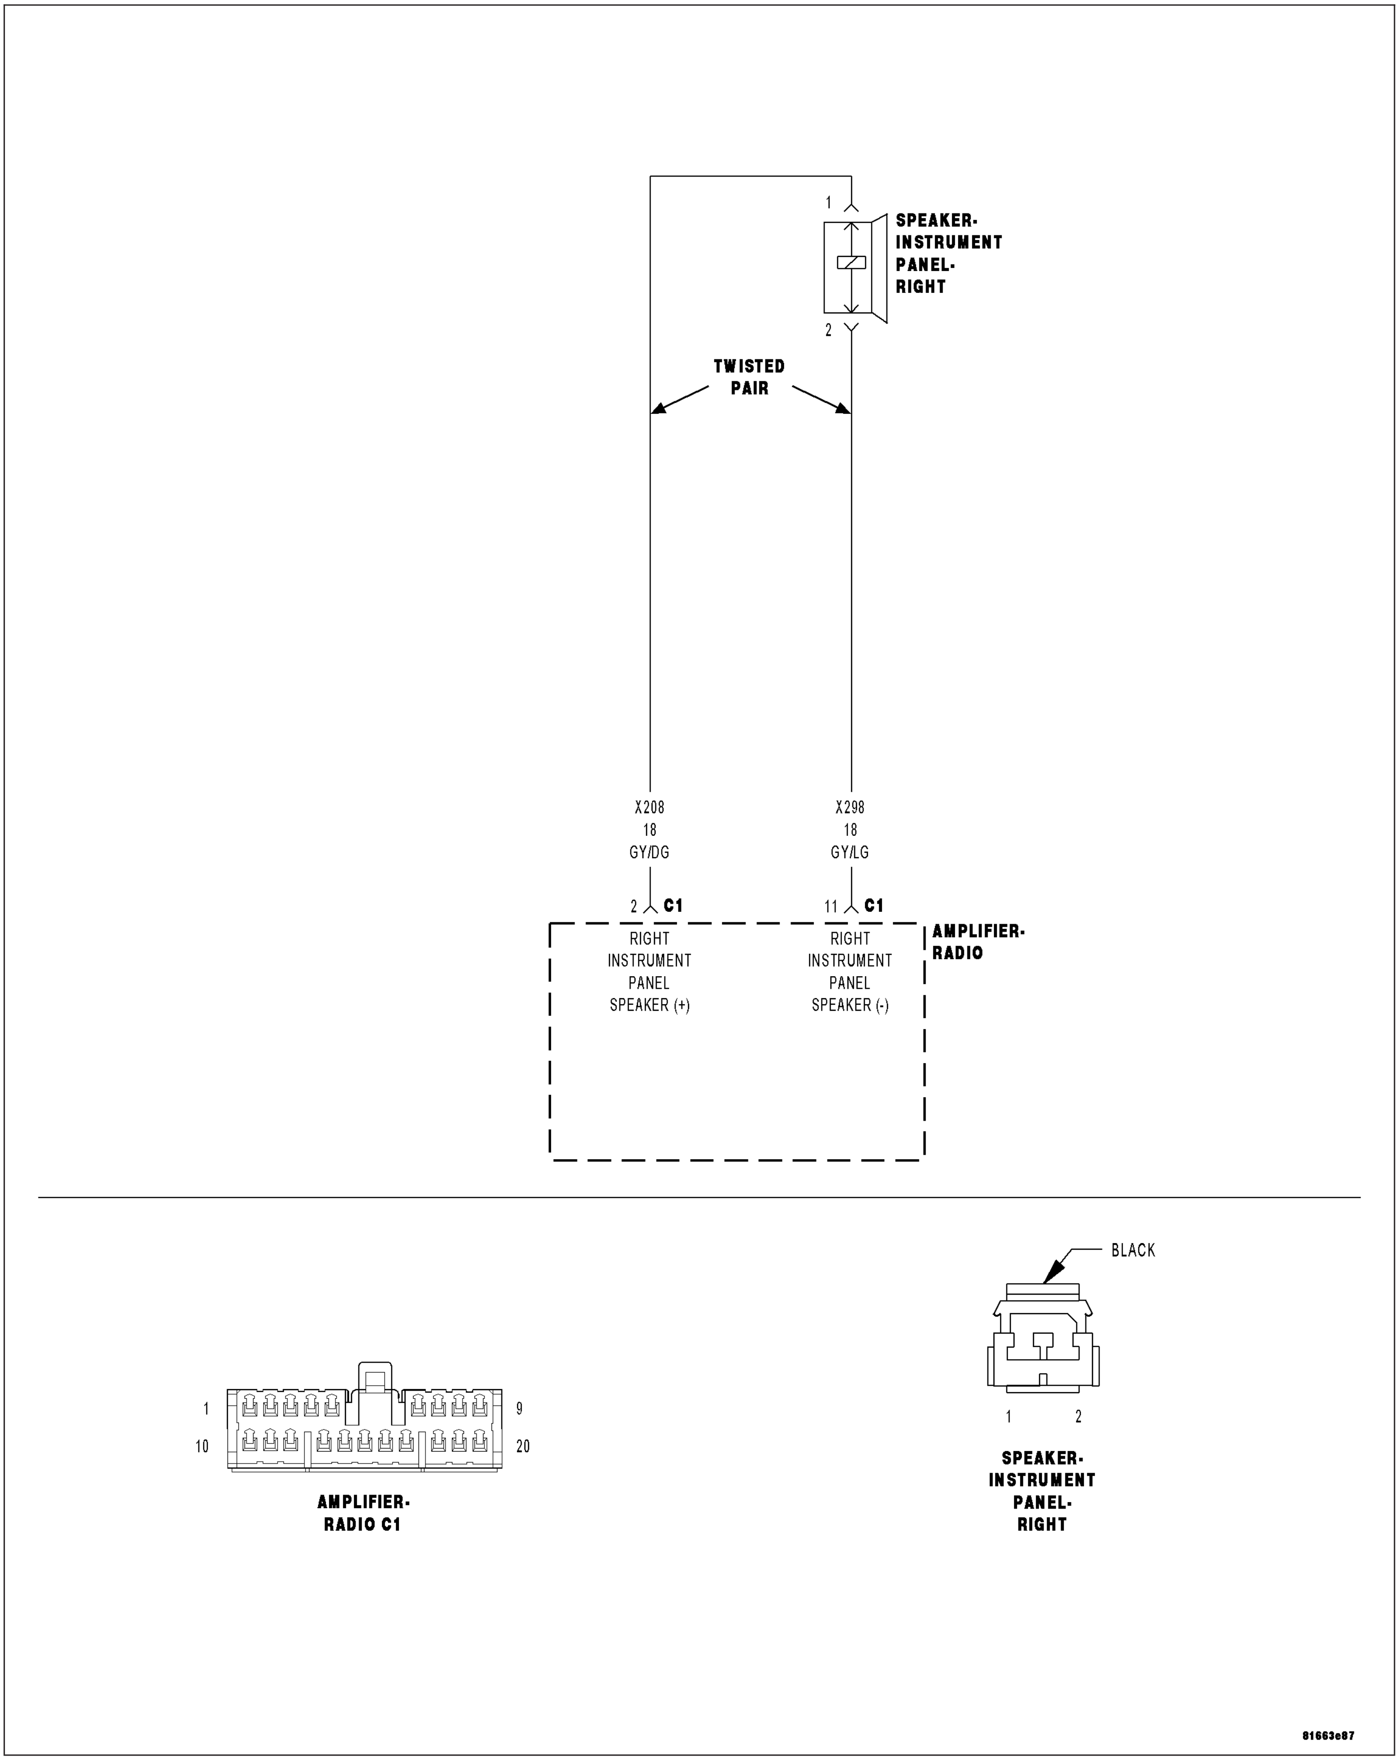
No >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT I/P SPEAKER

Turn the ignition off.

Reconnect and reinstall the Right Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground.



Is the resistance below 10K ohms?

Yes >> Replace the Right Front I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

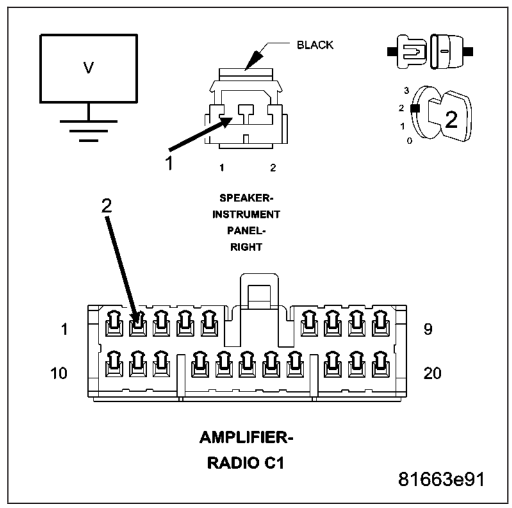
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT



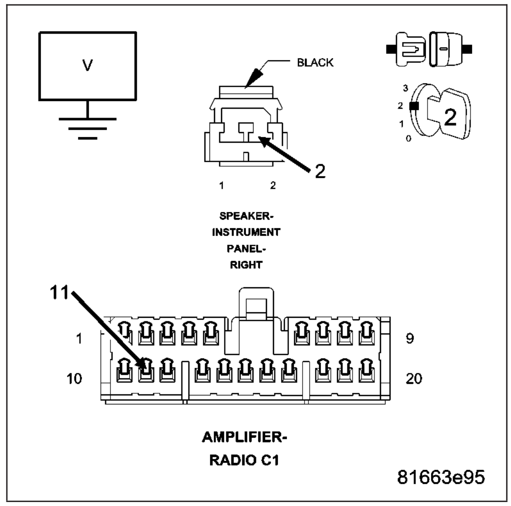
Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Right I/P Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X208) Amplified Right I/P Speaker (+) circuit.



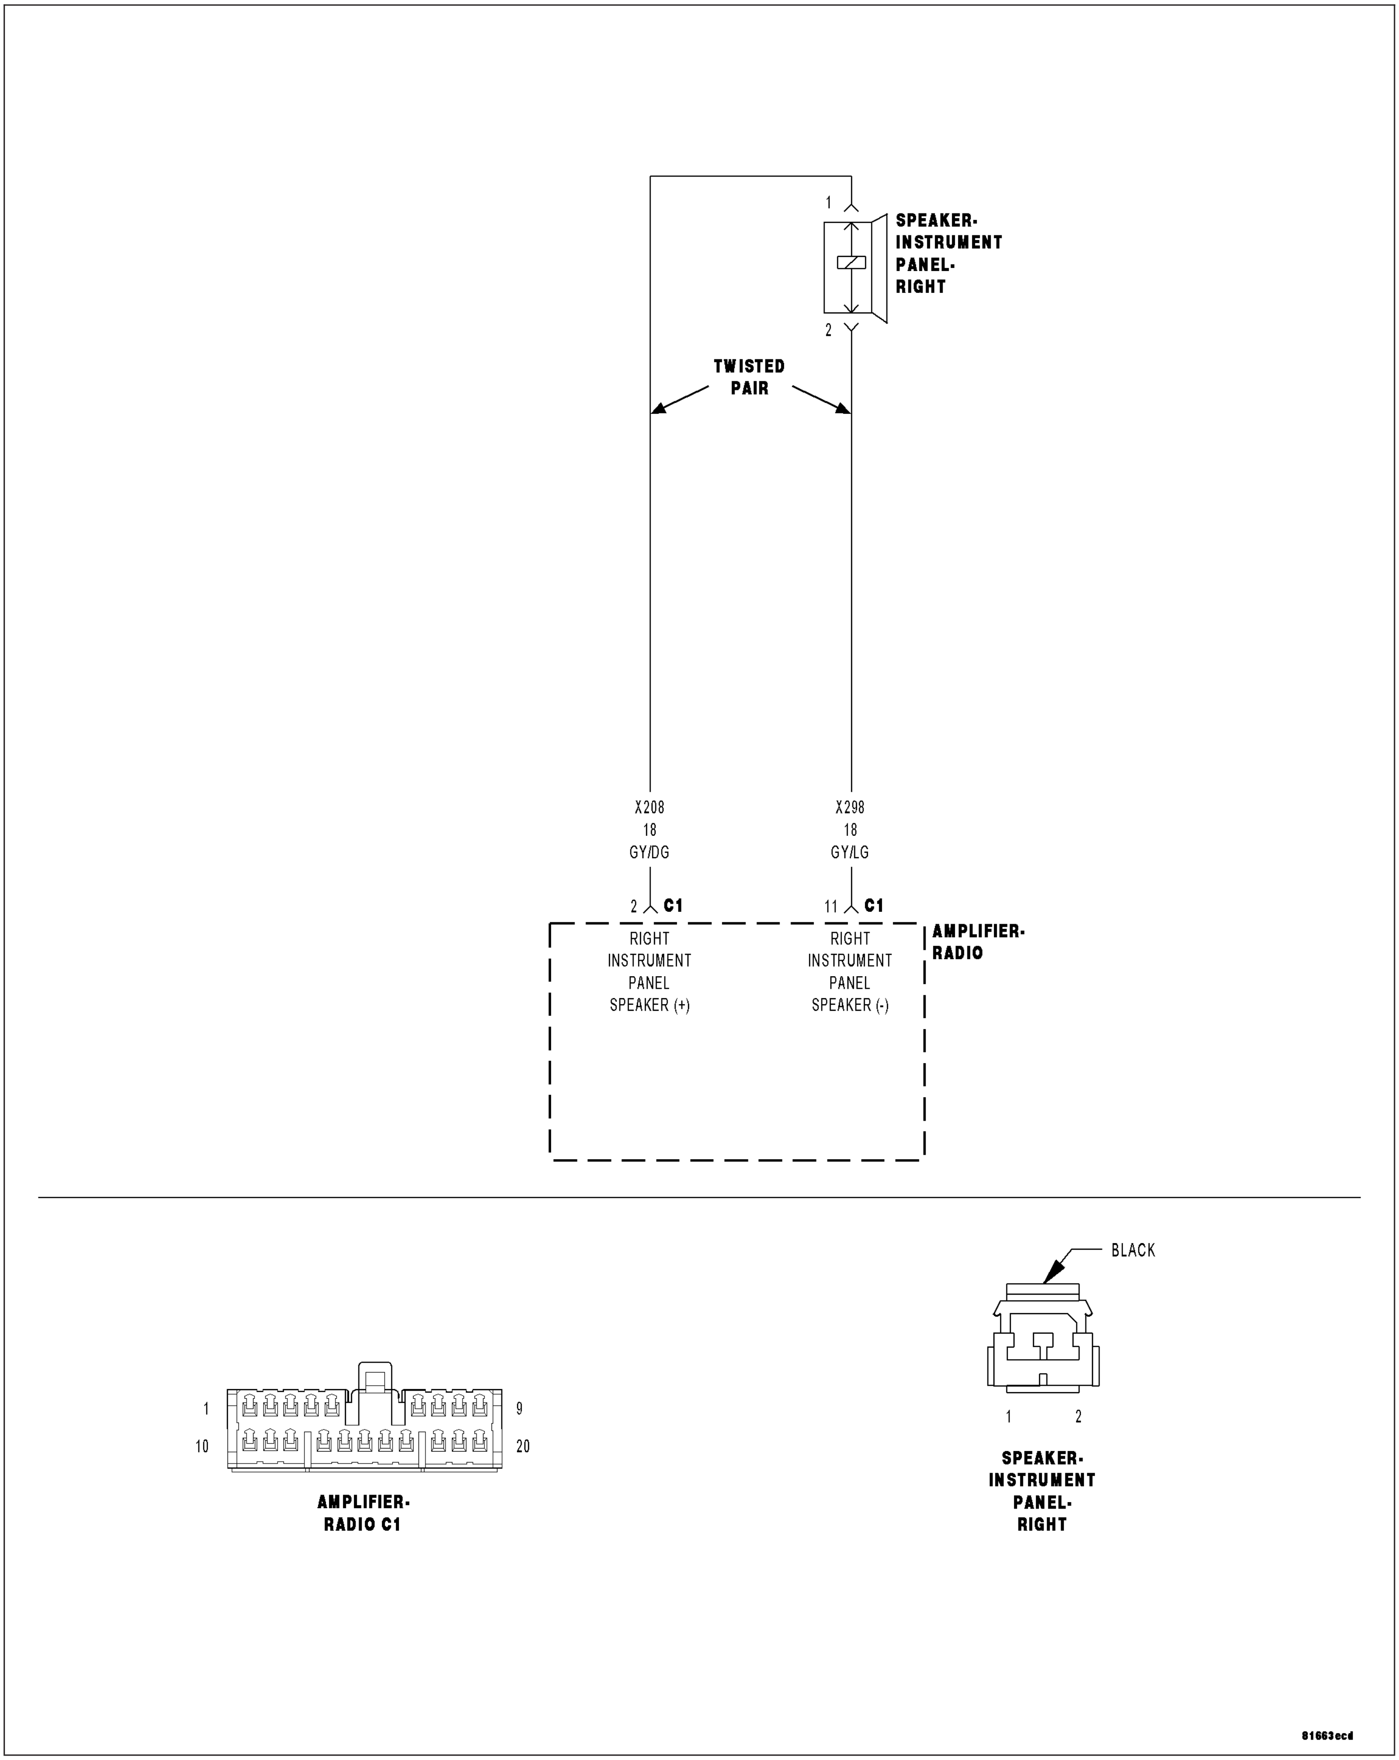
Is the voltage above 10.0 volts?

Yes >> Repair the (X208) Amplified Right I/P Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK FOR VOLTAGE ON THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT

Measure for voltage on the (X298) Amplified Right I/P Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X298) Amplified Right I/P Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

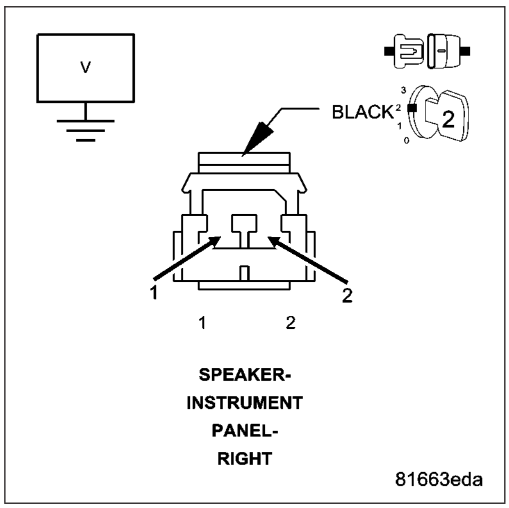
- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.
- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT OPEN
(X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT OPEN
RIGHT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.
Turn the radio on.
With the scan tool, erase Amplifier DTCs.
With the scan tool, reset the amplifier.
With the scan tool, read Amplifier DTCs.



Does the scan tool display active: B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

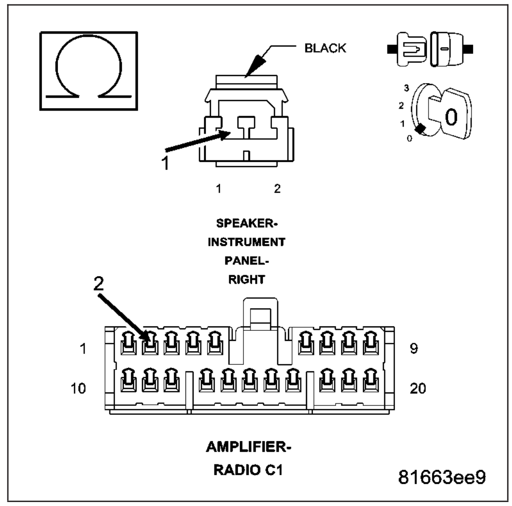
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE RIGHT FRONT I/P SPEAKER

Disconnect the Right I/P Speaker harness connector.
Turn the radio on and turn the volume to mid level.
With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right I/P Speaker circuits in the Amplified Right I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Right I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.



No >> Go To 3

3. CHECK THE (X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

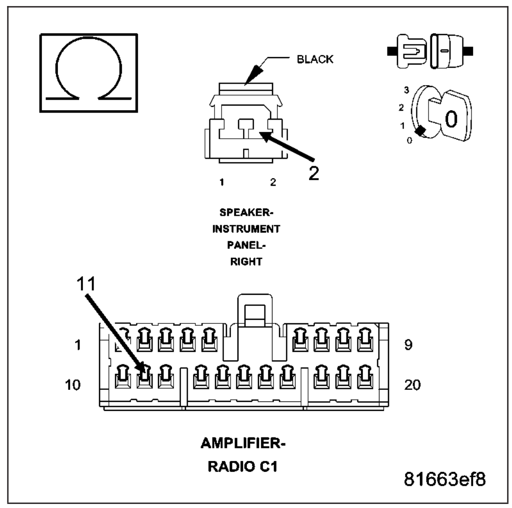
Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X208) Amplified Right I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X208) Amplified Right I/P Speaker (+) circuit for an open.



Perform BODY VERIFICATION TEST VER-1.

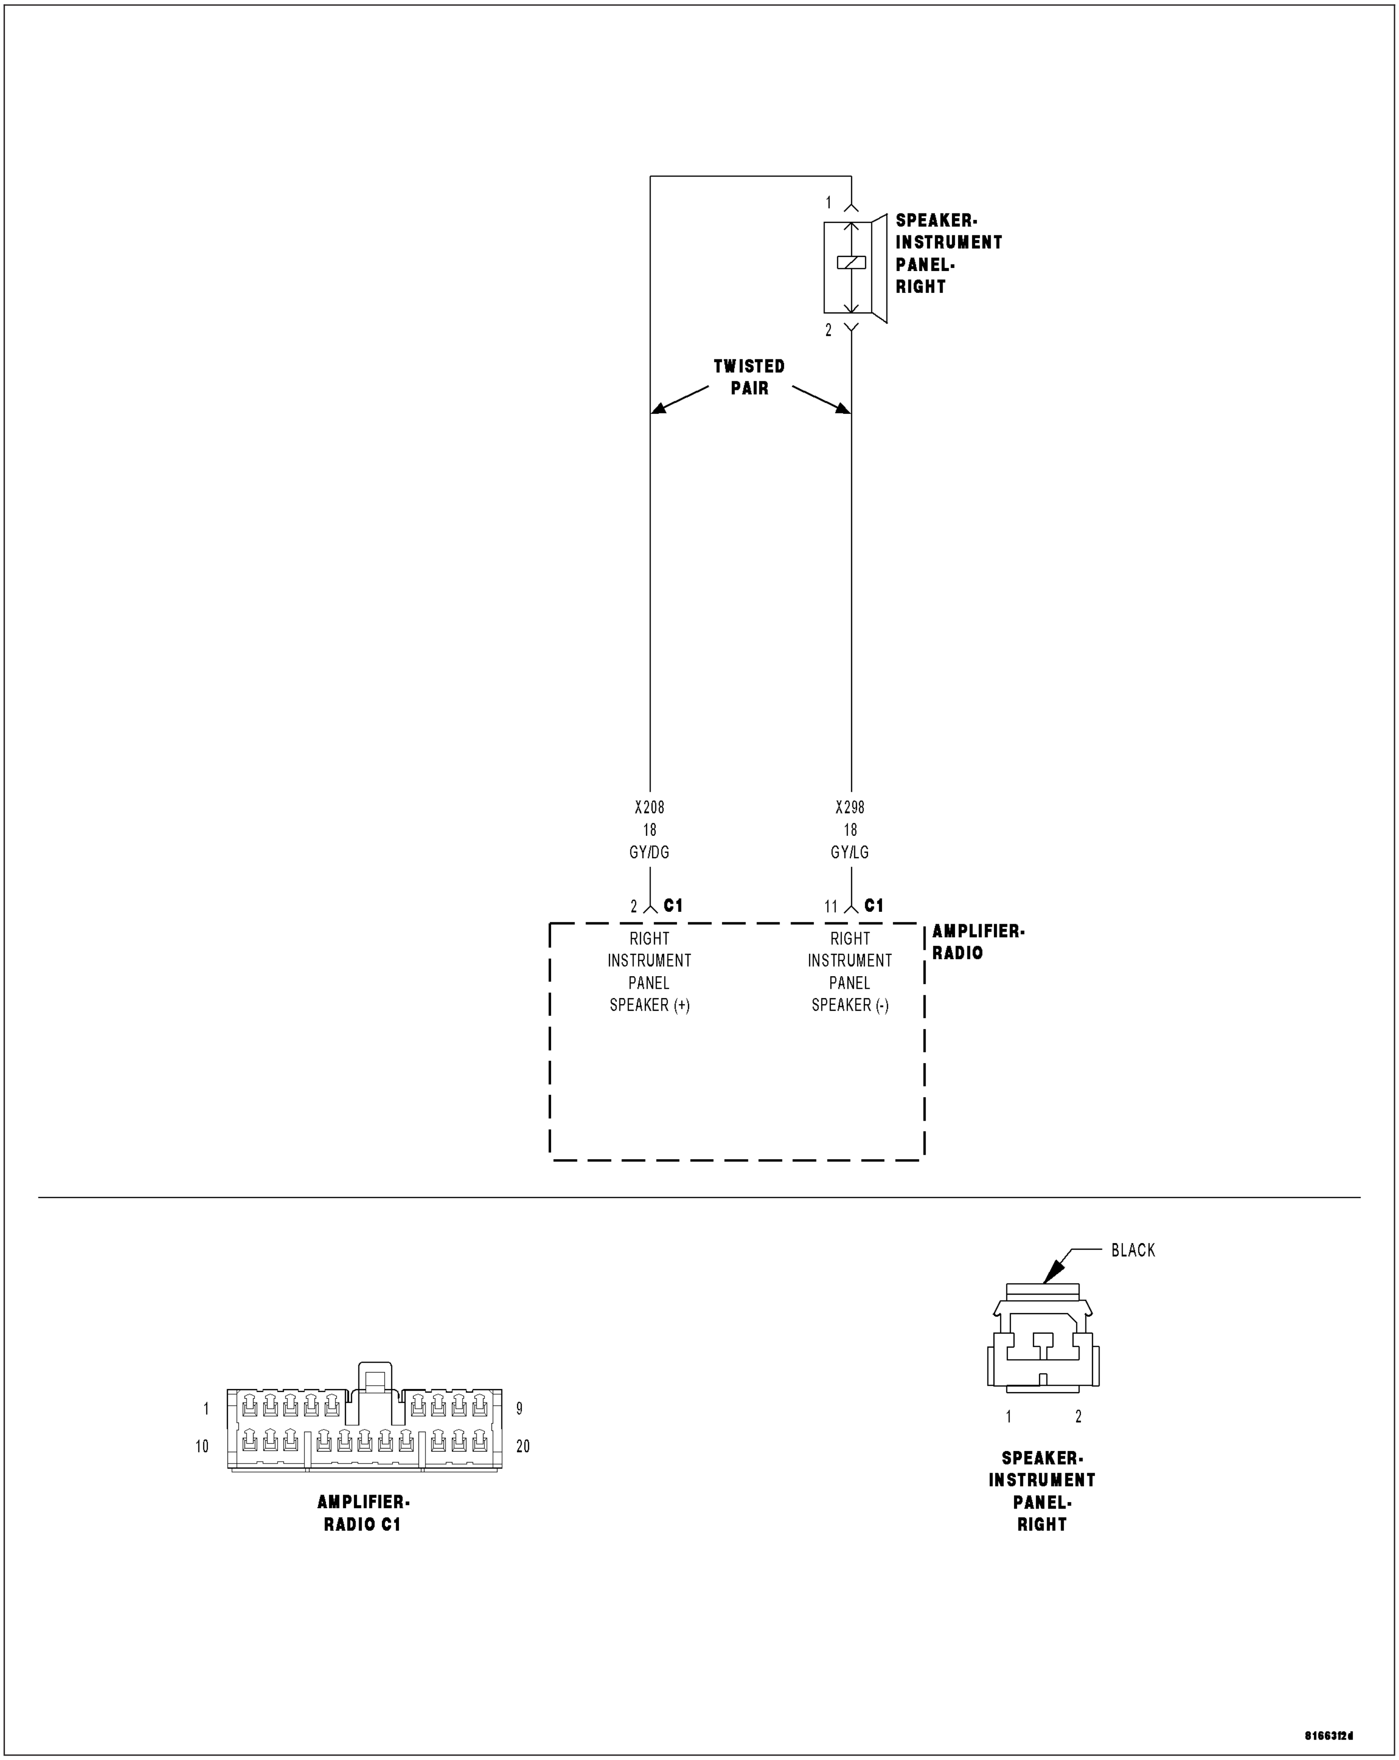
4. CHECK THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X298) Amplified Right I/P Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?



Yes >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X298) Amplified Right I/P Speaker (-) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT
AMPLIFIED RIGHT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

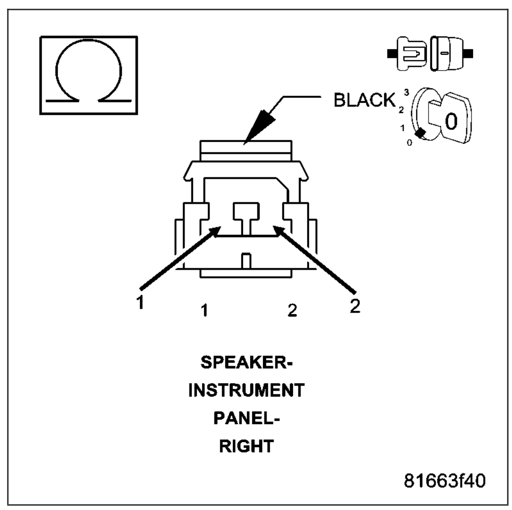
Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2



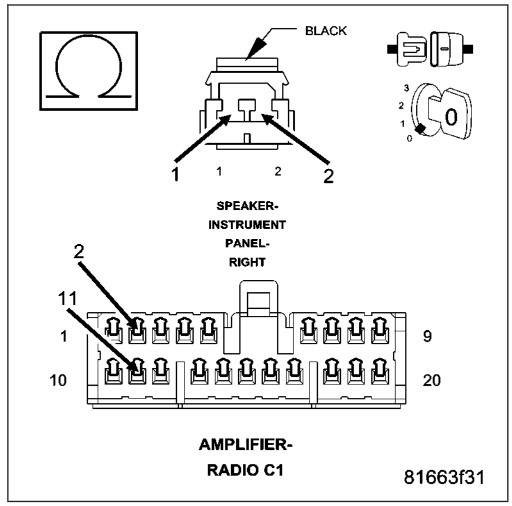
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT I/P SPEAKER

Disconnect the Amplified Right I/P Speaker.

Measure the resistance of the speaker between the two terminals.



Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Right I/P Speaker in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK THE (X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT, AND THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X208) Amplified Right I/P Speaker (+) circuit, and the (X298) Amplified Right I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X208) Amplified Right I/P Speaker (+) circuit, and the (X298) Amplified Right I/P Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

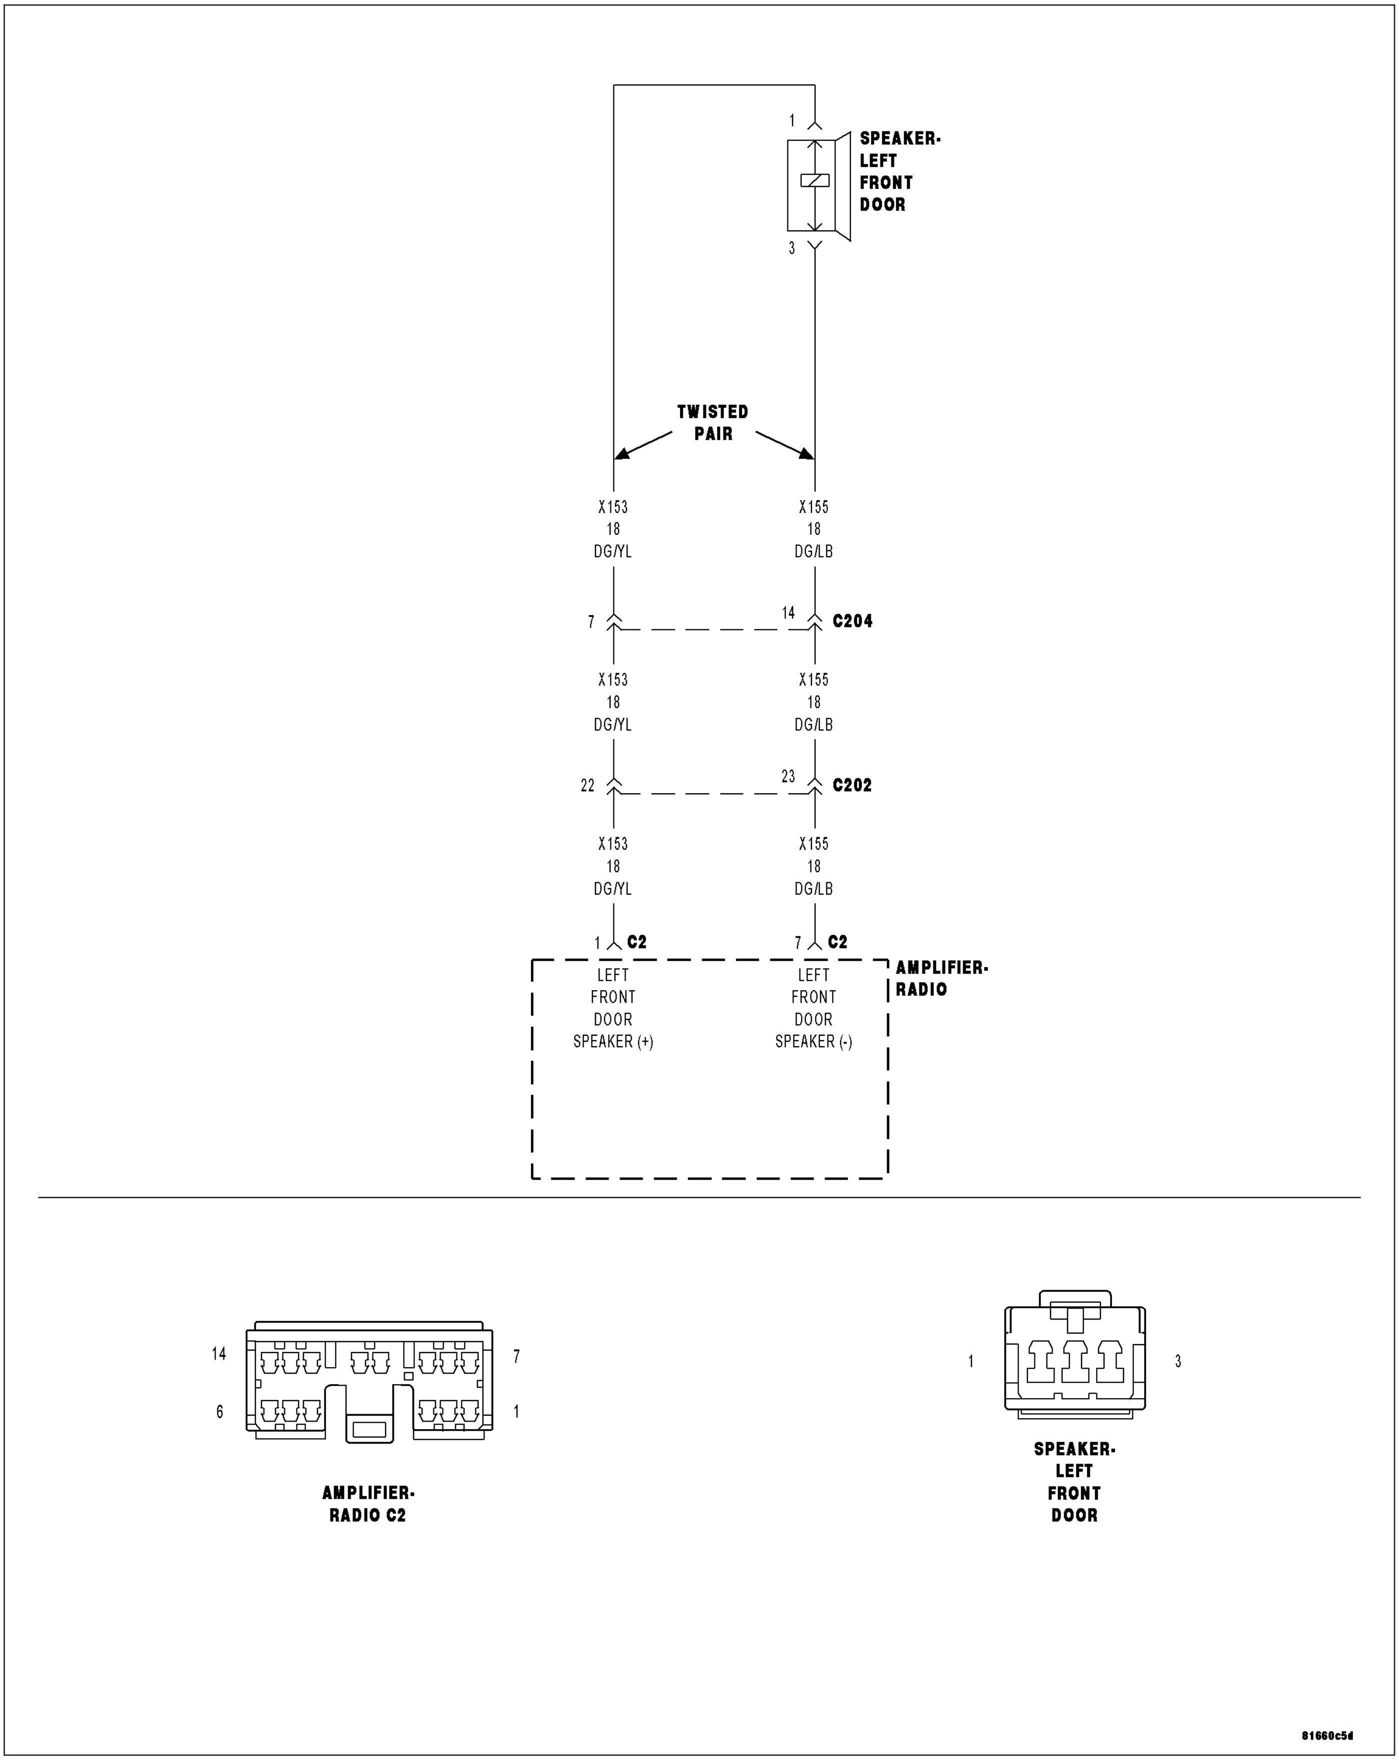
Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?



Yes >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT DOOR SPEAKER
AMPLIFIER

Diagnostic Test

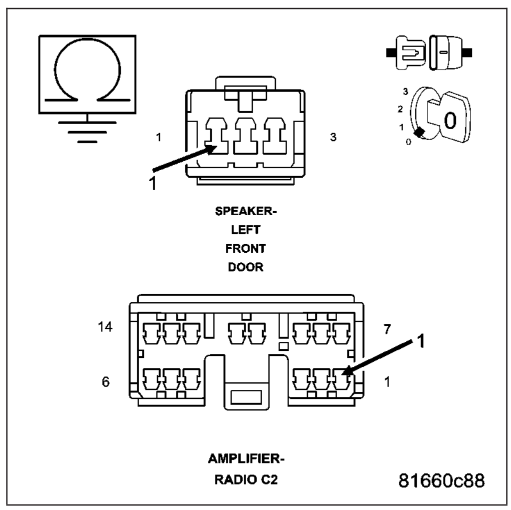
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2



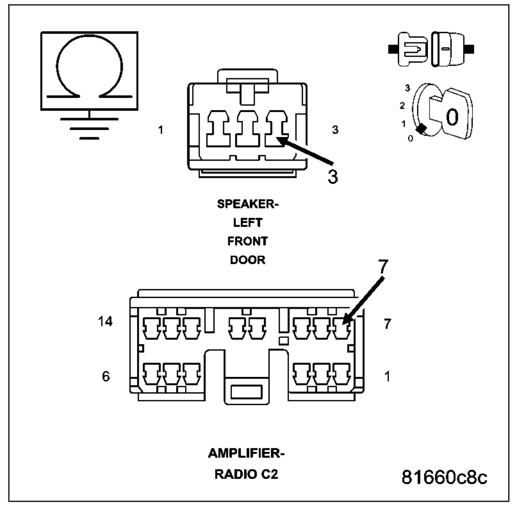
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X201) Amplified Left Front Door Speaker (+) circuit.



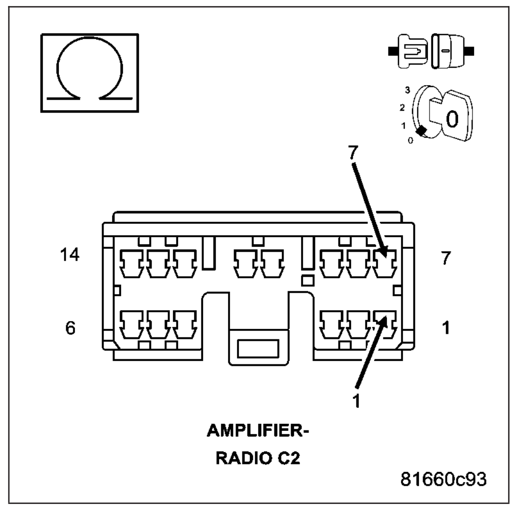
Is the resistance below 10K ohms?

Yes >> Repair the (X201) Amplified Left Front Door Speaker (+) circuit for a short to ground.

Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK THE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND



Measure the resistance between ground and the (X291) Amplified Left Front Door Speaker (-) circuit.

Is the resistance below 10K ohms?

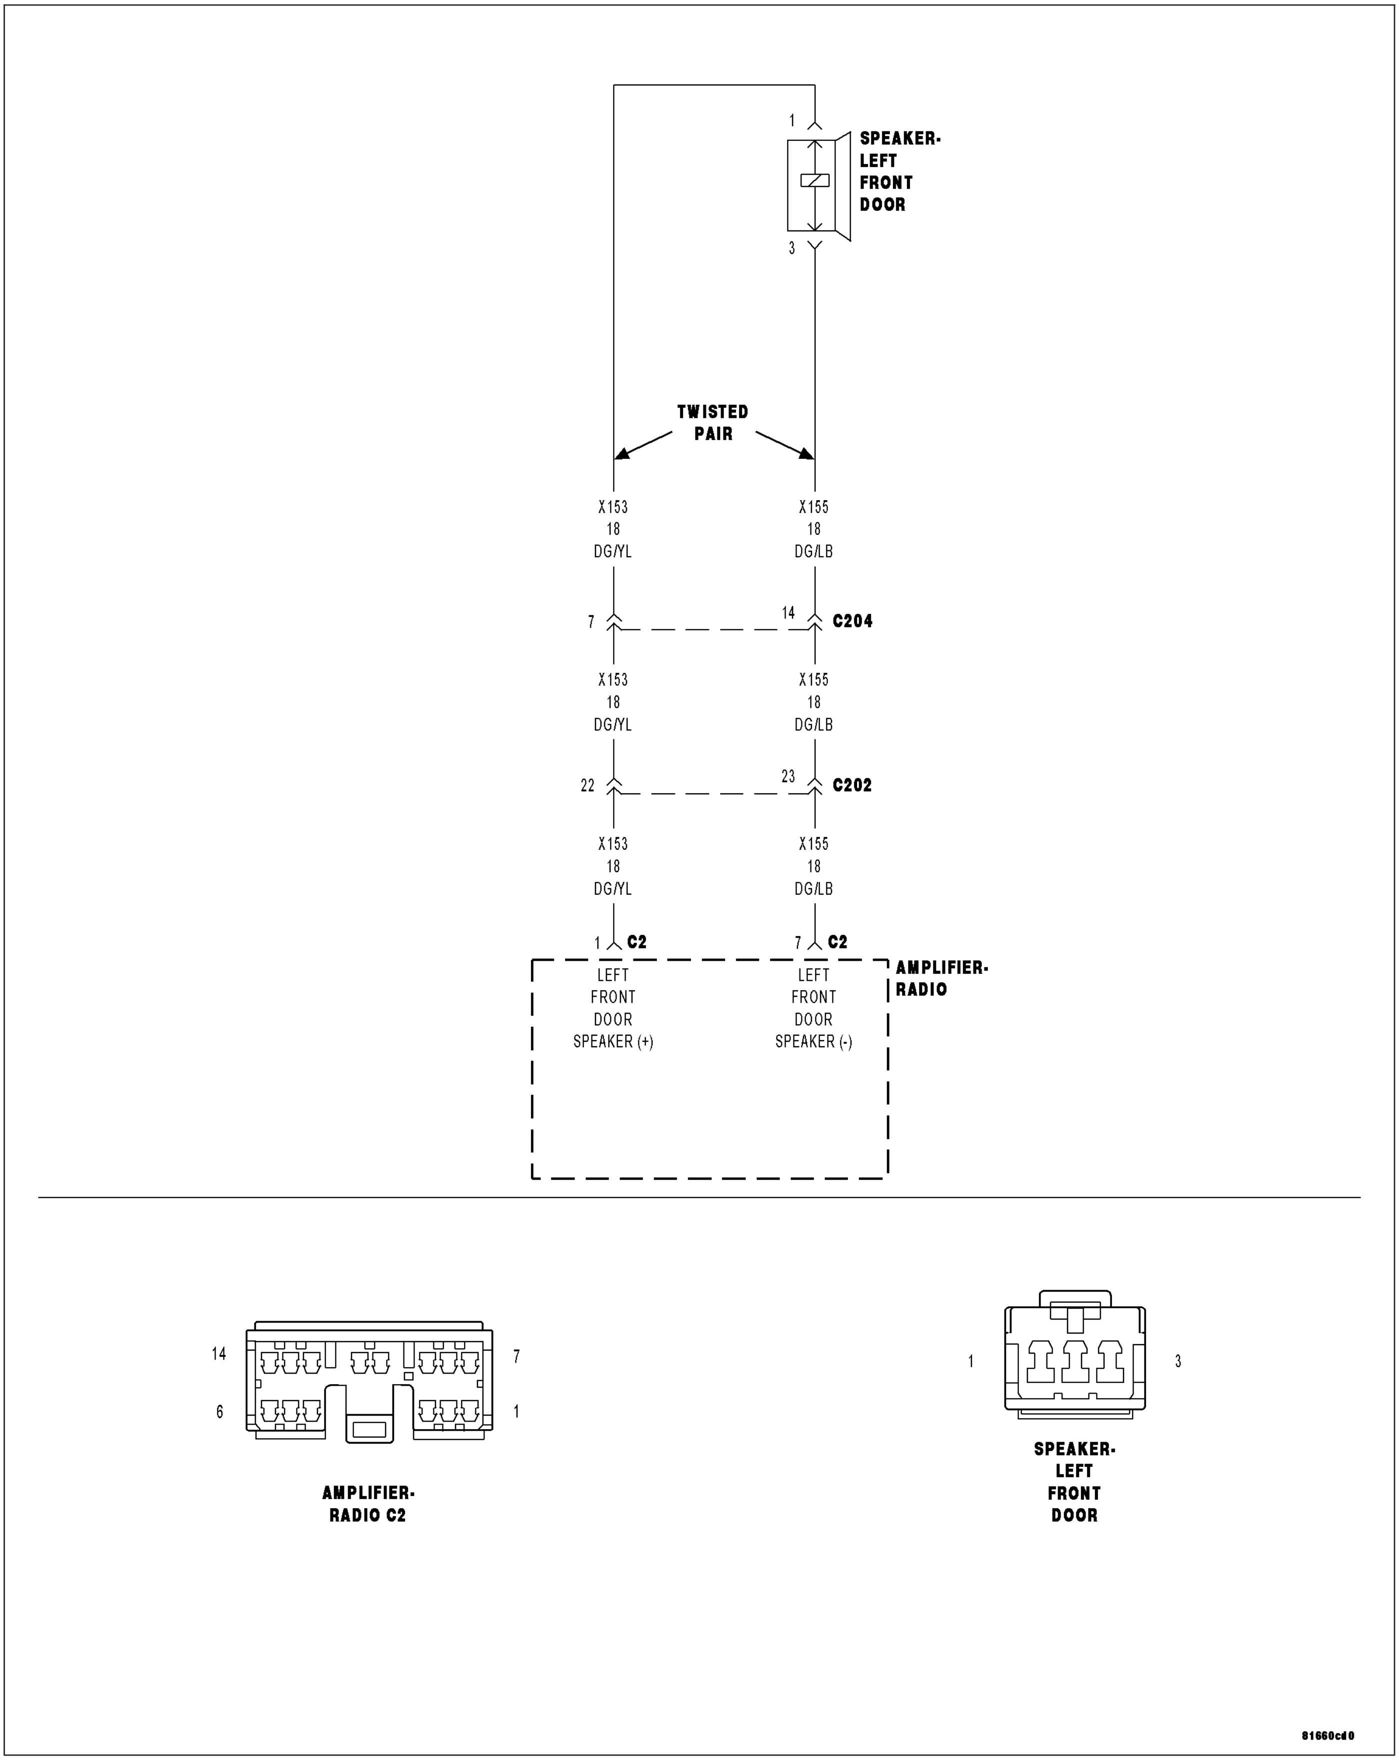
Yes >> Repair the (X291) Amplified Left Front Door Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT DOOR SPEAKER

Turn the ignition off.

Reconnect and reinstall the Left Front Door Speaker.



Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground..

Is the resistance below 10K ohms?

Yes >> Replace the Left Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X153) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X155) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

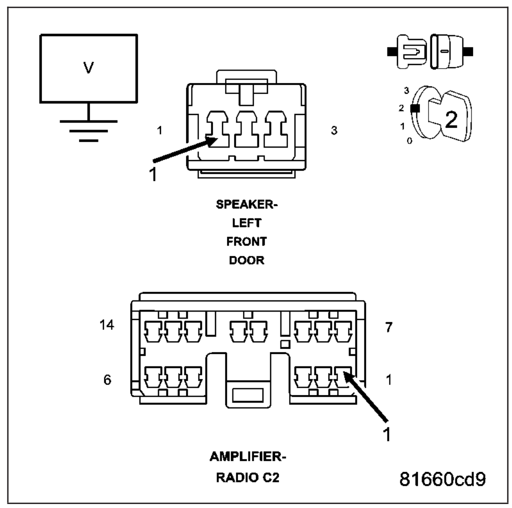
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X153) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT



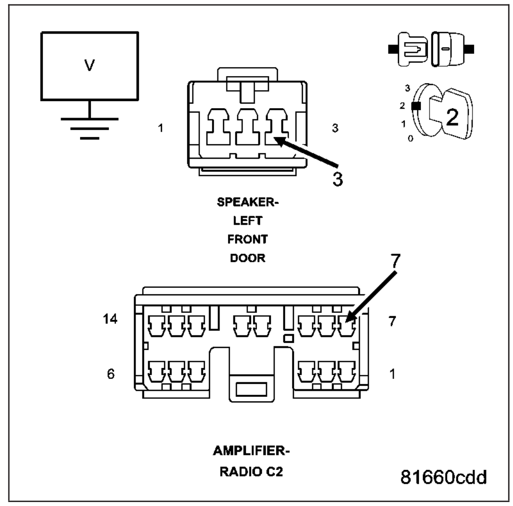
Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Left Front Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X153) Amplified Left Front Door Speaker (+) circuit.



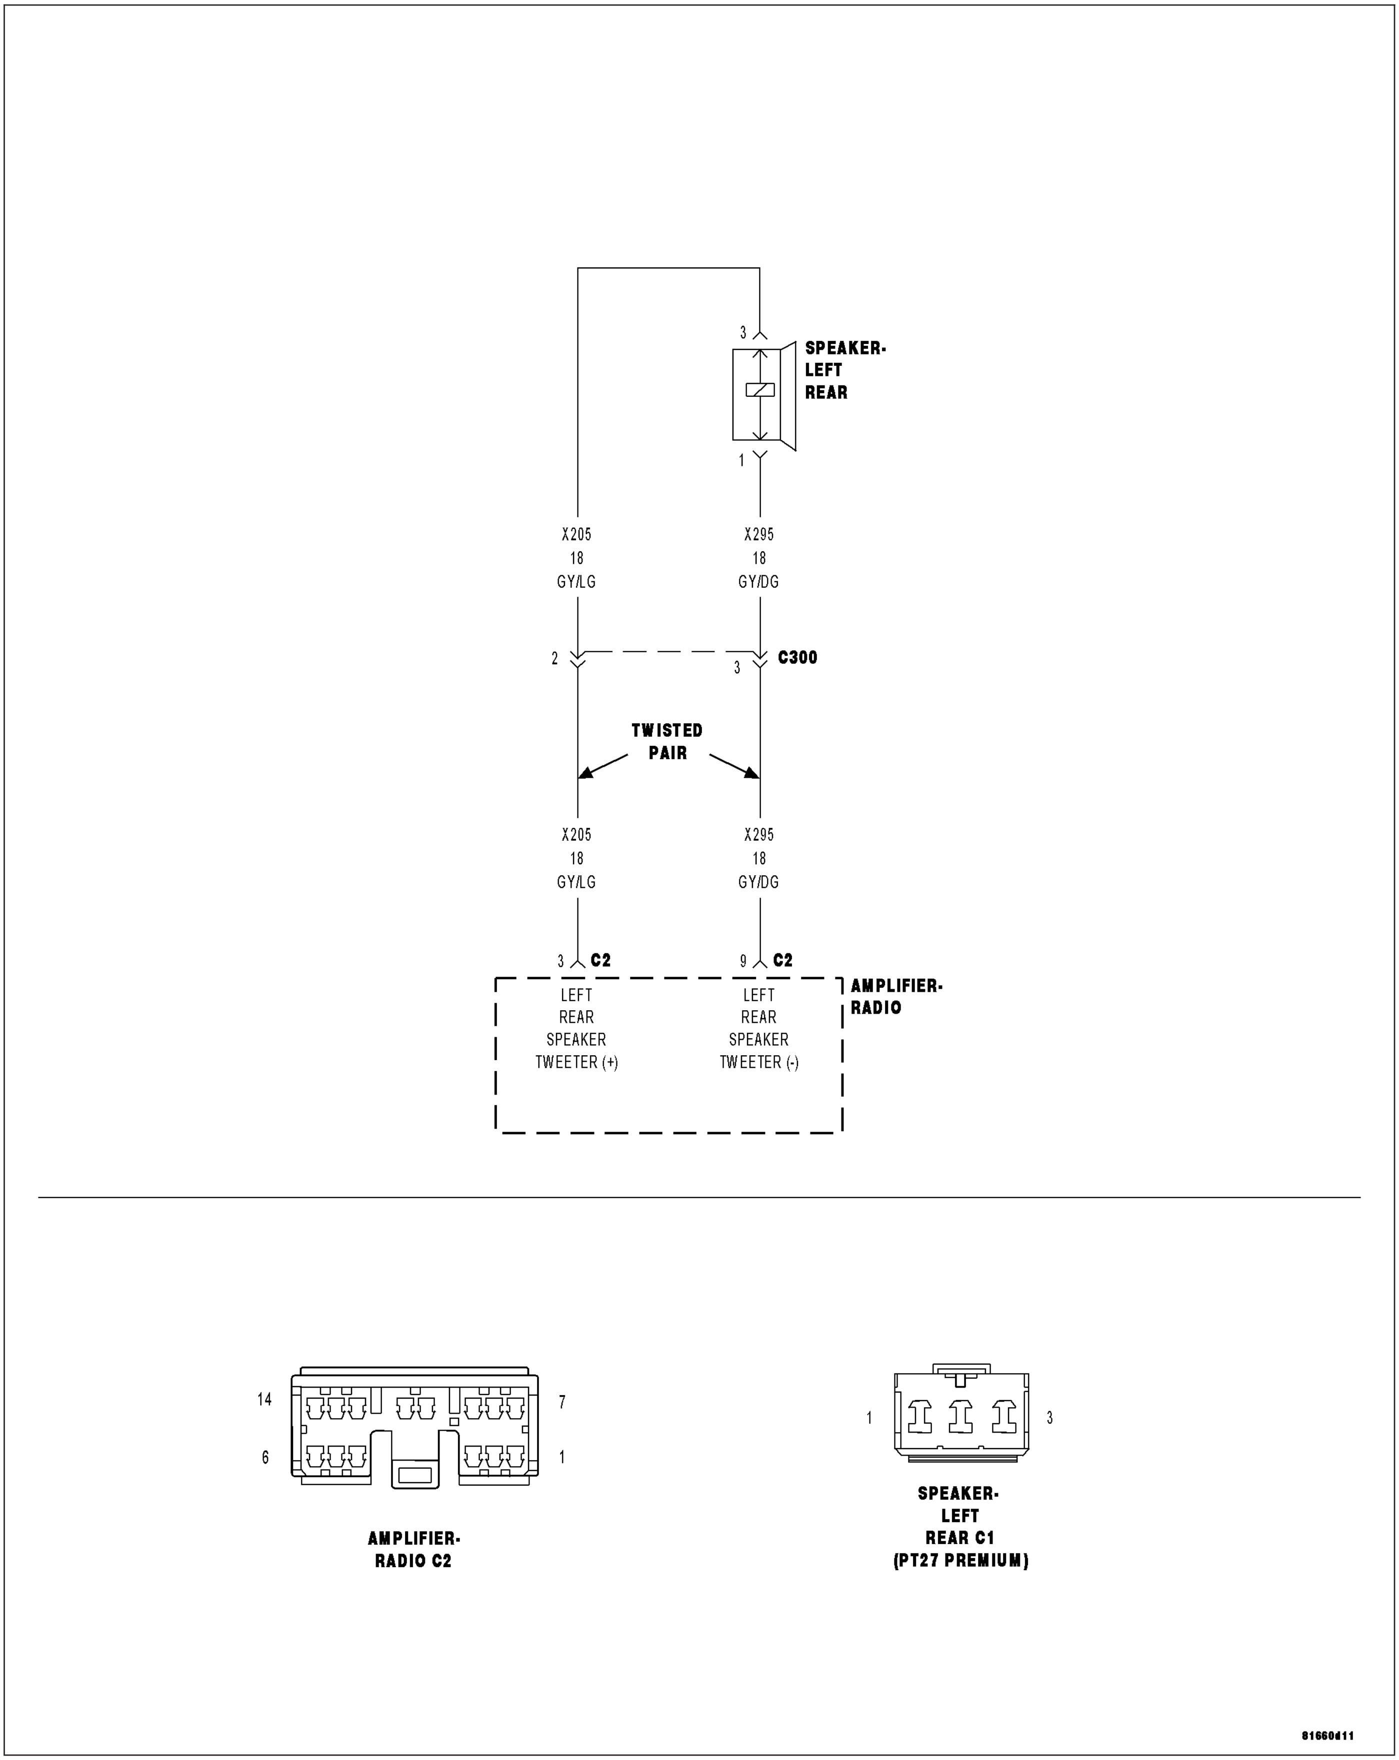
Is the voltage above 10.0 volts?

Yes >> Repair the (X153) Amplified Left Front Door Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK FOR VOLTAGE ON THE (X155) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT

Measure for voltage on the (X155) Amplified Left Front Door Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X155) Amplified Left Front Door Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.
- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT OPEN
(X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUIT OPEN
LEFT REAR SHELF SPEAKER
AMPLIFIER

Diagnostic Test

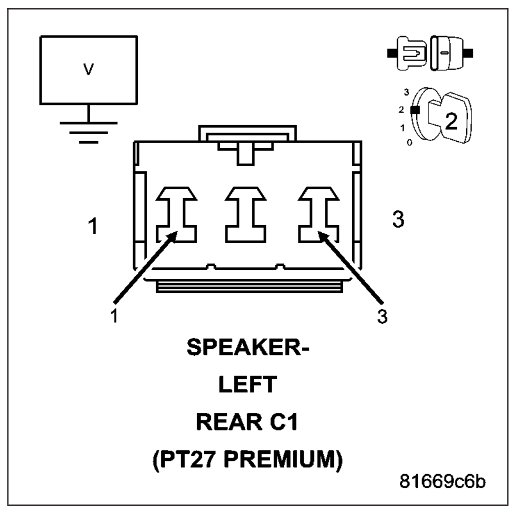
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.
Turn the radio on.
With the scan tool, erase Amplifier DTCs.
With the scan tool, reset the amplifier.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



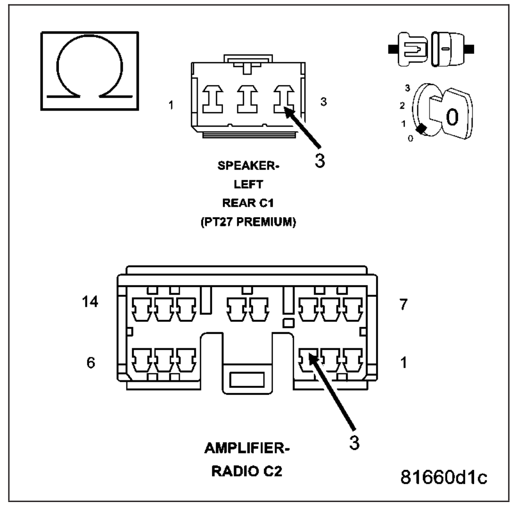
2. CHECK THE OPERATION OF THE LEFT REAR SHELF SPEAKER

Disconnect the Left Rear Shelf Speaker harness connector.
Turn the radio on and turn the volume to mid level.
With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Shelf Speaker circuits in the Amplified Left Rear Shelf Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Left Rear Shelf Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3



3. CHECK THE (X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT FOR AN OPEN

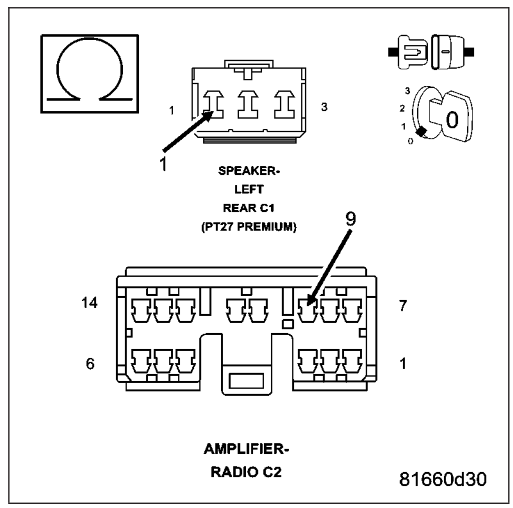
Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X205) Amplified Left Rear Shelf Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Shelf Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4



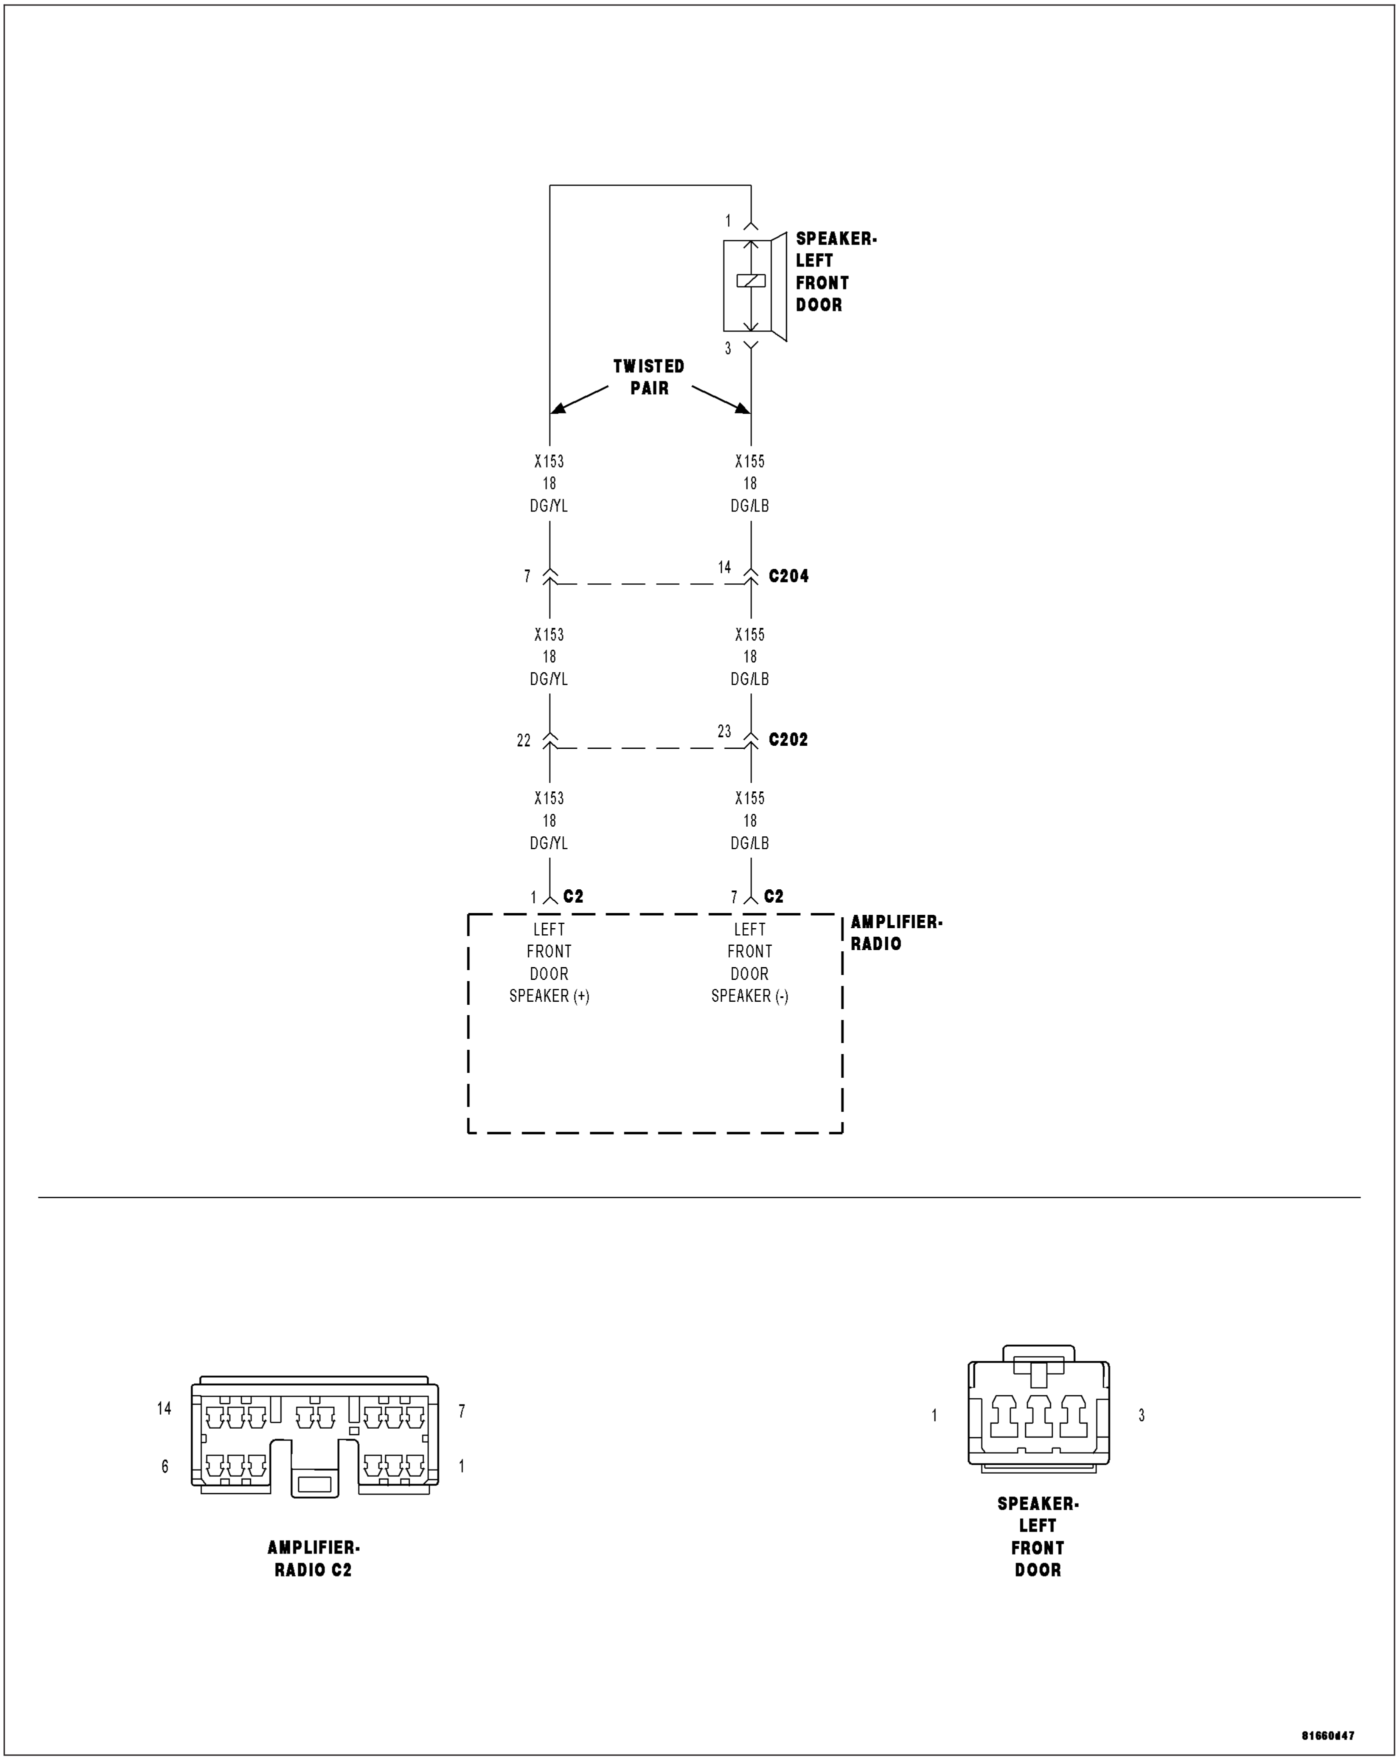
No >> Repair the (X205) Amplified Left Rear Shelf Speaker (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

4. CHECK THE (X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X295) Amplified Left Rear Shelf Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Shelf Speaker harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X291) Amplified Left Rear Shelf Speaker (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X153) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X155) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT
AMPLIFIED LEFT FRONT DOOR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

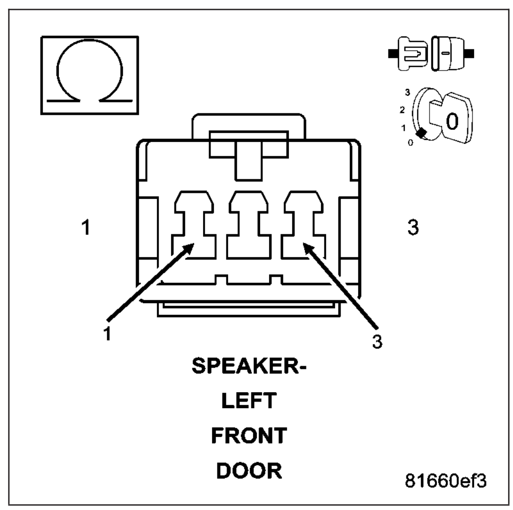
With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?



Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

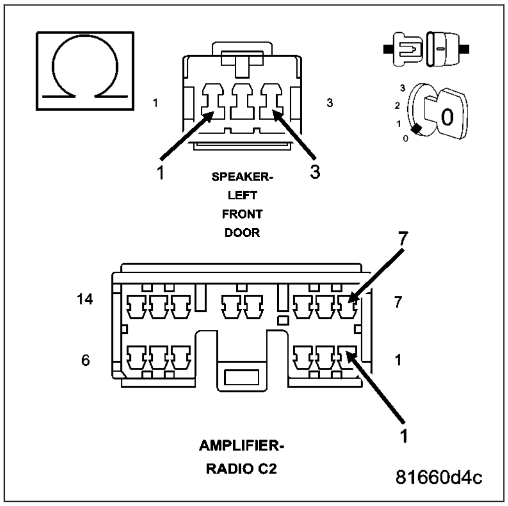
2. CHECK THE OPERATION OF THE AMPLIFIED LEFT FRONT DOOR SPEAKER

Disconnect the Amplified Left Front Door Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Left Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.



No >> Go To 3

3. CHECK THE (X153) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT, AND THE (X155) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X153) Amplified Left Front Door Speaker (+) circuit, and the (X155) Amplified Left Front Door Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X153) Amplified Left Front Door Speaker (+) circuit, and the (X155) Amplified Left Front Door Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

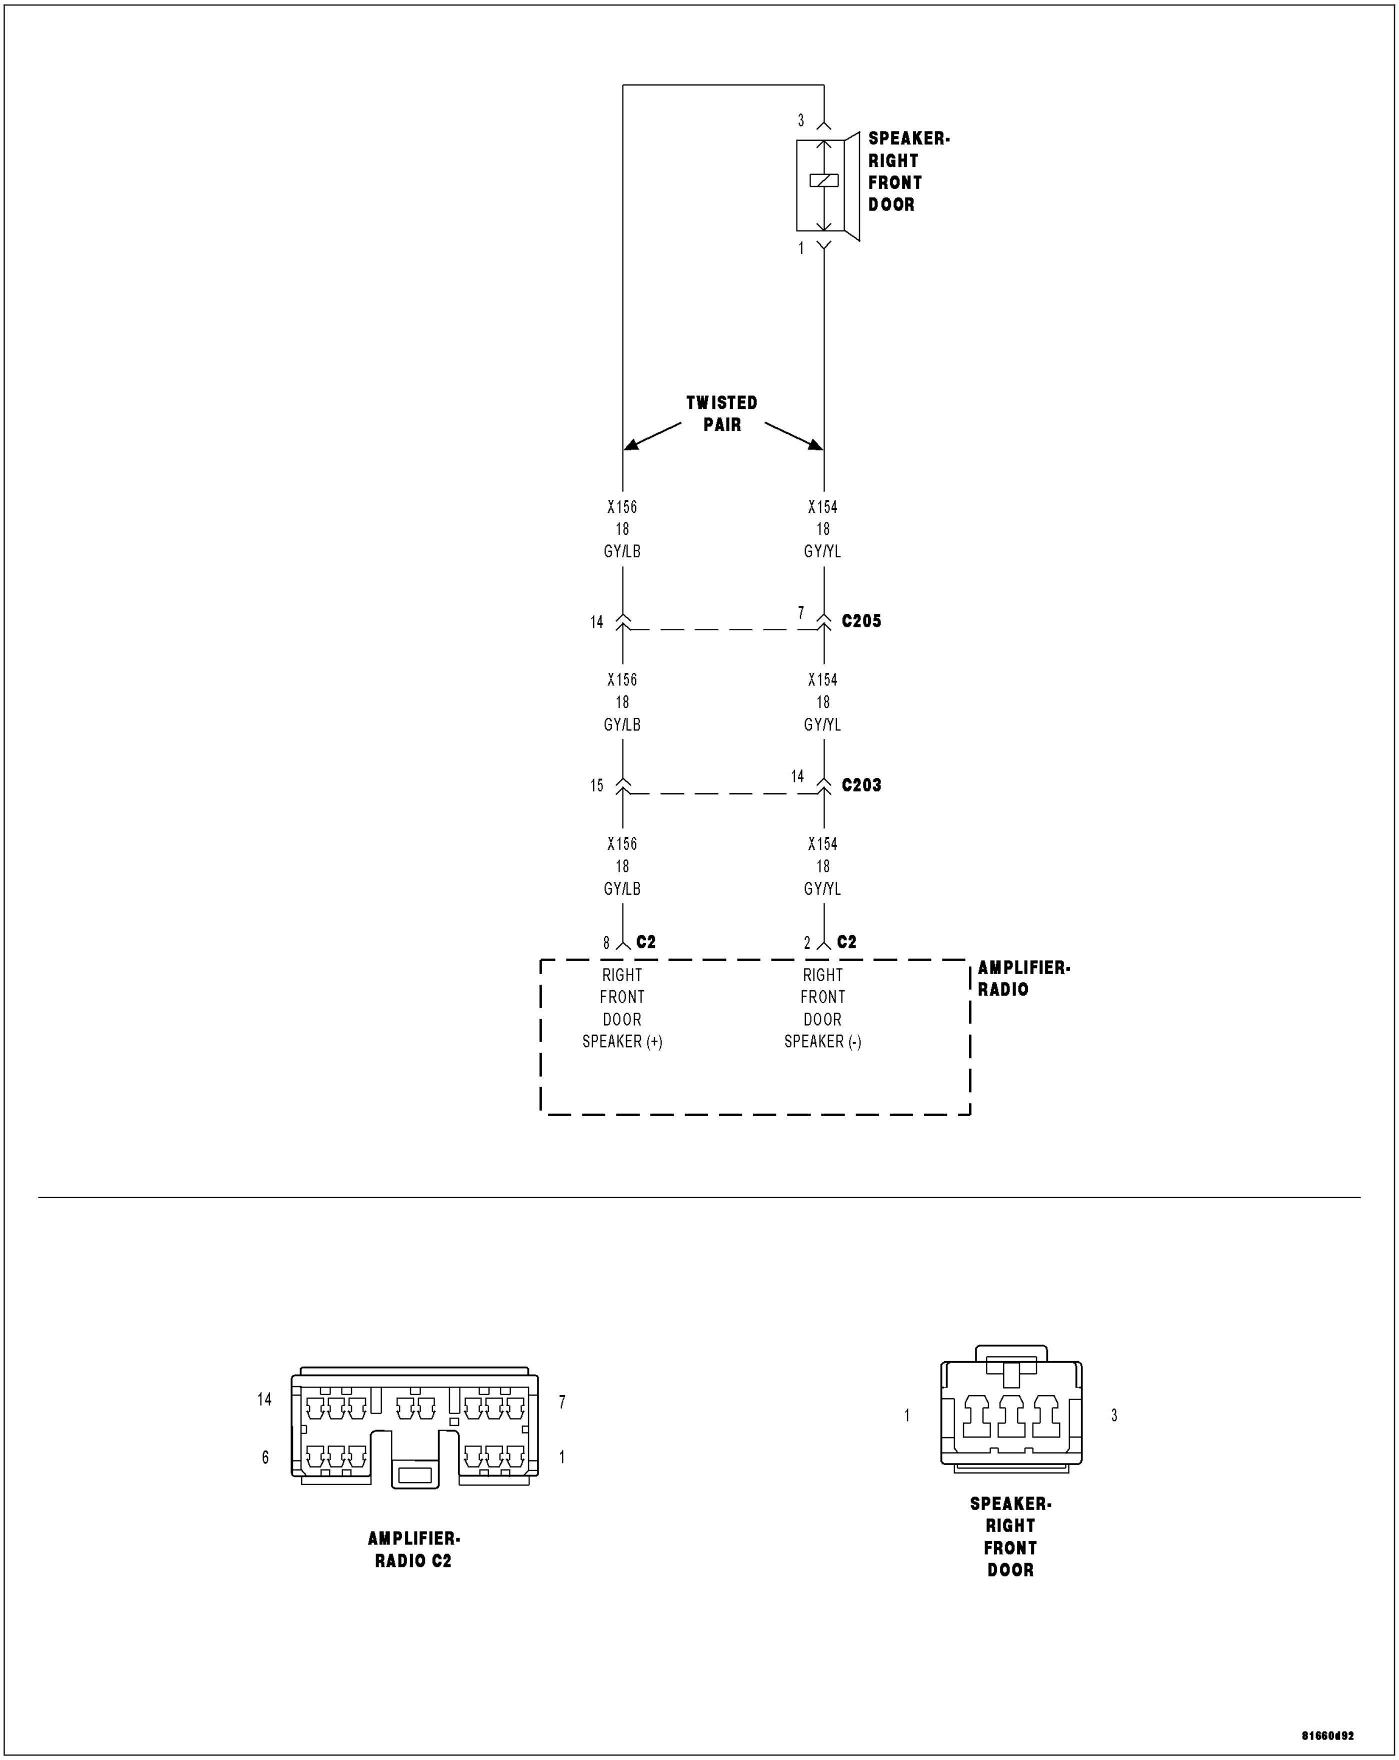
Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read amplifier DTCs.

Does the scan tool display active: B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?



Yes >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X154) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X156) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT DOOR SPEAKER
AMPLIFIER

Diagnostic Test

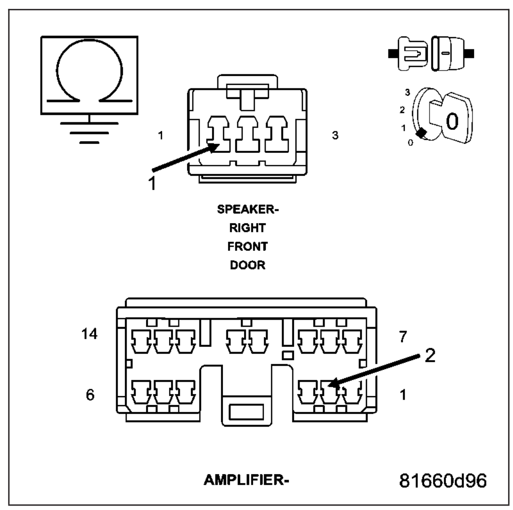
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2



No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X154) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C2 harness connector.

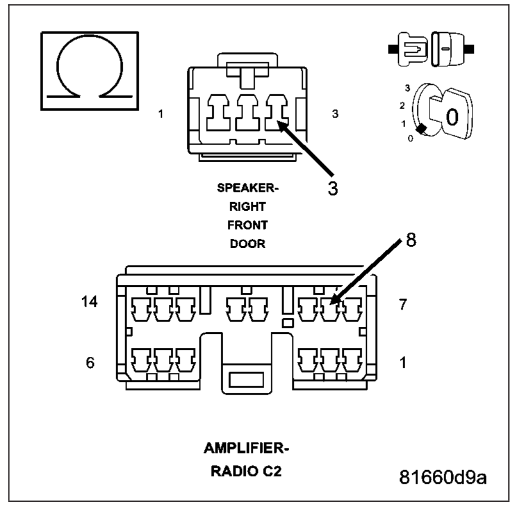
Disconnect the Right Front Door Speaker harness connector.

Measure the resistance between ground and the (X154) Amplified Right Front Door Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X154) Amplified Left Front Door Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3



3. CHECK THE (X156) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X156) Amplified Right Front Door Speaker (-) circuit.

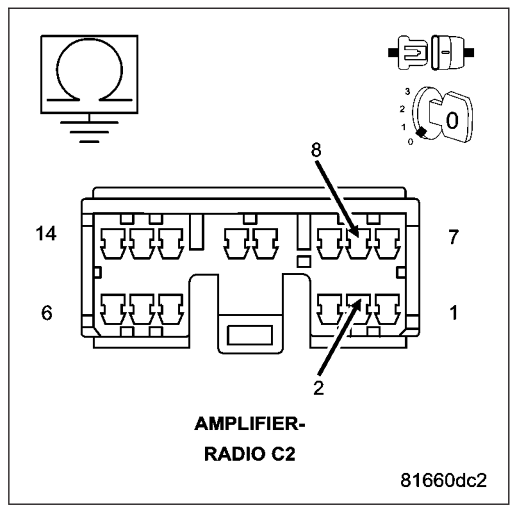
Is the resistance below 10K ohms?

Yes >> Repair the (X156) Amplified Right Front Door Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 4

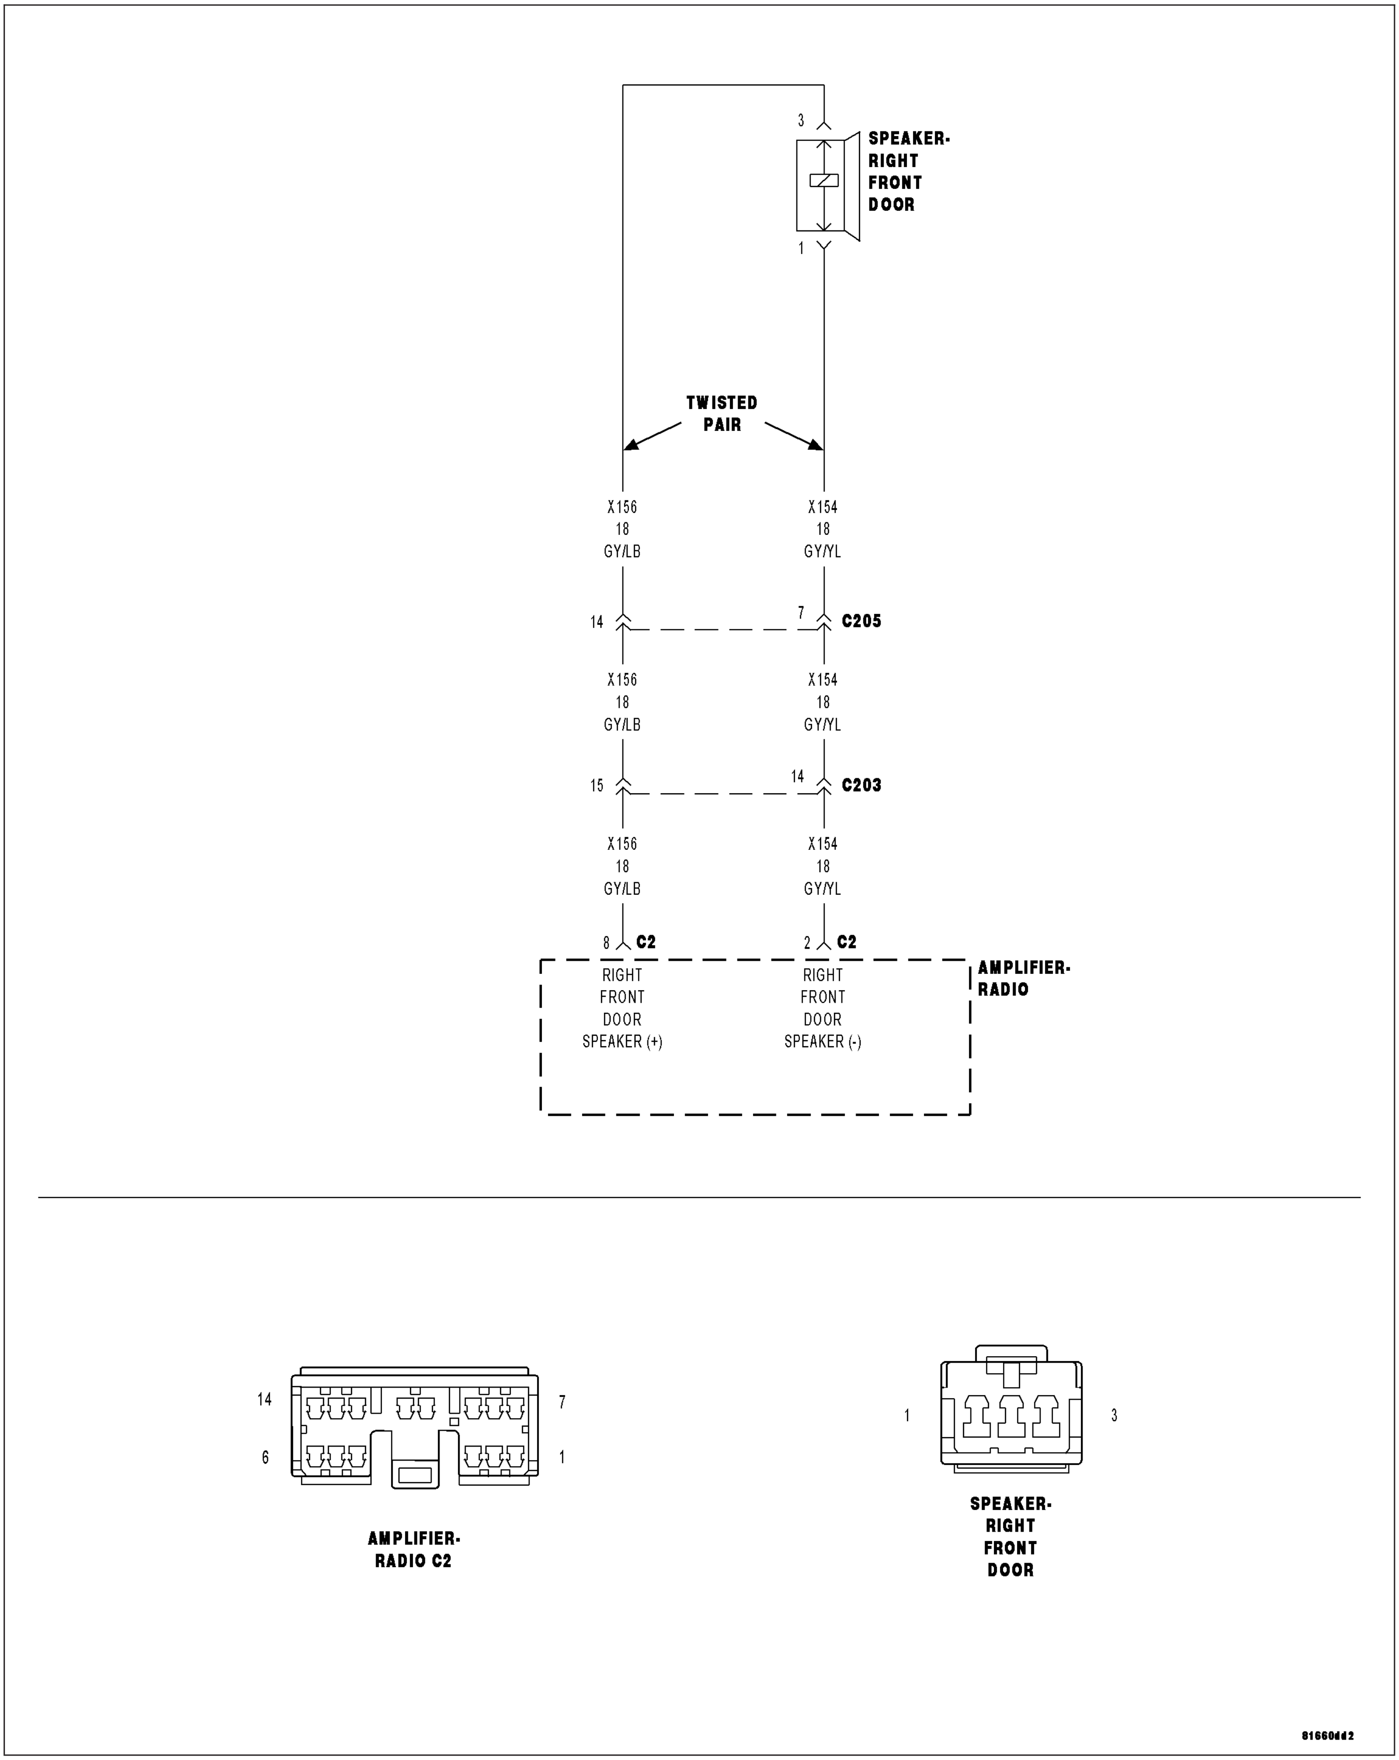
4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT DOOR SPEAKER

Turn the ignition off.



Reconnect and reinstall the Right Front Door Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.



Is the resistance below 10K ohms?

Yes >> Replace the Right Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X154) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X156) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

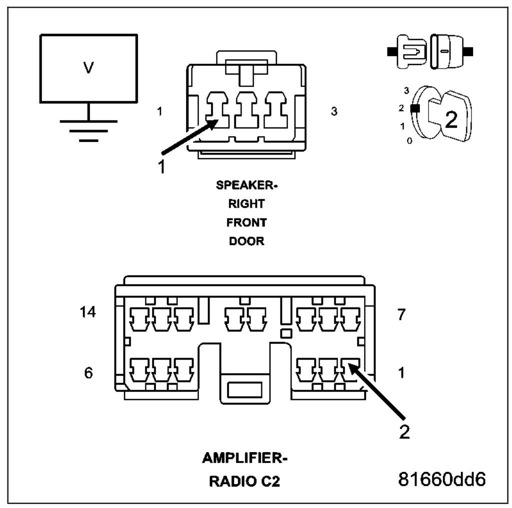
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X154) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT



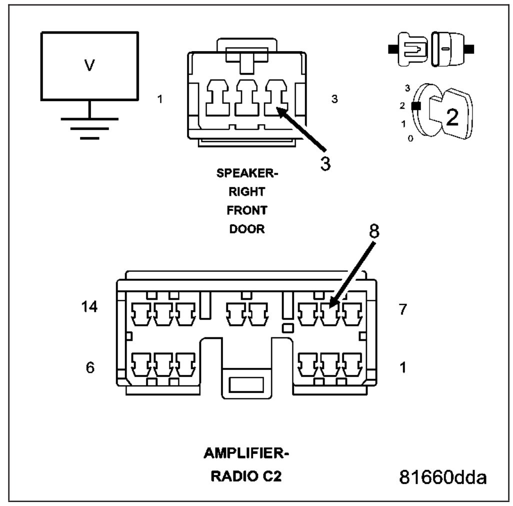
Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Right Front Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X154) Amplified Right Front Door Speaker (+) circuit.



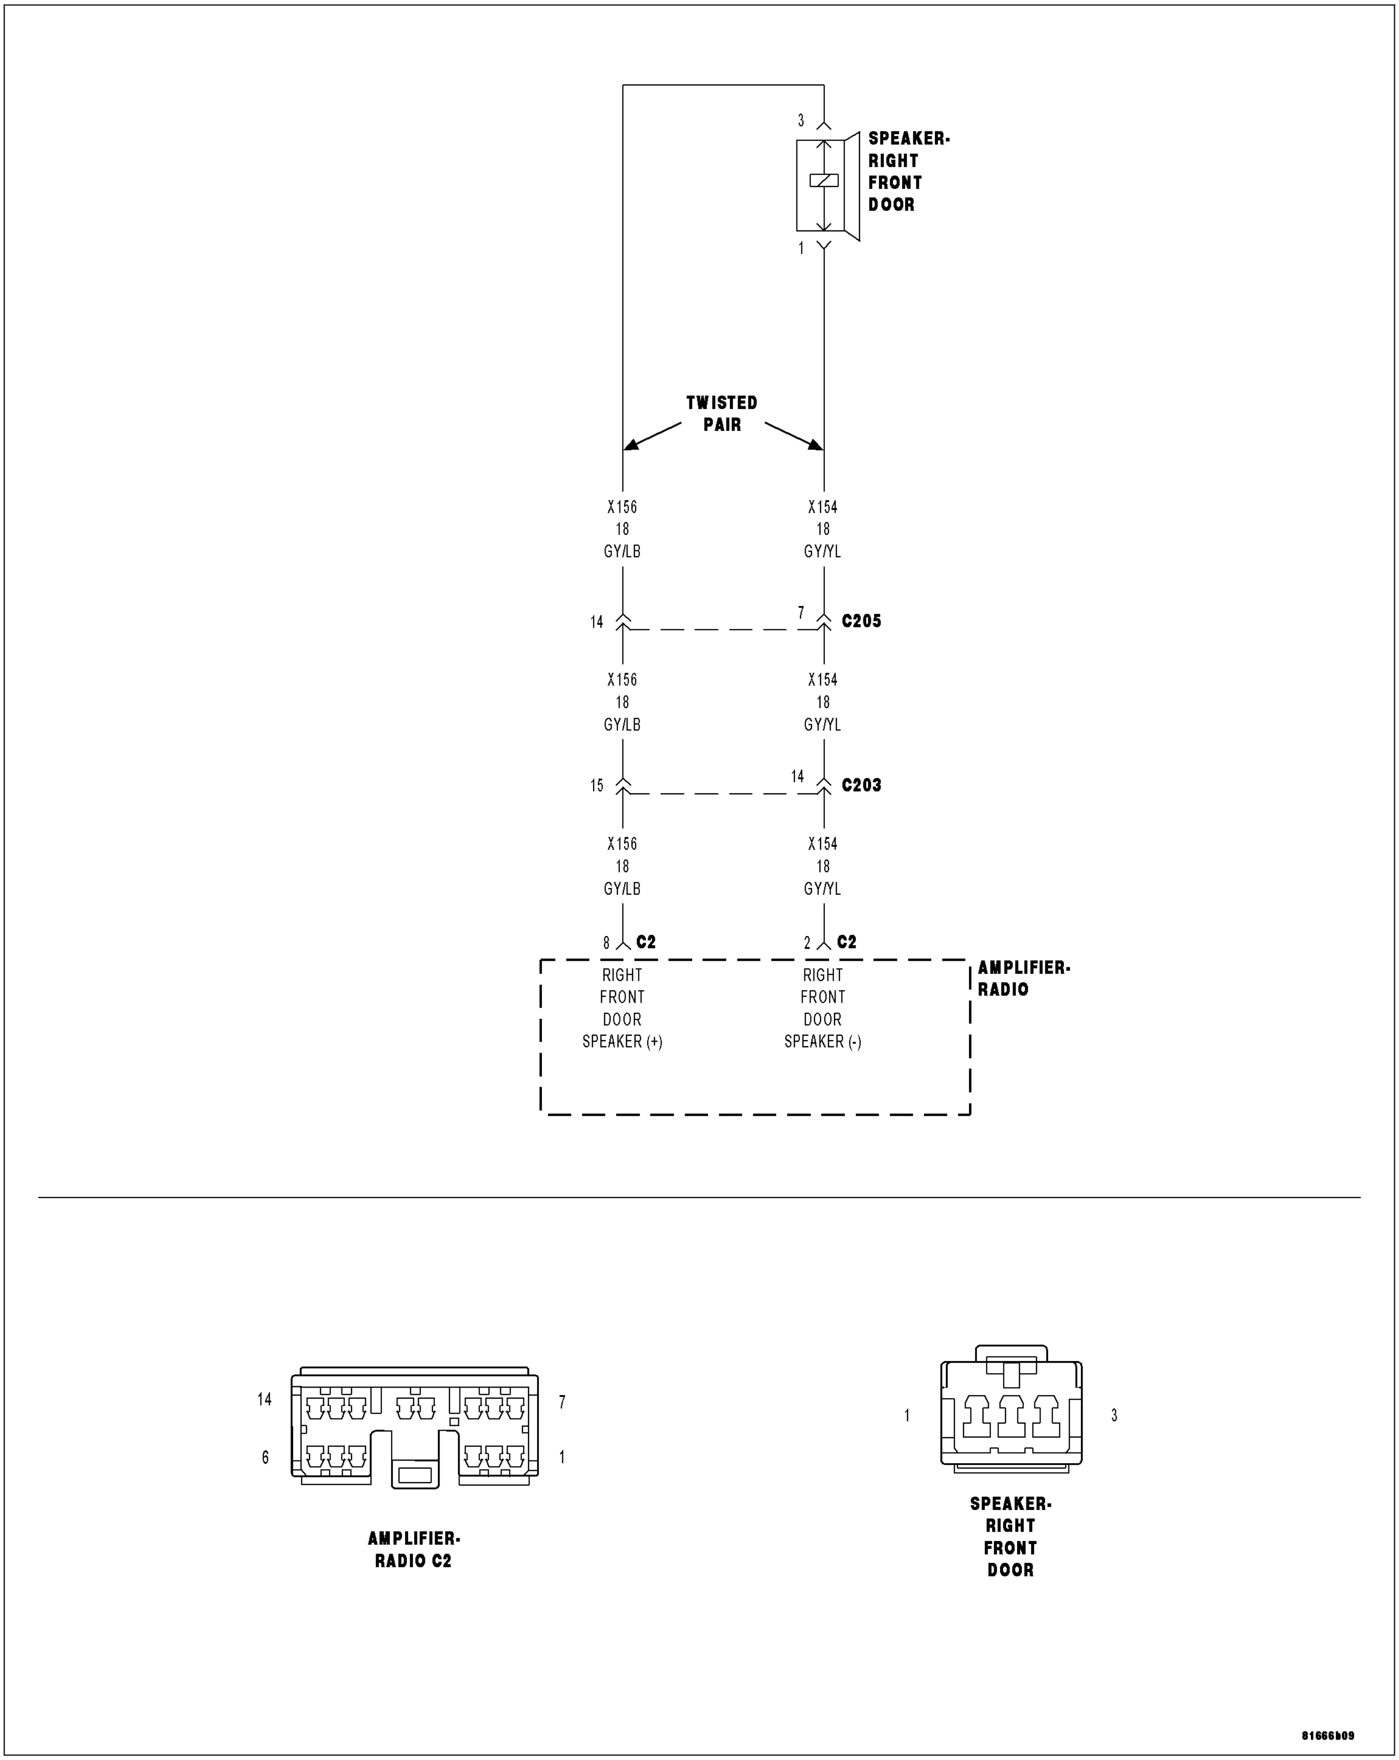
Is the voltage above 10.0 volts?

Yes >> Repair the (X154) Amplified Right Front Door Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK FOR VOLTAGE ON THE (X156) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT

Measure for voltage on the (X156) Amplified Right Front Door Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X156) Amplified Right Front Door Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.
- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X154) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT OPEN
(X156) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT OPEN
RIGHT FRONT DOOR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

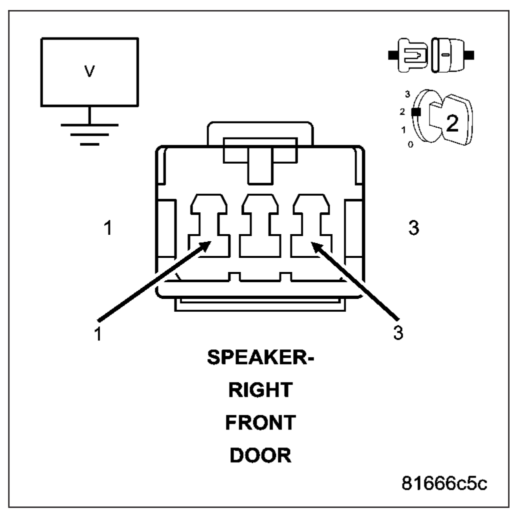
With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2



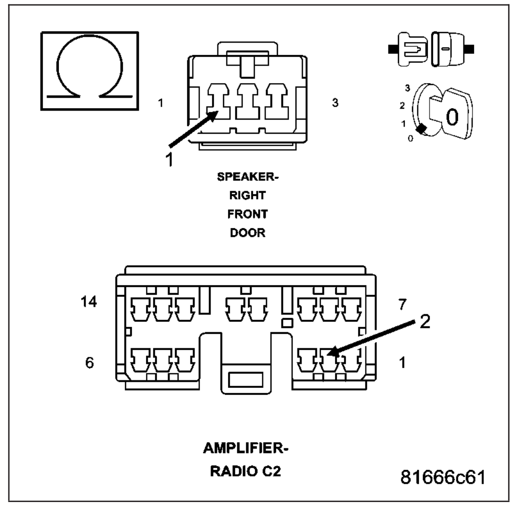
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE RIGHT FRONT DOOR SPEAKER

Disconnect the Right Front Door Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Front Door Speaker circuits in the Amplified Right Front Door Speaker harness connector.



Is the voltage present greater than 1 volt?

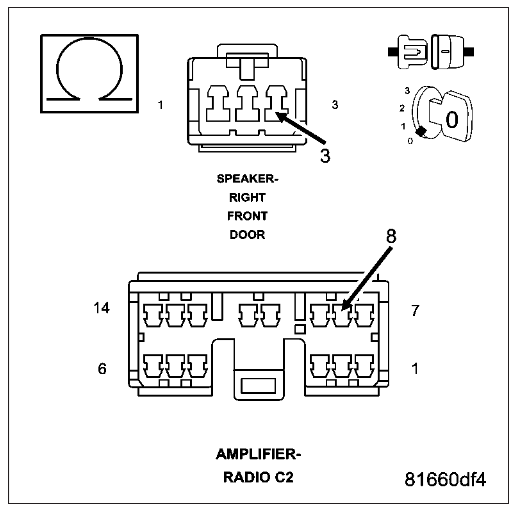
Yes >> Replace the Amplified Right Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK THE (X154) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.



Measure the resistance of the (X154) Amplified Right Front Door Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right Front Door Speaker harness connector.

Is the resistance below 5.0 ohms?

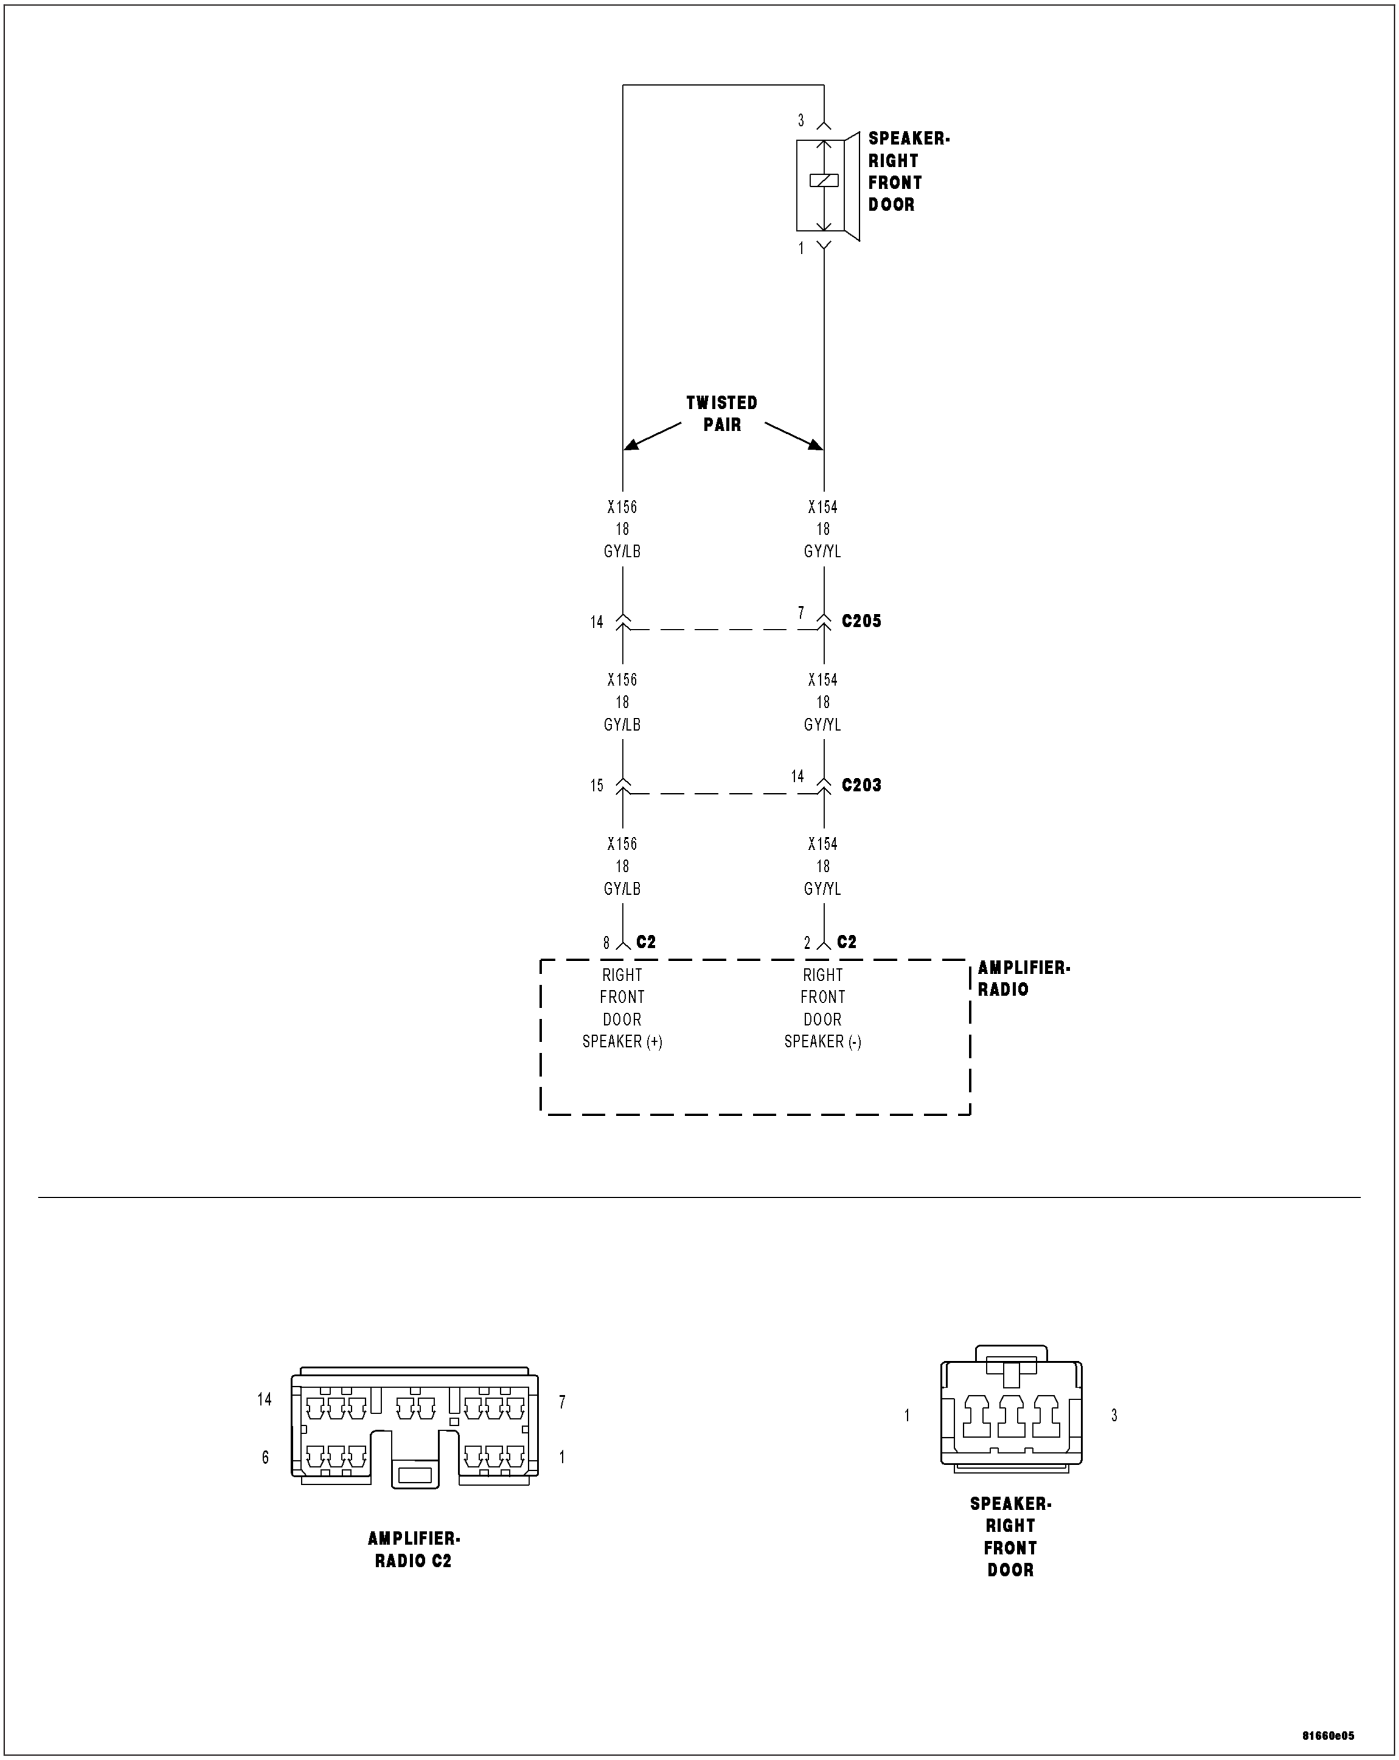
Yes >> Go To 4

No >> Repair the (X154) Amplified Right Front Door Speaker (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

4. CHECK THE (X156) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.



Measure the resistance of the (X156) Amplified Right Front Door Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right Front Door Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X156) Amplified Right Front Door Speaker (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X154) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X156) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT
AMPLIFIED RIGHT FRONT DOOR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

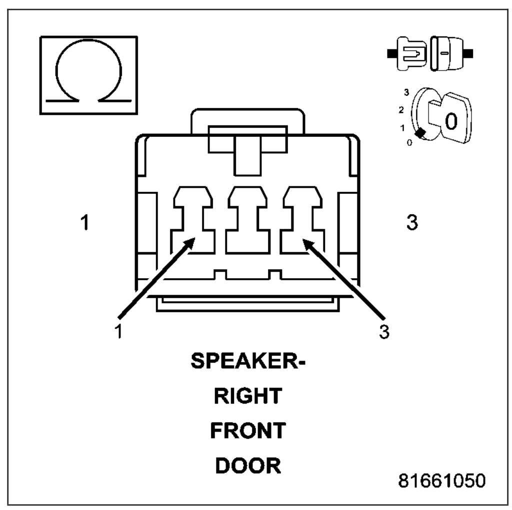
With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?



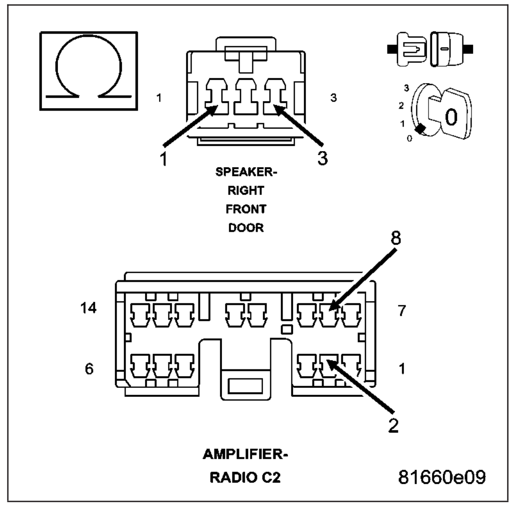
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT DOOR SPEAKER

Disconnect the Amplified Right Front Door Speaker.

Measure the resistance of the speaker between the two terminals.



Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Right Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK THE (X154) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT, AND THE (X156) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X154) Amplified Right Front Door Speaker (+) circuit, and the (X156) Amplified Right Front Door Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X154) Amplified Right Front Door Speaker (+) circuit, and the (X156) Amplified Right Front Door Speaker (-) circuit for a short together.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

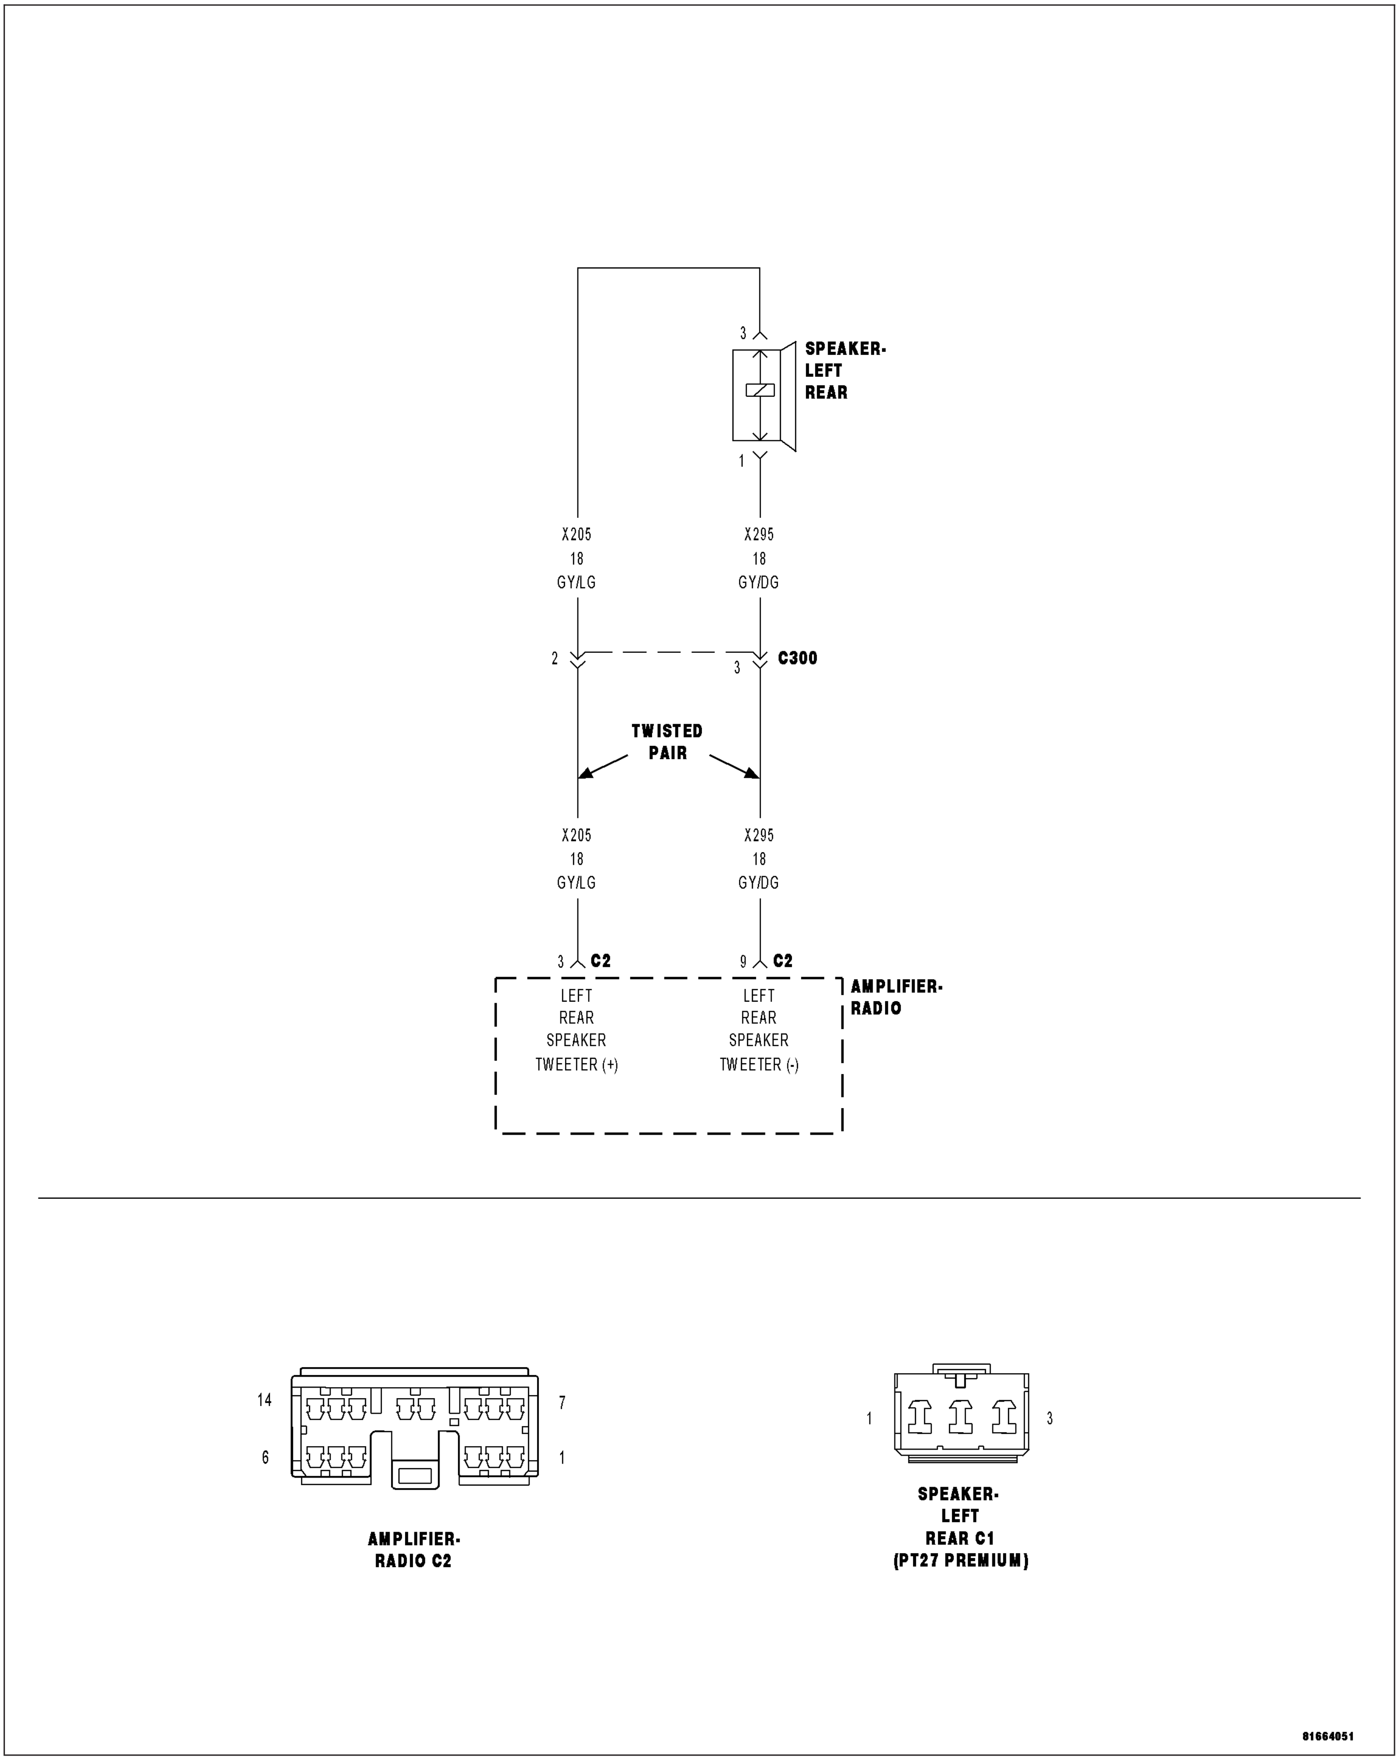
Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?



Yes >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT REAR SHELF SPEAKER
AMPLIFIER

Diagnostic Test

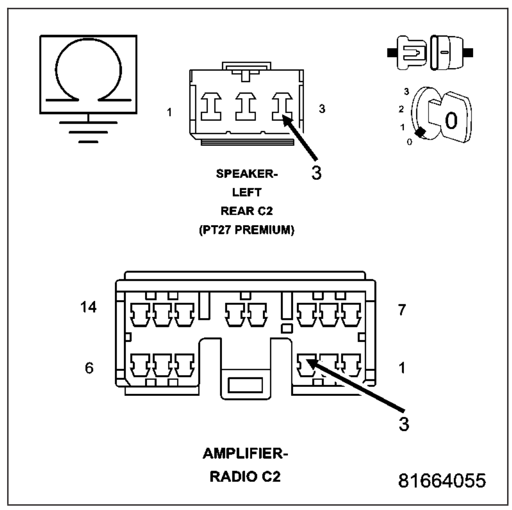
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2



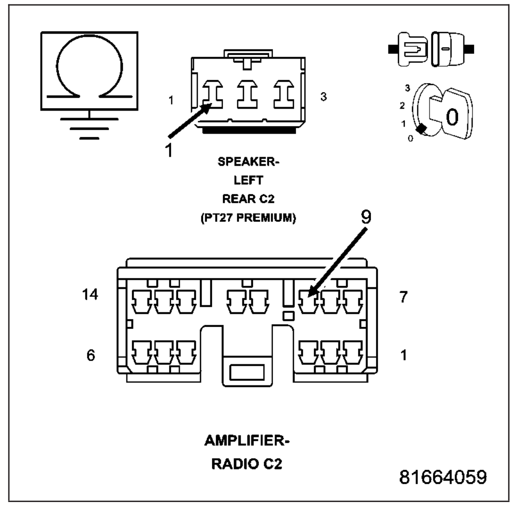
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C2 harness connector.

Disconnect the Left Rear Shelf Speaker harness connector.

Measure the resistance between ground and the (X205) Amplified Left Rear Shelf Speaker (+) circuit.



Is the resistance below 10K ohms?

Yes >> Repair the (X205) Amplified Left Rear Shelf Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

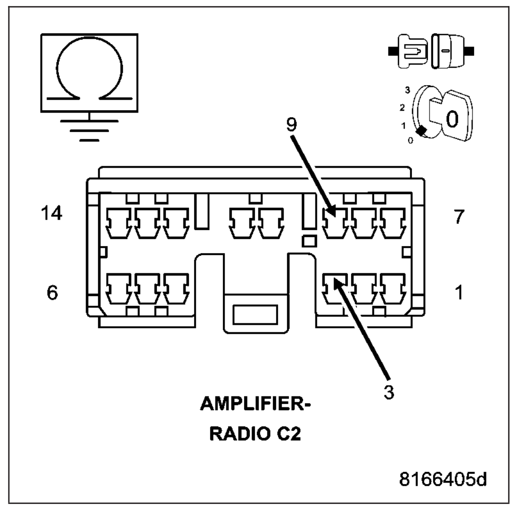
No >> Go To 3

3. CHECK THE (X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X295) Amplified Left Rear Shelf Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X295) Amplified Left Rear Shelf Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.



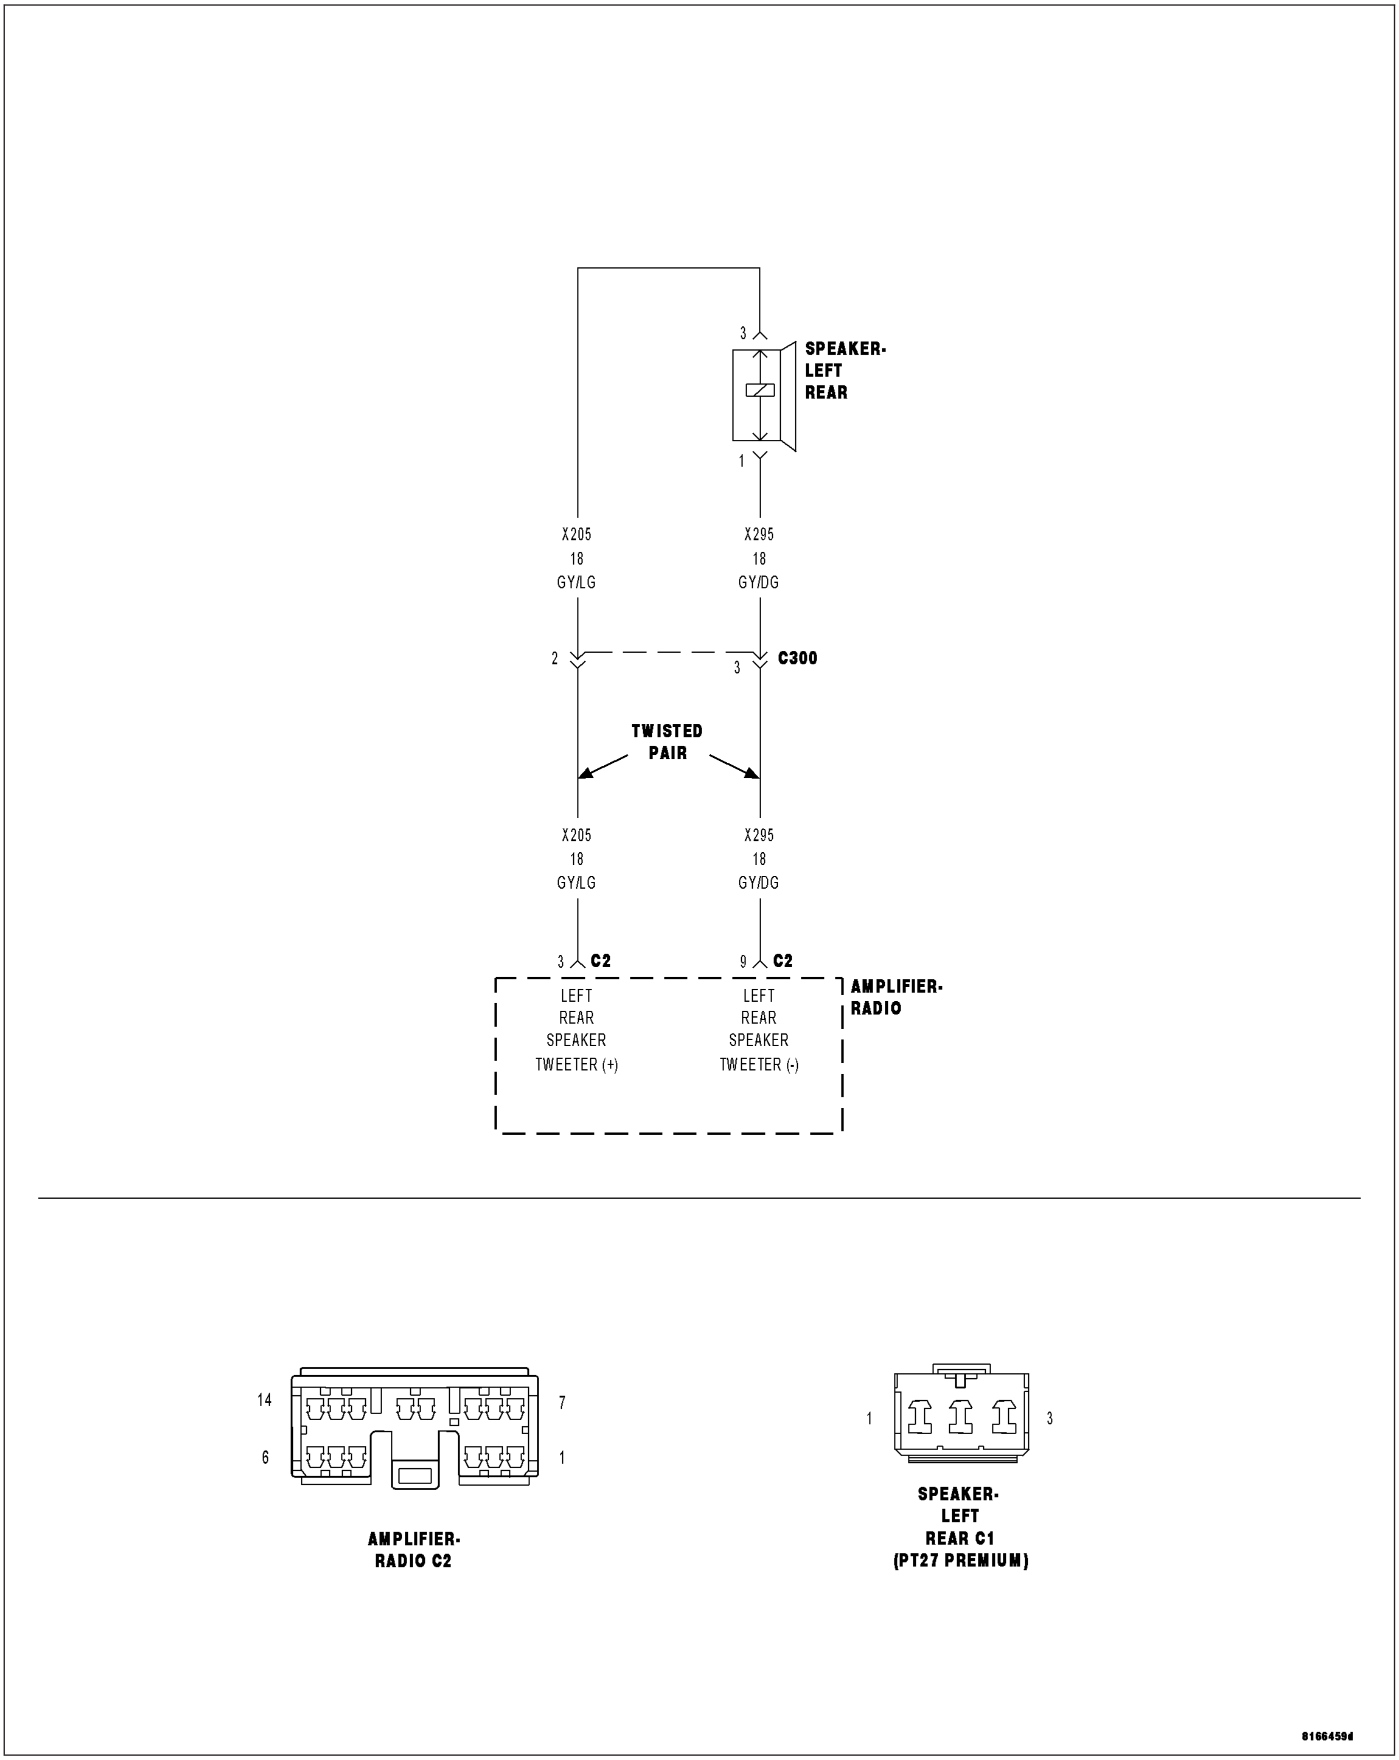
No >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED LEFT REAR SHELF SPEAKER

Turn the ignition off.

Reconnect and reinstall the Left Rear Shelf Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground..



Is the resistance below 10K ohms?

Yes >> Replace the Left Rear Shelf Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

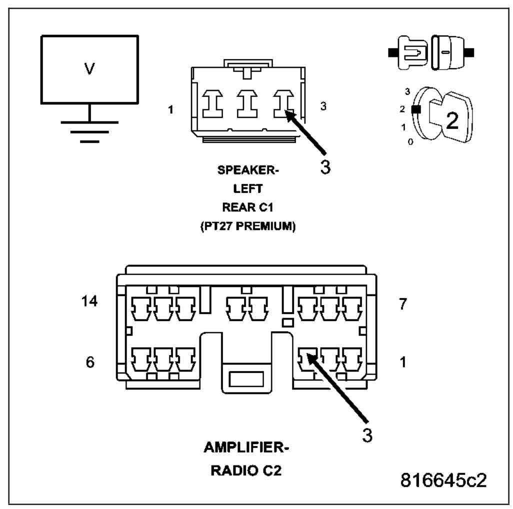
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT



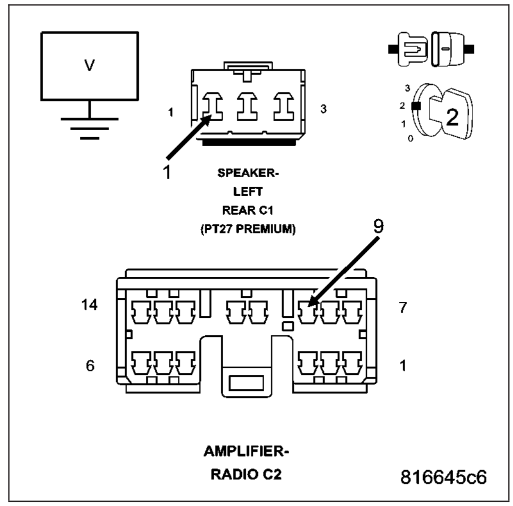
Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Left Rear Shelf Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X205) Amplified Left Rear Shelf Speaker (+) circuit.



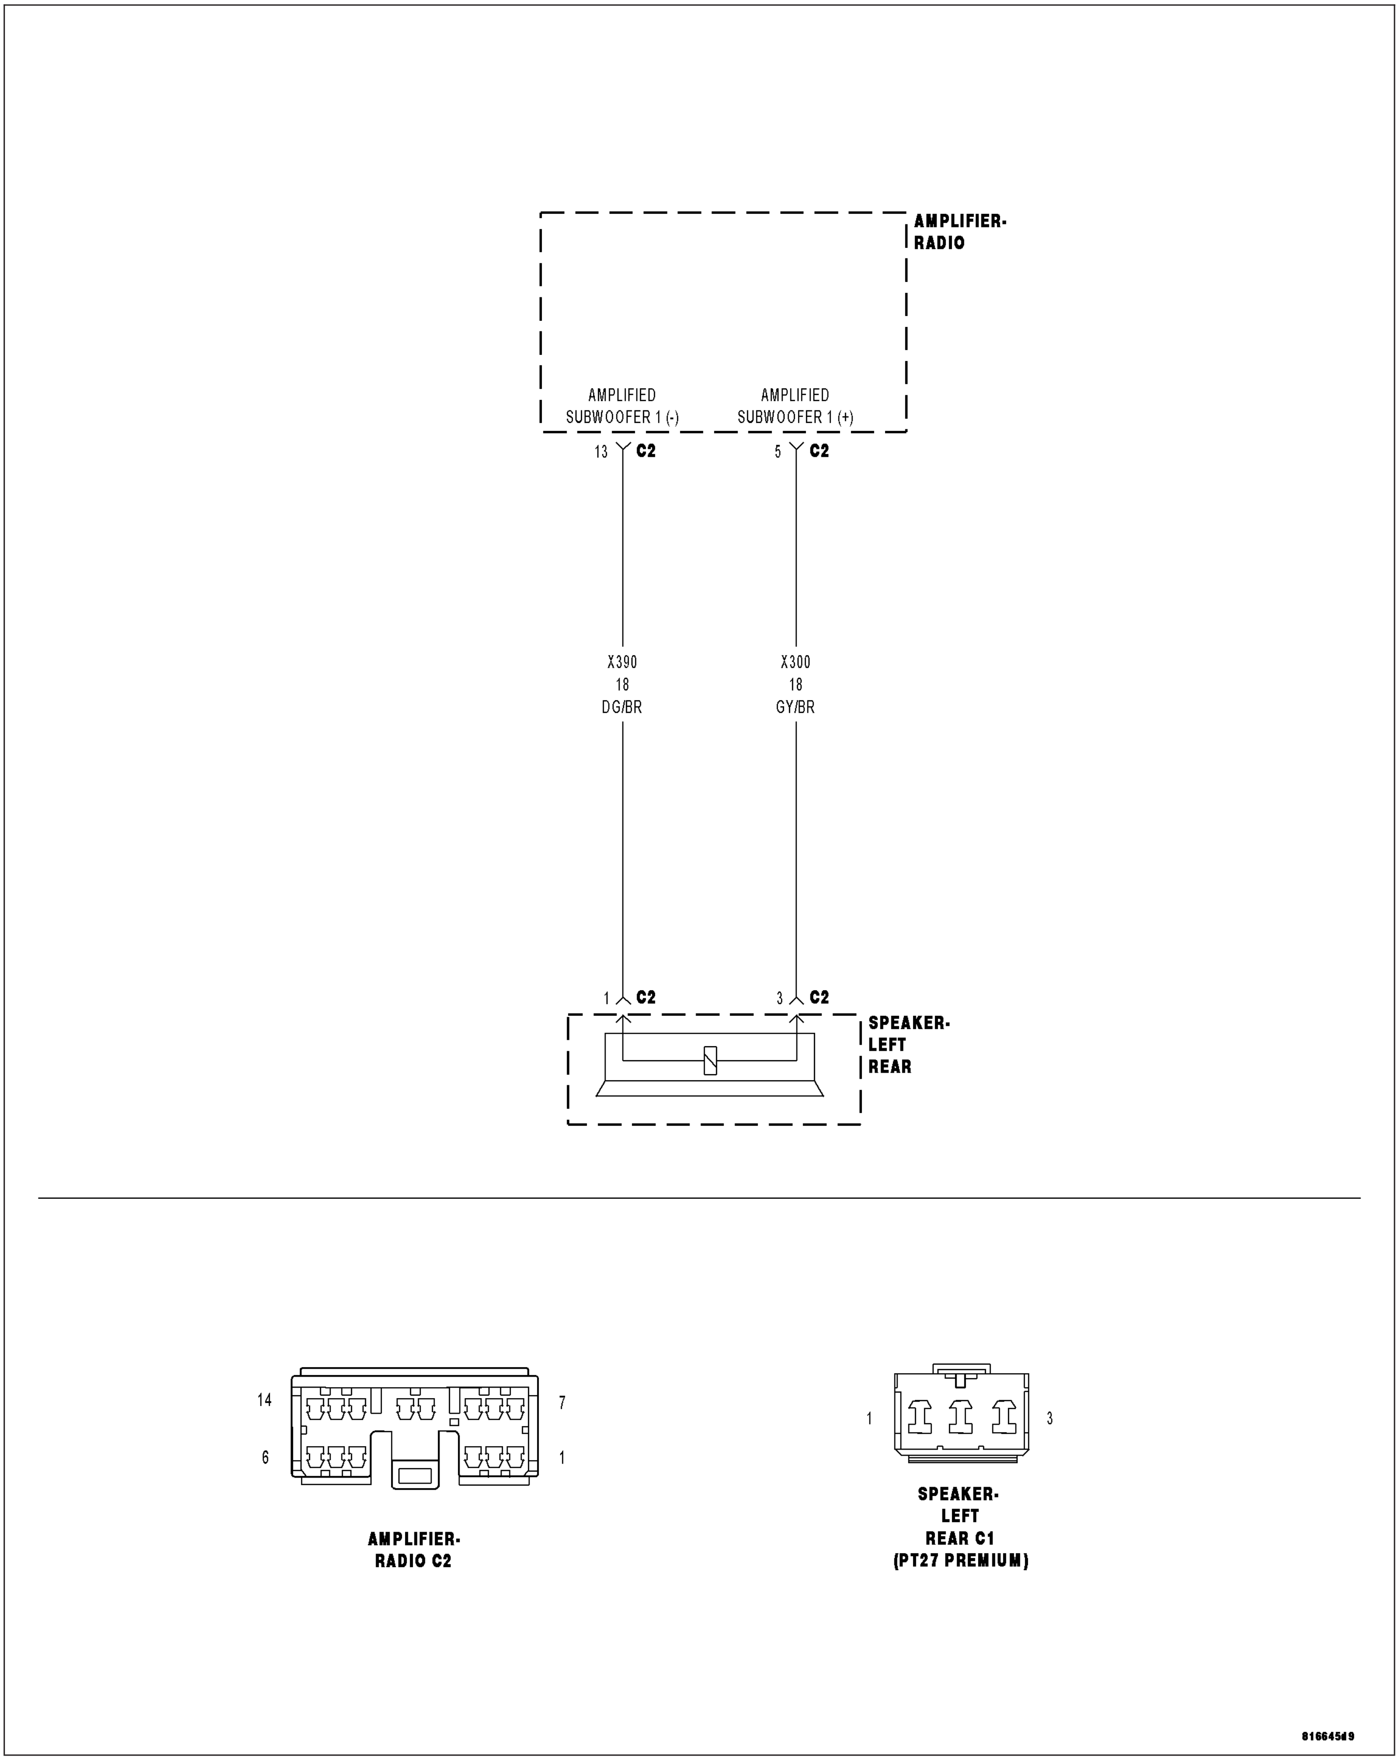
Is the voltage above 10.0 volts?

Yes >> Repair the (X205) Amplified Left Rear Shelf Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK FOR VOLTAGE ON THE (X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUIT

Measure for voltage on the (X295) Amplified Left Rear Shelf Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X295) Amplified Left Rear Shelf Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

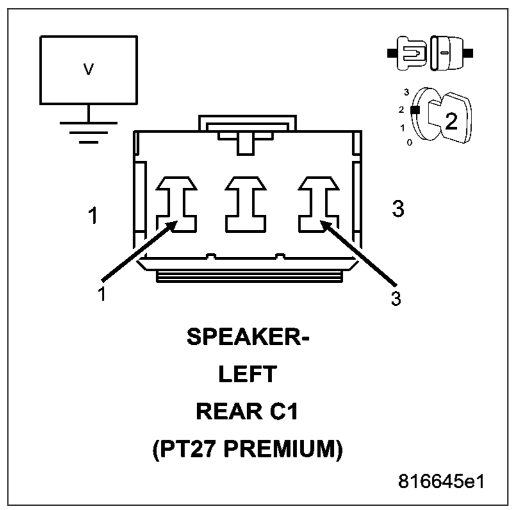
- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.
- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT OPEN
(X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUIT OPEN
LEFT REAR SHELF SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.
Turn the radio on.
With the scan tool, erase Amplifier DTCs.
With the scan tool, reset the amplifier.
With the scan tool, read Amplifier DTCs.



Does the scan tool display active: B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

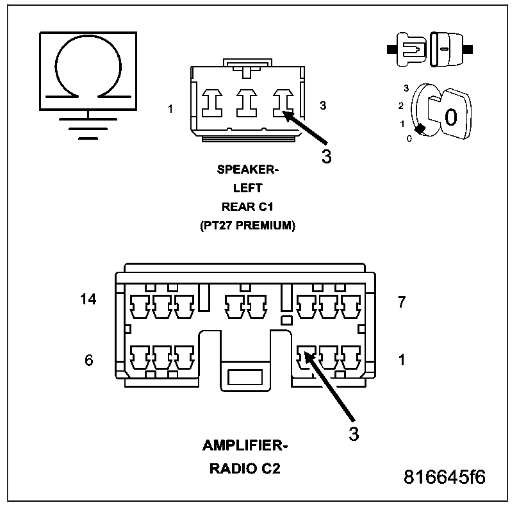
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE LEFT REAR SHELF SPEAKER

Disconnect the Left Rear Shelf Speaker harness connector.
Turn the radio on and turn the volume to mid level.
With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Shelf Speaker circuits in the Amplified Left Rear Shelf Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Left Rear Shelf Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.



No >> Go To 3

3. CHECK THE (X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

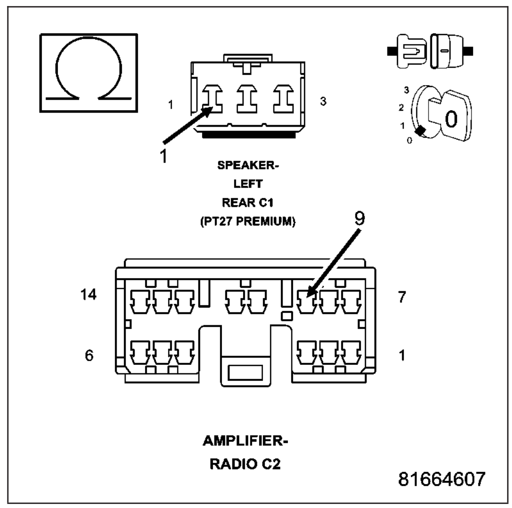
Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X205) Amplified Left Rear Shelf Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Shelf Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X205) Amplified Left Rear Shelf Speaker (+) circuit for an open.



Perform BODY VERIFICATION TEST VER-1.

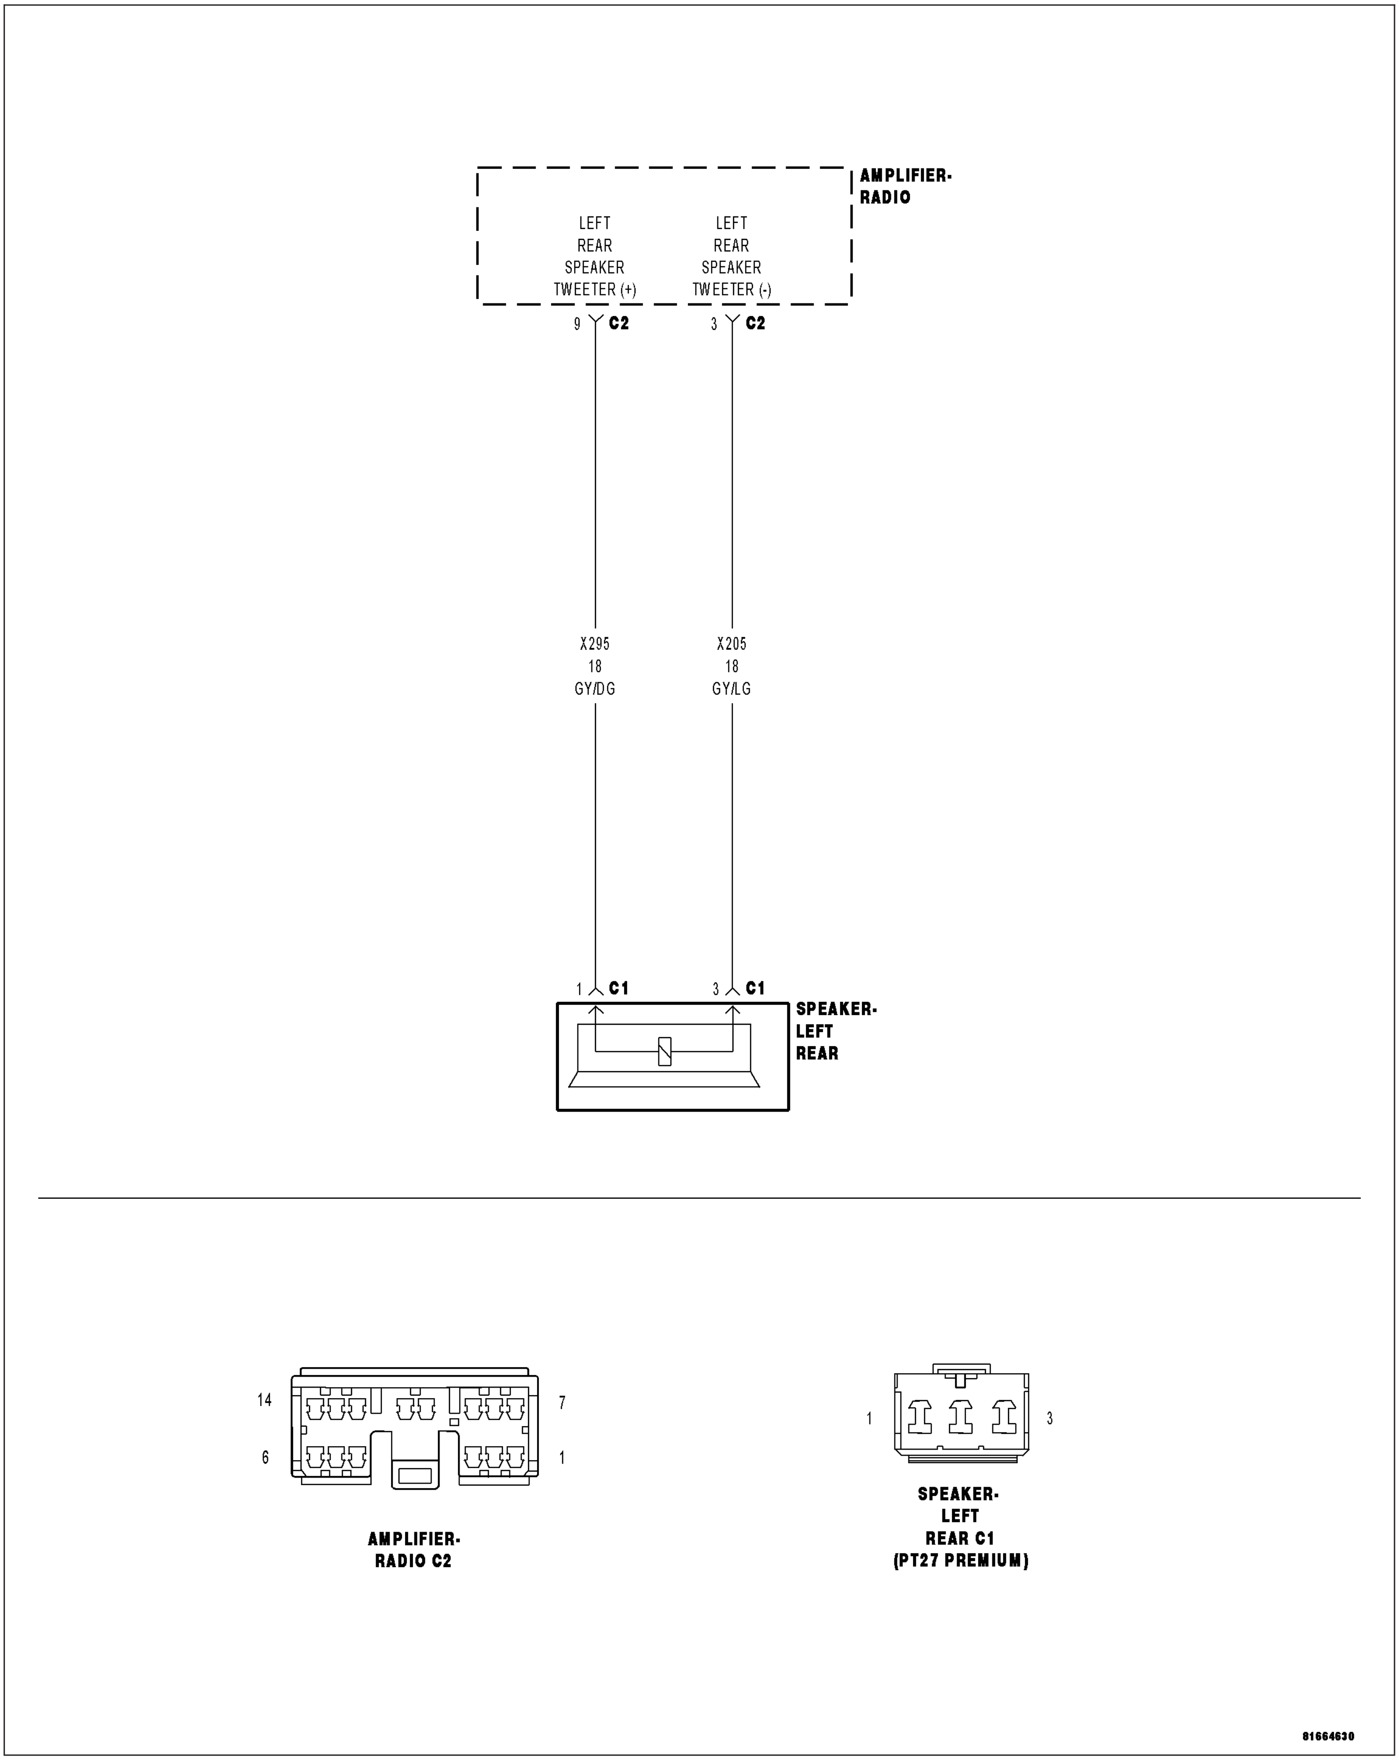
4. CHECK THE (X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X295) Amplified Left Rear Shelf Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left Rear Shelf Speaker harness connector.

Is the resistance below 5.0 ohms?



Yes >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X295) Amplified Left Rear Shelf Speaker (-) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT SHORTED TO THE (X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUIT
AMPLIFIED LEFT REAR SHELF SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

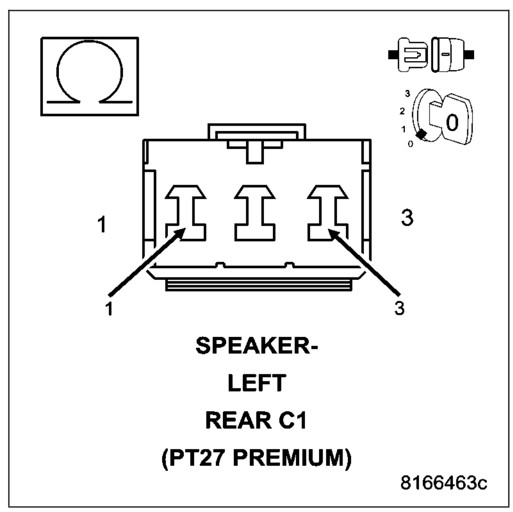
With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?



Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

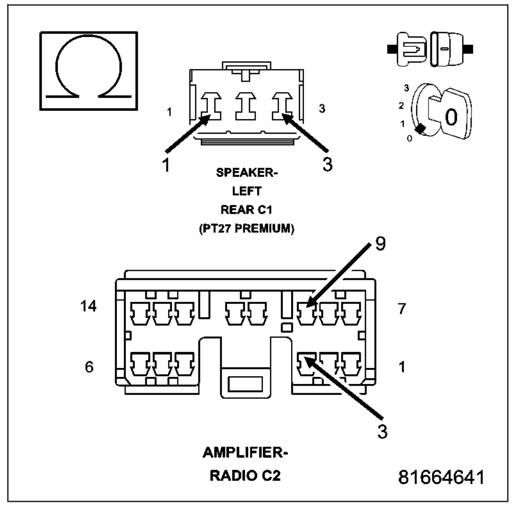
2. CHECK THE OPERATION OF THE AMPLIFIED LEFT REAR SHELF SPEAKER

Disconnect the Amplified Left Rear Shelf Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Left Rear Shelf Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.



No >> Go To 3

3. CHECK THE (X205) AMPLIFIED LEFT REAR SHELF SPEAKER (+) CIRCUIT, AND THE (X295) AMPLIFIED LEFT REAR SHELF SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X205) Amplified Left Rear Shelf Speaker (+) circuit, and the (X295) Amplified Left Rear Shelf Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X205) Amplified Left Rear Shelf Speaker (+) circuit, and the (X295) Amplified Left Rear Shelf Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

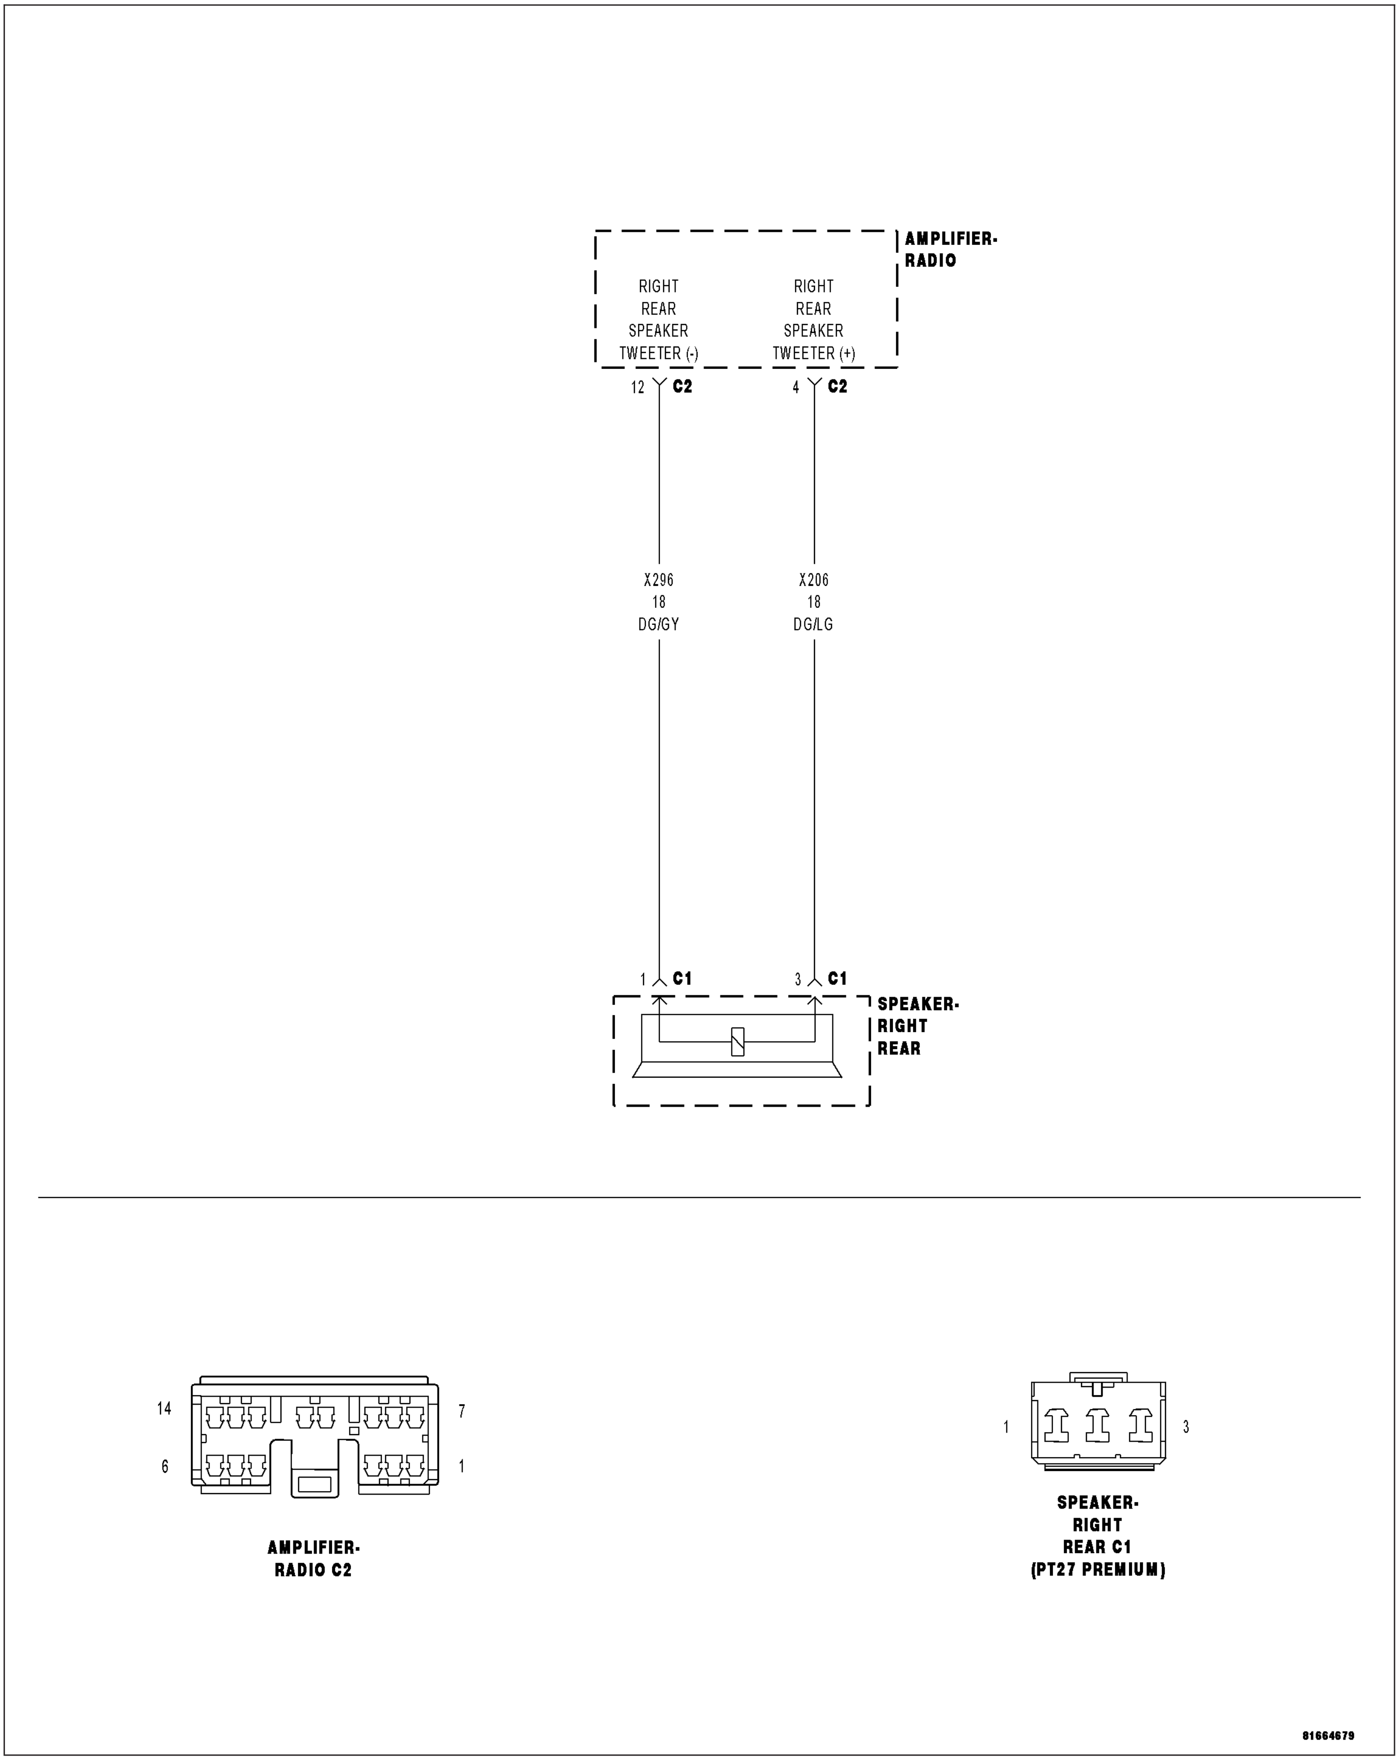
Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?



Yes >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X206) AMPLIFIED RIGHT REAR SHELF SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X296) AMPLIFIED RIGHT REAR SHELF SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT REAR SHELF SPEAKER
AMPLIFIER

Diagnostic Test

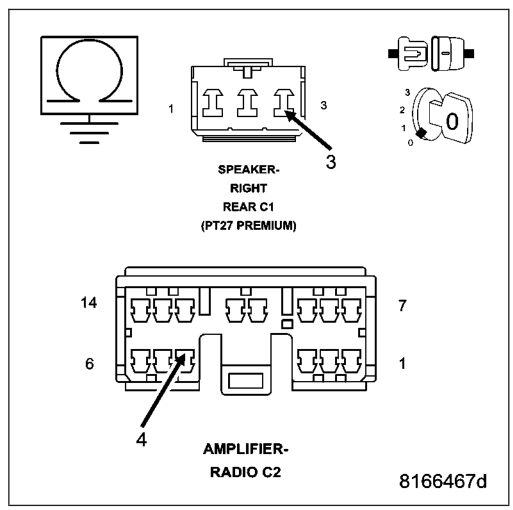
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2



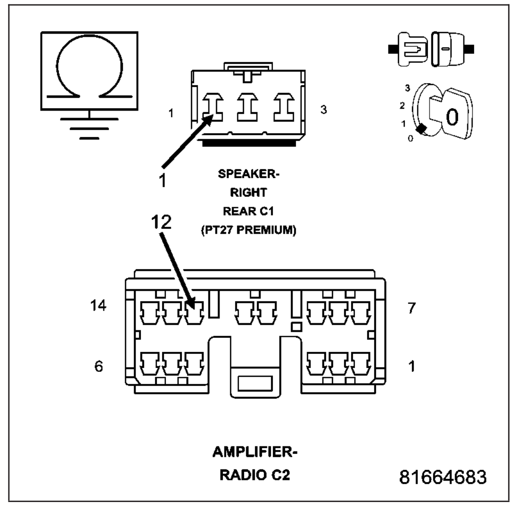
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X206) AMPLIFIED RIGHT REAR SHELF SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C2 harness connector.

Disconnect the Right Rear Shelf Speaker harness connector.

Measure the resistance between ground and the (X206) Amplified Right Rear Shelf Speaker (+) circuit.



Is the resistance below 10K ohms?

Yes >> Repair the (X206) Amplified Right Rear Shelf Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

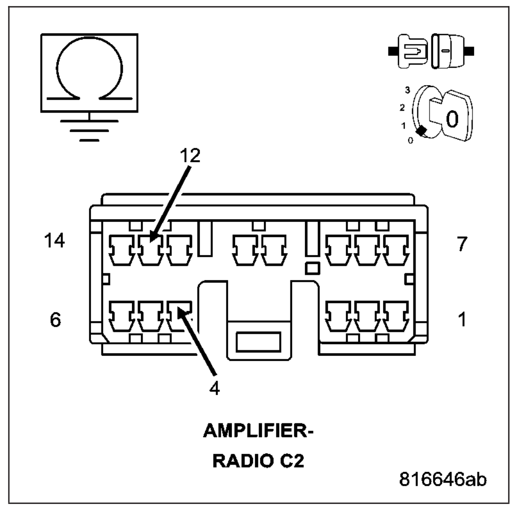
No >> Go To 3

3. CHECK THE (X296) AMPLIFIED RIGHT REAR SHELF SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X296) Amplified Right Rear Shelf Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X296) Amplified Right Rear Shelf Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.



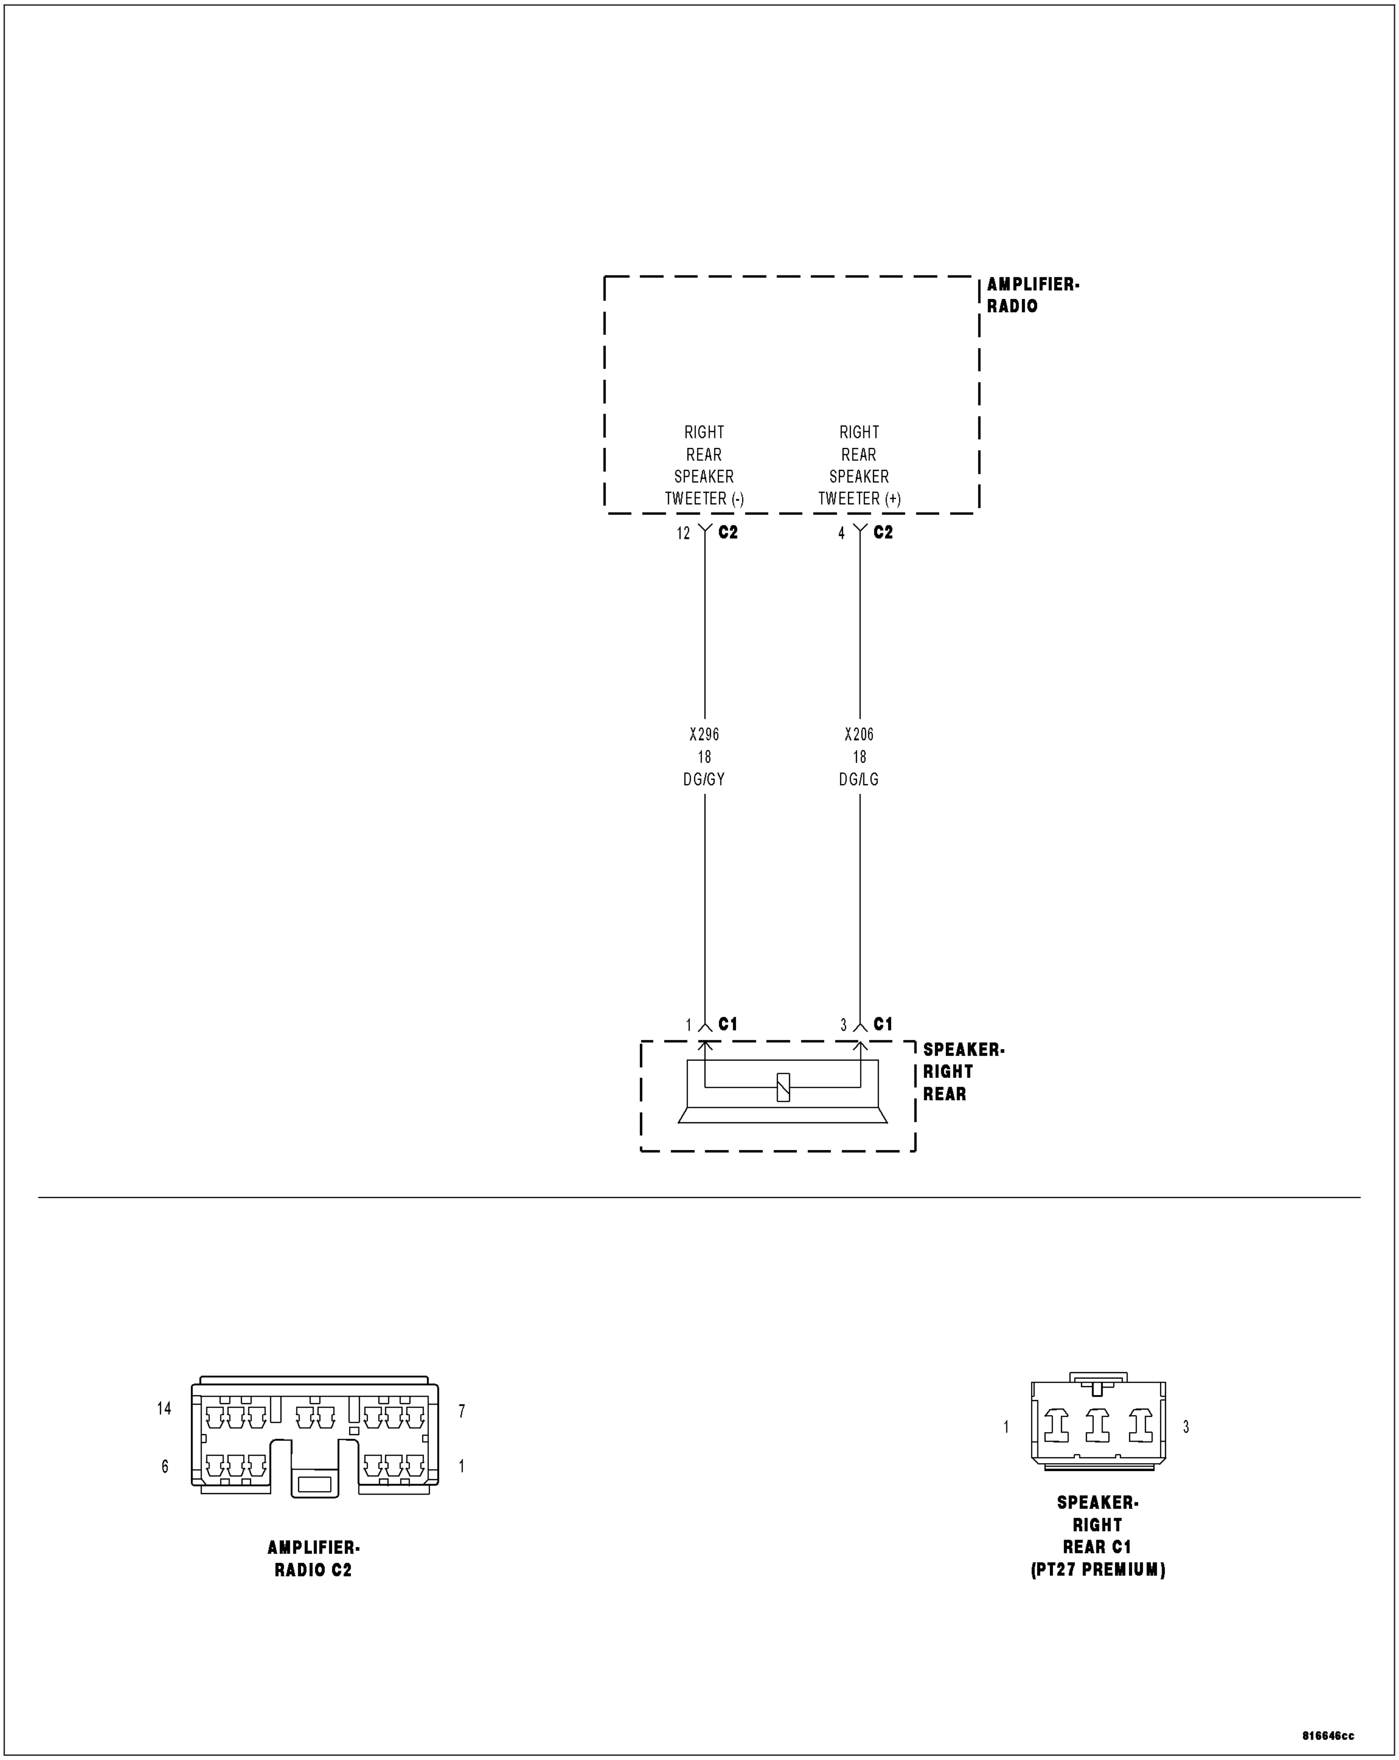
No >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED RIGHT REAR SHELF SPEAKER

Turn the ignition off.

Reconnect and reinstall the Right Rear Shelf Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground..



Is the resistance below 10K ohms?

Yes >> Replace the Right Rear Shelf Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X206) AMPLIFIED RIGHT REAR SHELF SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X296) AMPLIFIED RIGHT REAR SHELF SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

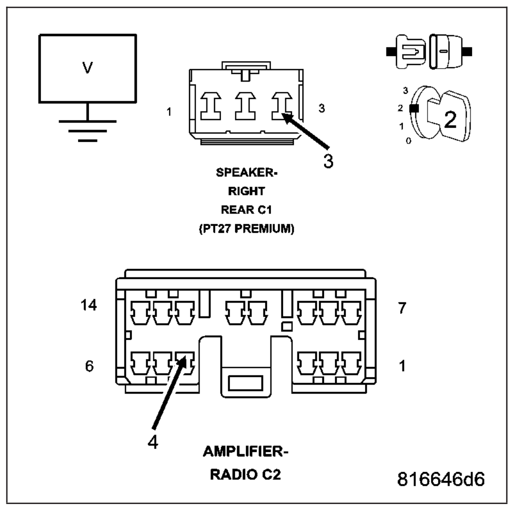
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X206) AMPLIFIED RIGHT REAR SHELF SPEAKER (+) CIRCUIT



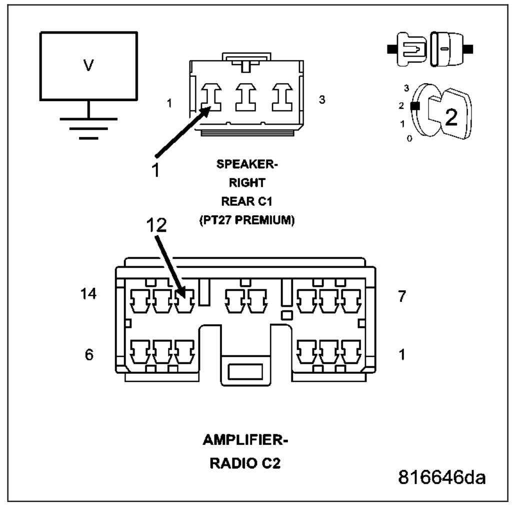
Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Right Rear Shelf Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X206) Amplified Right Rear Shelf Speaker (+) circuit.



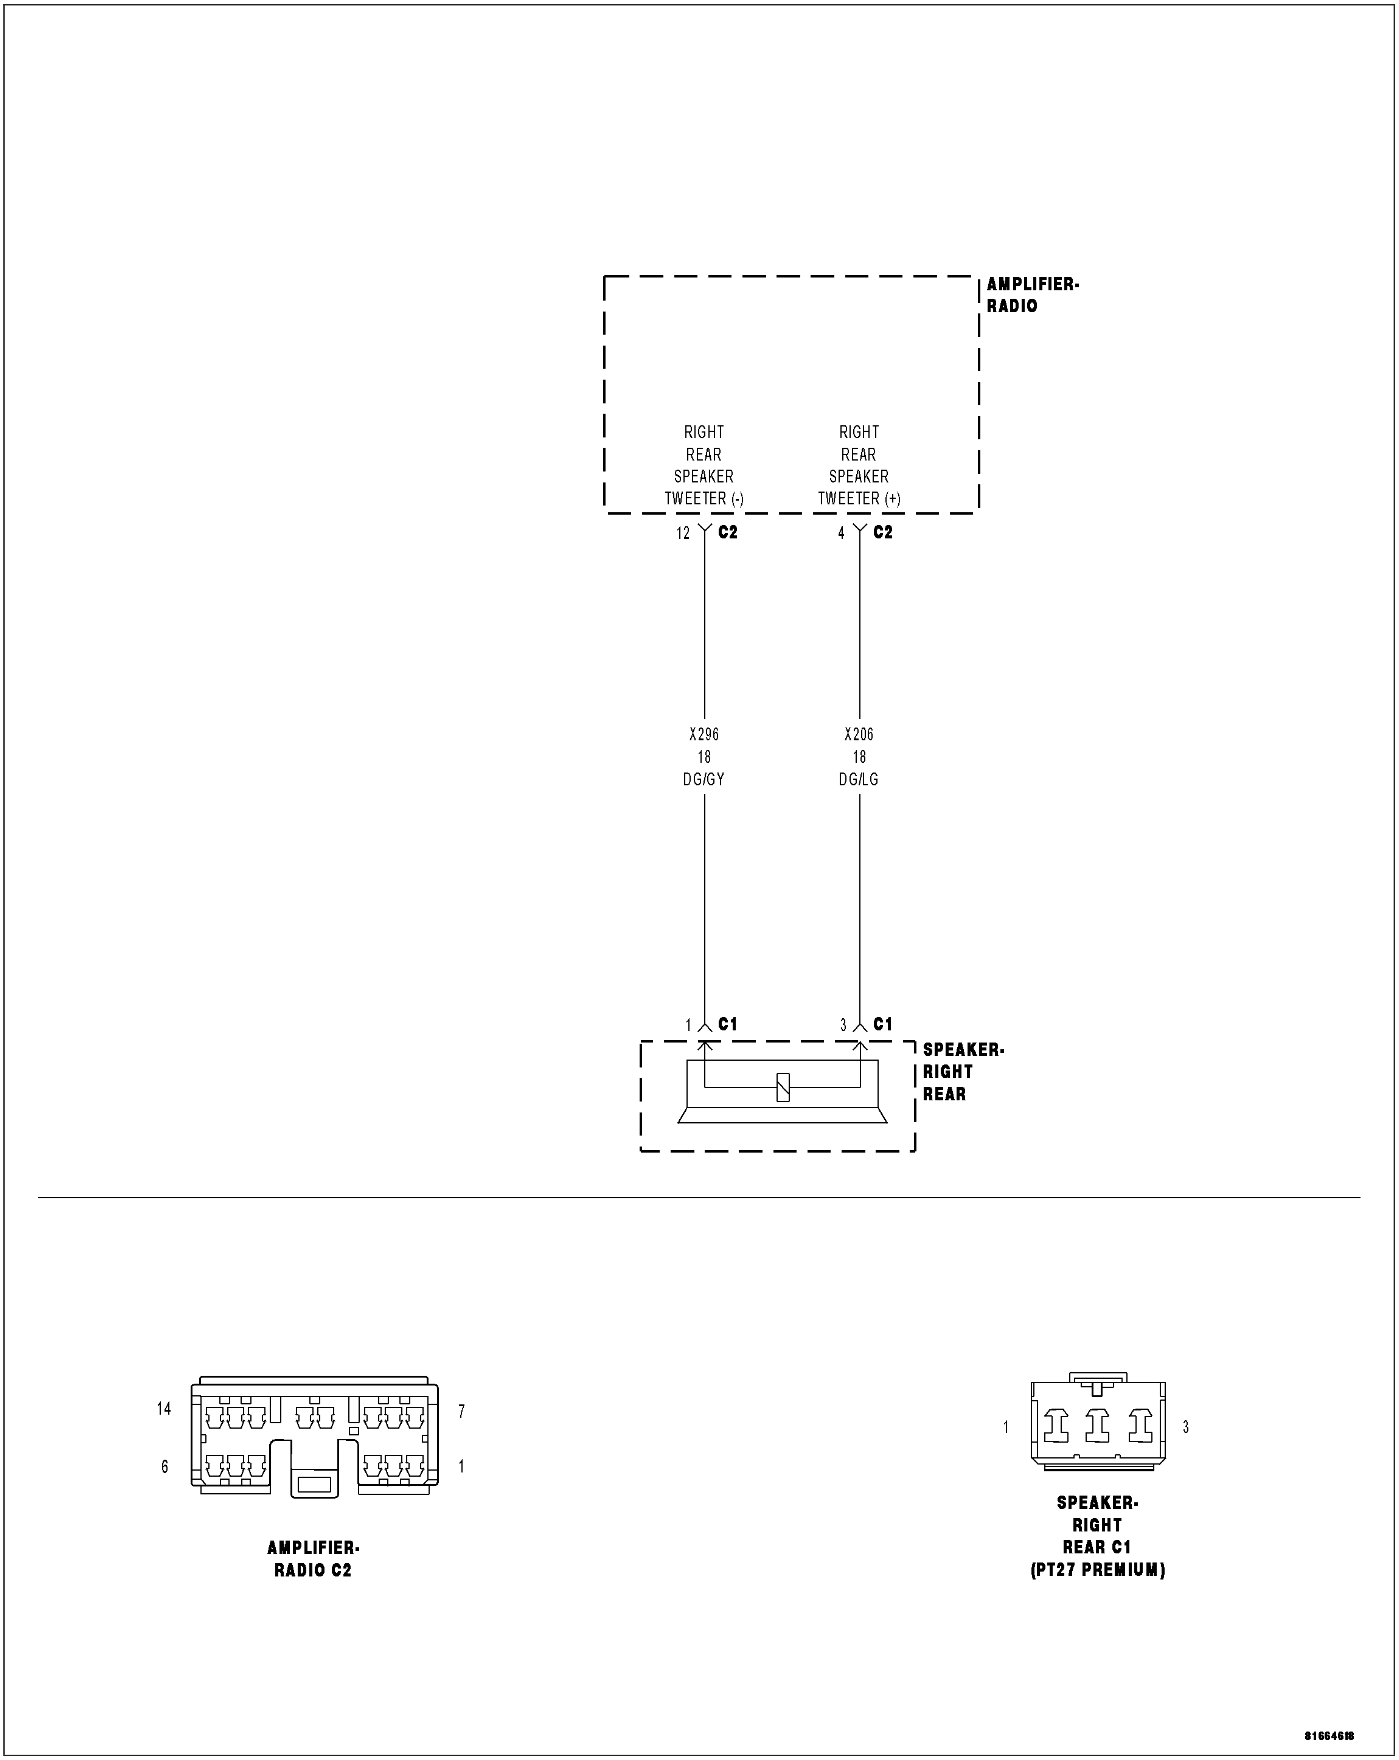
Is the voltage above 10.0 volts?

Yes >> Repair the (X206) Amplified Right Rear Shelf Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK FOR VOLTAGE ON THE (X296) AMPLIFIED RIGHT REAR SHELF SPEAKER (-) CIRCUIT

Measure for voltage on the (X296) Amplified Right Rear Shelf Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X296) Amplified Right Rear Shelf Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Amplifier BUS wake-up. Amplifier reset with scan tool.
- **Set Condition:**
- The amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X206) AMPLIFIED RIGHT REAR SHELF SPEAKER (+) CIRCUIT OPEN
(X296) AMPLIFIED RIGHT REAR SHELF SPEAKER (-) CIRCUIT OPEN
RIGHT REAR SHELF SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.

Turn the radio on.

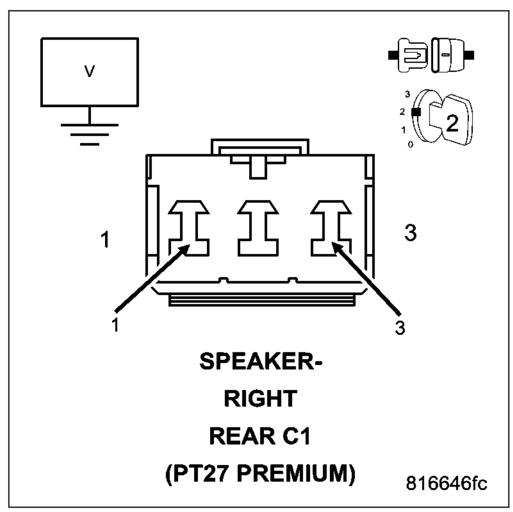
With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2



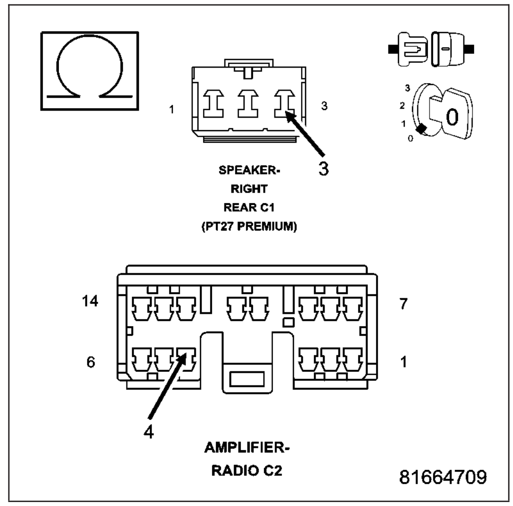
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE RIGHT REAR SHELF SPEAKER

Disconnect the Right Rear Shelf Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Rear Shelf Speaker circuits in the Amplified Right Rear Shelf Speaker harness connector.



Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Right Rear Shelf Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

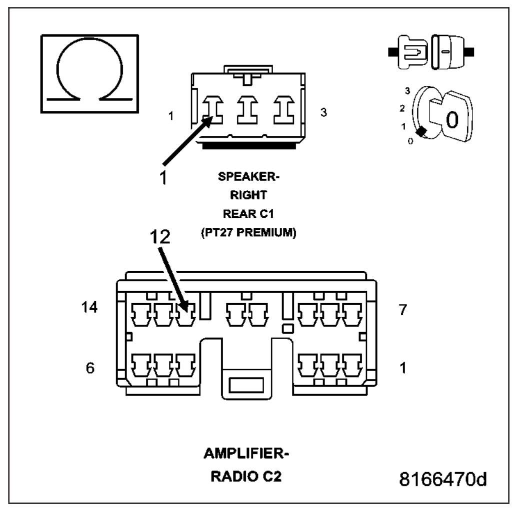
No >> Go To 3

3. CHECK THE (X206) AMPLIFIED RIGHT REAR SHELF SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X206) Amplified Right Rear Shelf Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right Rear Shelf Speaker harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X206) Amplified Right Rear Shelf Speaker (+) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

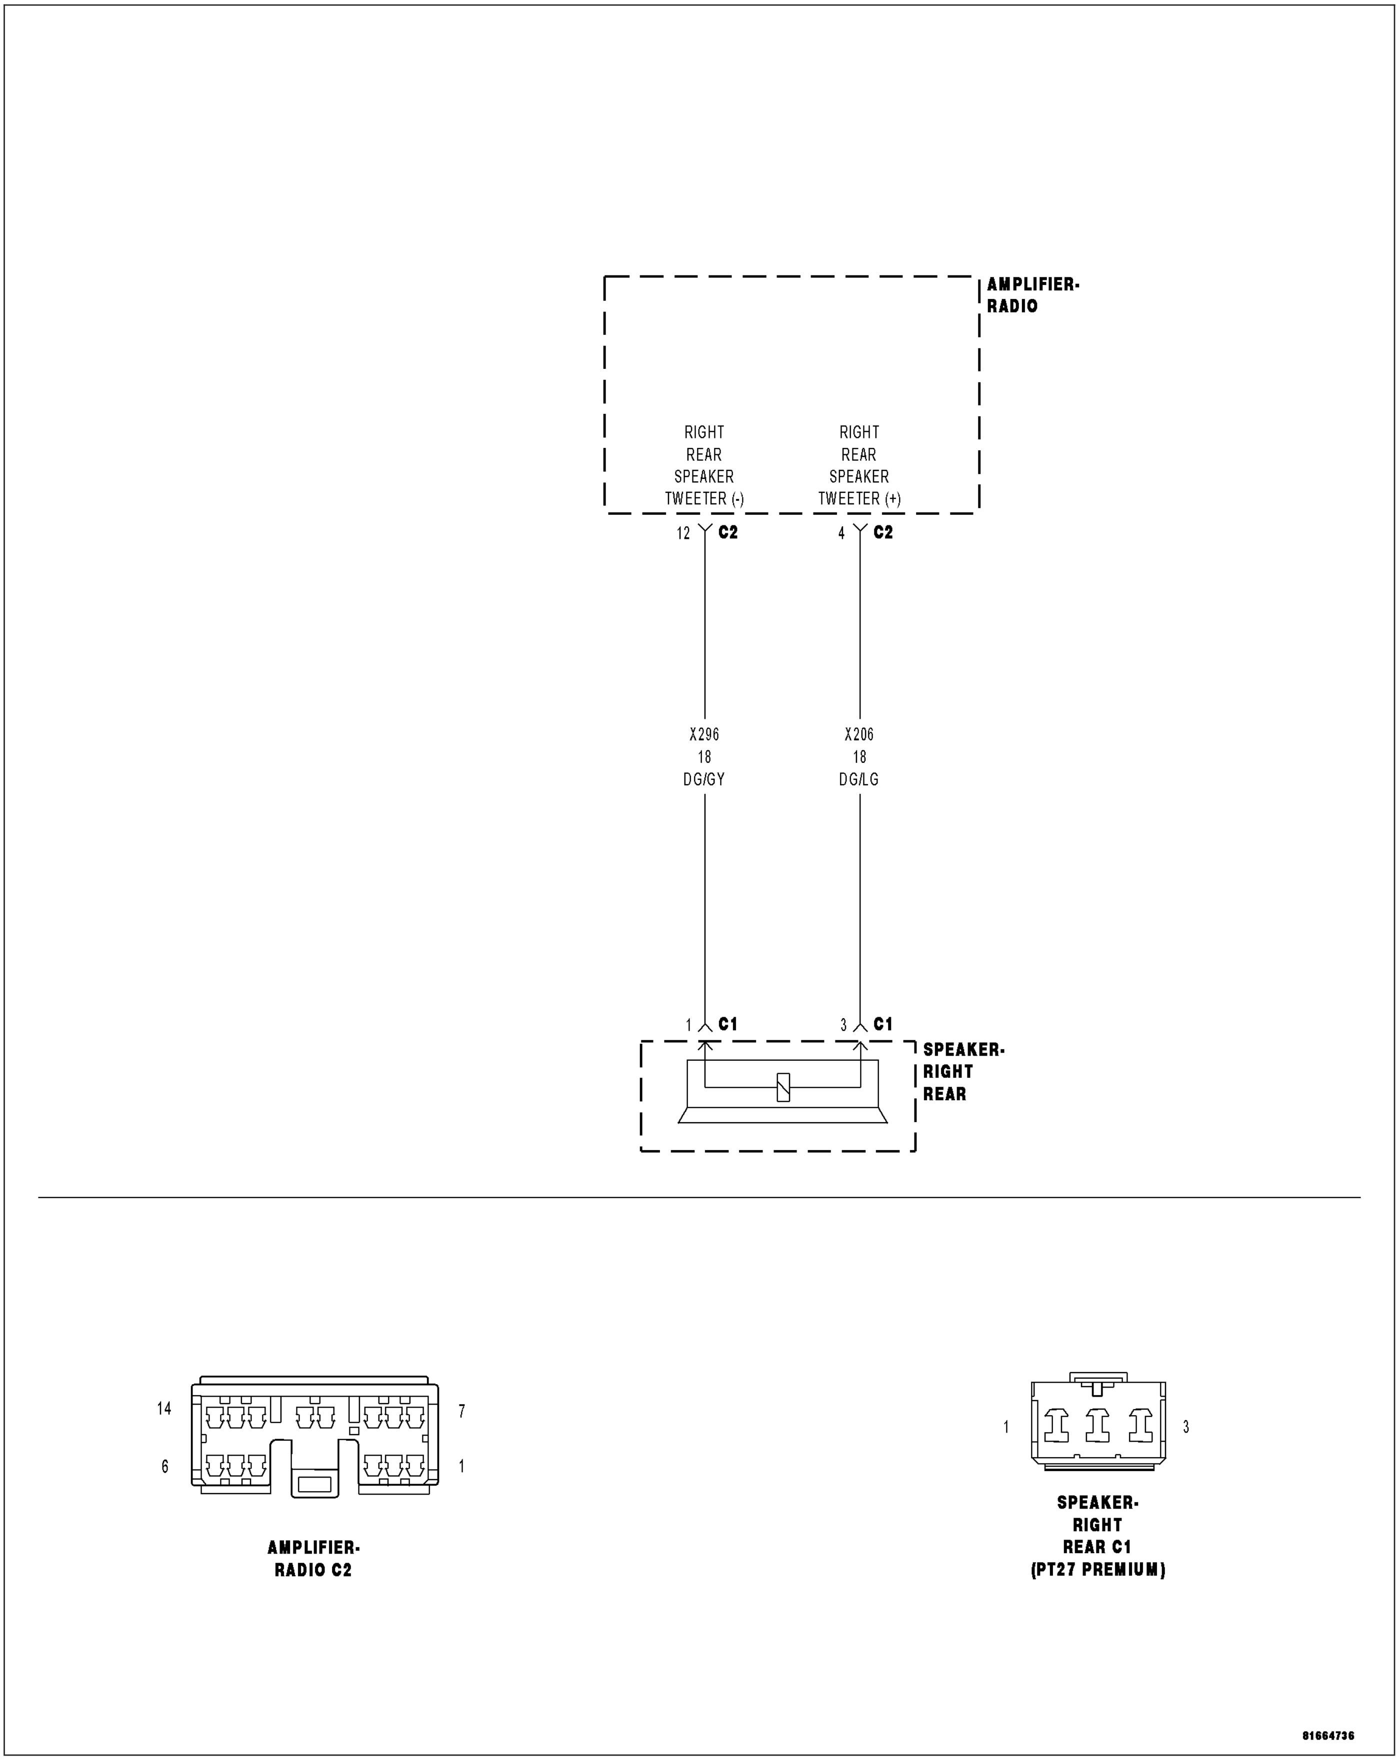
4. CHECK THE (X296) AMPLIFIED RIGHT REAR SHELF SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X296) Amplified Right Rear Shelf Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right Rear Shelf Speaker harness connector.

Is the resistance below 5.0 ohms?



Yes >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X296) Amplified Right Rear Shelf Speaker (-) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
- The amplifier detects that the output circuits are shorted together.

Possible Causes
(X206) AMPLIFIED RIGHT REAR SHELF SPEAKER (+) CIRCUIT SHORTED TO THE (X296) AMPLIFIED RIGHT REAR SHELF SPEAKER (-) CIRCUIT
AMPLIFIED RIGHT REAR SHELF SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

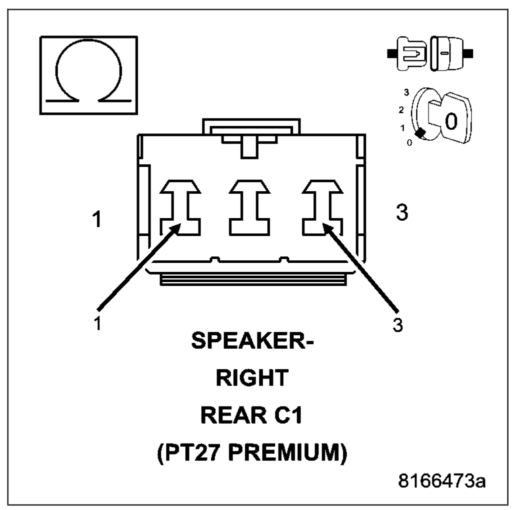
With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?



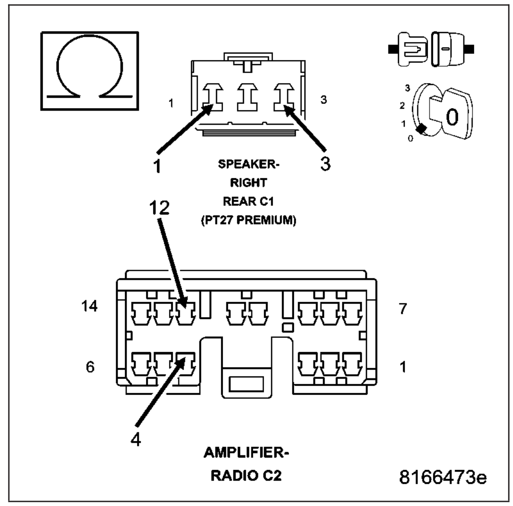
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT REAR SHELF SPEAKER

Disconnect the Amplified Right Rear Shelf Speaker.

Measure the resistance of the speaker between the two terminals.



Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Right Rear Shelf Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

3. CHECK THE (X206) AMPLIFIED RIGHT REAR SHELF SPEAKER (+) CIRCUIT, AND THE (X296) AMPLIFIED RIGHT REAR SHELF SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X206) Amplified Right Rear Shelf Speaker (+) circuit, and the (X296) Amplified Right Rear Shelf Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X206) Amplified Right Rear Shelf Speaker (+) circuit, and the (X296) Amplified Right Rear Shelf Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B2222-SATELLITE RADIO RECEIVER INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- The Satellite Radio Receiver detects a software checksum test failure.

Possible Causes
SATELLITE RADIO RECEIVER

Diagnostic Test

1. REPLACE THE SATELLITE RADIO RECEIVER

When this code is set, the Satellite Radio must be replaced.

Repair

Replace the Satellite Radio Receiver in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER 1.

U0019–CAN B BUS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Continuously.
- **Set Condition:**
- Whenever the CAN B BUS (+) or B BUS (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTCs IN THE TOTALLY INTEGRATED POWER MODULE
(D54) CAN B BUS (–) CIRCUIT OPEN
(D55) CAN B BUS (+) CIRCUIT OPEN
AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display: U0019–CAN B BUS CIRCUIT?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.

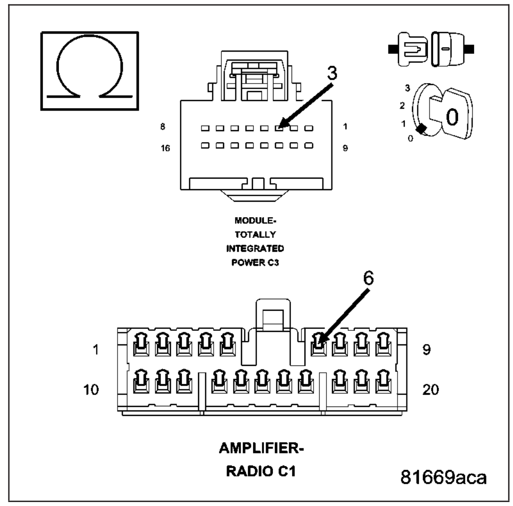
2. CHECK TOTALLY INTEGRATED POWER MODULE DTCs

With the scan tool, read Totally Integrated Power Module DTCs

Does the scan tool display any CAN B BUS DTCs – ACTIVE?

Yes >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

No >> Go to 3



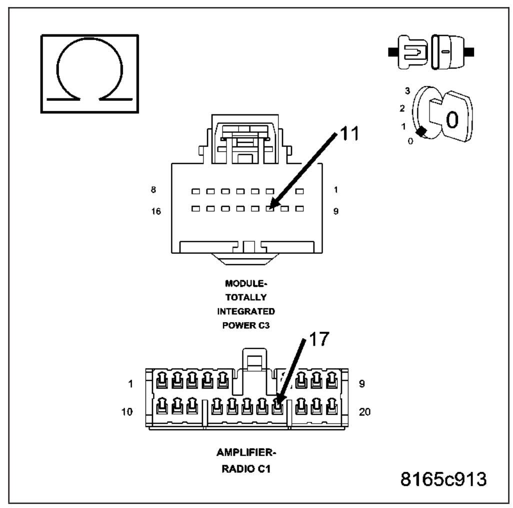
3. CAN B BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Totally Integrated Power Module C3 harness connector.

Measure the resistance of the (D55) CAN B BUS (+) circuit between the Totally Integrated Power Module C3 harness connector and the Amplifier C1 harness connector.



Is the resistance below 2.0 ohms?

Yes >> Go To 4
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the CAN B BUS (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. CAN B BUS (–) CIRCUIT OPEN

Measure the resistance of the (D54) CAN B BUS (–) circuit between the Totally Integrated Power Module C3 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the CAN B BUS (–) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

U0020-CAN B BUS OFF PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Continuously.
- **Set Condition:**
- Whenever the CAN B BUS (+) or B BUS (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTCs IN THE TOTALLY INTEGRATED POWER MODULE
(D54) CAN B BUS (–) CIRCUIT OPEN
(D55) CAN B BUS (+) CIRCUIT OPEN
AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display: U0020-CAN B BUS OFF PERFORMANCE?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.

2. CHECK FRONT CONTROL MODULE DTCs

With the scan tool, read Totally Integrated Power Module DTCs.

Does the scan tool display any CAN B BUS DTCs – ACTIVE?

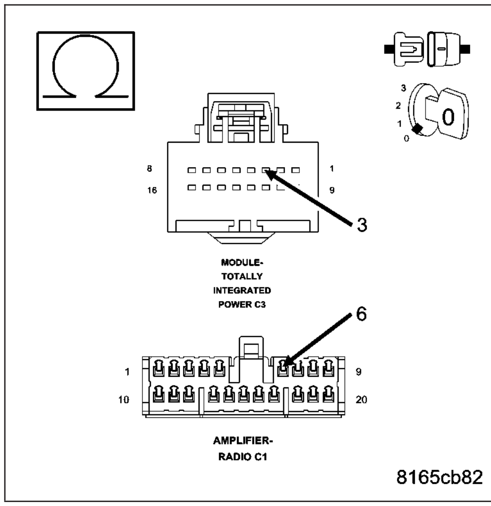
Yes >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

No >> Go to 3

3. CAN B BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.



Disconnect the Totally Integrated Power Module C3 harness connector.

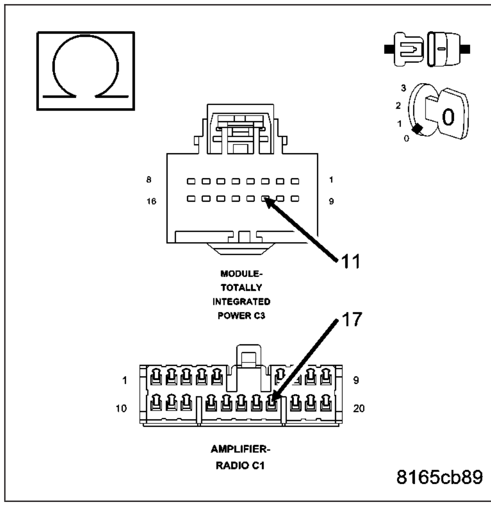
Measure the resistance of the (D55) CAN B BUS (+) circuit between the Totally Integrated Power module C3 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes >> Go To 4
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the CAN B BUS (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

8165cb82



4. CAN B BUS (–) CIRCUIT OPEN

Measure the resistance of the (D54) CAN B BUS (–) circuit between the Totally Integrated Power Module C3 harness connector and the Amplifier C1 harness connector.

Is the resistance below 2.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the CAN B BUS (–) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

8165cb89

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0195-LOST COMMUNICATION WITH SDAR

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0197-LOST COMMINICATION WITH HANDS FREE MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0199-LOST COMMINICATION WITH DRIVERS DOOR MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0200-LOST COMMINICATION WITH PASSENGER DOOR MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0151-LOST COMMINICATION WITH OCCUPANT RESTRAINT CONTROLLER

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0154-LOST COMMINICATION WITH OCCUPANT CLASSIFICATION MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

AUDIO

TABLE OF CONTENTS

AUDIO

DESCRIPTION

Several combinations of radio receivers are offered. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the RUN or ACCESSORY positions.

An optional navigation radio (REC) is available on this vehicle. With this system, the operator has the option of choosing a street address, point of interest, trip itinerary and other features outlined in the operator's manual.

The audio system includes the following components:

- Amplifier (if equipped)
- Antenna
- Antenna - satellite radio and navigation (if equipped)
- Radio noise suppression components
- Radio receiver
- Satellite receiver module (if equipped)
- Speakers

Certain functions and features of the audio system rely upon resources shared with other electronic modules in the vehicle over the Programmable Communication Interface (PCI) bus network. The data bus network allows the sharing of sensor information. For diagnosis of these electronic modules or of the data bus network, the use of a scan tool and the proper Diagnostic Procedures manual are recommended.

OPERATION

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

The available satellite radio system is a subscription based service. Information sent by satellite is transmitted to the roof mounted antenna, then to the satellite receiver module. The operator then has the choice of multiple music/ information channels.

The available navigation radio system receives GPS signals from up to eight satellites to display the position and direction of the vehicle. Map information is supplied through a DVD-ROM. An electronic gyro-sensor and the vehicle's speed sensor enable the system to display the present vehicle position even in locations where GPS signals may be blocked, however system performance will be degraded.

When a destination is selected, the navigation system uses information from the map to quickly calculate a route. As the vehicle is driven along the chosen route, the operator is guided with pictorial displays and voice prompts. The navigation system will also reroute the user if a turn is missed. For complete operating instructions, refer to the manual included with the vehicle.

The audio system components operate on battery current received through a fuse in the Junction Block (JB) on a fused ignition switch output (RUN-ACC) circuit so that the system will only operate when the ignition switch is in the ON or ACCESSORY positions.

DIAGNOSIS AND TESTING - AUDIO

Any diagnosis of the Audio system should begin with the use of the scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

AUDIO SYSTEM DIAGNOSIS

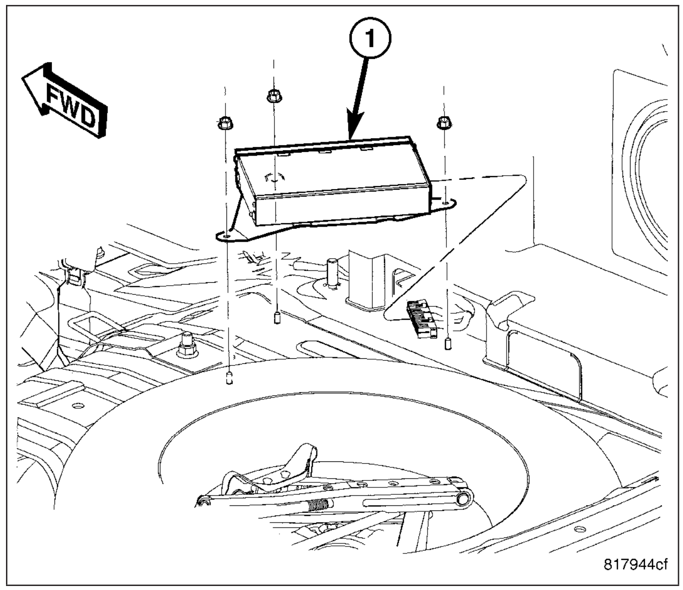
CONDITION	POSSIBLE CAUSES	CORRECTION
NO AUDIO	1. Fuse inoperative.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Junction Block (JB). Replace fuses, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for shorted or open wires. Repair wiring, if required.
	4. Radio ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Refer to appropriate Diagnostic Service information.
	6. Speakers inoperative.	6. Replace speaker as necessary.
NO SATELLITE RADIO AUDIO (PERFORM ALL DIAGNOSIS OUTDOORS)	1. Subscription service has expired (with subscription expired, one channel is still available)	1. Contact satellite radio provider.
	2. Items on roof blocking satellite antenna.	2. Remove or reposition items to allow clear space around antenna.
	3. Damaged satellite antenna cable.	3. Replace satellite antenna cable.
	4. Damaged satellite antenna.	4. Replace satellite antenna.
NO RADIO DISPLAY	1. Fuse inoperative.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Junction Block (JB). Replace fuses, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Radio ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Refer to appropriate Diagnostic Service information.
CLOCK WILL NOT KEEP SET TIME	1. Fuse inoperative.	1. Check Ignition-Off Draw (IOD) fuse in the Junction Block (JB). Replace fuse, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Radio ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Refer to appropriate Diagnostic Service information.

CONDITION	POSSIBLE CAUSES	CORRECTION
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners.	1. Inspect door trim panel and correct as necessary. Replace any missing fasteners.
	2. Water shield loose or misaligned.	2. Inspect water shield and adjust as required.
	3. Items placed in door trim panel map pockets vibrating or moving from side to side.	3. Remove items from door trim panel. Ensure that vibration is no longer present.
POOR RADIO RECEPTION	1. Antenna damaged or inoperative.	1. Diagnose and replace antenna if necessary.
	2. Radio ground damaged.	2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	3. Radio noise suppression inoperative.	3. Repair or replace ground strap as necessary.
	4. Radio inoperative.	4. Refer to appropriate Diagnostic Service information.
NO/POOR TAPE OPERATION	1. Damaged tape.	1. Insert known good tape and test operation.
	2. Foreign objects behind tape door.	2. Remove foreign objects and test operation.
	3. Dirty cassette tape head.	3. Clean head with Mopar Cassette Head Cleaner.
	4. Inoperative radio.	4. Exchange or replace radio, if required.
NO COMPACT DISC OPERATION	1. Damaged CD.	1. Insert known good CD and test operation.
	2. Foreign material on CD.	2. Clean CD and test operation.
	3. Condensation on CD or optics.	3. Allow temperature of vehicle interior to stabilize and test operation.
	4. Inoperative radio.	4. Refer to appropriate Diagnostic Service information.

AMPLIFIER

DESCRIPTION

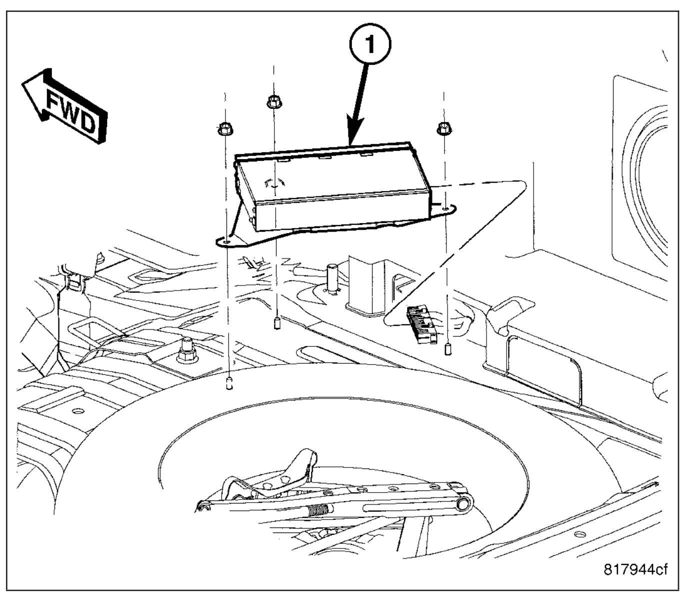
The optional premium speaker system includes a separate audio power amplifier. The amplifier is located on the floor behind the spare tire in the trunk.



OPERATION

The power amplifier electronically increases the frequency response of the normal audio signal output from the radio amplifier in order to improve the acoustic performance of the speakers. On vehicles equipped with an amplifier, the amplifier section of the radio becomes a pre-amplifier.

The amplifier receives audio signal inputs for speaker channels from the radio, then sends amplified audio outputs with dedicated feed and return circuits to the individual speakers.



REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the retaining fasteners.
3. Disconnect the wire harness connector.
4. Remove the amplifier (1).

INSTALLATION

1. Install amplifier (1).
2. Install the mounting fasteners.
3. Connect wire harness connector to amplifier.
4. Connect battery negative cable.

ANTENNA BODY AND CABLE

DESCRIPTION – Fixed Mast Antenna

The antenna body and cable are secured below the fender panel by the antenna cap nut through a mounting hole in the side of the right front fender. The primary coaxial antenna cable is then routed beneath the fender sheet metal and through an entry hole in the right cowl side panel into the interior of the vehicle. Inside the vehicle, the primary coaxial cable is connected to a secondary instrument panel antenna coaxial cable with an in-line connector that is located behind the right end of the instrument panel. The secondary coaxial cable is then routed behind the instrument panel to the back of the radio.

DESCRIPTION – Roof Mounted Antenna

The roof mounted antenna is a combination antenna that is used for the reception of Amplitude Modulation (AM) frequencies, Frequency Modulated (FM) frequencies and Satellite signals for the Digital Satellite Radio. The primary coaxial antenna cable is then routed through an entry hole in the roof panel into the interior of the vehicle. Inside the vehicle, the primary coaxial cable is connected to a secondary instrument panel antenna coaxial cable with an in-line connector that is located behind the right end of the instrument panel. The secondary coaxial cable is then routed behind the instrument panel to the back of the radio.

OPERATION

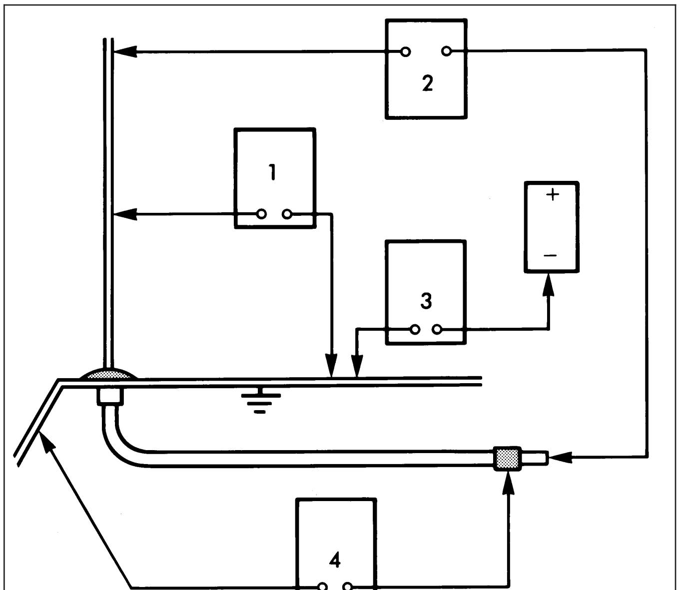
The antenna body and cable connects the antenna mast to the radio. The radio antenna is an electromagnetic circuit component used to capture radio frequency signals that are broadcast by local commercial radio stations in both the Amplitude Modulating (AM) and Frequency Modulating (FM) frequency ranges. These electromagnetic radio frequency signals induce small electrical modulations into the antenna as they move past the mast. The antenna body transfers the weak electromagnetic radio waves induced into the rigid antenna mast into the center conductor of the flexible primary antenna coaxial cable. The braided outer shield of the antenna coaxial cable is grounded through both the antenna body and the radio chassis, effectively shielding the radio waves as they are conducted to the radio. The radio then tunes and amplifies the weak radio signals into stronger electrical signals in order to operate the audio system speakers. For more information on the satellite radio operation of the roof mounted antenna, Refer to (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA MAST - OPERATION)

DIAGNOSIS AND TESTING - ANTENNA BODY AND CABLE

The following four tests are used to diagnose the antenna with an ohmmeter:

- **TEST 1** - Mast to ground test
- **TEST 2** - Tip-of-mast to tip-of-conductor test
- **TEST 3** - Body ground to battery ground test
- **TEST 4** - Body ground to antenna coaxial cable shield test.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.



The ohmmeter test lead connections for each test are shown in the illustration.

NOTE: This model has a two-piece antenna coaxial cable. Tests 2 and 4 must be conducted in two steps to isolate an antenna cable problem. First, test the primary antenna cable (integral to the antenna body and cable) from the coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel to the antenna body. Then, test the secondary antenna cable (instrument panel antenna cable) from the coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel to the coaxial cable connector at the radio.

TEST 1

Test 1 determines if the antenna mast is insulated from ground. Proceed as follows:

1. Disconnect and isolate the antenna coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel.
2. Touch one ohmmeter test lead to the tip of the antenna mast (below tip if ball tip is plastic). Touch the other test lead to the antenna cap nut. Check the ohmmeter reading for continuity.
3. There should be no continuity. If OK, go to Test 2. If not OK, replace the faulty antenna body and cable.

J898F-7

TEST 2

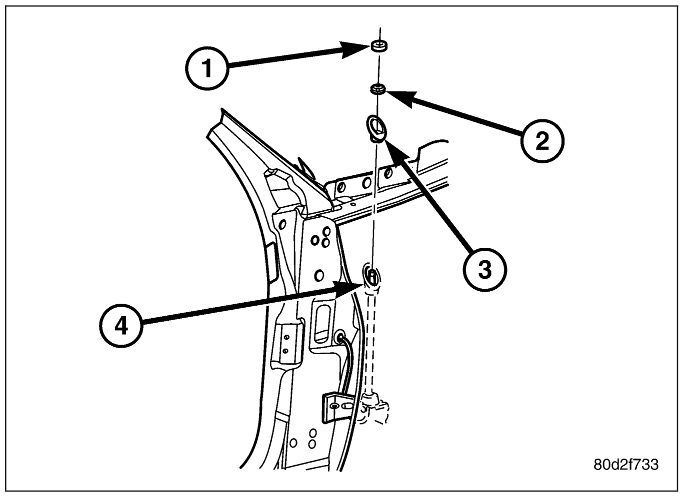
Test 2 checks the antenna conductor components for an open circuit. This test should be performed first on the entire antenna circuit, from the antenna mast to the center conductor of the coaxial cable connector at the radio. If an open circuit is detected, each of the three antenna conductor components (antenna mast, antenna body and primary cable unit, instrument panel antenna secondary cable) should be isolated and tested individually to locate the exact component that is the source of the open circuit. To begin this test, proceed as follows:

1. Disconnect the instrument panel (secondary) antenna cable coaxial connector from the back of the radio.
2. Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to the center conductor pin of the instrument panel antenna cable coaxial connector for the radio. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register only a fraction of an ohm resistance. High or infinite resistance indicates a damaged or open antenna conductor. If OK, go to Test 3. If not OK, isolate and test each of the individual antenna conductor components. Replace only the faulty antenna conductor component.

TEST 3

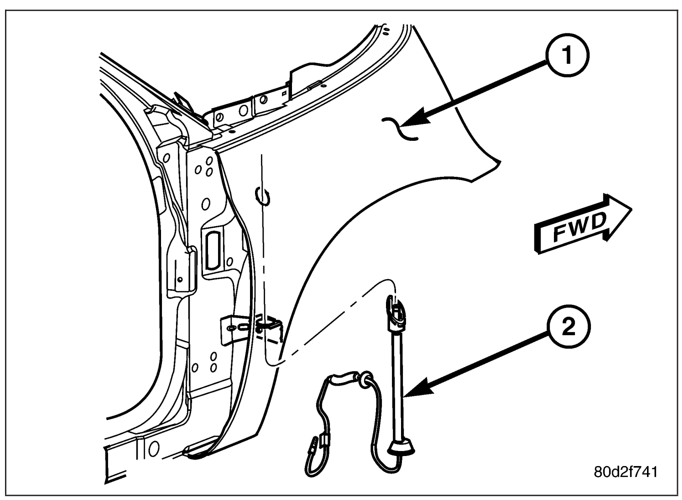
Test 3 checks the condition of the vehicle body ground connection. To begin this test, proceed as follows:

1. This test must be performed with the battery positive cable disconnected from the battery. Disconnect and isolate both battery cables, negative cable first.
2. Reconnect the battery negative cable.
3. Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the battery negative terminal post. Check the ohmmeter reading for continuity.
4. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the battery negative terminal and the vehicle body. If OK, go to Test 4. If not OK, check the battery negative cable connection to the vehicle body and the radio noise suppression ground strap connections to the engine and the vehicle body for being loose or corroded. Clean or tighten these connections as required.



TEST 4

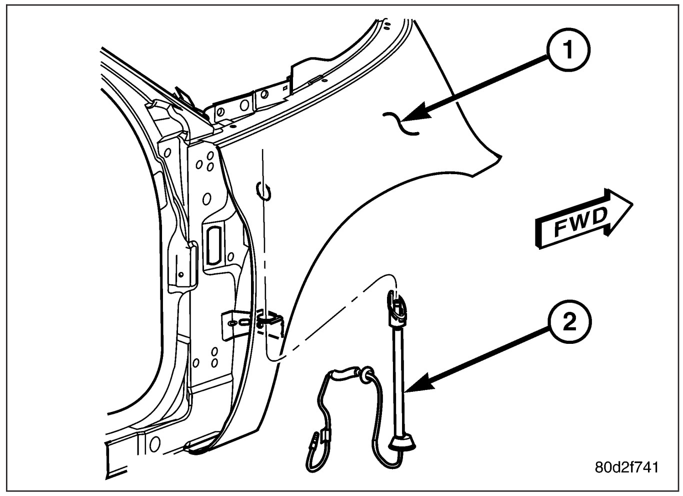
Test 4 checks the condition of the connection between the antenna coaxial cable shield and the vehicle body ground as follows:



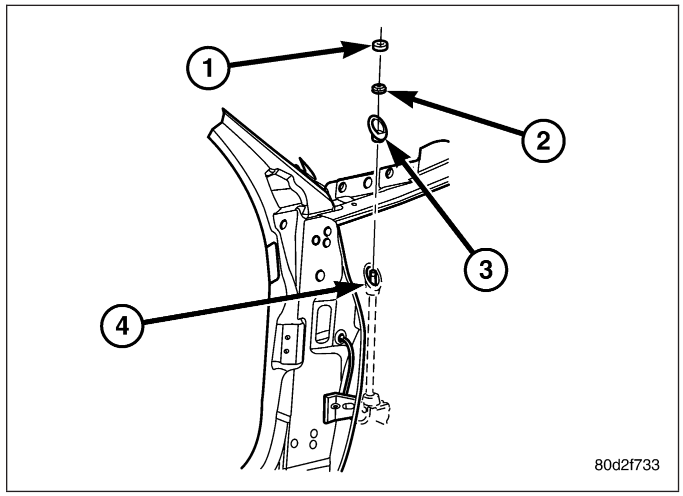
1. Disconnect and isolate the antenna coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel.
2. Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the outer crimp on the antenna coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the antenna body and the vehicle body or between the antenna body and the antenna coaxial cable shield. If not OK, clean the antenna body to fender mating surfaces and tighten the antenna cap nut to specifications.
4. Check the resistance again with an ohmmeter. If the resistance is still more then one ohm, replace the faulty antenna body and cable.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove antenna mast by unscrewing mast from antenna body. On vehicles equipped with manual retractable antenna, lower antenna fully.
3. Remove shroud (1), if equipped.
4. Remove antenna nut (2) and adapter (3)

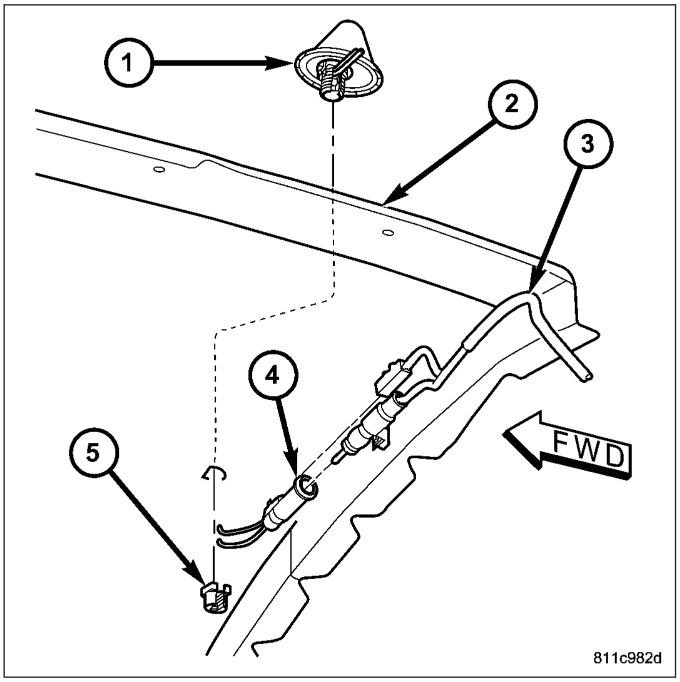


5. Disconnect antenna body cable from instrument panel antenna cable.
6. Remove inner fender shield as necessary to gain access to mounting fasteners.
7. Remove antenna body and cable (2) assembly from fender (1)



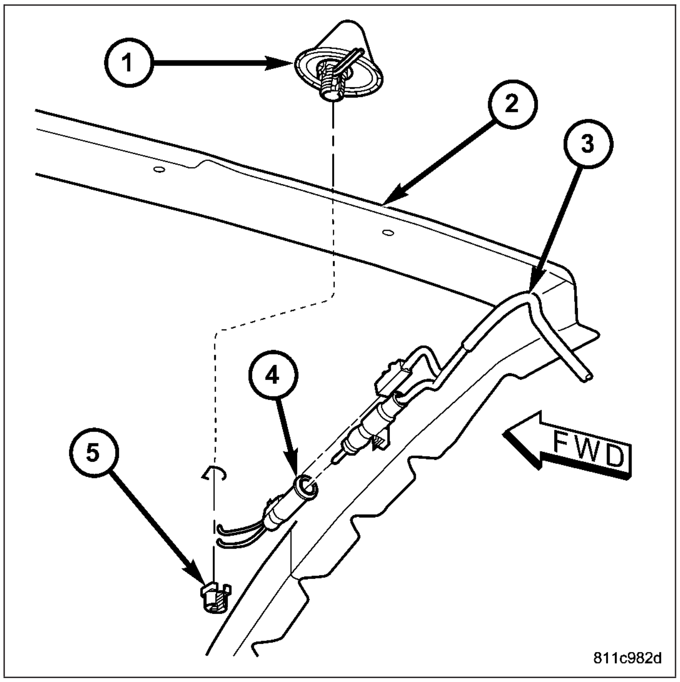
INSTALLATION

1. Position antenna body and cable assembly (2) into fender (1).
2. Insert antenna cable through the opening in fender.



3. Seat the grommet in the side panel and connect the cable to the instrument panel harness connector.
4. Install antenna nut (2) and adapter (3).
5. Install shroud (1), if equipped.
6. Install the inner fender shield.
7. Install antenna mast. Tighten to 5 N·m (46 in. lbs.). **Ensure that the antenna mast is fully seated on antenna base and that there is no gap between the mast and base.**
8. Connect the antenna cable to the instrument panel antenna cable.
9. Install the right side cowl trim panel.
10. Connect the battery negative cable.

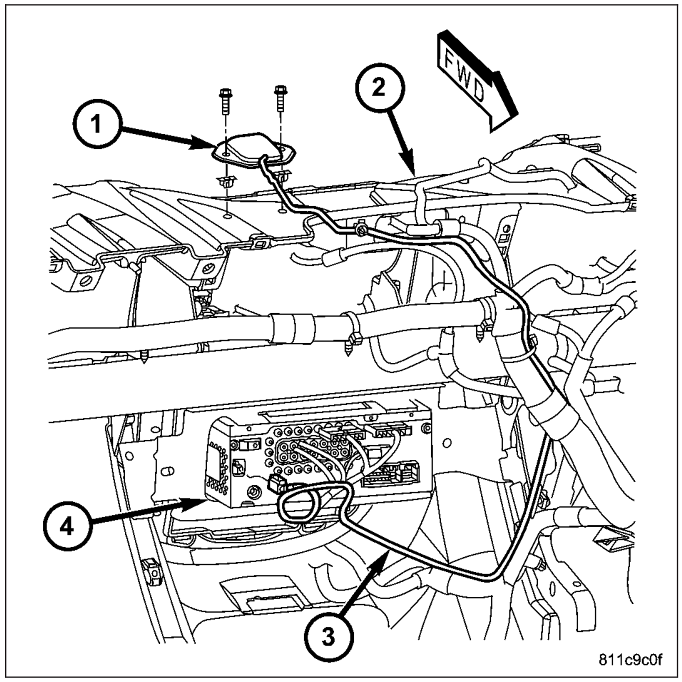
ANTENNA - EXPORT



REMOVAL

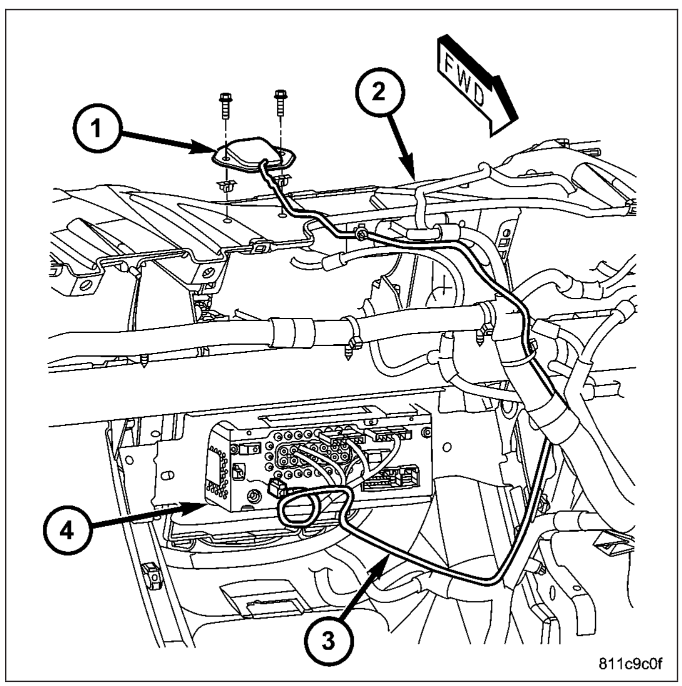
1. Disconnect and isolate the battery negative cable.
2. Lower the headliner as necessary to access antenna mounting fastener (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
3. Disconnect antenna cable and electrical harness connector (4).
4. Remove the mounting fastener.
5. Remove antenna from roof panel.

INSTALLATION



1. Position antenna to roof panel.
2. Install and tighten mounting fastener.
3. Connect antenna cable and electrical harness connector.
4. Raise headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
5. Connect battery negative cable.

ANTENNA - NAVIGATION



REMOVAL

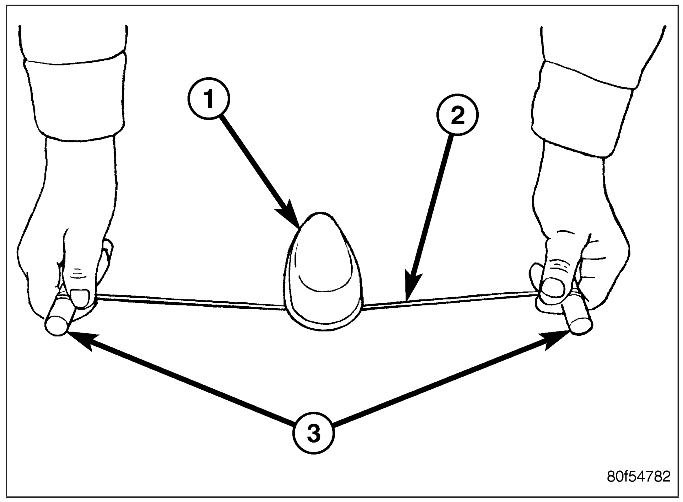
1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
3. Remove the radio (4) (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
4. Remove the antenna (1) mounting fasteners
5. Remove antenna cable (3) from wire harness.

INSTALLATION

1. Position antenna cable (3) to wire harness. Secure into place.
2. Install antenna (1) mounting fasteners.
3. Install radio (4) (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
4. Install instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).
5. Connect battery negative cable.

ANTENNA-SATELLITE

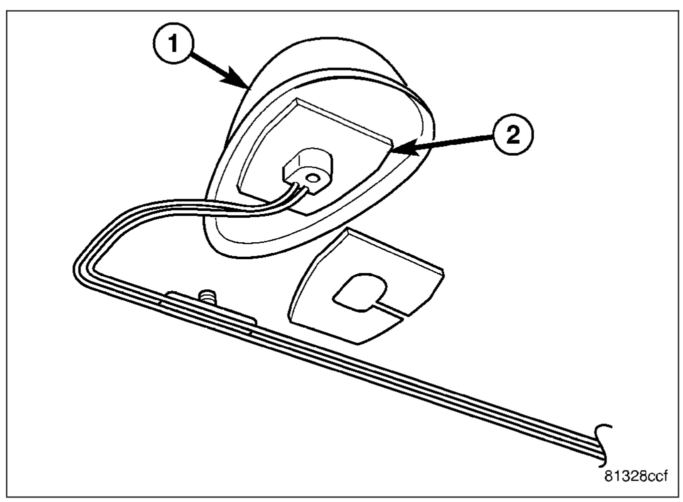
DESCRIPTION



The satellite radio antenna is secured by adhesive foam and retainers which protrude through a hole in the roof panel. Two wires from the antenna are connected to the body harness above the headliner.

OPERATION

The satellite radio antenna receives signals from orbiting satellites and sends these signals to the satellite receiver module. The satellite radio antenna must have open space in which to operate. Items carried on the roof, parking inside etc. can have an effect on the antenna's ability to receive signals.

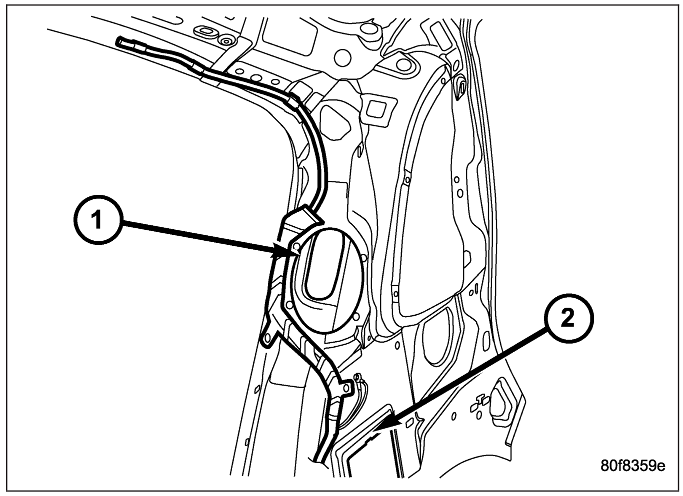


REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lower the rear portion of the headliner as necessary to access underside of antenna (1) (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
3. An adhesive removal tool can be created by using an 18 to 24 inch piece of nylon cord (2) wrapped around two handles (3). Using the removal tool, guide the nylon cord under the dust seal on the forward side of the antenna. Grab the handles and work the cord through the adhesive. Continue this for 360° around the antenna.
4. Disconnect the wire harness connectors from the antenna.
5. From inside the vehicle, and using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up the one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.
6. Remove any remaining adhesive from roof panel with isopropyl alcohol and a lint free cloth. If original antenna is being reinstalled, remove adhesive from antenna mounting surface.

INSTALLATION

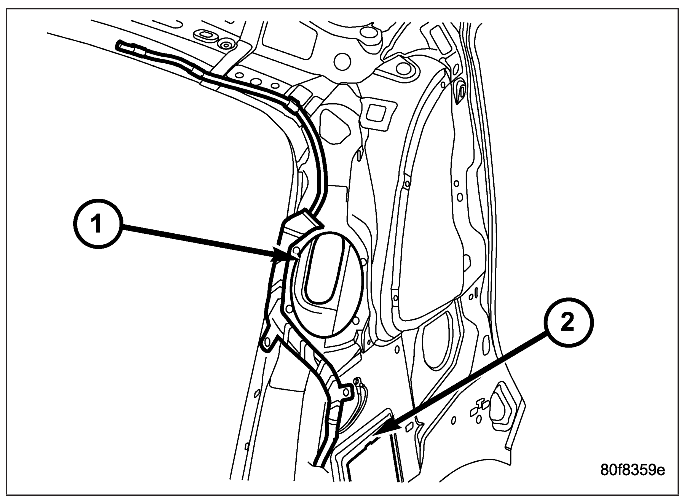
1. If original antenna is being reinstalled, remove backing from patch adhesive (2) and apply to antenna base (1).
2. Remove backing from the adhesive on the antenna.
3. Insert wire harness through hole in roof panel. Press antenna into position until both retainers snap into place.
4. Connect wire harness connectors to antenna.
5. Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
6. Connect battery negative cable.



ANTENNA CABLE - SATELLITE RADIO

DESCRIPTION

The satellite radio antenna cable connects the roof mounted antenna to the satellite receiver module. It has two connectors at each end and is routed above the headliner, then behind the left quarter panel trim.



REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL)
3. Lower the rear portion of the headliner as necessary to access the underside of the satellite antenna (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
4. Detach the antenna cable (1) from the body harness. Disconnect wire harness connectors at each end of the cable.

INSTALLATION

1. Secure the antenna cable (1) to the body harness. Connect the wire harness connectors at each end of the antenna.
2. Install the headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
3. Install the rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION)
4. Connect the battery negative cable.

RADIO

DESCRIPTION

Available radios for this vehicle include:

- AM/FM/cassette/6CD/MP3 (RAK sales code)
- AM/FM/6CD/MP3 (RAQ sales code)
- AM/FM/6CD (RAR sales code) - export only
- AM/FM/CD (REF sales code)
- AM/FM/6CD/MAP/DVD/GPS Navigation (REC sales code) - export only

All factory-installed radios can communicate on the Programmable Communications Interface (PCI) data bus network.

COUNTRY CODE AND CABIN EQ SETTING - RAR/REC RADIO ONLY

The RAR and REC radio may require the country code and cabin EQ setting to be set if not programmed correctly.

If battery power is lost to radio, the anti-theft code must be entered before radio will operate.

If the region the vehicle will be driven in uses 10 kHz spacing on the AM band (i.e. 950, 960 etc.), set the Country Code to “USA”. If the region uses 9 kHz spacing, has LW and MW Bands, and uses RDS (i.e. AF, PTY, TA, etc.), set the radio for “EUR”. If neither of the previous settings apply, and the vehicle is not being driven in Japan, set the radio to “ROW”. Vehicles driven in Japan should have the radio set to “JPN”. The following chart list selected country codes and radio broadcast standards.

To enter the country code and EQ setting, use a scan tool.

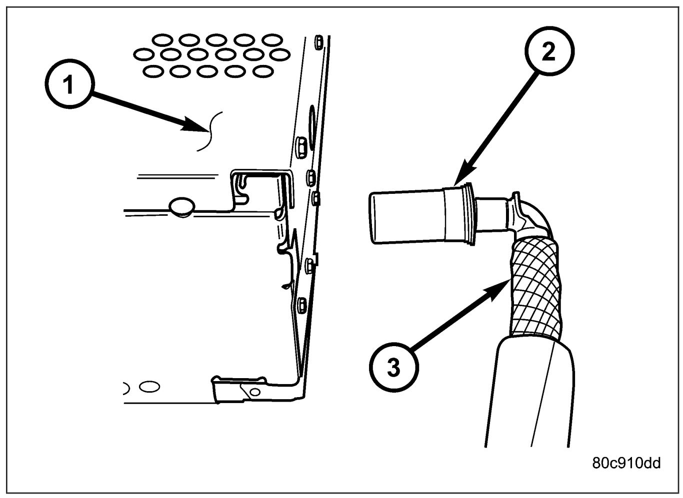
OPERATION

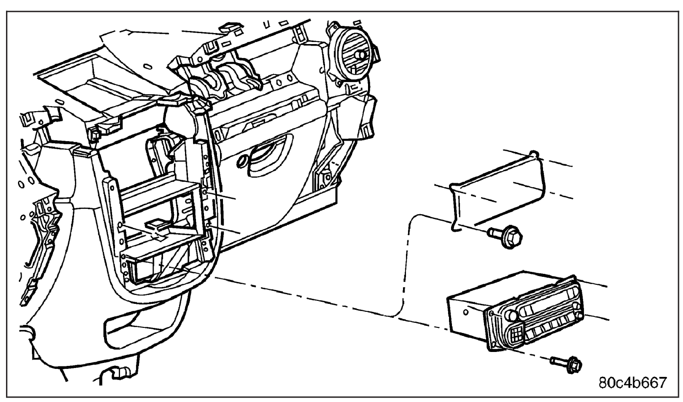
The radio receiver operates on ignition switched battery current that is available only when the ignition switch is in the ON or ACCESSORY positions. The electronic digital clock function of the radio operates on fused battery current supplied through the IOD fuse, regardless of the ignition switch position.



REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove instrument panel center bezel.
3. Remove mounting fasteners and remove radio from instrument panel.
4. Disconnect wire harness connectors from radio.

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.



5. Disconnect the antenna cable (3) by pulling the locking antenna connector (2) away from the radio (1).

INSTALLATION

1. Connect the wire harness connectors and antenna cable to radio.
2. Insert radio into instrument panel.
3. Install mounting fasteners. Tighten to 2 N·m (20 in. lbs.).
4. Install instrument panel center bezel.
5. Connect battery negative cable.

RADIO NOISE SUPPRESSION COMPONENTS

DESCRIPTION

Radio noise suppression devices are factory-installed standard equipment on this vehicle. Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of “buzzing,” “hissing,” “popping,” “clicking,” “crackling,” and/or “whirring” sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with factory-installed radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

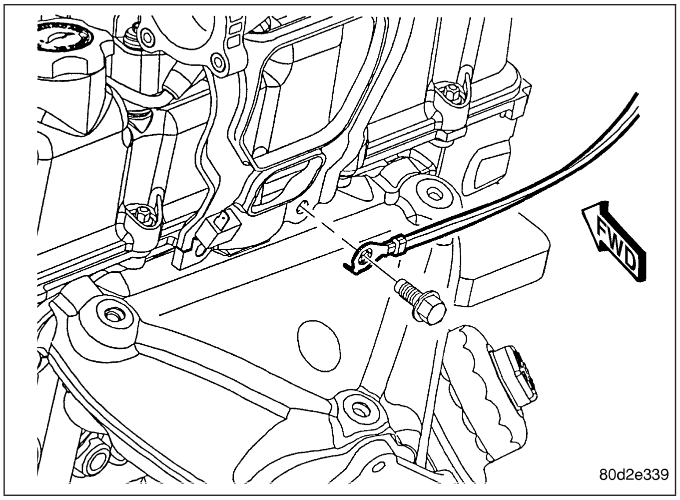
Radio noise suppression is accomplished primarily through circuitry or devices that are integral to the radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Ground straps** - This length of braided ground strap has an eyelet terminal connector crimped to each end. They are located in various locations on the vehicle.
- **Radio Noise Suppression Capacitor** - This component is attached near the exhaust manifold.
- **Resistor-type spark plugs** - This type of spark plug has an internal resistor connected in series between the spark plug terminal and the center electrode to help reduce the production of electromagnetic radiation that can result in radio noise.

OPERATION

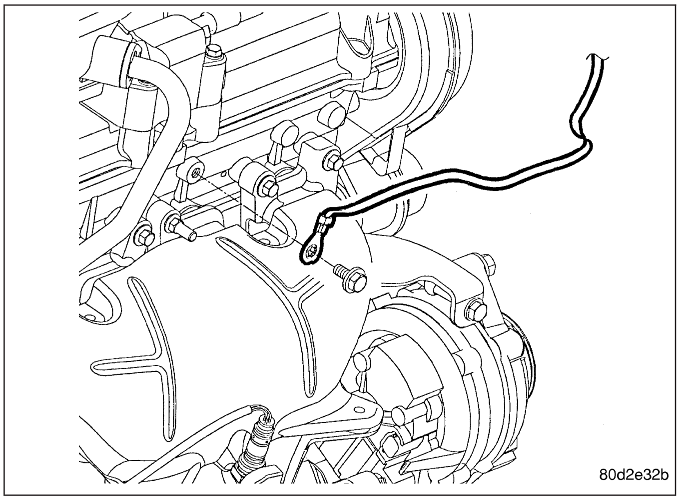
There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.



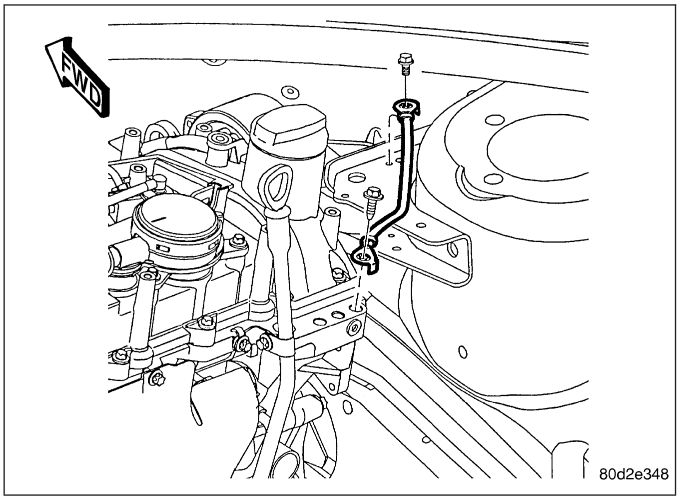
Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

REMOVAL

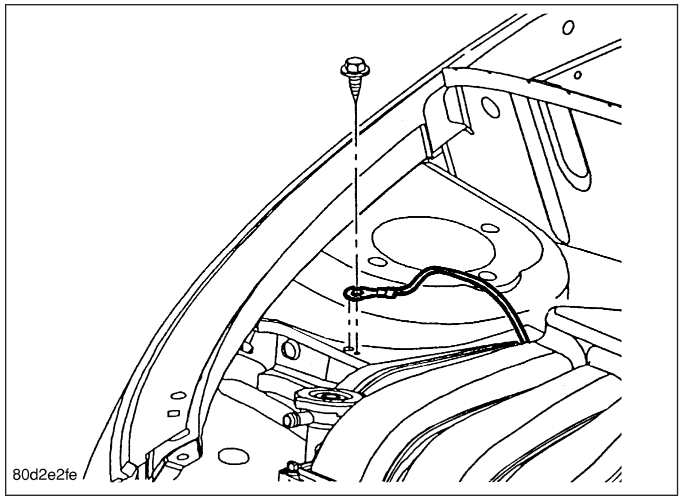


ENGINE GROUND STRAP

1. Disconnect and isolate the battery negative cable.

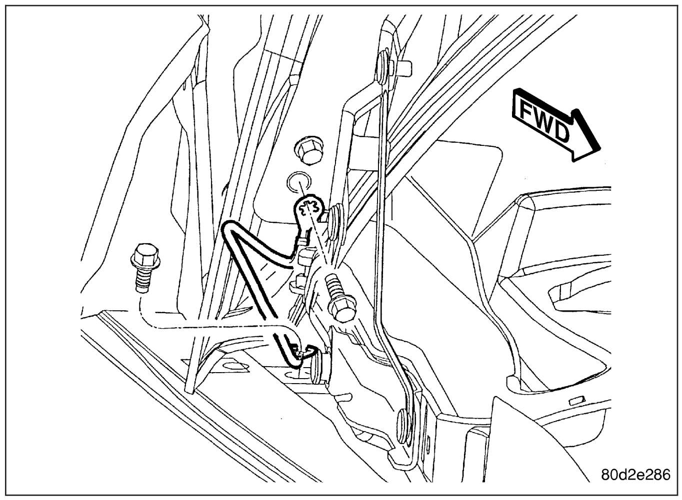


2. For the 1.6L Engine, remove bolt from engine cylinder head.



3. For the 2.0/2.4L Engine, remove bolt from engine cylinder head.

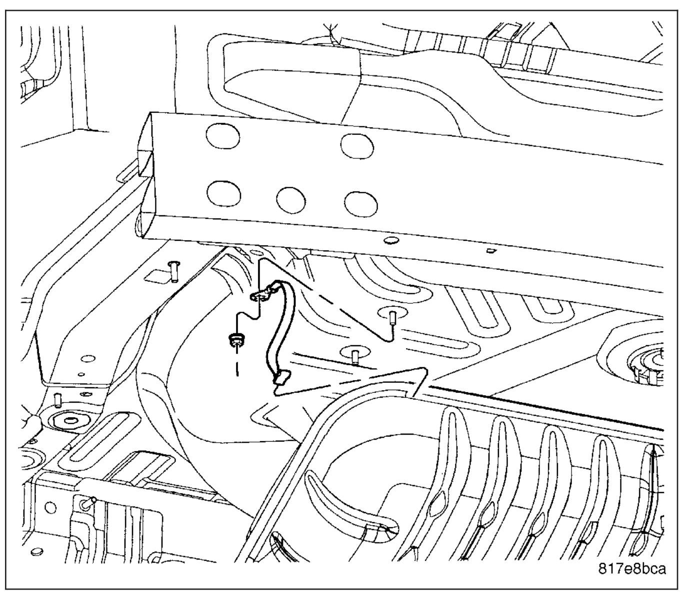
4. For the 2.2L Engine, remove bolt from engine cylinder head.



5. Remove bolt from strut tower and remove strap.

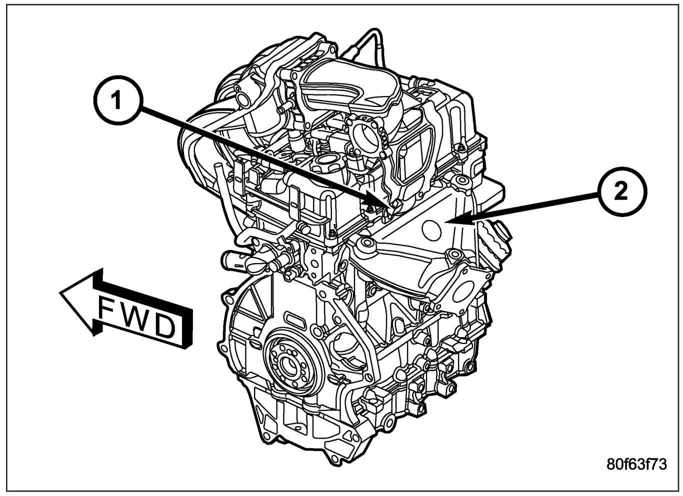
80d2e2fe

HOOD HINGE GROUND STRAP



1. Disconnect and isolate the battery negative cable.
2. Remove bolt from fender.
3. Remove bolt from hood and remove strap.

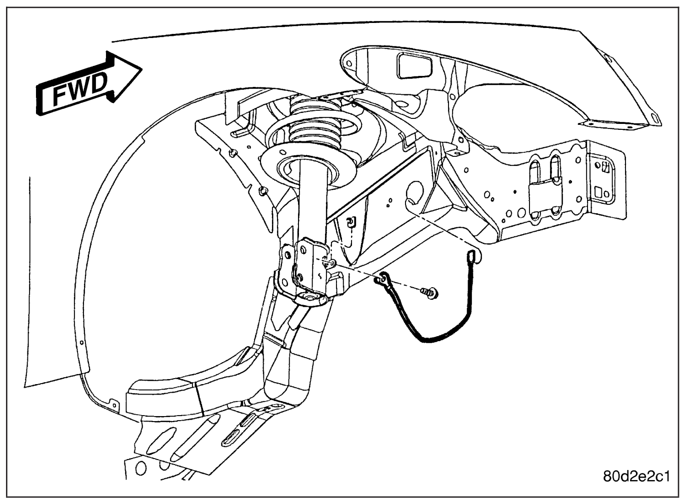
80d2e286



MUFFLER GROUND STRAP

1. Disconnect and isolate the battery negative cable.
2. Remove bolt from rear floor pan.
3. Remove bolt from muffler and remove strap.

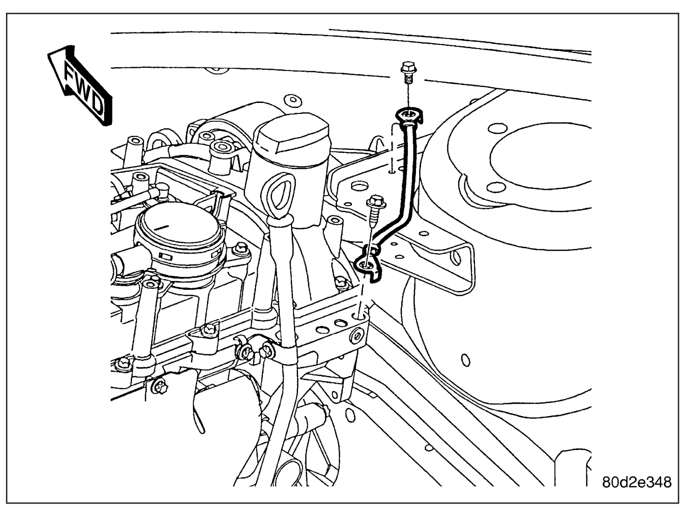
817e8bca



RADIO NOISE SUPPRESSION CAPACITOR

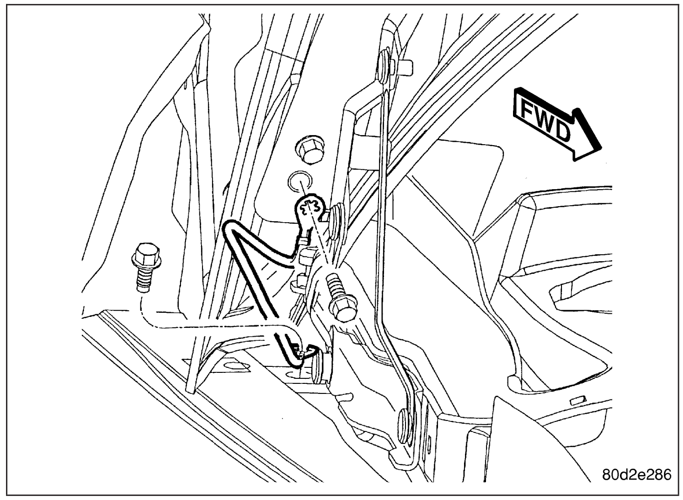
1. Disconnect and isolate the battery negative cable.
2. Disconnect electrical harness connector from capacitor (1).
3. Remove bolt from capacitor and remove capacitor.

STRUT BRACKET TO BODY GROUND STRAP



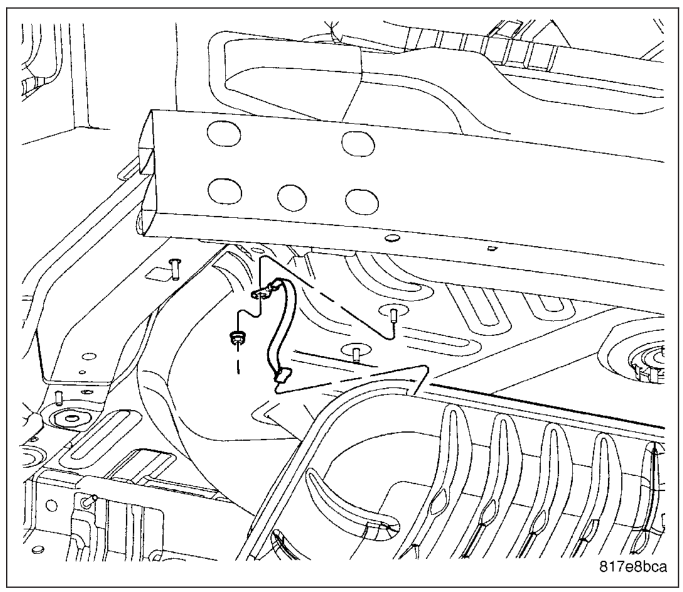
1. Disconnect and isolate the battery negative cable.
2. Remove bolt from strut.
3. Remove strap from frame rail.

INSTALLATION



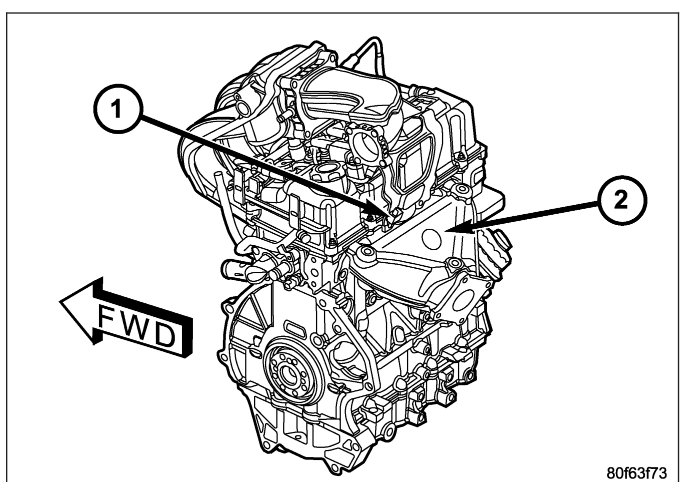
ENGINE GROUND STRAP

1. Install strap and bolt to strut tower. Tighten bolt to 12 N·m (105 in. lbs.).
2. Install strap and bolt to engine cylinder head. Tighten bolt to 28 N·m (21 ft. lbs.).
3. Connect battery negative cable.



HOOD HINGE GROUND STRAP

1. Install strap and bolt to fender. Tighten bolt to 4 N·m (35 in. lbs.).
2. Install strap and bolt to hood. Tighten bolt to 4 N·m (35 in. lbs.).
3. Connect battery negative cable.

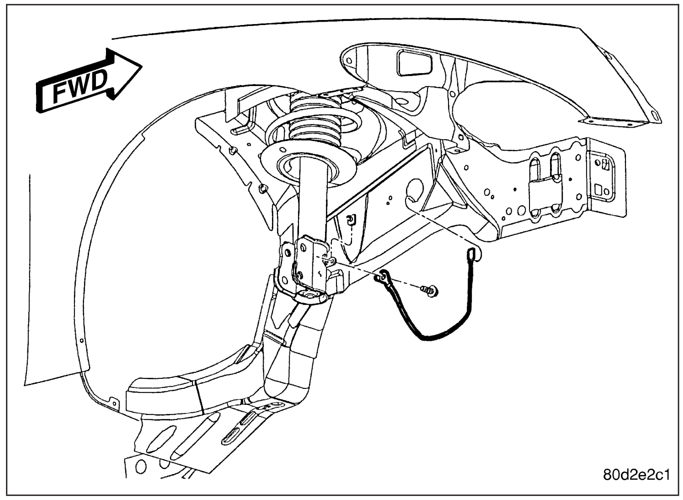


MUFFLER GROUND STRAP

1. Install strap and bolt to rear floor pan. Tighten bolt to 8 N·m (75 in. lbs.).
2. Install strap and bolt to muffler. Tighten bolt to 8 N·m (75 in. lbs.).
3. Connect battery negative cable.

RADIO NOISE SUPPRESSION CAPACITOR

1. Install capacitor and bolt.
2. Connect electrical harness connector to capacitor.
3. Connect battery negative cable.



STRUT BRACKET TO BODY GROUND STRAP

1. Install strap to frame rail.

CAUTION: Ensure that ground strap does not come in contact with brake hose. Damage to brake hose can result.

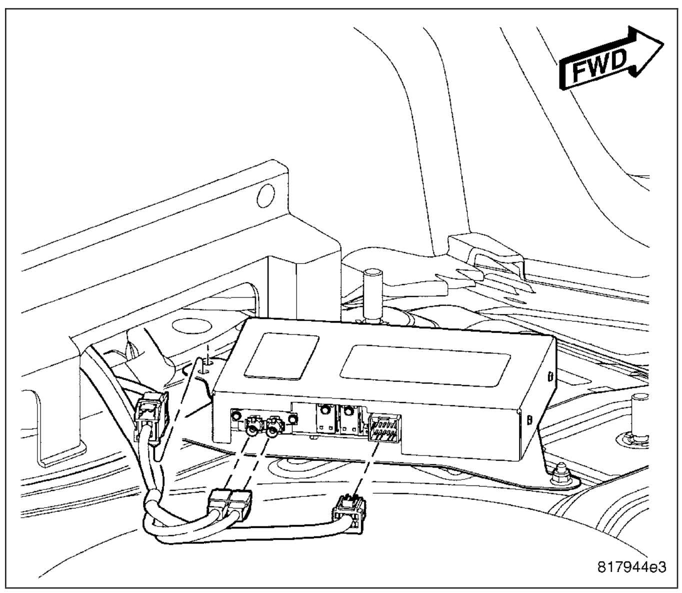
2. Install strap and bolt to strut. Tighten bolt to 12 N·m (105 in. lbs.).
3. Connect battery negative cable.

RECEIVER-SATELLITE

DESCRIPTION

The satellite receiver module is located behind the spare tire. It is mounted to a bracket which is fastened to the trunk floor sheet metal.

OPERATION



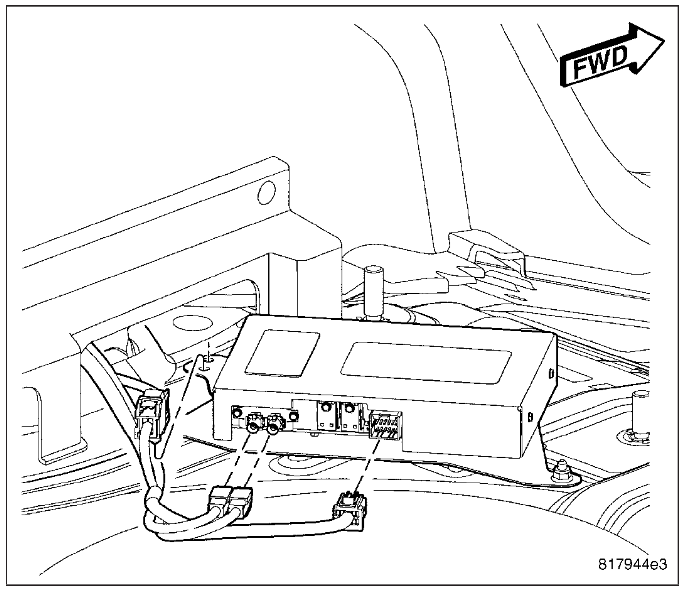
The satellite receiver module receives signals from the roof mounted antenna and processes this information before it is sent to the radio. The module operates on both battery and accessory feed circuits and will operate with the ignition key in the RUN or ACCESSORY position only.

REMOVAL

NOTE:
If the owner's satellite service was active before the satellite receiver module was replaced the new satellite receiver module will have to be activated. The existing satellite receiver module will have to be deactivated before the replacement satellite receiver module can be activated.
To activate Sirius satellite radio service, call Sirius at their toll-free number. Please have the following information available when activating a system:

- **Electronic Serial Number / Sirius Identification Number (ESN/SID) of the unit to be replaced**
- **ESN/SID of the replacement receiver**
- **Vehicle Owner's name and address**
- **VIN**
  The ESN/SID number can be obtained through the radio display by following the steps in the satellite radio owners manual.
  The vehicle must be outside with the audio system powered on, in the satellite radio mode, to receive the activation signal.

1. Disconnect and isolate the battery negative cable.
2. Remove the left rear quarter trim panel (Refer to 23 - BODY/INTERIOR/LEFT QUARTER TRIM PANEL - REMOVAL).
3. Remove the mounting bracket fasteners.
4. Disconnect the wire harness connectors.
5. Remove the module from the mounting bracket.



INSTALLATION

NOTE:
If the owner's satellite service was active before the satellite receiver module was replaced the new satellite receiver module will have to be activated. The existing satellite receiver module will have to be deactivated before the replacement satellite receiver module can be activated.
To activate Sirius satellite radio service, call Sirius at their toll-free number. Please have the following information available when activating a system:

- **Electronic Serial Number / Sirius Identification Number (ESN/SID) of the unit to be replaced**
- **ESN/SID of the replacement receiver**
- **Vehicle Owner's name and address**
- **VIN**

The ESN/SID number can be obtained through the radio display by following the steps in the satellite radio owners manual.
The vehicle must be outside with the audio system powered on, in the satellite radio mode, to receive the activation signal.

1. Position the module to the mounting bracket.
2. Connect wire harness connectors.
3. Install mounting bracket and fasteners.
4. Install the left rear quarter trim panel (Refer to 23 - BODY/INTERIOR/LEFT QUARTER TRIM PANEL - INSTALLATION).
5. Connect the battery negative cable.

REMOTE SWITCHES

DESCRIPTION

Two rocker-type switches (if equipped) are mounted on the back (instrument panel side) of the steering wheel spokes. The switch on the left spoke is the seek switch and has seek up, seek down, and preset station advance functions. The switch on the right spoke is the volume control switch and has volume up, and volume down functions. The switch on the right spoke also includes a “mode” control that allows the driver to sequentially select AM radio, FM radio, cassette player, CD player or CD changer (if equipped).

OPERATION

These switches are resistor multiplexed units that are hard-wired to the Body Control Module (BCM) through the clockspring. The BCM sends the proper messages on the Programmable Communications Interface (PCI) data bus network to the radio receiver. For diagnosis of the BCM or the PCI data bus, the use of a scan tool and the proper Diagnostic Procedures manual are recommended. For more information on the operation of the remote radio switch controls, refer to the owner’s manual in the vehicle glove box.

DIAGNOSIS AND TESTING - REMOTE SWITCHES

WARNING: On vehicles equipped with airbags, refer to electrical, restraints before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

Any diagnosis of the Audio system should begin with the use of the DRB III® diagnostic tool. For information on the use of the DRB III®, refer to the appropriate Diagnostic Service Manual.

For complete circuit diagrams, refer to the appropriate wiring information.

1. Disconnect and isolate the battery negative cable.
2. Remove the remote radio switch(es) from the steering wheel. (Refer to 8 - ELECTRICAL/AUDIO/REMOTE SWITCHES - REMOVAL).
3. Use an ohmmeter to check the switch resistance as shown in the Remote Radio Switch Test table

REMOTE RADIO SWITCH TEST

Switch	Switch Position	Resistance
Right (White)	Volume Up	1.210 Kilohms
Right (White)	Volume Down	3.010 Kilohms
Right (White)	Mode Advance	0.0511 Kilohms
Left (Black)	Seek Up	0.261 Kilohms
Left (Black)	Seek Down	0.681 Kilohms
Left (Black)	Pre-Set Station Advance	0.162 Kilohms

NOTE: The right remote radio switch back is white in color. The left switch back is black in color. The right/left remote radio switch orientation is with the steering wheel installed, and driver in driver’s seat.

4. If the switch resistance checks OK, go to Step 5. If not OK, replace the faulty switch.
5. Check for continuity between the ground circuit cavity of the switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open circuit as required.

6. Unplug the 24-way white wire harness connector from the Body Control Module (BCM). Check for continuity between the radio control circuit cavity of the remote radio switch wire harness connector and a good ground. There should be no continuity. If OK, go to Step 7. If not OK, repair the short circuit as required.
7. Check for continuity between the radio control circuit cavities of the remote radio switch wire harness connector and the BCM wire harness connector. There should be continuity. If OK, refer to the proper Diagnostic Procedures manual to test the BCM and the PCI data bus. If not OK, repair the open circuit as required.

REMOVAL

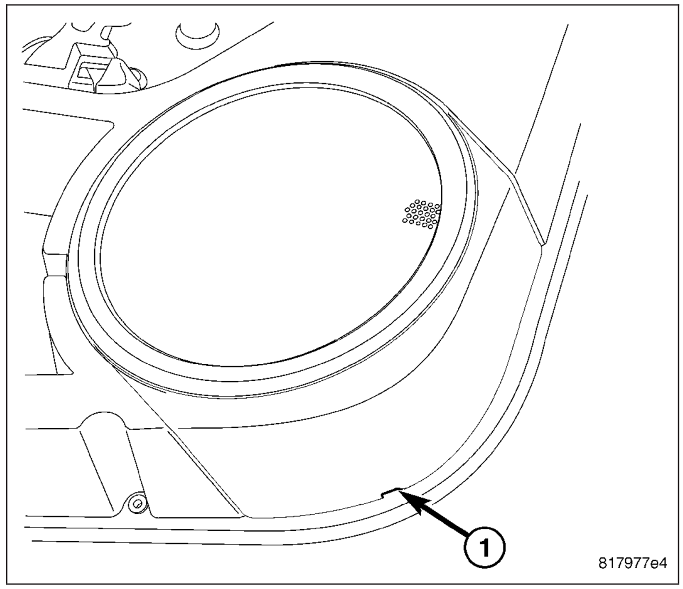
WARNING: On vehicles equipped with airbags, refer to electrical, restraints before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

1. Disconnect and isolate the battery negative cable.
2. Remove the driver side airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
3. Remove the steering wheel (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL).
4. Unplug the wire harness connector from the remote radio switch.
5. Remove steering wheel rear cover.
6. Remove the remote radio switch from the steering wheel by depressing tabs on each side of each switch.

NOTE: The right remote radio switch back is white in color. The left switch back is black in color. The right/left remote radio switch orientation is with the steering wheel installed, and driver in driver's seat.

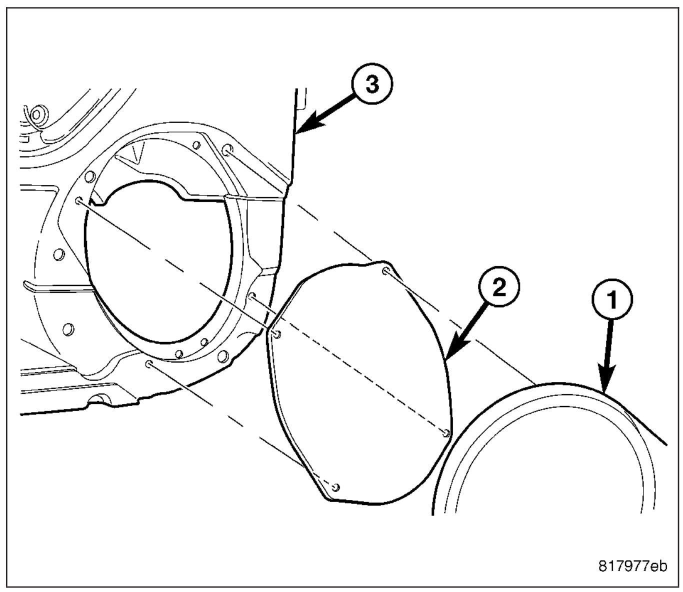
INSTALLATION

WARNING: On vehicles equipped with airbags, refer to electrical, restraints before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.



1. Install remote radio switch to the steering wheel.
2. Install steering wheel rear cover.
3. Connect the wire harness to the remote radio switch.
4. Install the steering wheel (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION).
5. Install the driver side airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
6. Connect the battery negative cable.

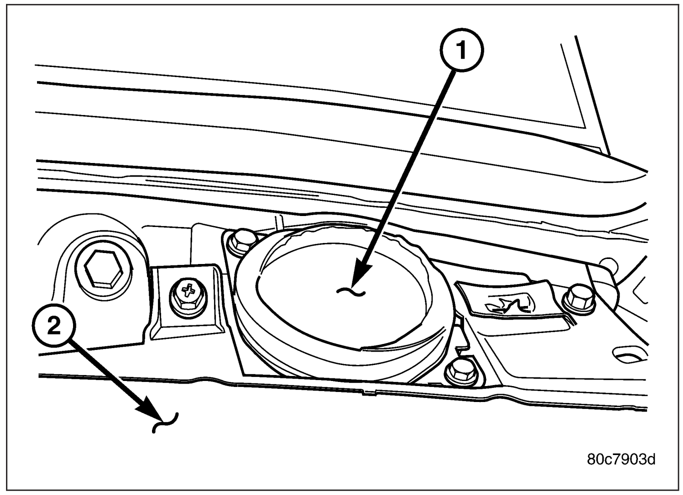
SPEAKER



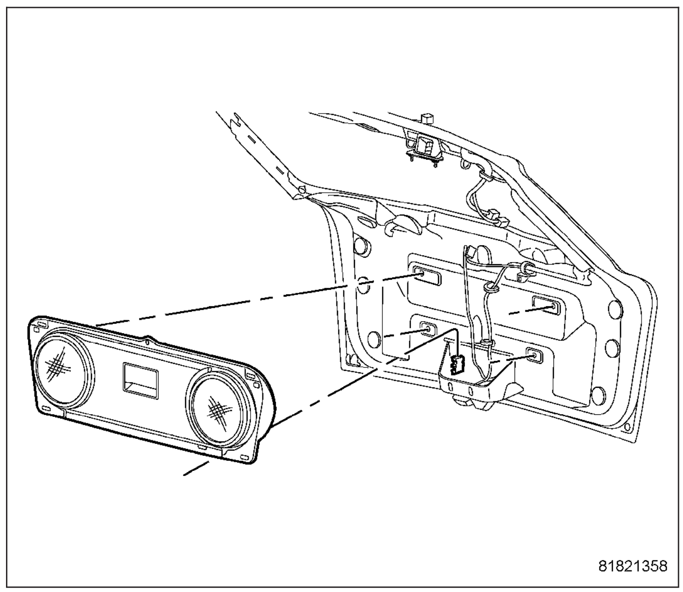
REMOVAL

DOOR SPEAKERS

1. Using an approved flat blade tool find the service notch located at the bottom of speaker grille and pry up speaker grille.

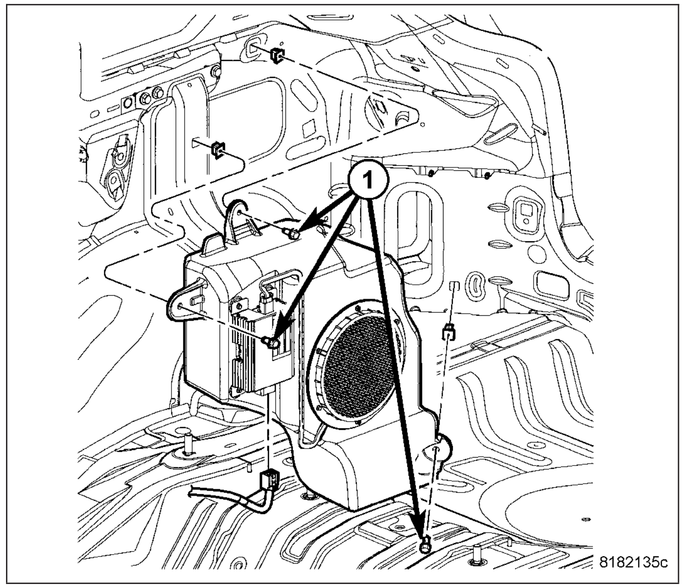


2. Remove the four screws attaching the speaker (2) to door panel (3).
3. Disconnect the electrical connector and remove the speaker.



INSTRUMENT PANEL SPEAKER

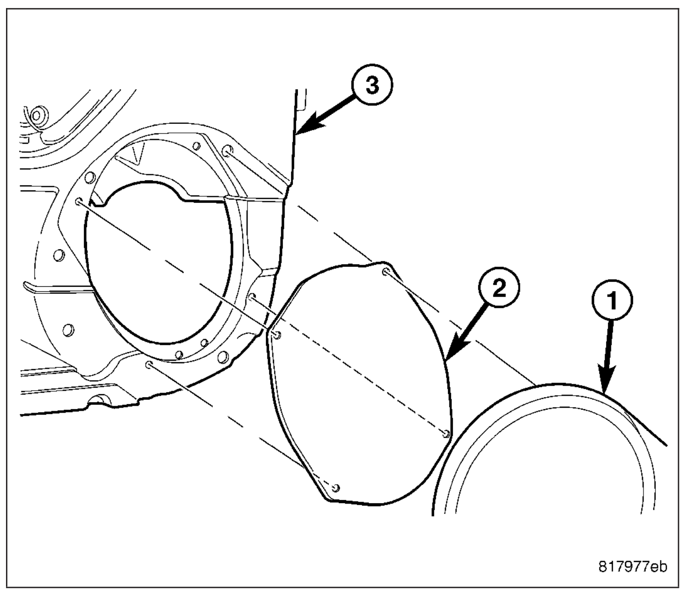
1. Disconnect and isolate the battery negative cable.
2. Remove instrument panel (2) top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
3. Remove speaker retaining screws.
4. Remove speaker (1) and disconnect wire harness connector.



REAR SPEAKER - LIFTGATE

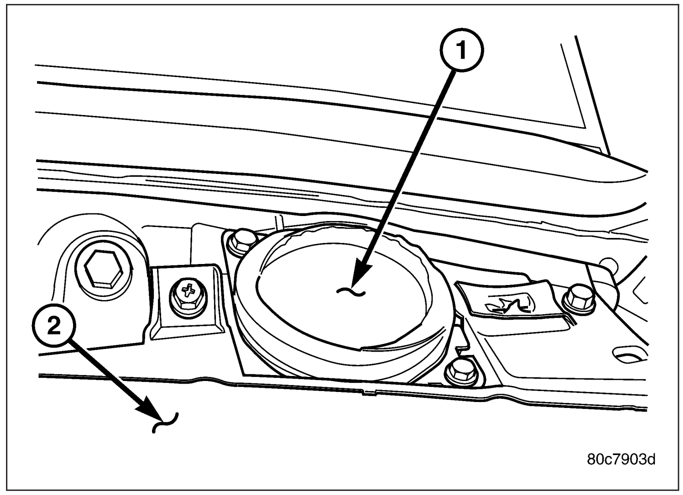
1. Disconnect and isolate the battery negative cable.
2. Remove the speaker enclosure fasteners.
3. Remove speaker and disconnect the electrical harness connector.

REAR SUBWOOFER



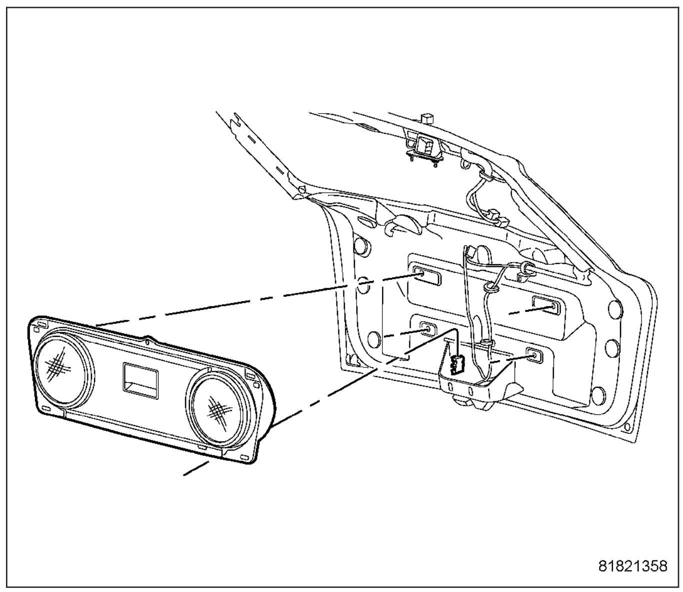
1. Disconnect and isolate the battery negative cable.
2. Remove the right quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
3. Remove the subwoofer mounting fasteners.
4. Disconnect the electrical harness connector.
5. Remove the speaker.

INSTALLATION



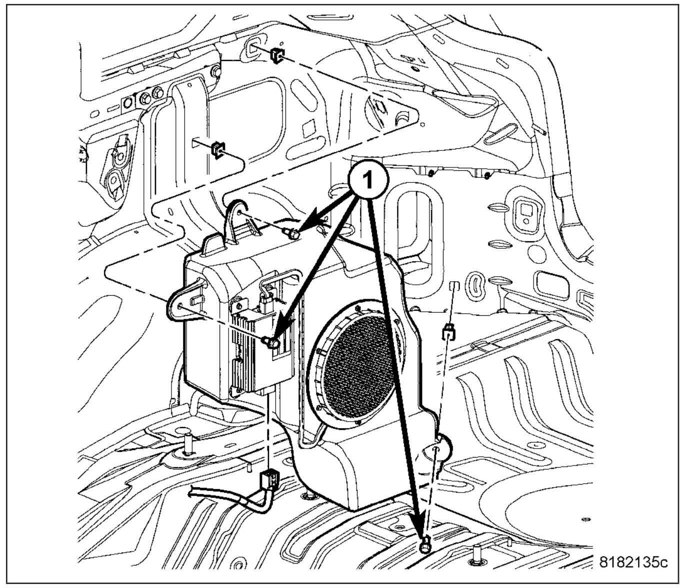
DOOR SPEAKERS

1. Connect wire connector.
2. Install speaker (2) into the door panel (3) opening and install the four screws into door panel.
3. Install speaker grille (1) onto trim panel.



INSTRUMENT PANEL SPEAKER

1. Connect wire harness connector to speaker (1).
2. Install speaker screws.
3. Install instrument panel (2) top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).
4. Connect the battery negative cable.



REAR SPEAKER - TAILGATE

1. Connect electrical harness connector and position speaker.
2. Install and tighten mounting fasteners.
3. Connect battery negative cable.

REAR SUBWOOFER

1. Position the speaker and connect the electrical harness connector.
2. Install the subwoofer mounting fasteners.
3. Install the right rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).
4. Connect the battery negative cable.

CHIME/BUZZER

TABLE OF CONTENTS

CHIME/BUZZER - SERVICE INFORMATION

DESCRIPTION

The chime software is located within, and serviced with the instrument cluster. The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board inside of the ElectroMechanical Instrument Cluster (EMIC) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants. The EMIC also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based EMIC utilizes electronic chime request messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus along with hard wired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the EMIC allow it to control the audible outputs that are produced through its on-board transducer and relay.

OPERATION

CHIME WARNING SYSTEM

The chime warning system operates on battery voltage received through a fuse in the Junction Block (JB) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the On position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **Airbag Indicator Warning** - The Cab Compartment Node (CCN) will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the Controller Area Network (CAN) data bus from the Occupant Restraint Controller (ORC) requesting “Airbag” indicator illumination. This warning will only occur following completion of the “Airbag” indicator bulb test, and will only occur once during any ignition cycle.
- **Door Ajar Indicator Warning** - The CCN will generate one short chime when the ignition switch is in the On position, a hard wired input is received indicating that the status of any door ajar switch has changed, and an electronic message is received over the CAN data bus indicating that the vehicle is moving. Door ajar chime occurs only if the door ajar status is true.
  - Door opened and
  - Ignition in RUN position and
  - Vehicle speed is present
- **Fasten Seat Belt Indicator Warning** - The CCN will generate repetitive chimes at a slow rate to announce that a hard wired input from the seat belt switch indicates that the driver side front seat belt is not fastened with the ignition switch in the On position. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled.

NOTE: If the vehicle is equipped with the Occupant Classification System (OCS), this will apply to the front passenger seatbelt as well.

There are two different Fasten Seatbelt Reminder announcements incorporated into the cluster’s logic, a Non-enhanced announcement and an Enhanced announcement.

When the Enhanced announcement is DISABLED:

- The cluster will chime five times (not greater than six seconds) and illuminate the Seatbelt Lamp after turning the ignition to the run/start position if the driver/passenger seatbelt is unbuckled.

When the Enhanced announcement is ENABLED;

- The cluster will chime continuously at a slow rate for a period of 6 seconds and illuminate the Seatbelt Lamp after turning the ignition to the run/start position if the driver/passenger seatbelt is unbuckled. After 6 seconds the chime will stop, but the Seatbelt Lamp will stay illuminated. If the ignition is in the run position for a period greater than 60 seconds, and the driver/passenger seatbelt is unbuckled, and the vehicle’s speed is greater

than 5 mph (8 km/h) in a forward gear, the Enhanced Fasten Seatbelt Reminder will activate. This will cause the Seatbelt Lamp to blink and a slow continuous chime to sound for 5 seconds. After 5 seconds, the chime will stop, but the lamp will remain illuminated for an additional 3 seconds. The Enhanced Seatbelt Reminder cycles for a total of 12 times (96 seconds). After the 12th time, the Seatbelt Lamp will remain on without any chime. Buckling the driver/passenger seatbelt at anytime will cancel the Fasten Seatbelt Reminder announcement.

The seatbelt indicator includes a programmable enhanced seatbelt reminder or “beltminder” feature that is enabled when the vehicle is shipped from the factory. This beltminder feature can be disabled and enabled by the customer using a specific programming event sequence, or by the dealer using a diagnostic scan tool.

- **Gate Ajar Indicator Warning** - The CCN will generate one short chime when the ignition switch is in the On position, a hard wired input is received indicating that the status of the liftgate ajar switch has changed (switch position has to change to true), and an electronic message is received over the CAN data bus indicating that the vehicle is moving.
- **Head/Park Lamps-On Warning** - The CCN will generate repetitive chimes at a fast rate to indicate that hard wired inputs from the driver door ajar switch, the headlamp switch, and the ignition switch indicate that the exterior lamps are turned On with the driver side front door opened and the ignition switch in the Off position. The chimes will continue to sound until the exterior lamps are turned Off, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Key-In-Ignition Warning** - The CCN will generate repetitive chimes at a fast rate to indicate that hard wired inputs from the driver door ajar switch, the ignition switch, and the key-in ignition switch circuitry of the ignition switch indicate that the key is in the ignition in the lock position with the driver side front door open and the ignition switch in the Off position. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Low Fuel Indicator Warning** - The CCN will generate one short chime when the low fuel indicator is illuminated by the instrument cluster circuitry. This chime will only occur once during any ignition cycle.
- **Park Brake Reminder -** The CCN will generate one short chime to announce that the hard wired input from the park brake switch and a vehicle speed message input received over the CAN data bus indicate that the park brake is applied and the vehicle is moving. This chime will repeat each time the input conditions are met.
- **Sentry Key “Customer Learn” Mode Announcement** - The CCN will generate one short chime to confirm that an electronic “Customer Learn” mode message has been received over the CAN data bus to indicate that the Sentry Key Remote Entry Module (SKREEM) is prepared for programming additional sentry key transponders. This chime feature is only active on vehicles equipped with the optional Sentry Key system, and sold in a market where “Customer Learn” programming is an allowed feature.
- **Turn Signal/Hazard Warning Flasher Emulation** - The CCN relay will generate repetitive clicks at a slow rate to emulate an electromechanical flasher when the turn signal or hazard warning system are operating. The CCN relay will generate repetitive clicks at a fast rate to indicate that the right or left turn signal are operating with one or more bulbs inoperative. In either case, the clicks will continue until the turn signal and hazard warning systems are turned off.
- **Turn Signal On Warning** - The CCN will generate repetitive chimes at a slow rate to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers for this feature. The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first. The hazard warning flashers will not activate this chime feature.
- **Warning Indicator Announcement** - The CCN will generate one short chime each time the Malfunction Indicator or MIL lamp is illuminated by the instrument cluster circuitry. The check gauges indicator may be illuminated when any critical engine or transmission systems are operating outside of their normal parameters. The instrument cluster monitors electronic messages received over the CAN data bus to determine when to illuminate the check gauges indicator.

The CCN provides chime service for all available features in the chime warning system. The CCN relies upon its internal programming, numerous hard wired inputs, and electronic message inputs received from other modules over the CAN data bus network to provide the chime warning system features. The internal programming of the CCN determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard wired chime warning system inputs to the CCN may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the CCN, the CAN data bus, or the electronic messages received by the CCN from other modules. The most reliable, efficient and accurate means to diagnose the CCN, the CAN/LIN data bus, or the electronic message inputs used for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

BRAKE/PARK BRAKE INDICATOR

The brake/park brake indicator illuminates when the parking brake is applied with the ignition switch turned to the ON position (Refer to the PARK BRAKE SWITCH TEST table. The same lamp will also illuminate if one of the two (hydraulic or ABS) service brake systems fail when the brake pedal is applied.

PARK BRAKE SWITCH TEST

PROCEDURE	EXPECTED RESULTS
1. Turn key to run wait till bulb check is complete	
2. Apply park brakes.	Verify that the brake indicator lamp comes ON.
3. Disengage the park brakes.	Verify Brake indicator lamp turns OFF.
4. Repeat steps 2 and 3 with key in OFF/ACC and LOCK positions.	Brake indicator lamp should not come ON.
5. In an Automatic Transmission vehicle apply park brakes, start the vehicle, press brake pedal and shift into reverse or drive.	The brake indicator lamp should flash. (Move on to Step 7)
6. In a Manual Transmission vehicle, start the vehicle with park brakes applied.	The brake indicator lamp should start flashing. (Move on to Step 7)
7. Drive the vehicle over 8 km/h (5 mph) with the park brake engaged.	The park brake lamp should flash accompanied with a chime.

TO TEST THE SYSTEM:

- As the ignition switch is turned to the START position, the lamp should light.
- Turn ignition switch to the ON position and apply the parking brake. The lamp should light.

IF LAMPS FAILS TO LIGHT, INSPECT FOR:

- A broken or disconnected wire at the switch
- Defective switch
- A burned out Light Emitting Diode (LED)
- A damaged circuit board

To test the service brake warning system, refer to Brakes, Diagnosis and Testing, Base Brake System Diagnosis Charts, Red Brake Warning Lamp.

CHIME/BUZZER SYSTEM

The hard wired chime warning system inputs to the ElectroMechanical Instrument Cluster (EMIC), as well as other hard wired circuits for this system may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the Controller Area Network (CAN) data bus, or the electronic message inputs used by the EMIC to provide chime warning system service. The most reliable, efficient, and accurate means to diagnose the EMIC, the CAN data bus, and the elec-

tronic message inputs for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

CONDITION	POSSIBLE CAUSES	CORRECTION
NO KEY-IN IGNITION WARNING CHIME, BUT OTHER CHIME FEATURES OK	1. Driver door ajar switch sense circuit open.	1. Check for continuity between the driver door ajar switch sense circuit connector and the instrument cluster connector. Repair the open driver door ajar switch sense circuit, if required.
	2. Key-in ignition switch sense circuit open.	2. Check for continuity between the key-in ignition switch sense circuit connector and instrument cluster connector. Repair the open key-in ignition switch sense circuit, if required.
	3. Key-in ignition switch ground circuit open.	3. Check for continuity between the ground circuit cavity of the ignition switch connector and a good ground. Repair the open ground circuit, if required.
	4. Faulty ignition switch.	4. Check for continuity between the ground circuit terminal and the key-in ignition switch sense circuit terminal in the ignition switch connector. There should be continuity with a key in the ignition lock cylinder. Replace the faulty ignition switch, if required.
NO EXTERIOR LAMPS-ON WARNING CHIME, BUT OTHER CHIME FEATURES OK	1. Driver door ajar switch sense circuit open.	1. Check for continuity between the driver door ajar switch sense circuit connector and the instrument cluster connector. Repair the open driver door ajar switch sense circuit, if required.
	2. Headlamp switch signal circuit open.	2. Check for continuity between the headlamp switch output circuit connector and the instrument cluster connector. Repair the open headlamp switch signal circuit, if required.
NO CHIMES AND OTHER INSTRUMENT CLUSTER FEATURES ERRATIC OR DISABLED	1. Instrument cluster ground circuit(s) open.	1. Check for continuity between the ground circuits of the instrument cluster connector and a good ground. Repair the open ground circuits(s), if required.
	2. Instrument cluster fused B(+) circuit(s) open.	2. Check for battery voltage at the B(+) circuits of the instrument cluster connector. Repair the open fused B(+) circuit(s), if required.
	3. Instrument cluster fused ignition switch output (run-start) circuit open.	3. With the ignition switch in the On position, check for battery voltage at the fused ignition switch output (run-start) circuit of the instrument cluster connector. Repair the open fused ignition switch output (run-start) circuit, if required.
	4. Faulty instrument cluster.	4. Replace the faulty instrument cluster, if required.

CONDITION	POSSIBLE CAUSES	CORRECTION
NO CHIMES, BUT ALL OTHER INSTRUMENT CLUSTER FEATURES OK	1. Faulty instrument cluster.	1. Replace the faulty instrument cluster, if required.

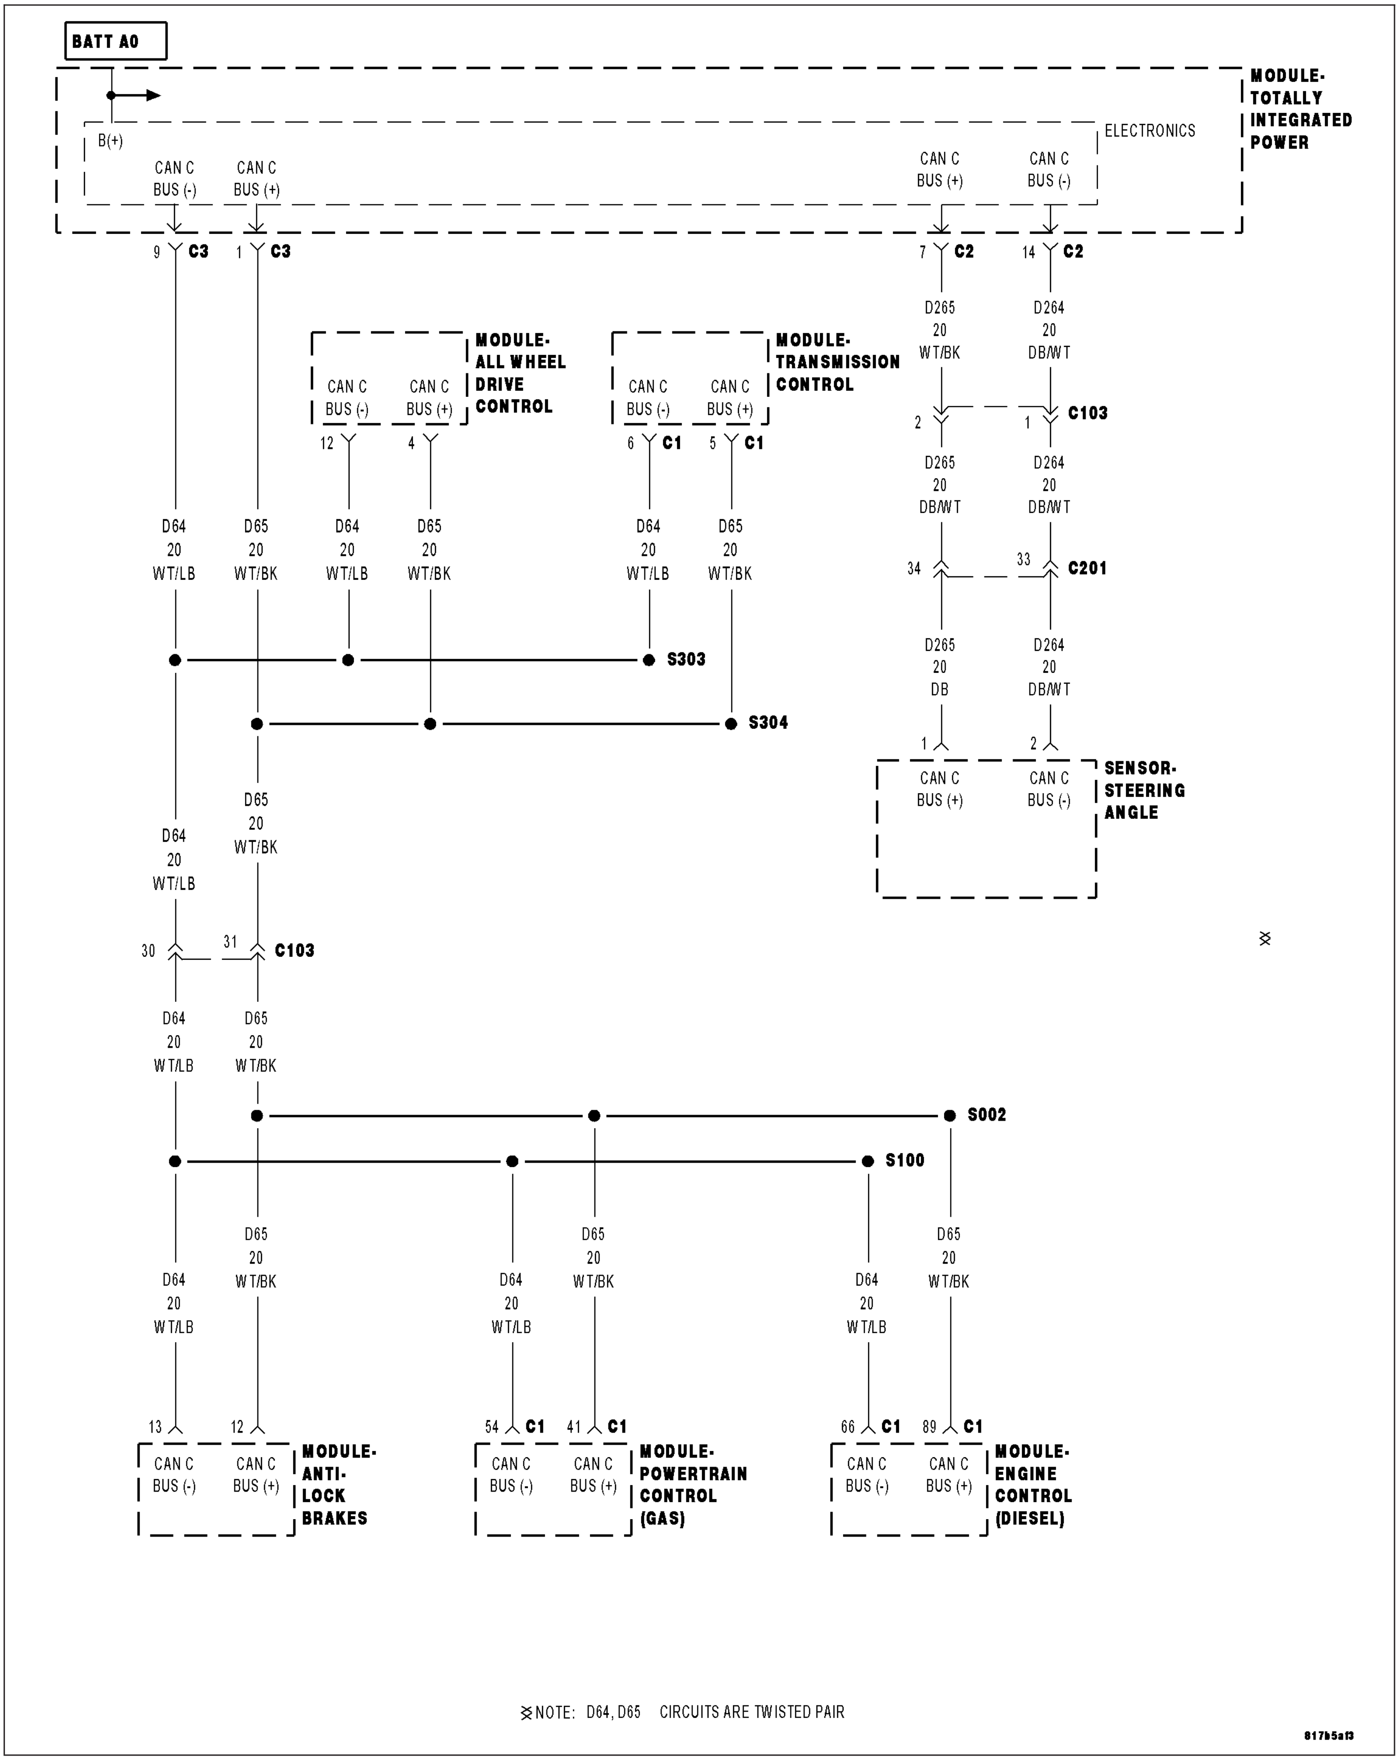
FASTEN SEAT BELTS

To test the fasten seat belts function, turn the ignition switch to the ON position with the driver's seat belt unbuckled and fully retracted. The seat belt warning lamp should light for four to eight seconds and the tone should sound three to five times.

If the lamp does not light, check the connection at the seat belt retractor. Replace as necessary.

ELECTRONIC CONTROL MODULES

TABLE OF CONTENTS



ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

U0001-CAN C BUS CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The TIPM detects a short in either CAN C Bus circuit.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE
TRANSMISSION CONTROL MODULE (CVT)
ENGINE CONTROL MODULE (DIESEL ONLY)
STEERING ANGLE SENSOR
ALL WHEEL DRIVE CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC’s.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC’s.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ANTILOCK BRAKE MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC’s.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC’s.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Antilock Brake Module in accordance with the service information.

Perform ABS VERIFICATION TEST — VER 1.

3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC’s.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC’s.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 4

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.

Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

4. TRANSMISSION CONTROL MODULE (CVT) — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Transmission Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC’s.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC’s.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 5

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Transmission Control Module in accordance with the service information.

Perform the appropriate VERIFICATION TEST VER 1.

5. ENGINE CONTROL MODULE (DIESEL ONLY) — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the Engine Control Module C1 harness connectors.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC’s.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC’s.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 6

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Engine Control Module in accordance with the service information.

Perform the ECM VERIFICATION TEST.

6. STEERING ANGLE SENSOR— INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this sensor, answer yes to the question.

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 7

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Steering Angle Sensor in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

7. ALL WHEEL DRIVE CONTROL (AWD) MODULE — INTERNAL SHORT

Turn the ignition off.

NOTE: If vehicle is not equipped with this module, answer yes to the question.

Disconnect the AWD Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 8

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the All Wheel Drive Control (AWD) Module in accordance with the service information.

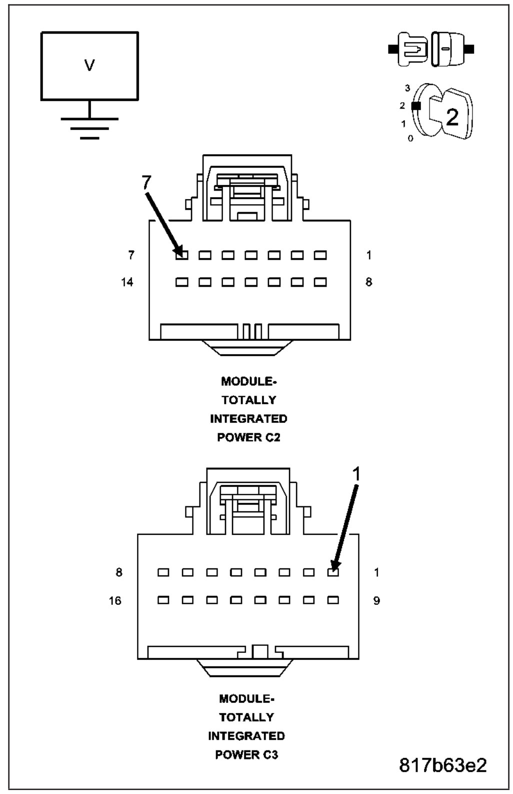
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Totally Integrated Power Module C2 and C3 harness connectors.

Turn the ignition on.



Measure the voltage between the (D65) CAN C Bus (+) circuit and ground on both connectors.

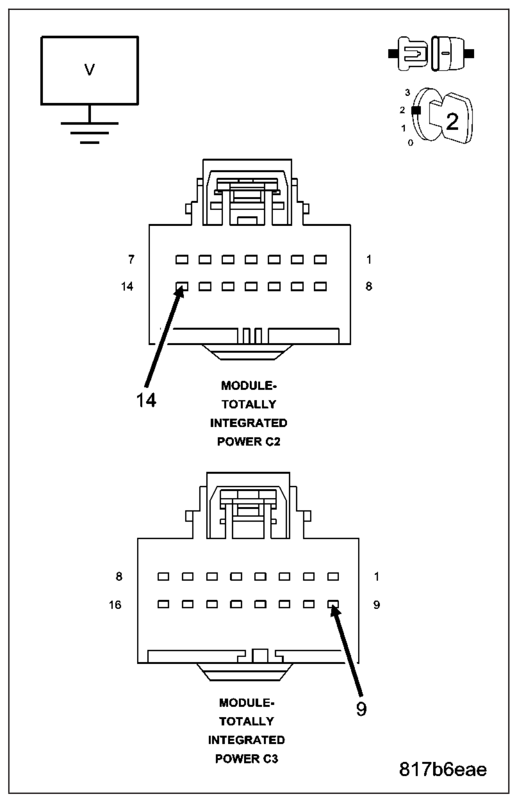
Is there any voltage present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 9

9. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE



Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?

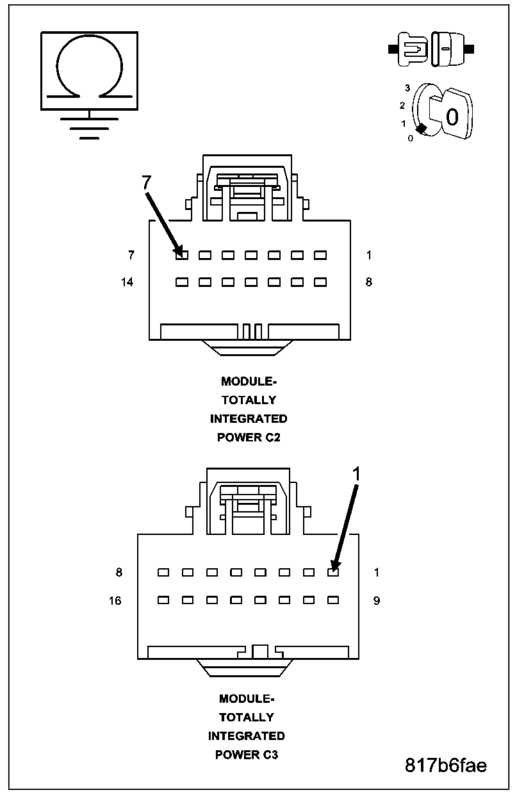
Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 10

10. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.



Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

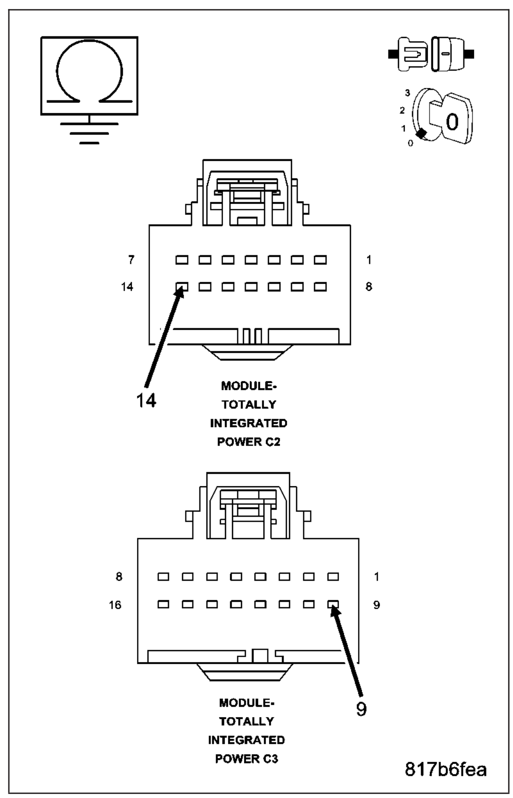
Is any resistance present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 11

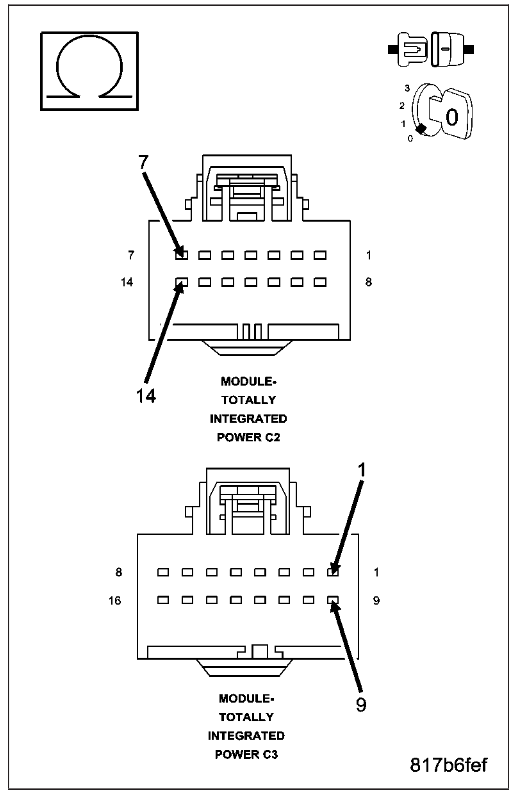
11. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to ground.



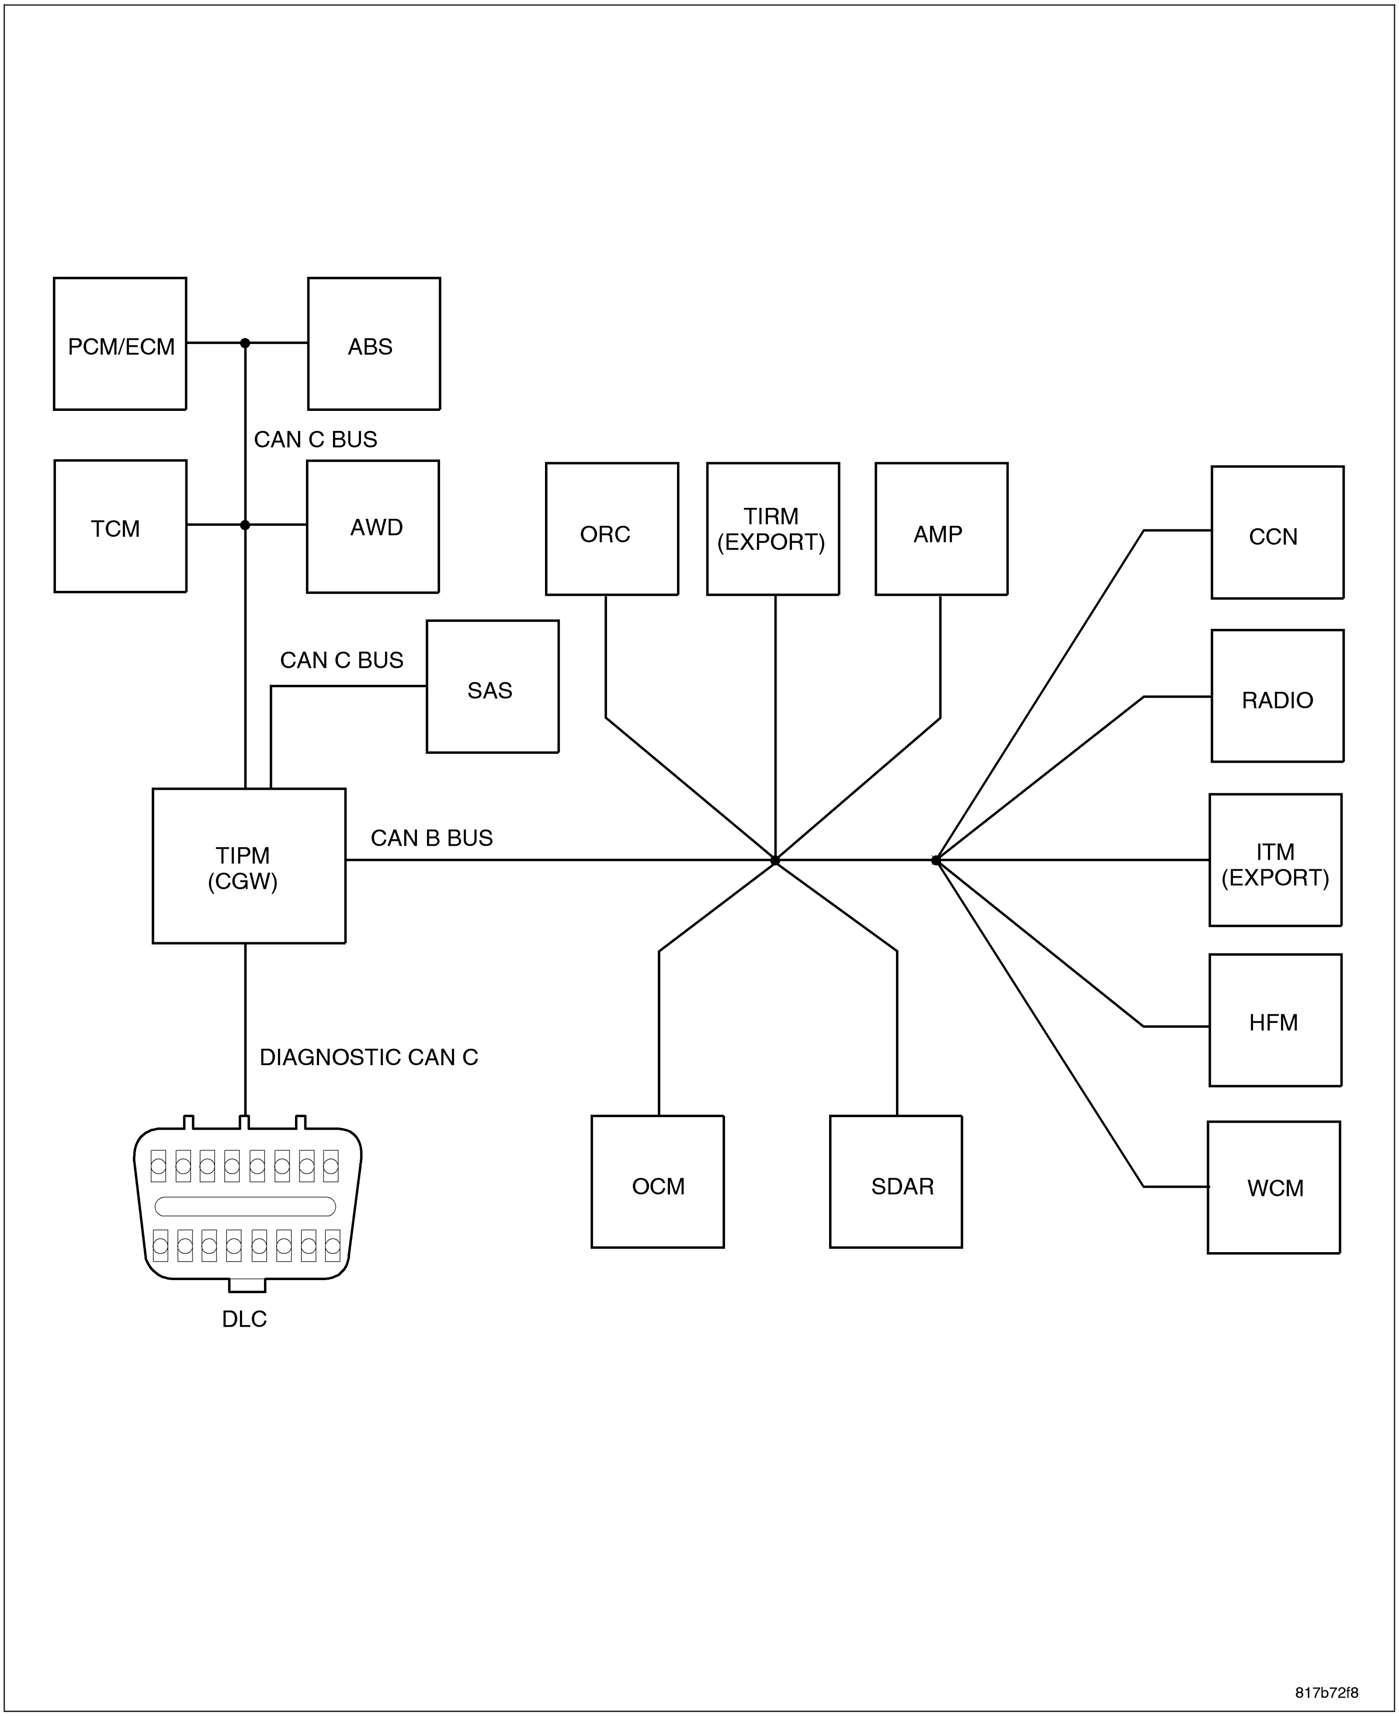
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 12

12. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

Is any resistance present?



Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Totally Integrated Power Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0019-CAN B BUS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The TIPM detects an open, a short high, a short low or a short together in either of the CAN B Bus circuits.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT OPEN
(D54) CAN B BUS (-) CIRCUIT OPEN
(D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND
(D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND
(D55) CAN B BUS (+) CIRCUIT SHORTED TO (D54) CAN B BUS (-) CIRCUIT
ANY CAN B BUS MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase TIPM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

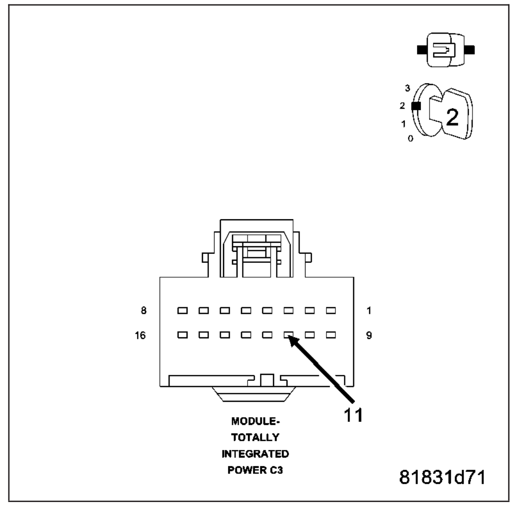
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. MEASURE VOLTAGE AT TIPM

Gain access to the Totally Integrated Power Module C3 harness connector, but do not disconnect.
Backprobe and measure the voltage on both the (D55) CAN B Bus (+) and the (D54) CAN B (-) circuits.

Does the voltage read approximately 4.65 - 4.98 volts on the (D54) CAN B Bus (-) and 0.39 - 0.46 volts on the (D55) CAN B (+) circuits?



Yes >> Go To 3

No - Voltage Between 0.3 - 0.7 Volts on Both Circuits
Go To 9

No - Voltage Reads 0 Volts on Either Circuit
Go To 7

No - Voltage Above 10 Volts on Either Circuit
Go To 5

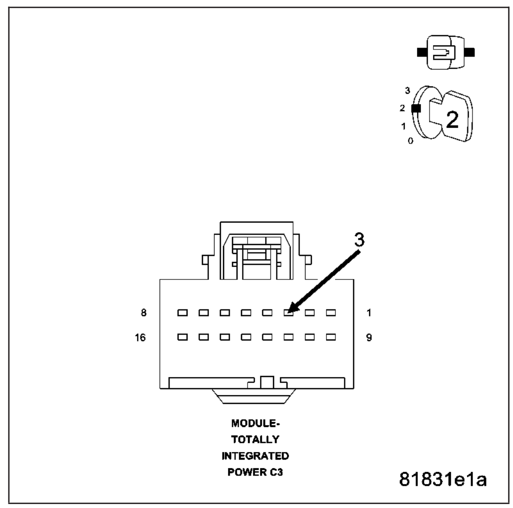
3. (D55) CAN B BUS (+) CIRCUIT OPEN

Turn the ignition on.

With the scan tool select ECU View.

Using a fused jumper wire, connect one end to ground and with the other end backprobe the (D54) CAN B Bus (-) circuit at the TIPM C3 harness connector.

NOTE: A red “X” will appear next to modules that can no longer communicate on the Bus.



Did a red “X” appear next to any modules on the scan tool?

Yes >> Using the Wiring Diagrams to further isolate the open in the circuit, repair the (D55) CAN B Bus (+) circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. (D54) CAN B BUS (-) CIRCUIT OPEN

With the scan tool select ECU View.

Using a fused jumper wire, connect one end to ground and with the other end backprobe the (D55) CAN B Bus (+) circuit at the TIPM C3 harness connector.

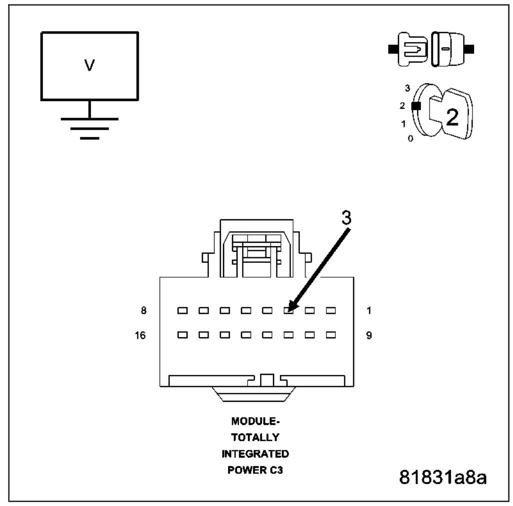
NOTE: A red “X” will appear next to modules that can no longer communicate on the Bus.

Did a red “X” appear next to any modules on the scan tool?

Yes >> Using the Wiring Diagrams to further isolate the open in the circuit, repair the (D54) CAN B Bus (-) circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage. If ok, replace and program the Totally Integrated Power Module in accordance with the service information. Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



5. (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE

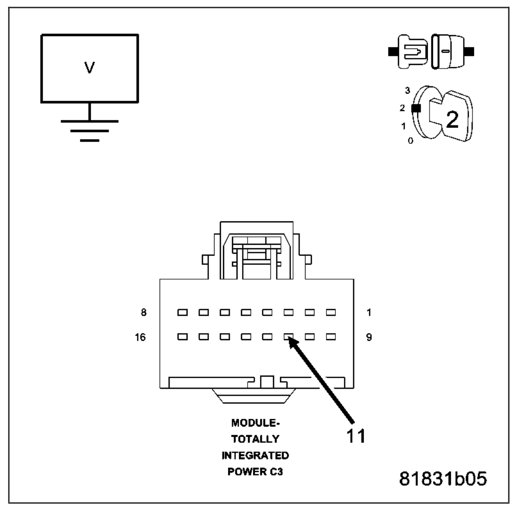
Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Turn the ignition on.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is the voltage above 10.0 volts?



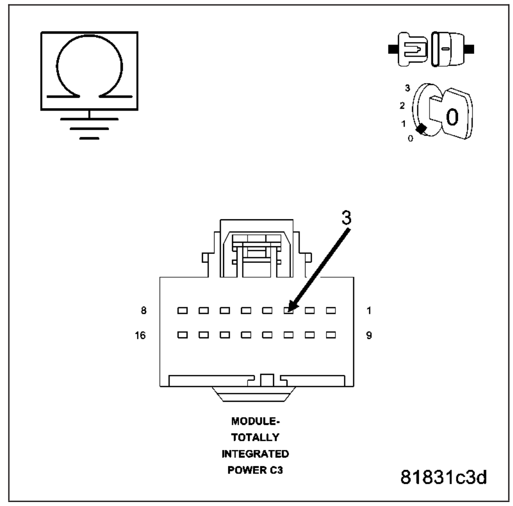
Yes >> Disconnect each CAN B Bus module one at a time while observing the voltage to determine if the short is caused by an internal short within a module. Replace the module, in accordance with the service information, that when disconnected eliminates the short to voltage. If the short condition is still present with all CAN B Bus modules disconnected use the Wiring Diagrams to help isolate and repair the (D55) CAN B Bus (+) circuit for a short to voltage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

6. (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.



Is the voltage above 10.0 volts?

Yes >> Disconnect each CAN B Bus module one at a time while observing the voltage to determine if the short is caused by an internal short within a module. Replace the module, in accordance with the service information, that when disconnected eliminates the short to voltage. If the short condition is still present with all CAN B Bus modules disconnected use the Wiring Diagrams to help isolate and repair the (D54) CAN B Bus (-) circuit for a short to voltage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

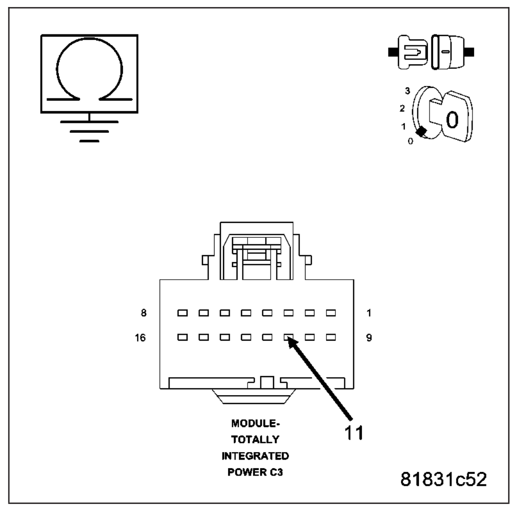
No >> Inspect the wiring and connectors for damage. If ok, replace and program the Totally Integrated Power Module in accordance with the service information. Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

7. (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.



Is the resistance above 1000.0 ohms?

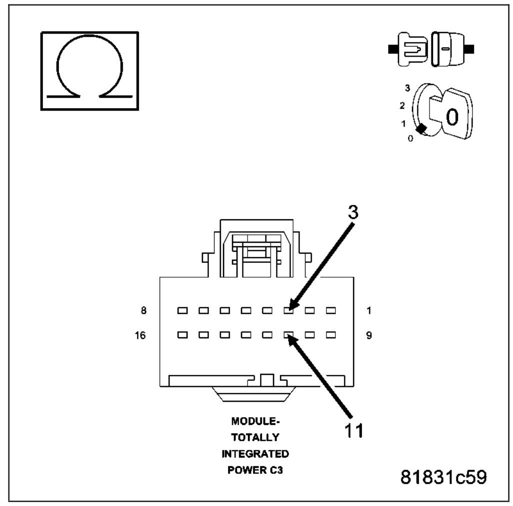
Yes >> Go To 8

No >> Disconnect each CAN B Bus module one at a time while observing the resistance to determine if the short is caused by an internal short within a module. Replace the module, in accordance with the service information, that when disconnected eliminates the short to ground. If the short condition is still present with all CAN B Bus modules disconnected use the Wiring Diagrams to help isolate and repair the (D55) CAN B Bus (+) circuit for a short to ground.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8. (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.



Is the resistance above 1000.0 ohms?

Yes >> Inspect the wiring and connectors for damage. If ok, replace and program the Totally Integrated Power Module in accordance with the service information. Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Disconnect each CAN B Bus module one at a time while observing the resistance to determine if the short is caused by an internal short within a module. Replace the module, in accordance with the service information, that when disconnected eliminates the short to ground. If the short condition is still present with all CAN B Bus modules disconnected use the Wiring Diagrams to help isolate and repair the (D54) CAN B Bus (-) circuit for a short to ground.

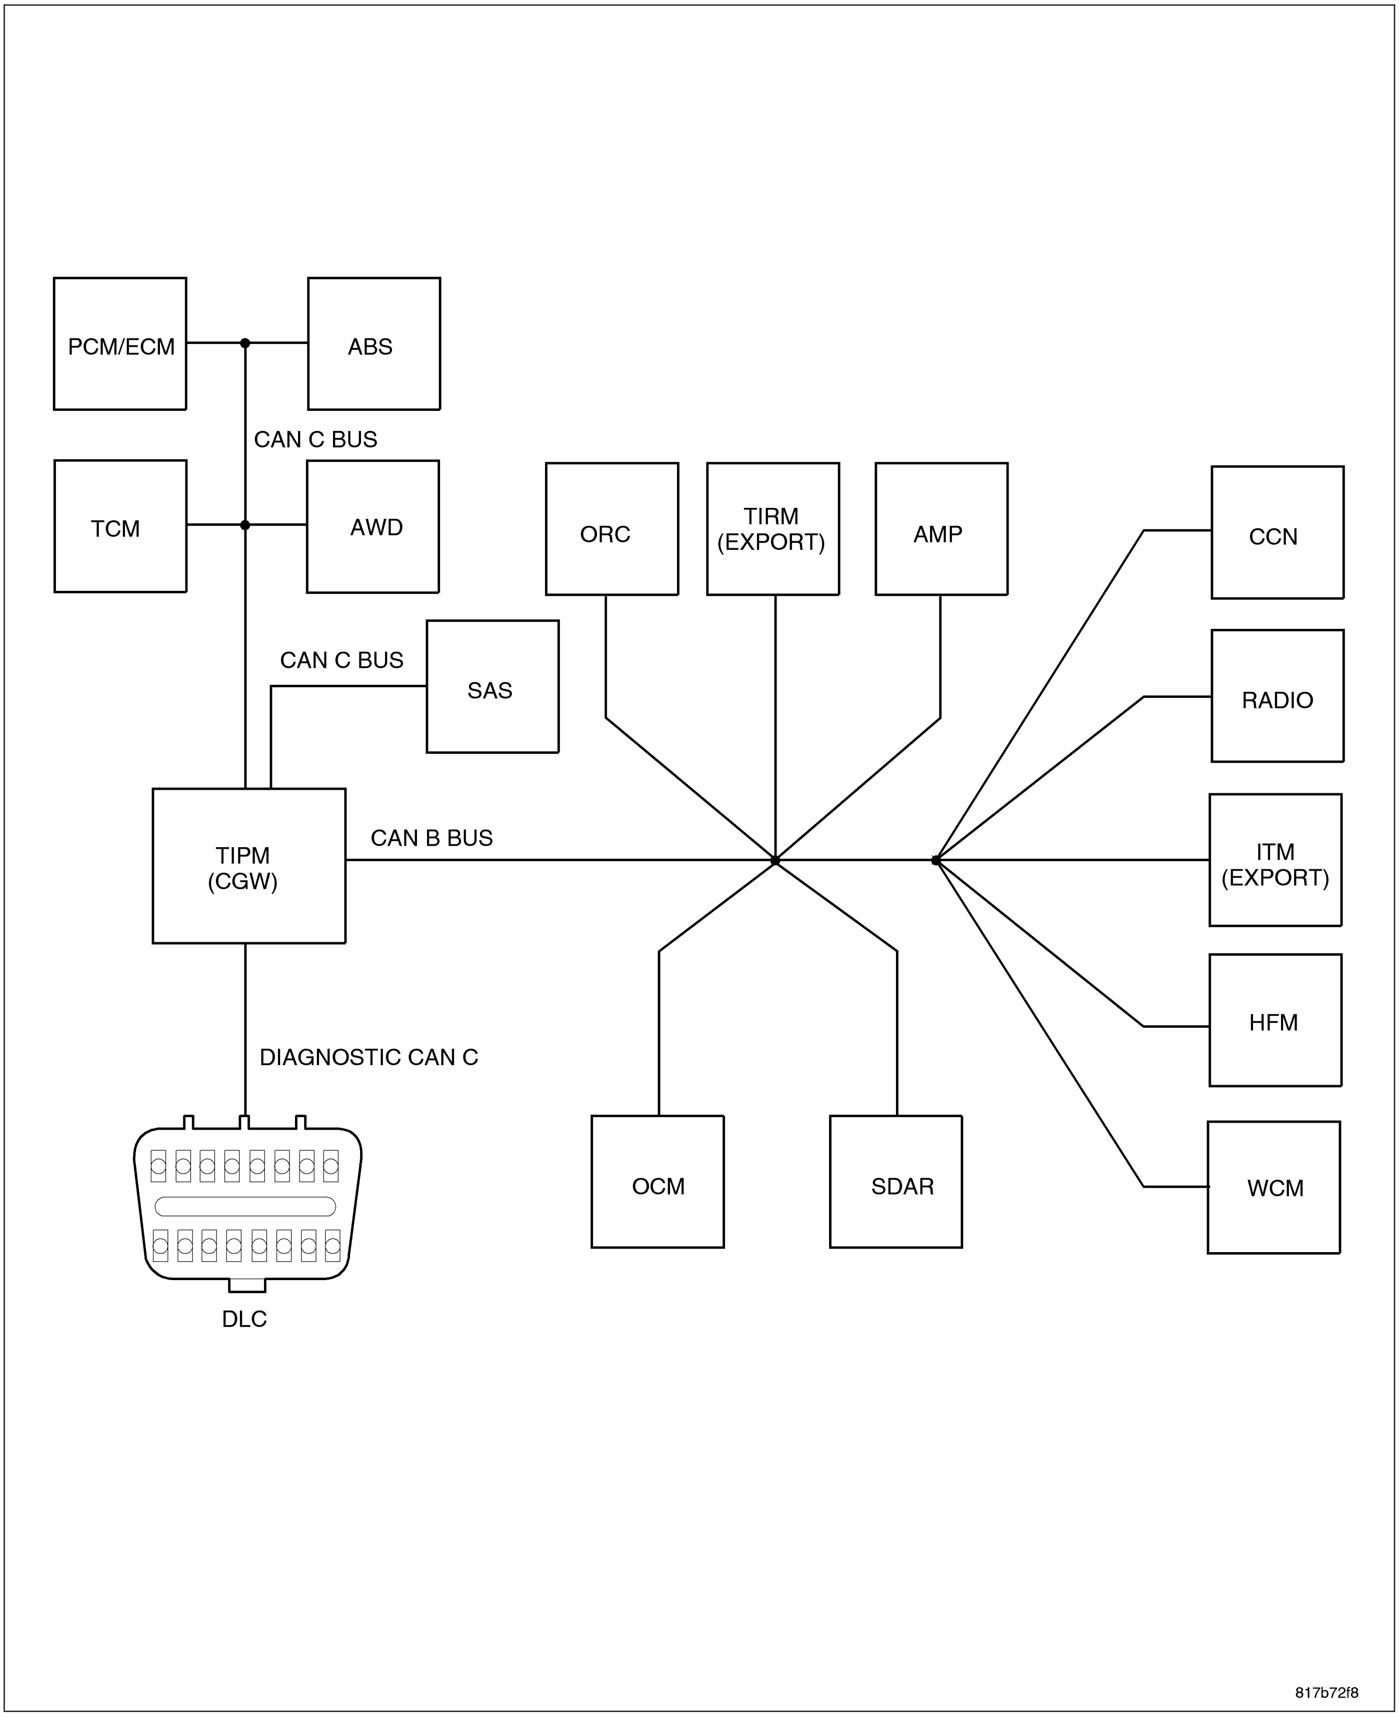
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

9. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.



Is any resistance present?

Yes >> Disconnect each CAN B Bus module one at a time while observing the resistance to determine if the short is caused by an internal short within a module. Replace the module, in accordance with the service information, that when disconnected eliminates the short between the two circuits. If the short condition is still present with all CAN B Bus modules disconnected use the Wiring Diagrams to help isolate and repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage. If ok, replace and program the Totally Integrated Power Module in accordance with the service information. Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0021-CAN B BUS (+) CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and battery voltage between 10 and 16 volts.
- **Set Condition:**
  The TIPM detects the (D55) CAN B Bus (+) circuit is open.

Possible Causes
CAN B BUS TERMINAL PUSH OUT
SPREAD CAN B BUS TERMINAL
(D55) CAN B BUS (+) CIRCUIT OPEN
INTERNAL OPEN IN A CAN B BUS MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC’s.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC’s.

Does the scan tool display this DTC as active?

Yes >> Go To 2

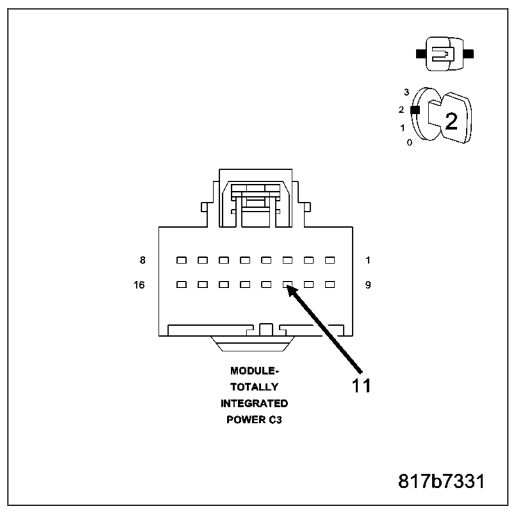
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ATTEMPT TO ISOLATE THE OPEN CONDITION

Turn the ignition on.

With the scan tool select ECU View.

Verify that all CAN B Bus modules are communicating with the scan tool.



NOTE: A red X will be next to a module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: If any module is not communicating, perform the appropriate no response test procedure before proceeding.

Turn the ignition off.

Gain access to the Totally Integrated Power Module C3 harness connector, but do not disconnect.

Using a fused jumper wire, connect one end to ground and with the other end backprobe the CAN B Bus (-) circuit at the TIPM C3 harness connector.

Turn the ignition on.

With the scan tool monitor the ECU View screen and document all modules that display a red X.

Are there any red X’s displayed next to any CAN B Bus modules?

Yes >> Go To 3

No >> Check backprobe connection to ground, make sure it is proper. The CAN B Bus open DTC may no longer be active, it may be stored. Check all module connections.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. ATTEMPT TO ISOLATE THE OPEN CONDITION — MULTIPLE RED X'S

With the scan tool continue monitoring the ECU View screen.

Are there multiple red X's displayed next to CAN B Bus modules?

Yes >> The most likely cause of this condition is an open CAN B Bus (+) circuit between a common CAN B Bus splice and the modules that display the red X next to them. Use the wiring diagrams to help you determine where the open condition exists.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. (D55) CAN B BUS (+) CIRCUIT OPEN — SINGLE RED X

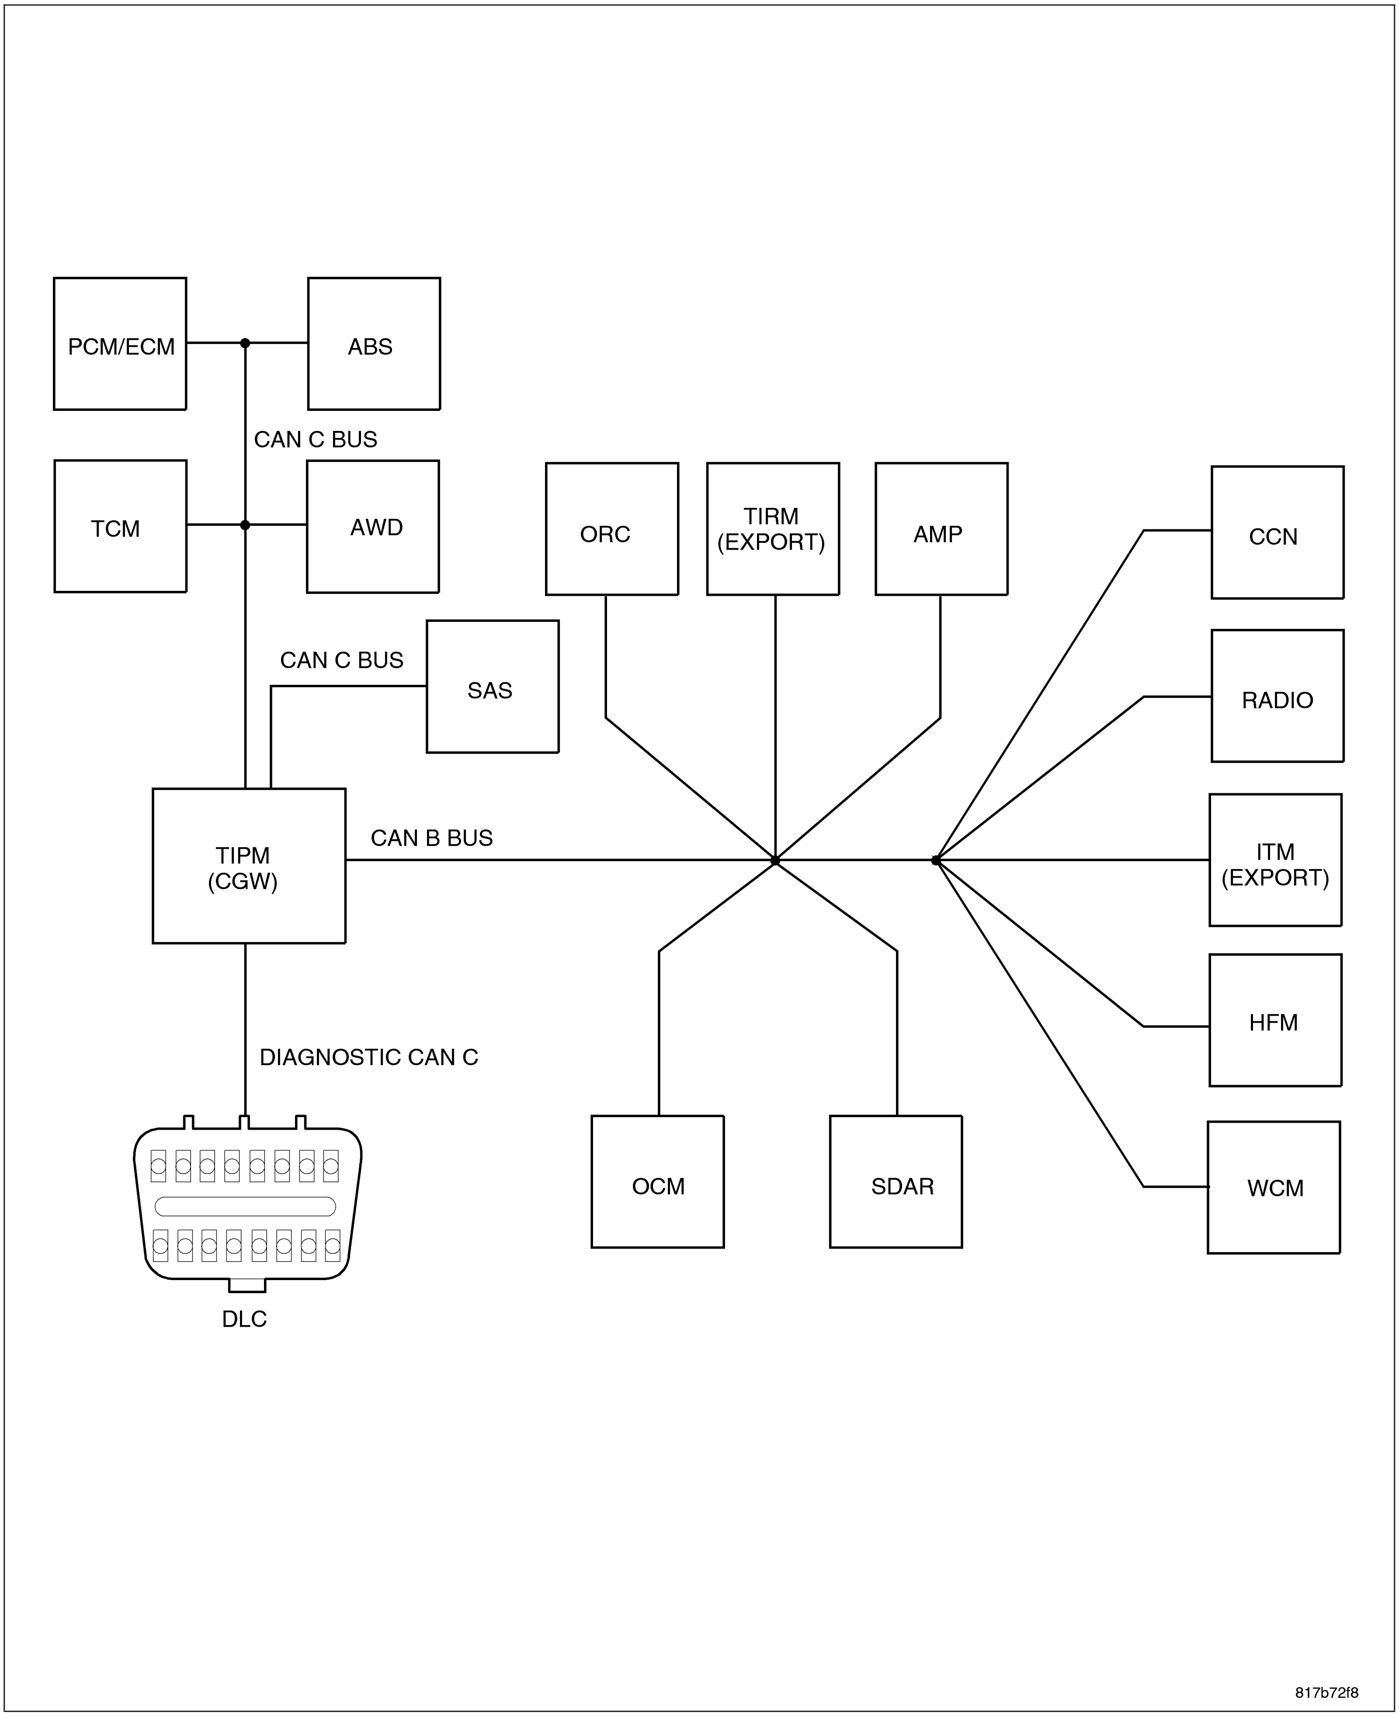
Turn the ignition off.

Disconnect the module that has the red X displayed next to it.

Turn the ignition on.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present?



Yes >> Inspect the connector and terminal for damage, inspect for spread terminals, or pushed out terminals. If ok, replace the module that displayed the red X next to it in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) CAN B Bus (+) circuit for an open between the next common splice and the module that has the red X displayed next to it. Use the wiring diagrams to help you determine where the open condition exists.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0022-CAN B BUS (+) CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The TIPM detects the (D55) CAN B Bus (+) circuit is shorted to ground.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND
ANY CAN B BUS MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

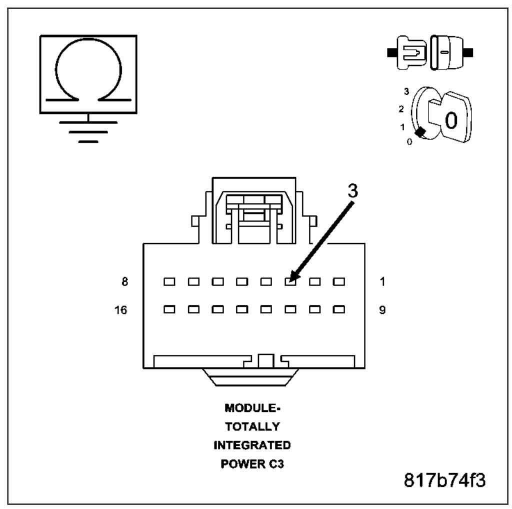
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Totally Integrated Power Module C3 harness connector.



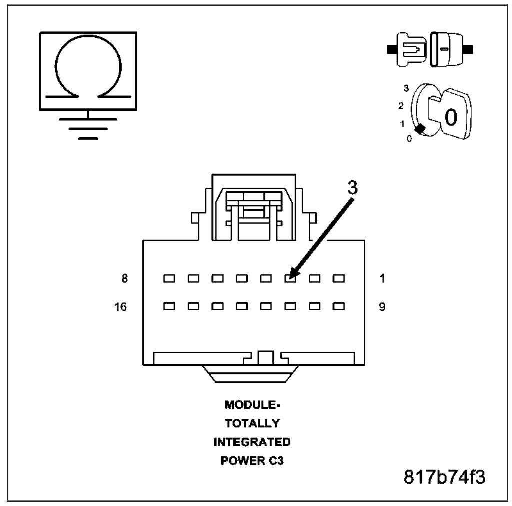
Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.

Is resistance below 1000.0 ohms?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



3. (D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND

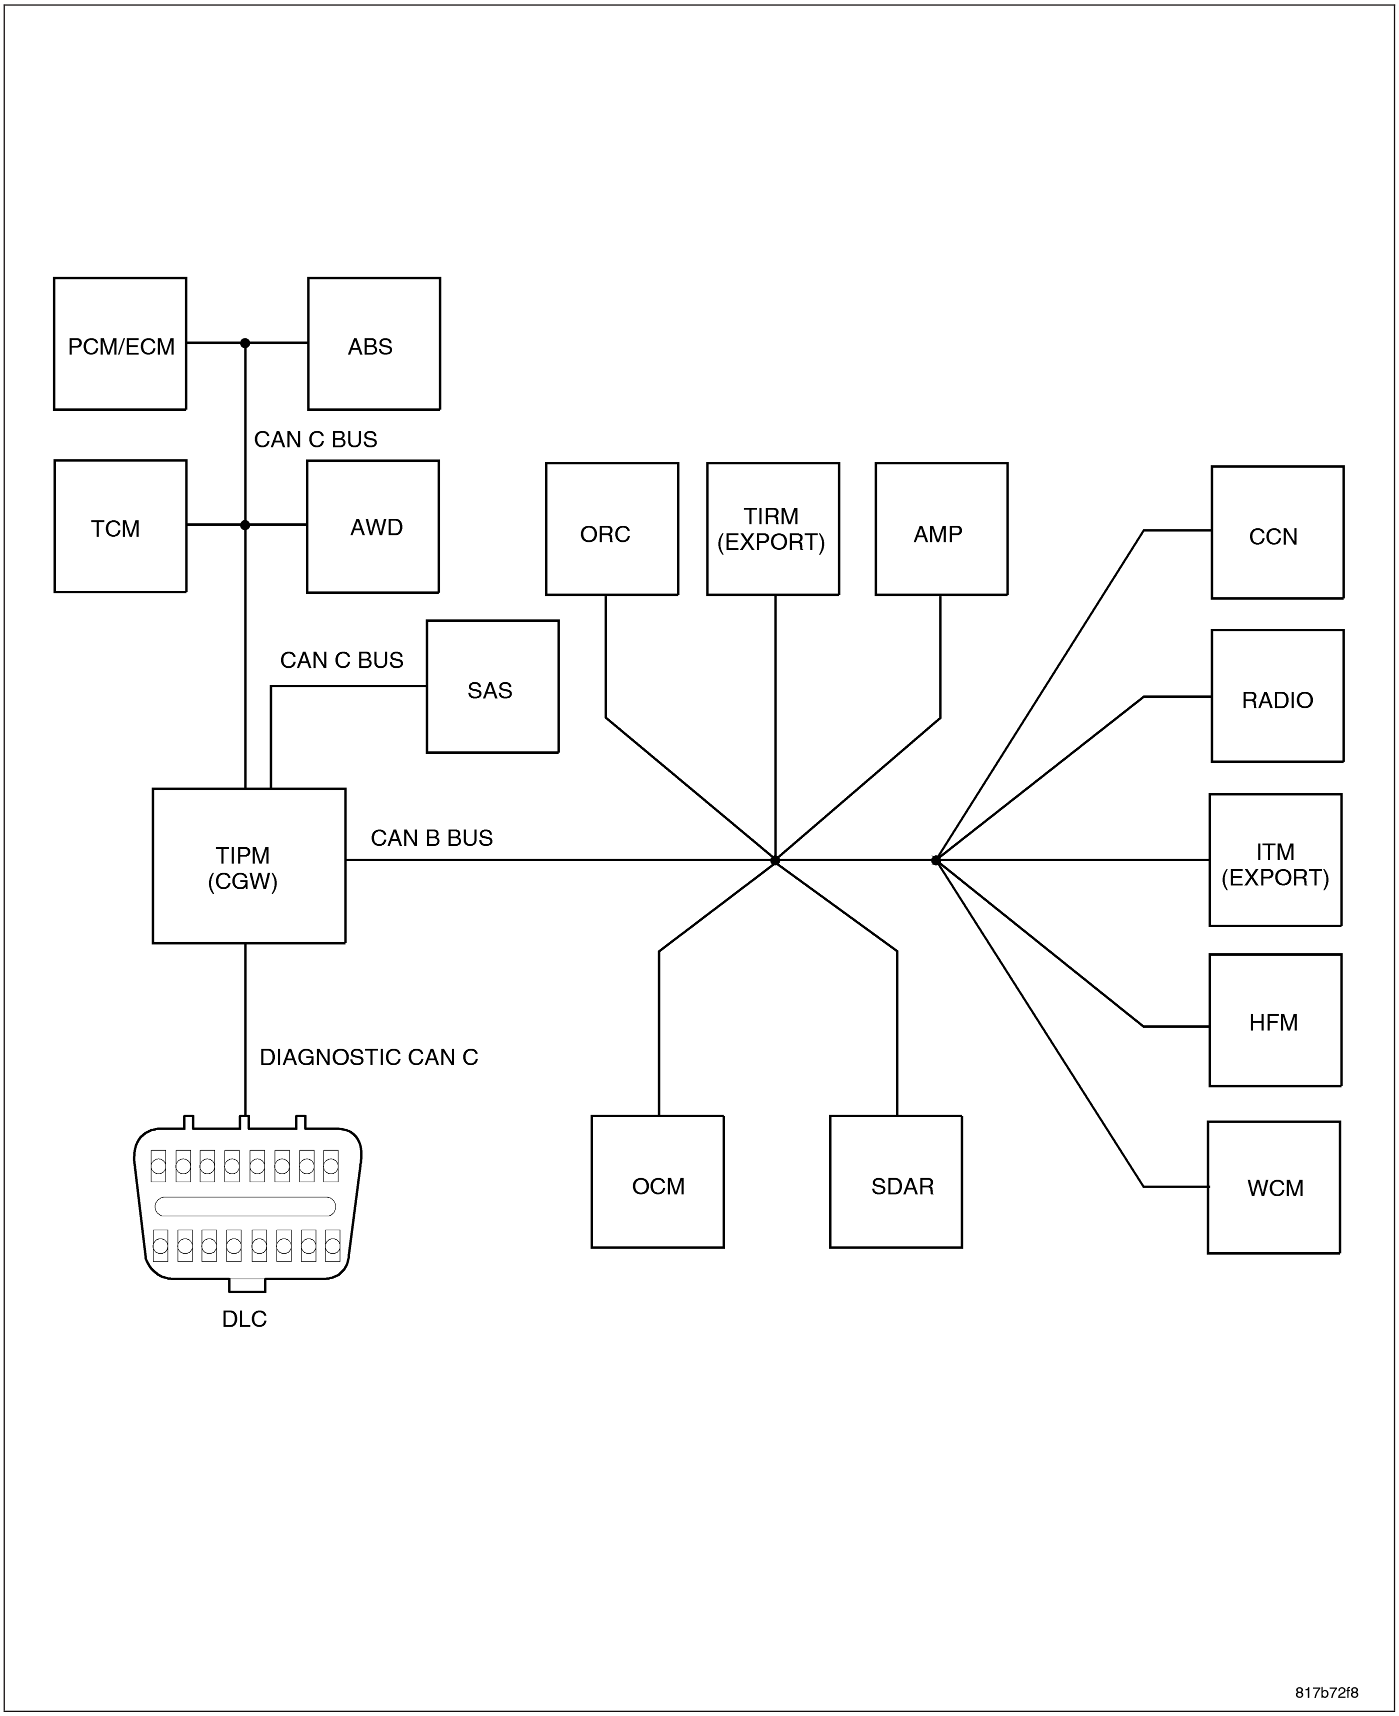
Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

NOTE: This is to determine if the circuit is shorted to ground internally within a module or if the circuit is shorted in the harness.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wring diagrams to assist in diagnosis.

Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?



Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to ground.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module that when disconnected eliminated the short to ground in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0023-CAN B BUS (+) CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The TIPM detects the (D55) CAN B Bus (+) circuit is shorted to voltage.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE
ANY CAN B BUS MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

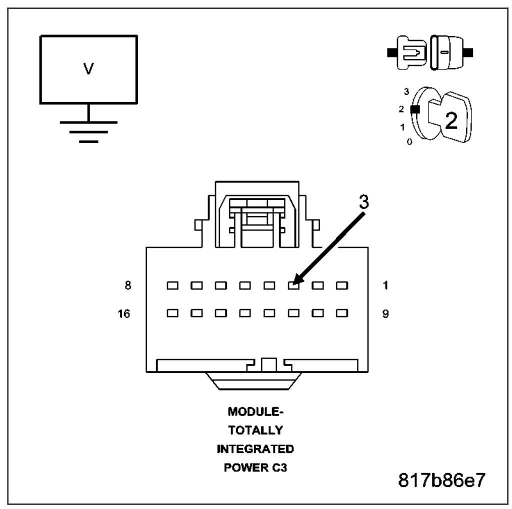
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Totally Integrated Power Module C3 harness connector.

Turn the ignition on.



Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

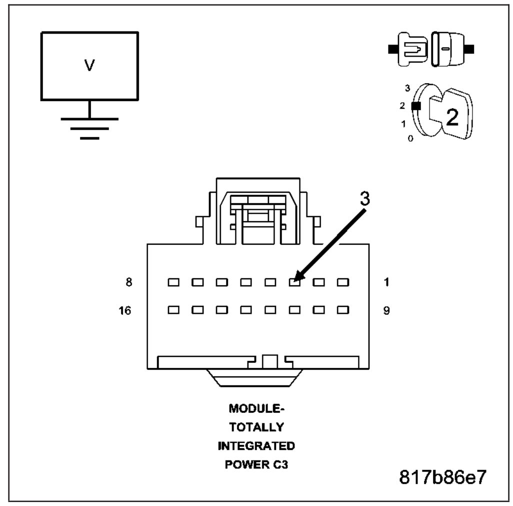
Is voltage above 10.0 volts?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE



Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

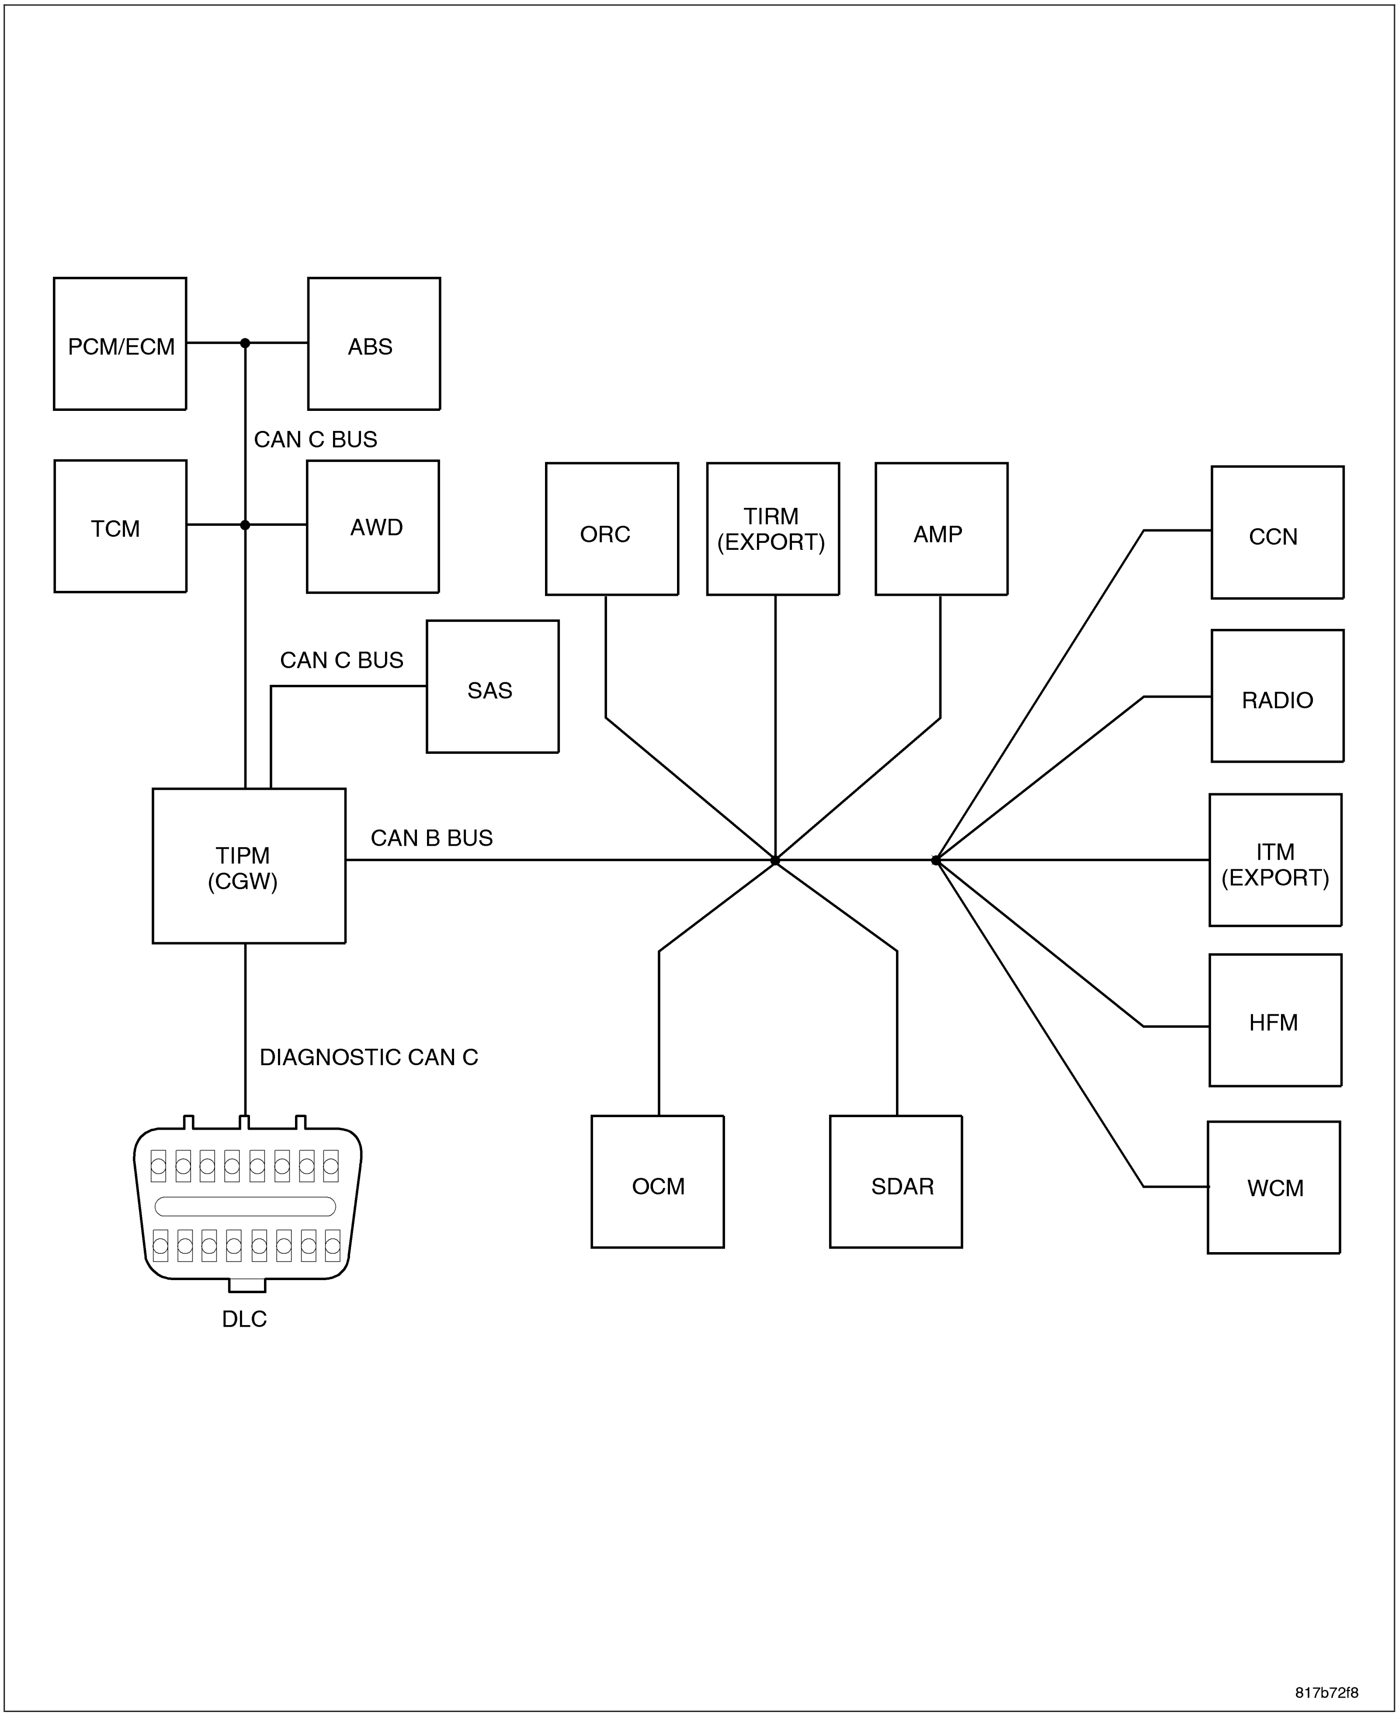
While monitoring the voltmeter, disconnect each CAN B Bus module one at a time.

NOTE: When performing the above step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on to check for a short to voltage.

NOTE: This is to determine if the circuit is shorted to voltage internally within a module or if the circuit is shorted to voltage in the harness.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wring diagrams to assist in diagnosis.

Is the voltage above 10.0 volts with all the CAN B Bus modules disconnected?



Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to voltage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module that when disconnected eliminated the short to voltage in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0024-CAN B BUS (-) CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and battery voltage between 10 and 16 volts.
- **Set Condition:**
  The TIPM detects the (D54) CAN B Bus (-) circuit is open.

Possible Causes
CAN B BUS TERMINAL PUSH OUT
SPREAD CAN B BUS TERMINAL
(D54) CAN B BUS (-) CIRCUIT OPEN
INTERNAL OPEN IN A CAN B BUS MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

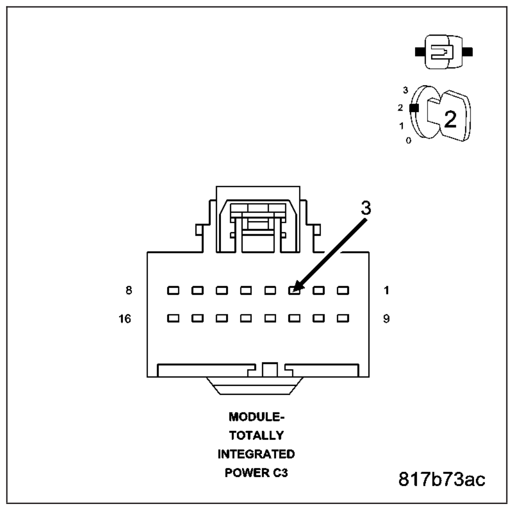
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ATTEMPT TO ISOLATE THE OPEN CONDITION

Turn the ignition on.

With the scan tool select ECU View.

Verify that all CAN B Bus modules are communicating with the scan tool.



NOTE: A red X will be next to a module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: If any module is not communicating, perform the appropriate no response test procedure before proceeding.

Turn the ignition off.

Gain access to the Totally Integrated Power Module C3 harness connector, but do not disconnect.

Using a fused jumper wire, connect one end to ground and with the other end backprobe the CAN B Bus (+) circuit at the TIPM C3 harness connector.

Turn the ignition on.

With the scan tool monitor the ECU View screen and document all modules that display a red X.

Are there any red X's displayed next to any CAN B Bus modules?

Yes >> Go To 3

No >> Check backprobe connection to ground, make sure it is proper. The CAN B Bus open DTC may no longer be active, it may be stored. Check all module connections.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. ATTEMPT TO ISOLATE THE OPEN CONDITION — MULTIPLE RED X'S

With the scan tool continue monitoring the ECU View screen.

Are there multiple red X's displayed next to CAN B Bus modules?

Yes >> The most likely cause of this condition is an open CAN B Bus (-) circuit between a common CAN B Bus splice and the modules that display the red X next to them. Use the wiring diagrams to help you determine where the open condition exists.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. (D54) CAN B BUS (-) CIRCUIT OPEN — SINGLE RED X

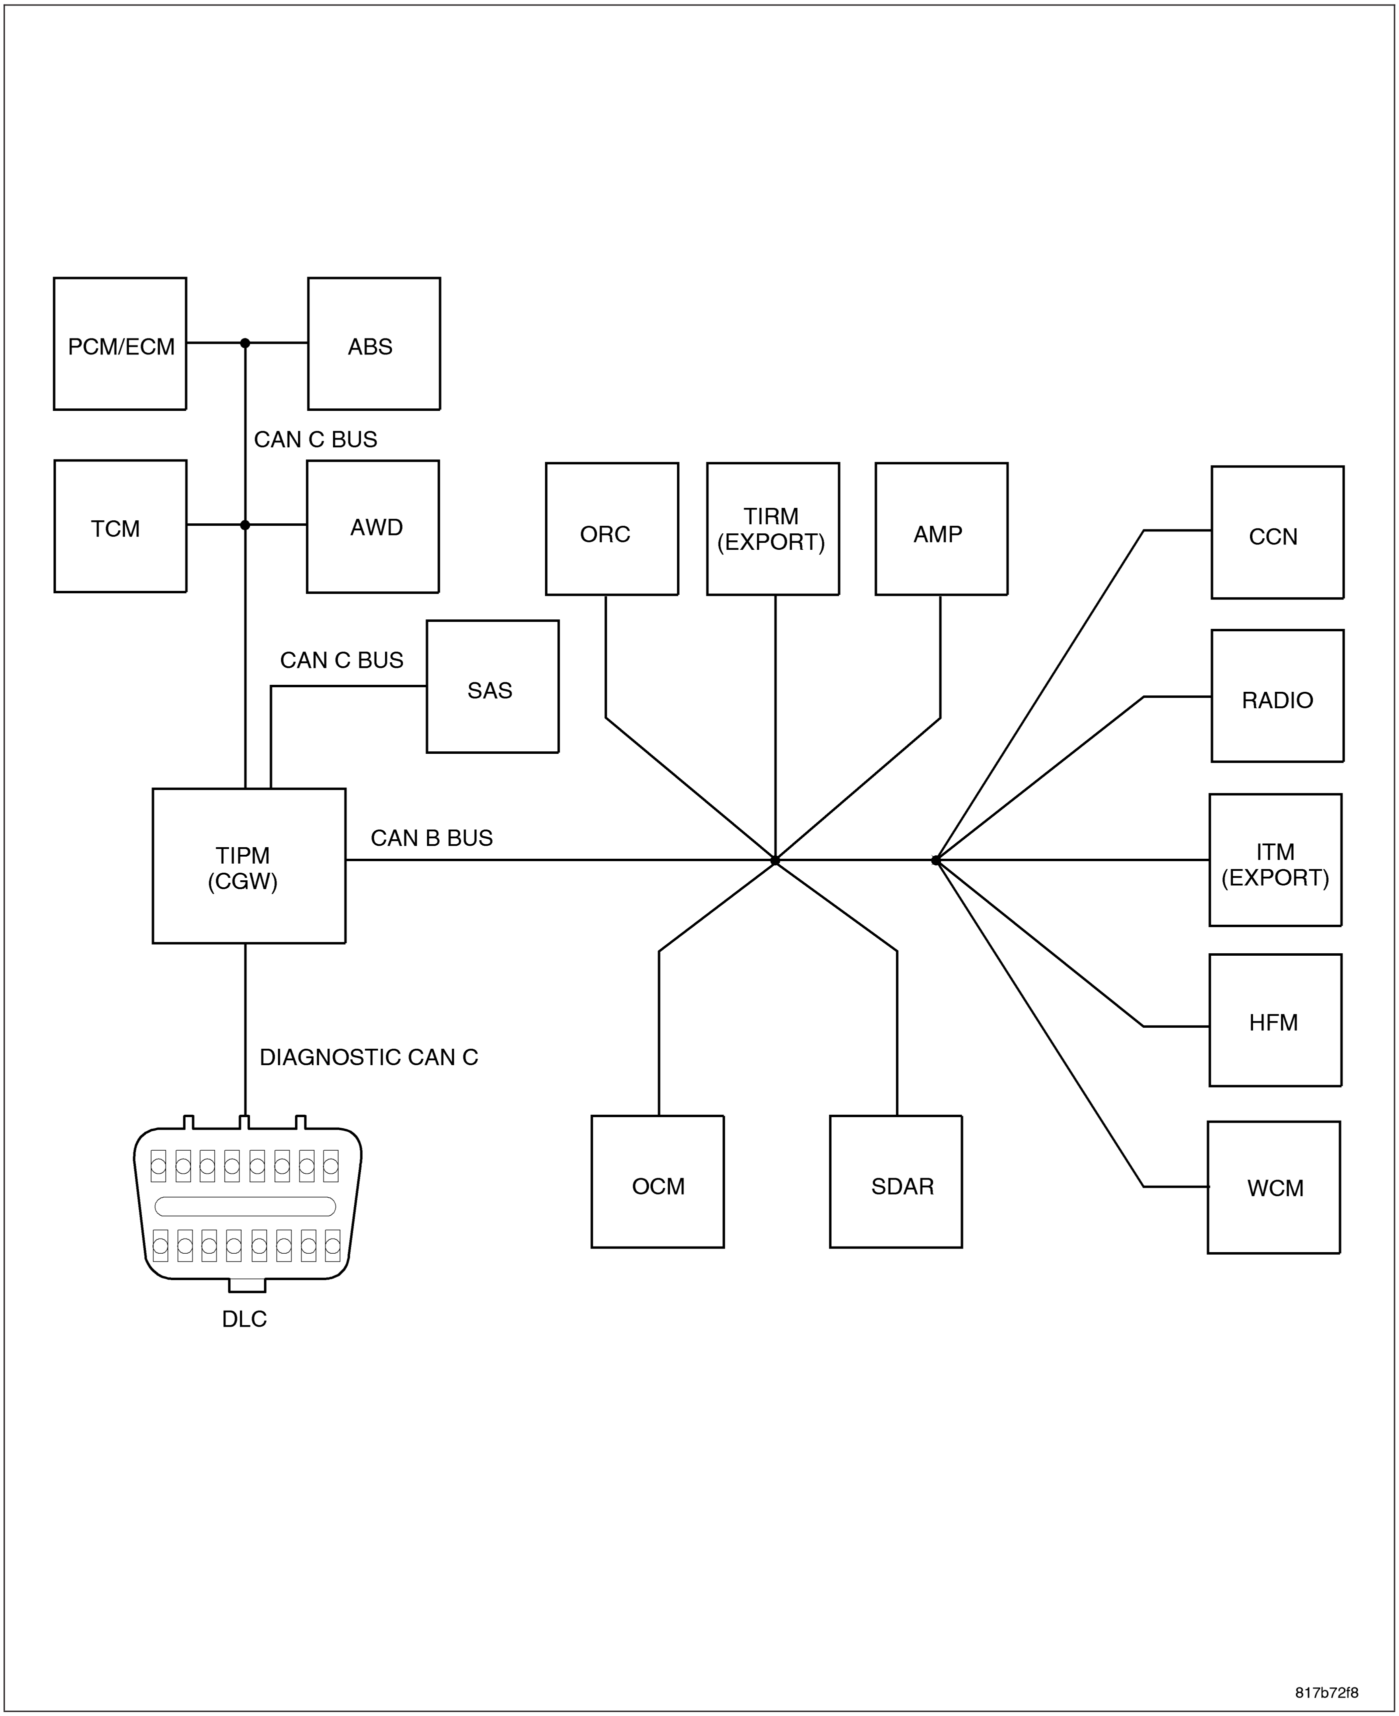
Turn the ignition off.

Disconnect the module that has the red X displayed next to it.

Turn the ignition on.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Is there any voltage present?



Yes >> Inspect the connector and terminal for damage, inspect for spread terminals, or pushed out terminals. If ok, replace the module that displayed the red X next to it in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D54) CAN B Bus (-) circuit for an open between the next common splice and the module that has the red X displayed next to it. Use the wiring diagrams to help you determine where the open condition exists.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0025-CAN B BUS (-) CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The TIPM detects the (D54) CAN B Bus (-) circuit is shorted to ground.

Possible Causes
(D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND OR TO (D55) CAN B BUS (+) CIRCUIT
ANY CAN B BUS MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

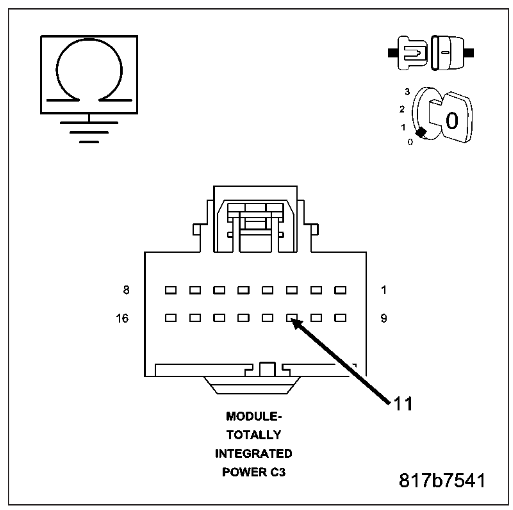
Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2



No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK THE (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

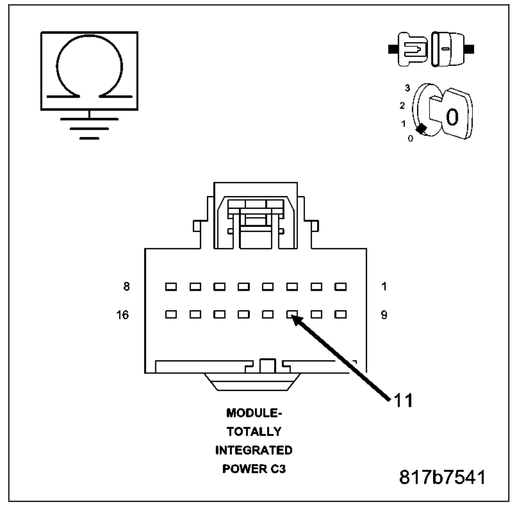
Disconnect the Totally Integrated Power Module C3 harness connector.

Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.

Is resistance below 1000.0 ohms?

Yes >> Go To 3

No >> Go To 4



3. (D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.

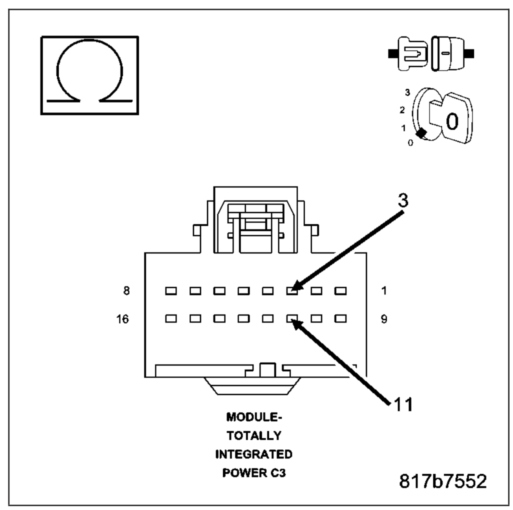
While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

NOTE: This is to determine if the circuit is shorted to ground internally within a module or if the circuit is shorted to ground in the harness.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wring diagrams to assist in diagnosis.

Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?

Yes >> Repair the (D54) CAN B Bus (-) circuit for a short to ground.



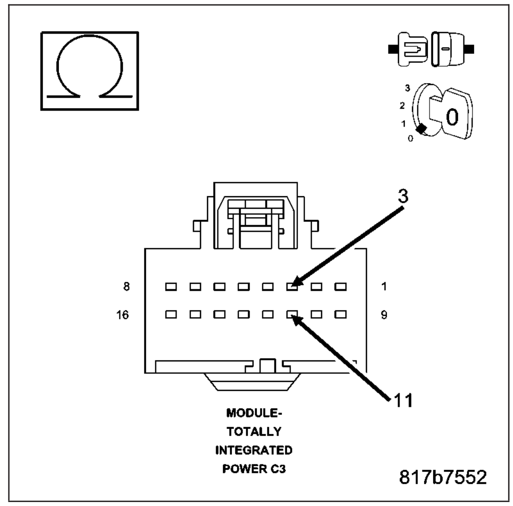
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module that when disconnected eliminated the short to ground in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO THE (D54) CAN B BUS (-) CIRCUIT

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.



Is resistance below 1000.0 ohms?

Yes >> Go To 5

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

5. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT

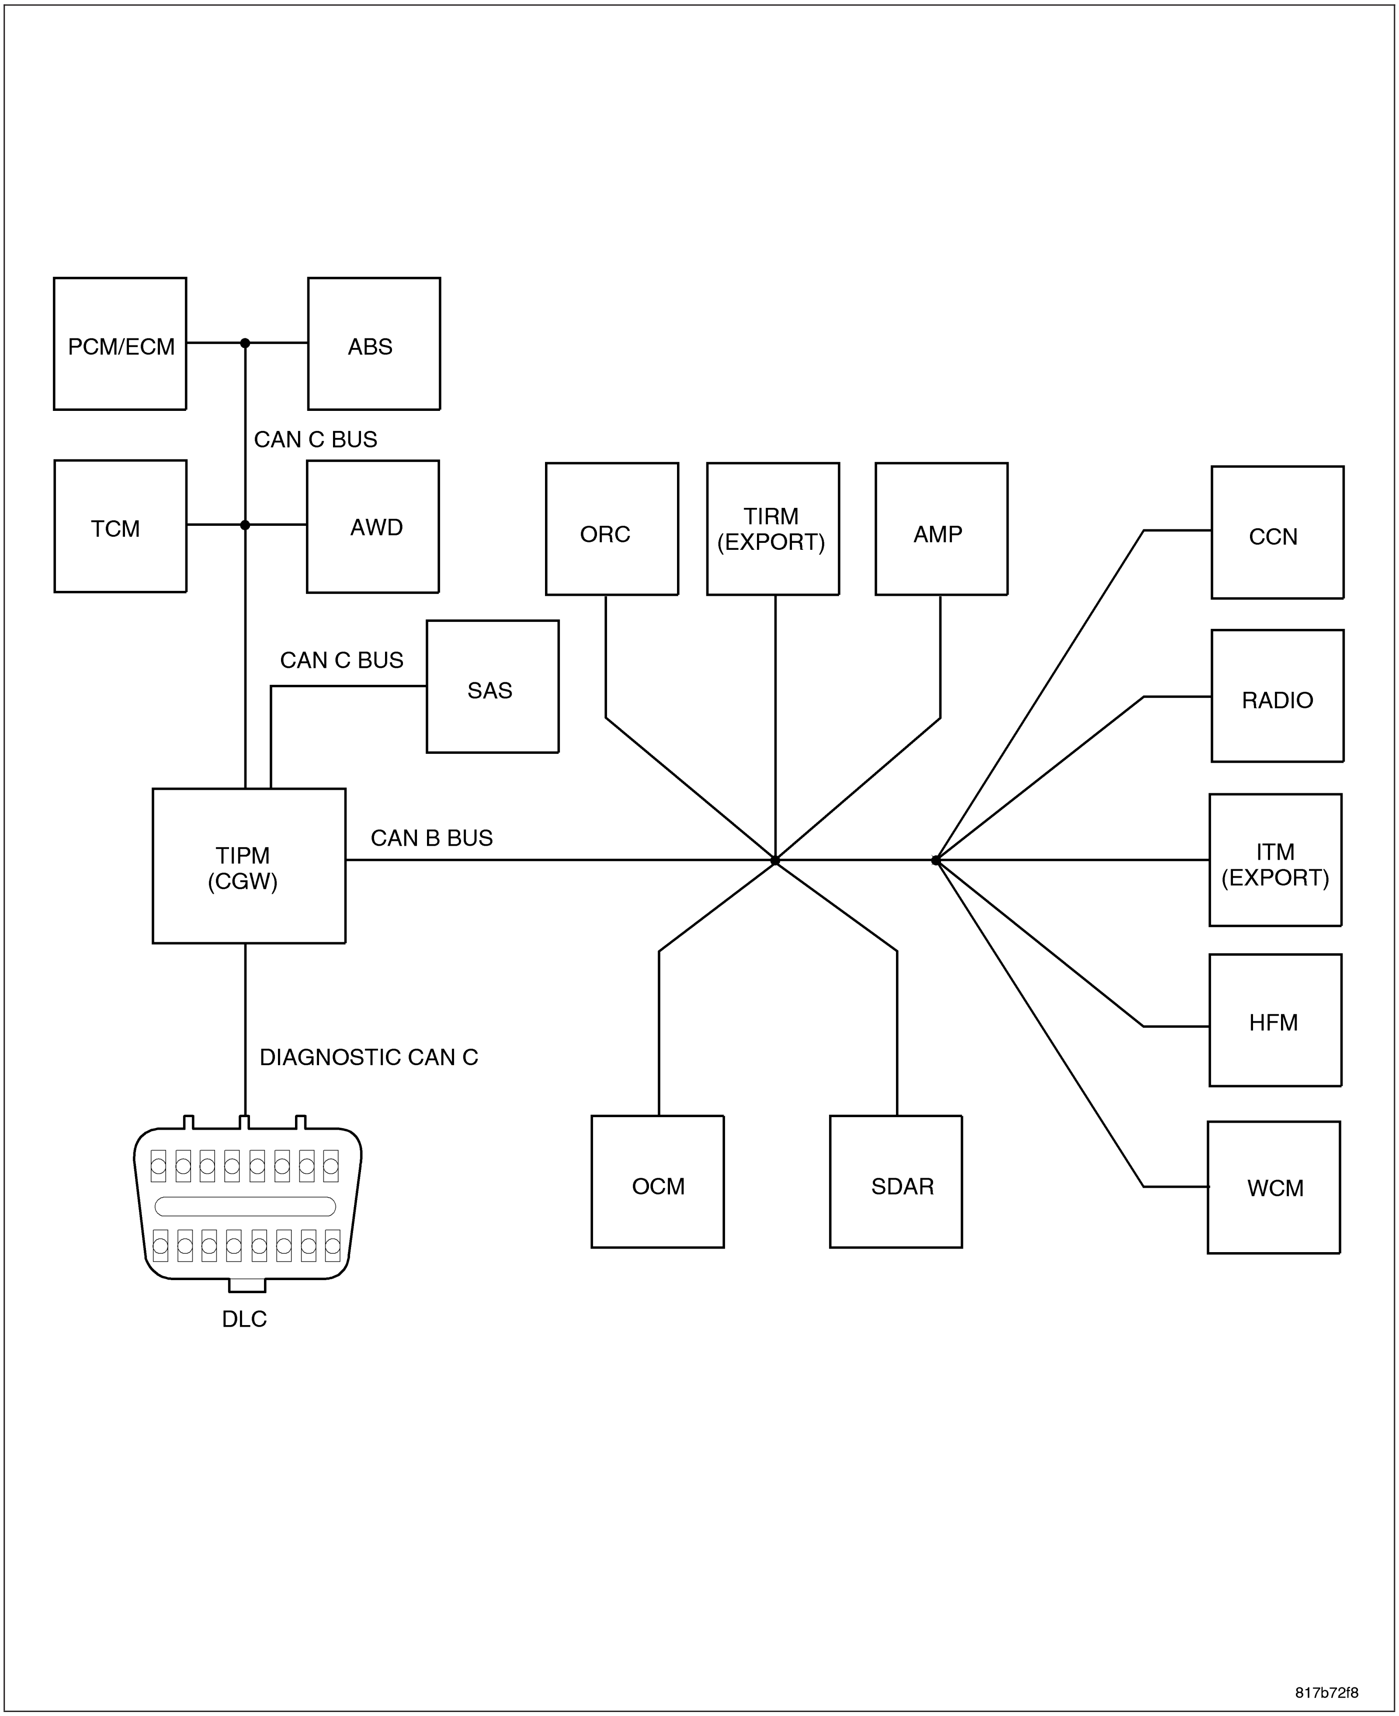
Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

NOTE: This is to determine if the short together is internal within a module or if the circuits are shorted together.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wring diagrams to assist in diagnosis.

Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?



Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module that when disconnected the short together was eliminated, in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0026-CAN B BUS (-) CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The TIPM detects the (D54) CAN B Bus (-) circuit is shorted to voltage.

Possible Causes
(D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE
ANY CAN B BUS MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

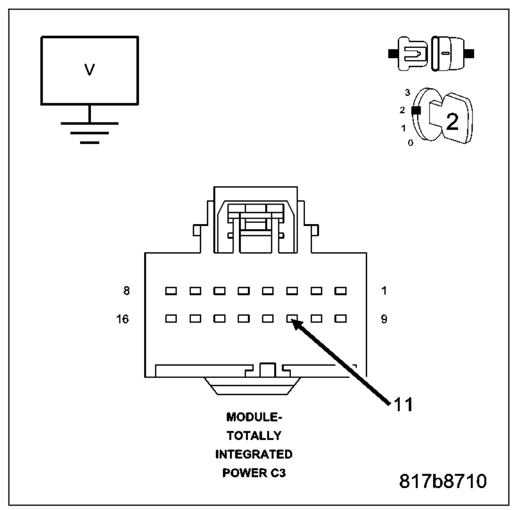
Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.



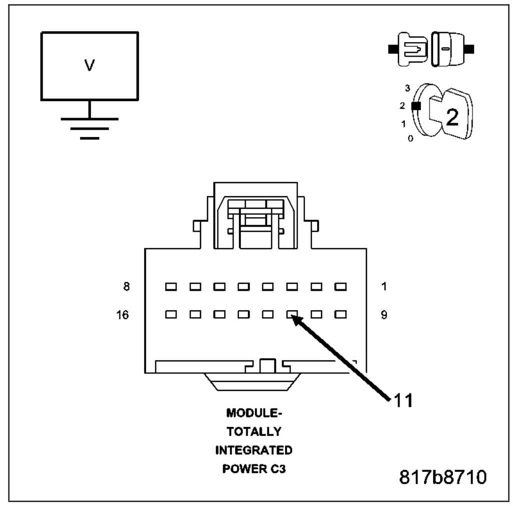
2. CHECK THE (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Totally Integrated Power Module C3 harness connector.

Turn the ignition on.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.



Is voltage above 10.0 volts?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

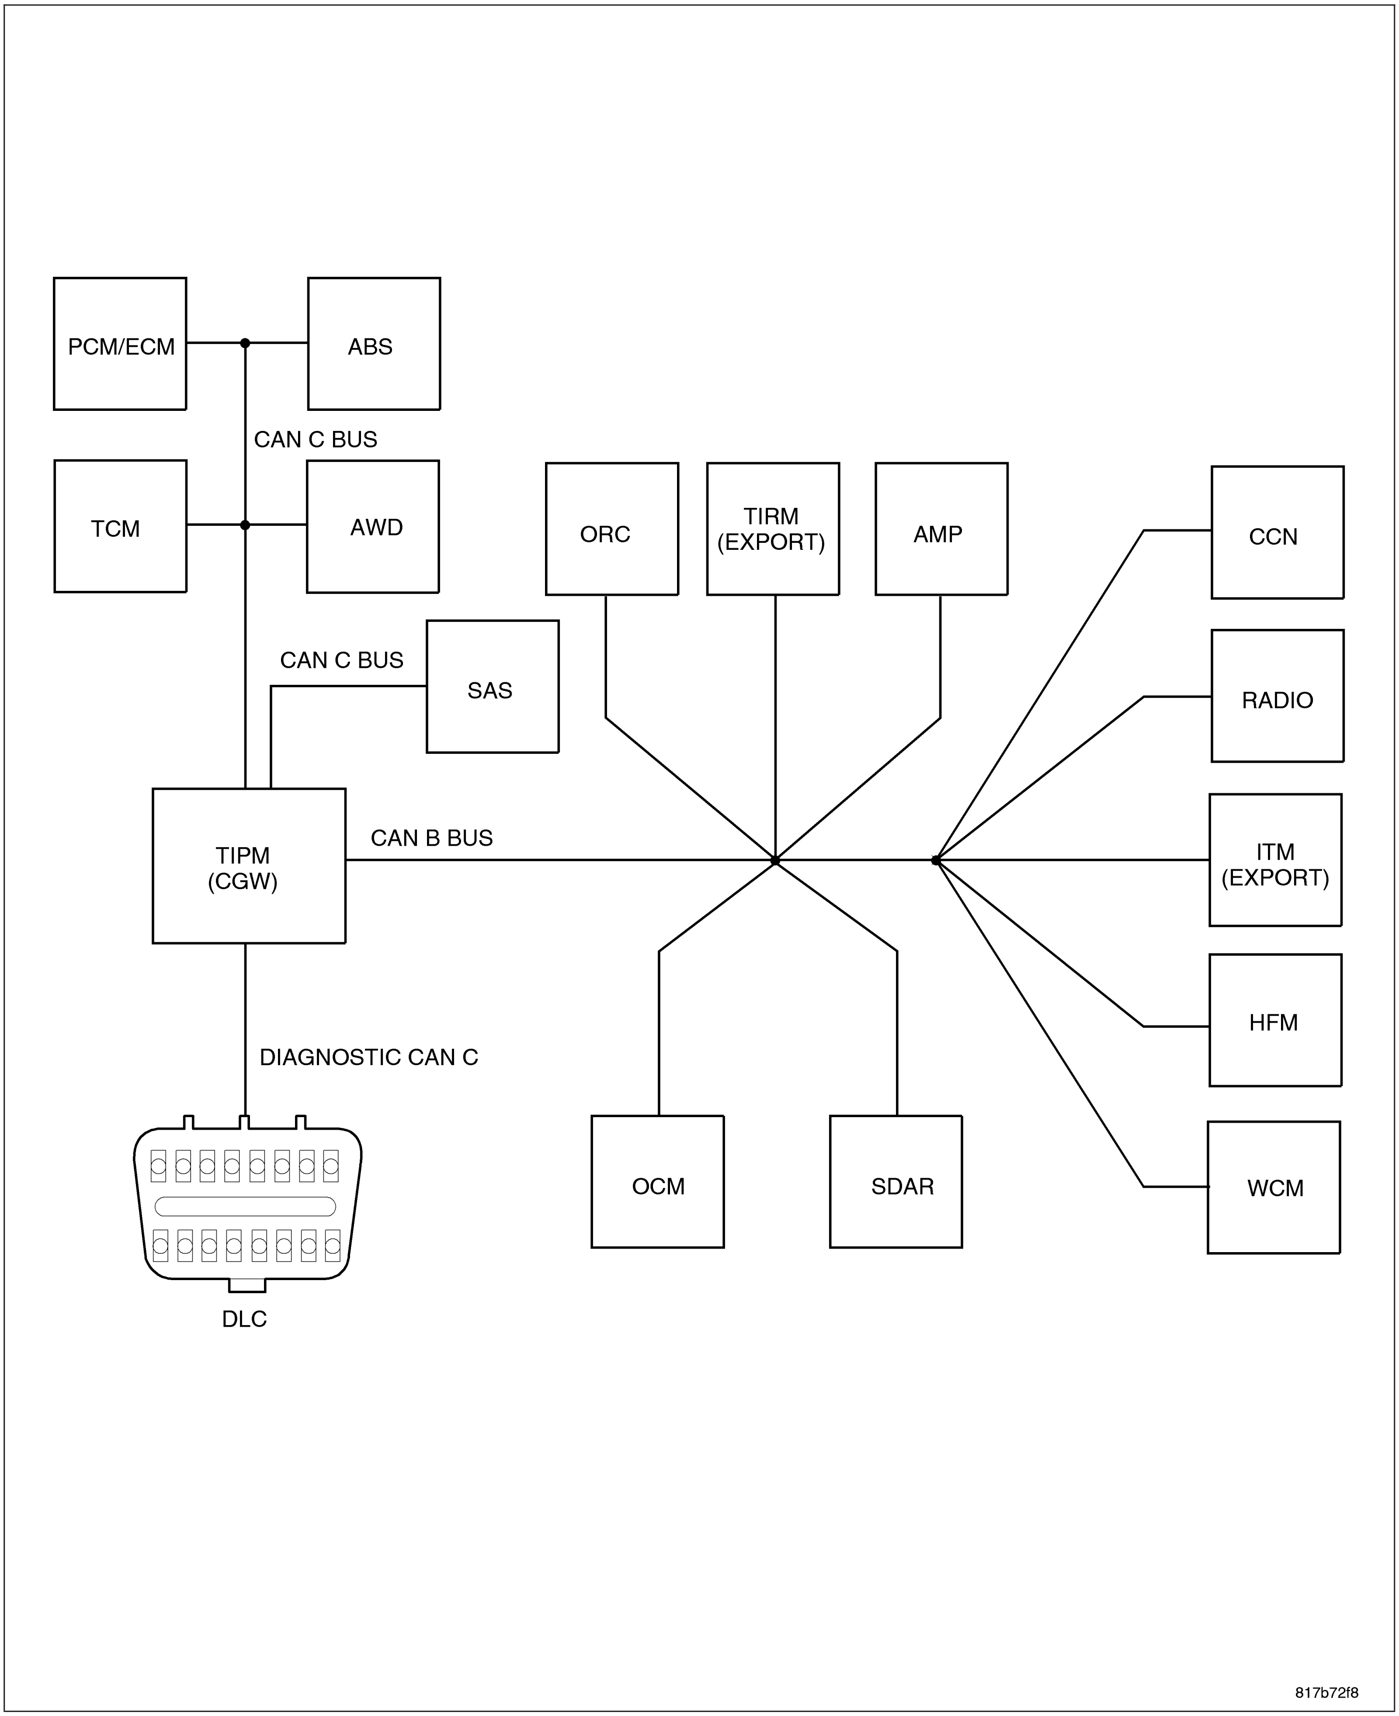
While monitoring the voltmeter, disconnect each CAN B Bus module one at a time.

NOTE: When performing the above step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on to check for a short to voltage.

NOTE: This is to determine if the circuit is shorted to voltage internally within a module or if the circuit is shorted to voltage in the harness.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wring diagrams to assist in diagnosis.

Is the voltage above 10.0 volts with all the CAN B Bus modules disconnected?



Yes >> Repair the (D54) CAN B Bus (-) circuit for a short to voltage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module, in accordance with the service information, that when disconnected eliminated the short to voltage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0027-CAN B BUS (-) SHORTED TO BUS (+)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The TIPM detects the (D55) CAN B Bus (+) circuit is shorted to the (D54) CAN B Bus (-) circuit.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT
ANY CAN B BUS MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

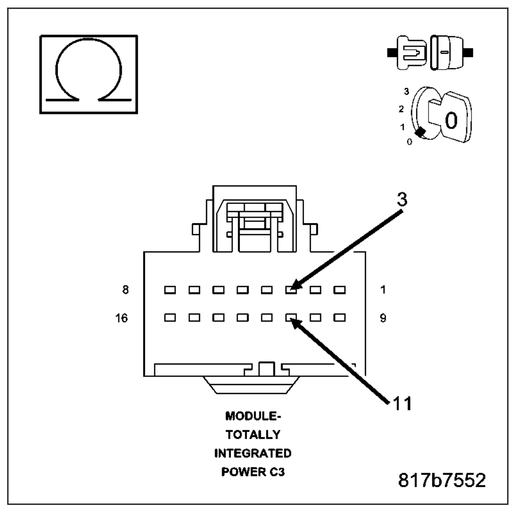
Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2



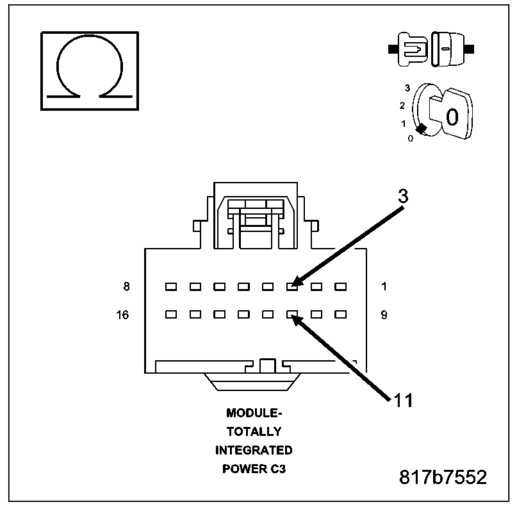
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO THE (D54) CAN B BUS (-) CIRCUIT

Turn the ignition off.

Disconnect the Totally Integrated Power Module C3 harness connector.

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.



Is resistance below 1000.0 ohms?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT

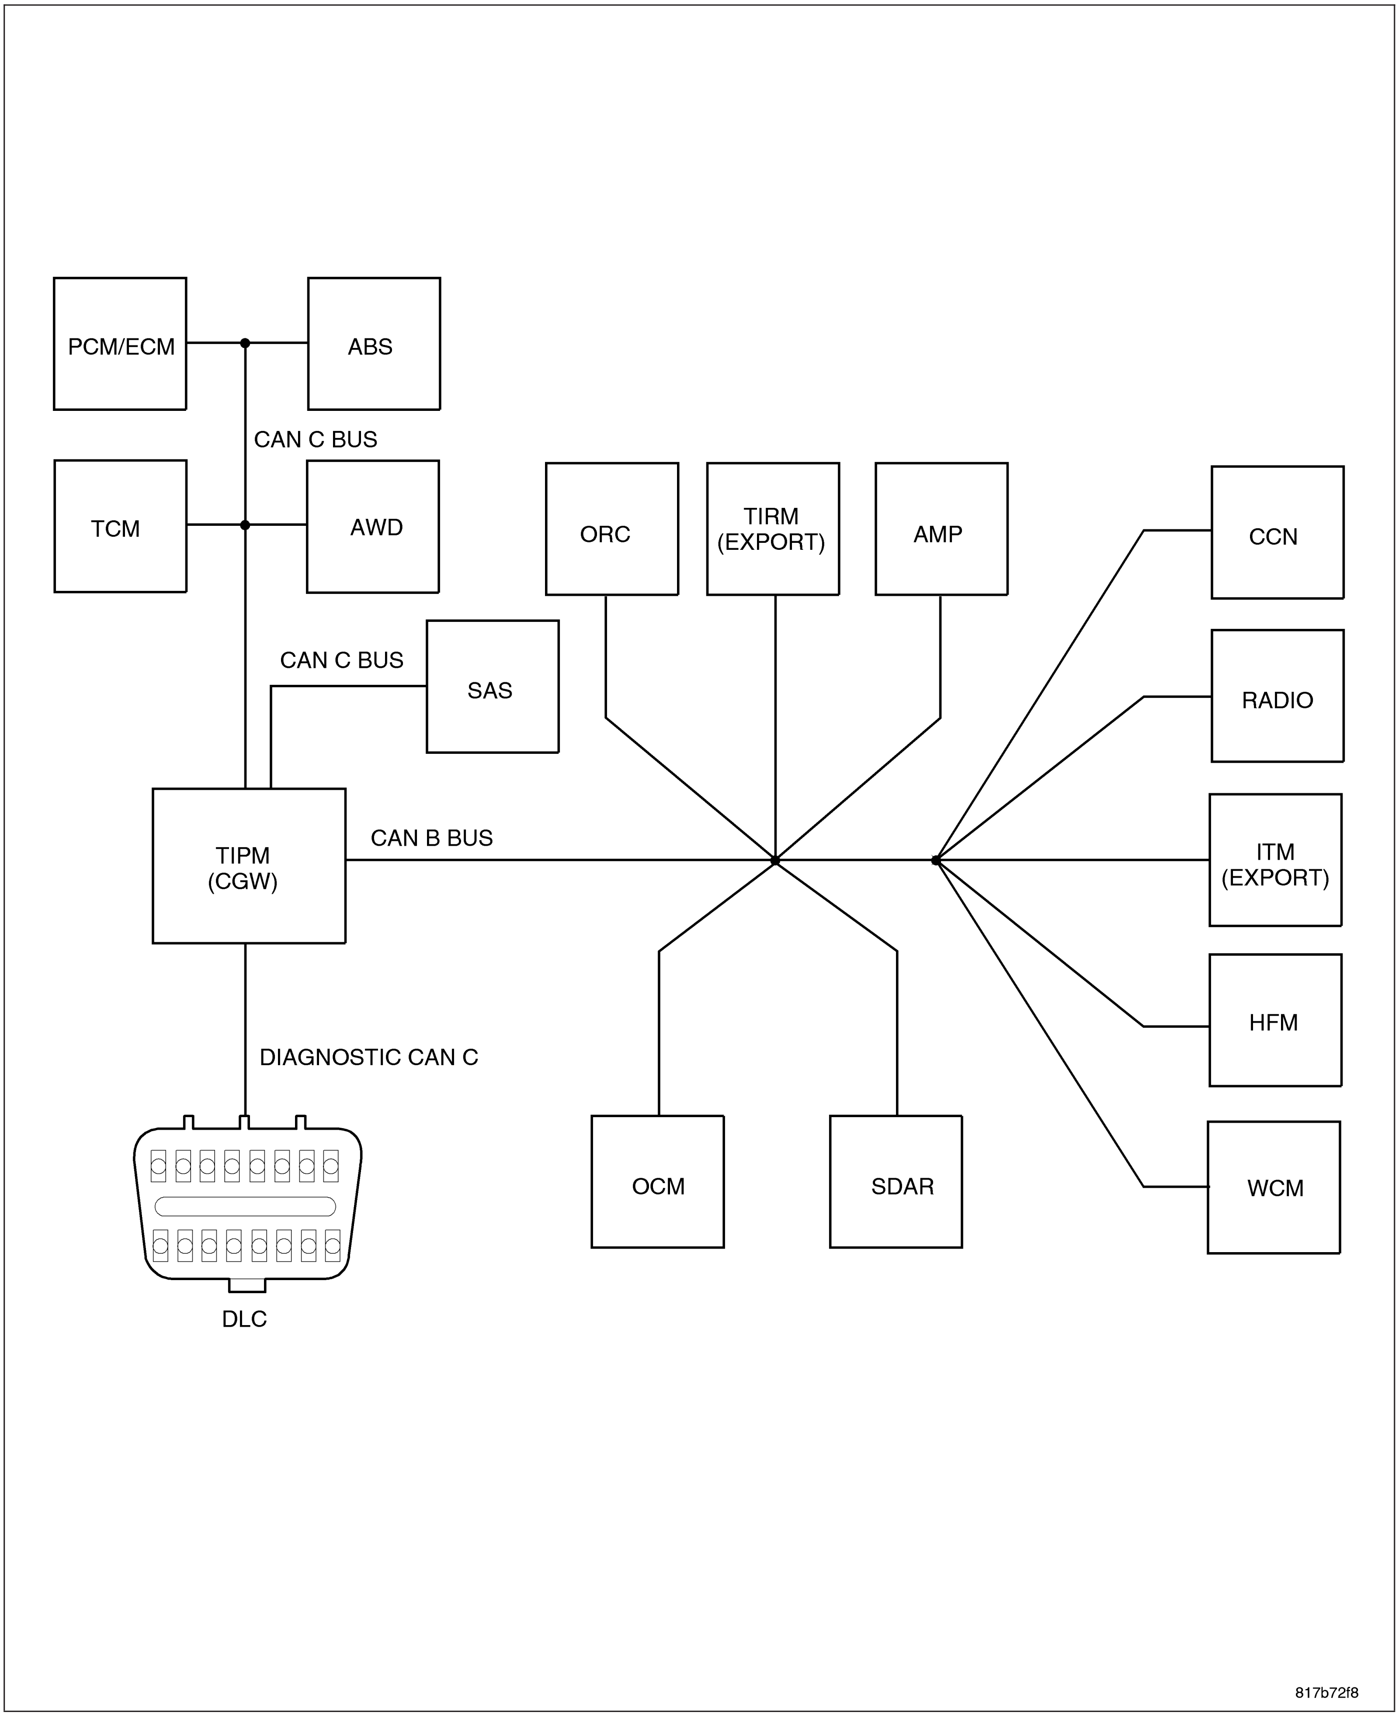
Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

NOTE: This is to determine if the circuits are shorted together internally within a module or if the circuits are shorted together in the harness.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wring diagrams to assist in diagnosis.

Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?



Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module, in accordance with the service information, that when disconnected eliminated the shorted together circuits.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0100-LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
- **Set Condition:**
  Bus messages not received from the PCM/ECM for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
ECM/PCM
ECM/PCM POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read all active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

Verify that the ECM/PCM is active on the bus.

Is the ECM/PCM active on the bus?

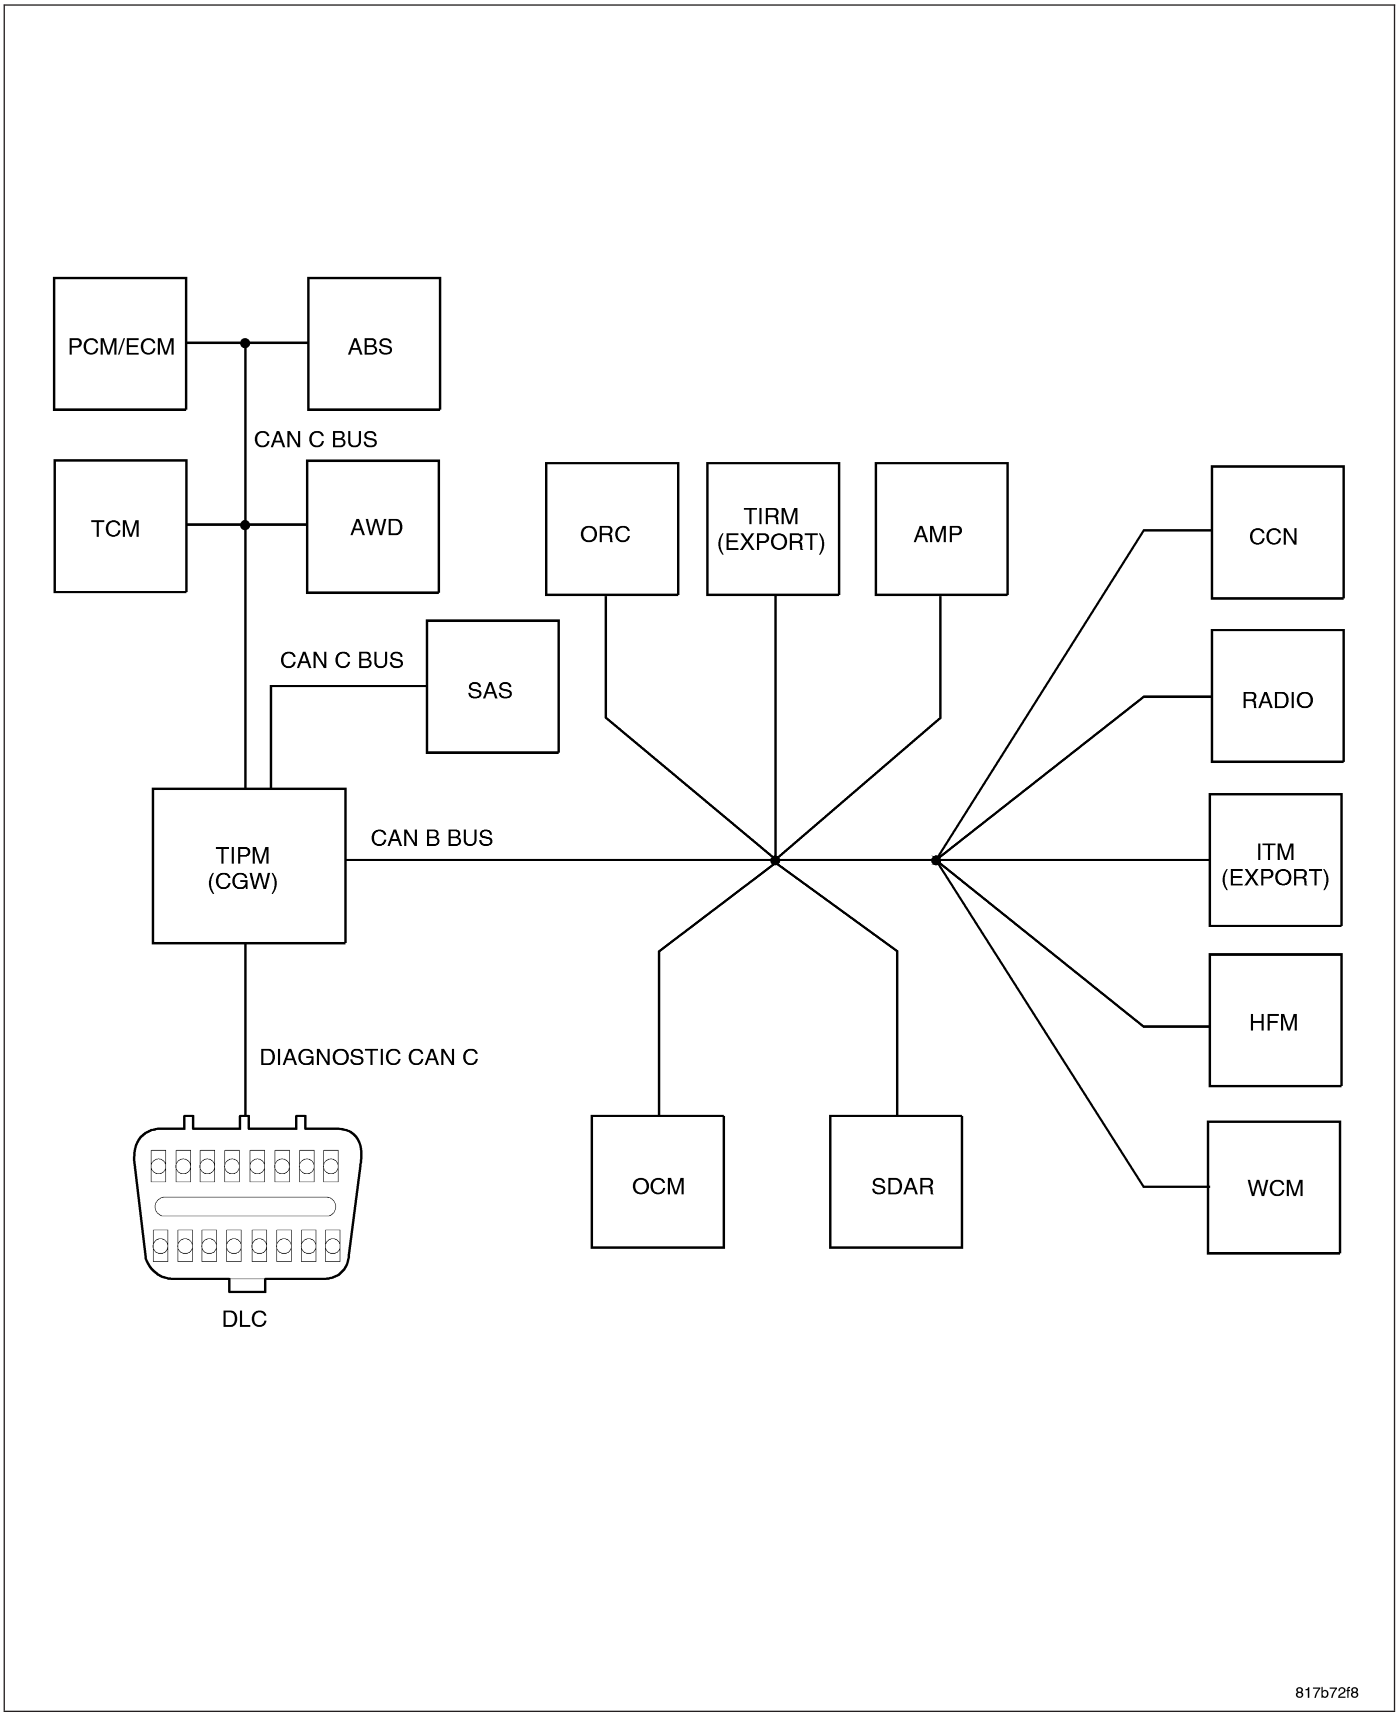
Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the ECM/PCM?



Yes >> Replace/update the ECM/PCM in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0101-LOST COMMUNICATION WITH TCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the TCM for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TCM
TCM POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read all active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

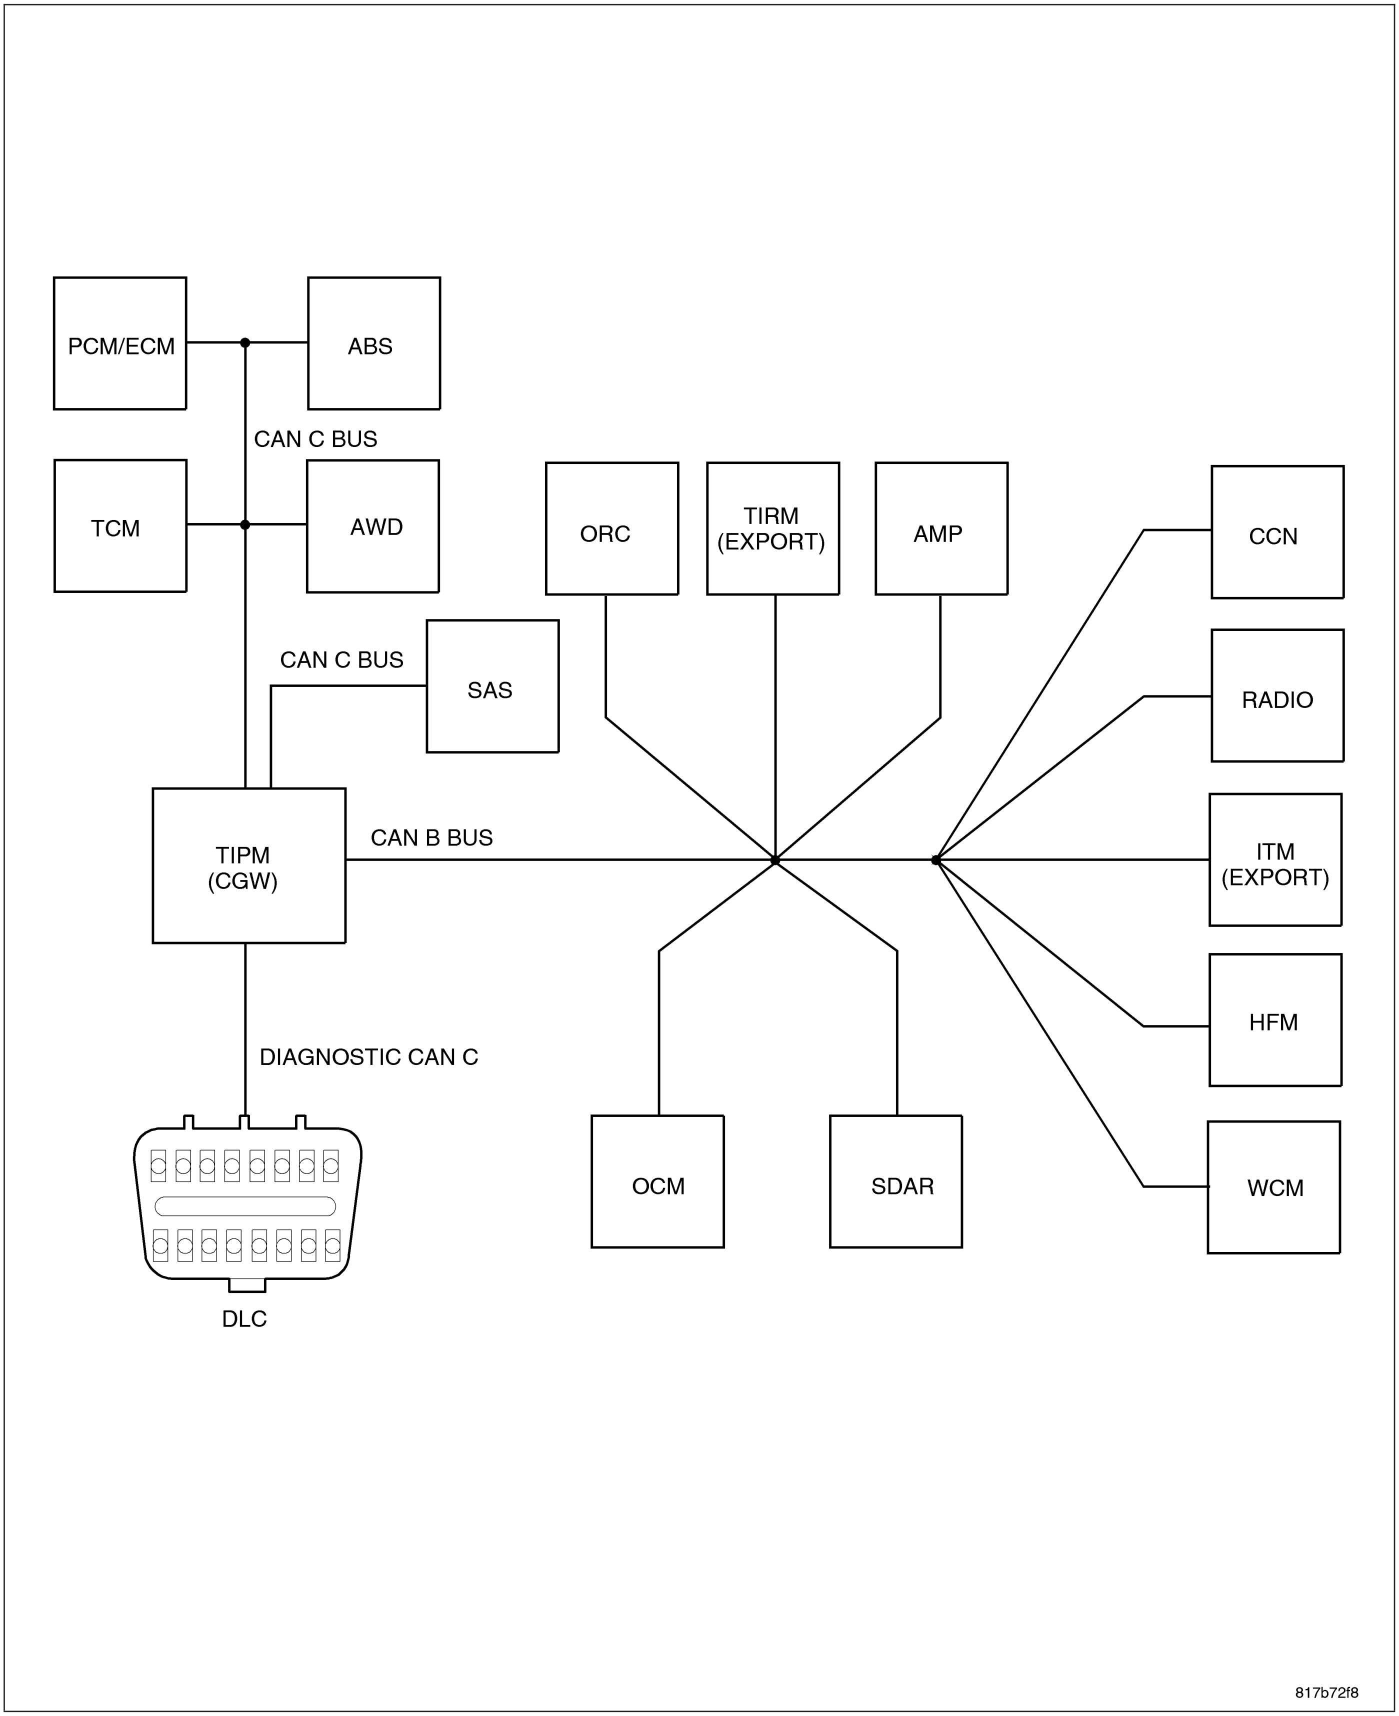
Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the TCM?



Yes >> Replace/update the TCM in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0114-LOST COMMUNICATION WITH FINAL DRIVE CONTROL MODULE (ALL WHEEL DRIVE CONTROL MODULE) (AWD)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the All Wheel Drive Control (AWD) Module for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ALL WHEEL DRIVE CONTROL (AWD) MODULE POWER AND GROUND
ALL WHEEL DRIVE CONTROL (AWD) MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read all active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. VERIFY THAT THE AWD IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

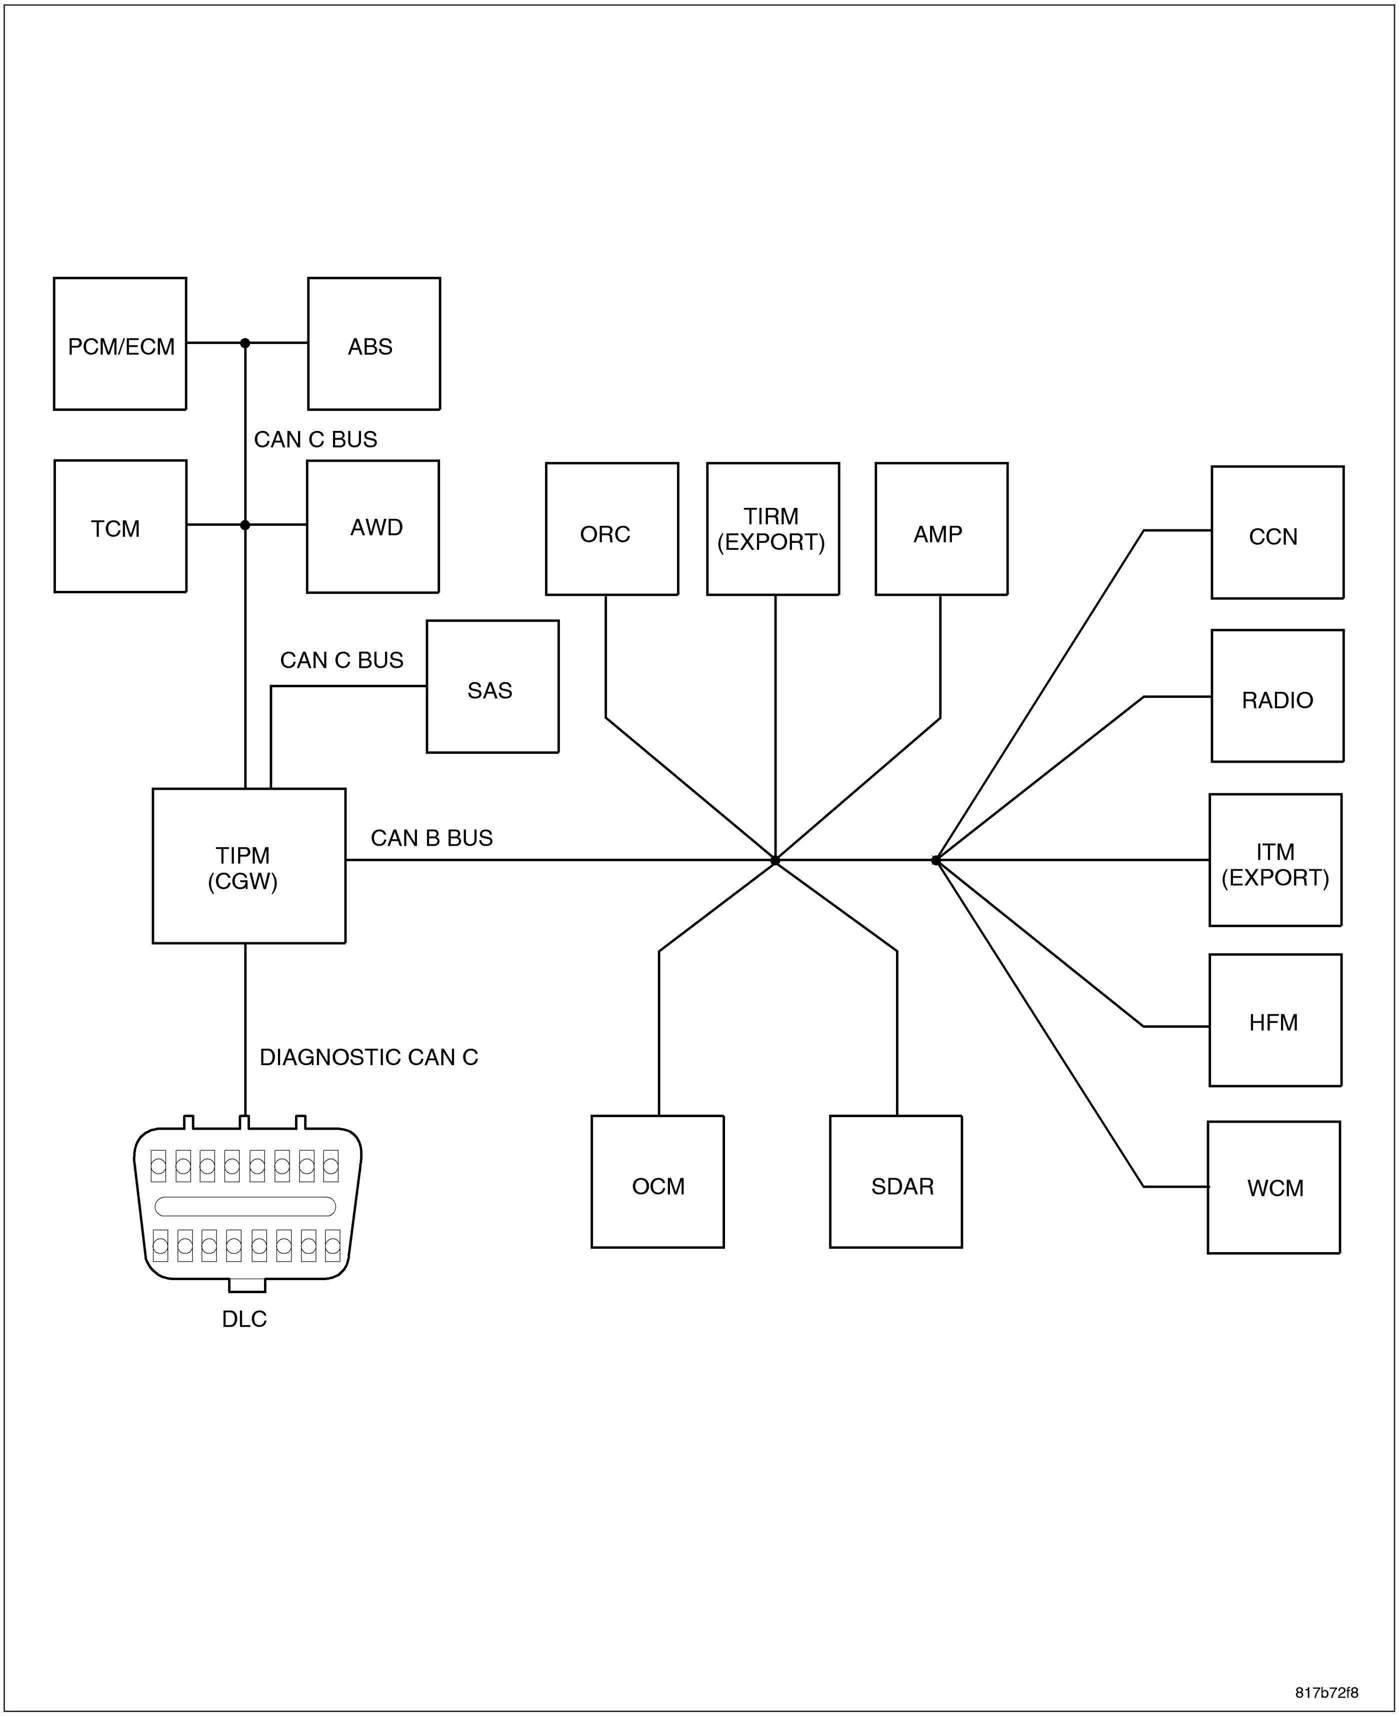
Verify that the AWD is active on the bus.

Is the AWD active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the AWD?

Yes >> Replace/update the All Wheel Drive Control (AWD) Module in accordance with the service information. Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0121-LOST COMMUNICATION WITH ANTILOCK BRAKE MODULE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the Antilock Brake Module for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
ANTILOCK BRAKE MODULE POWER AND GROUND
ANTILOCK BRAKE MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read all active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. VERIFY THAT THE ABS IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

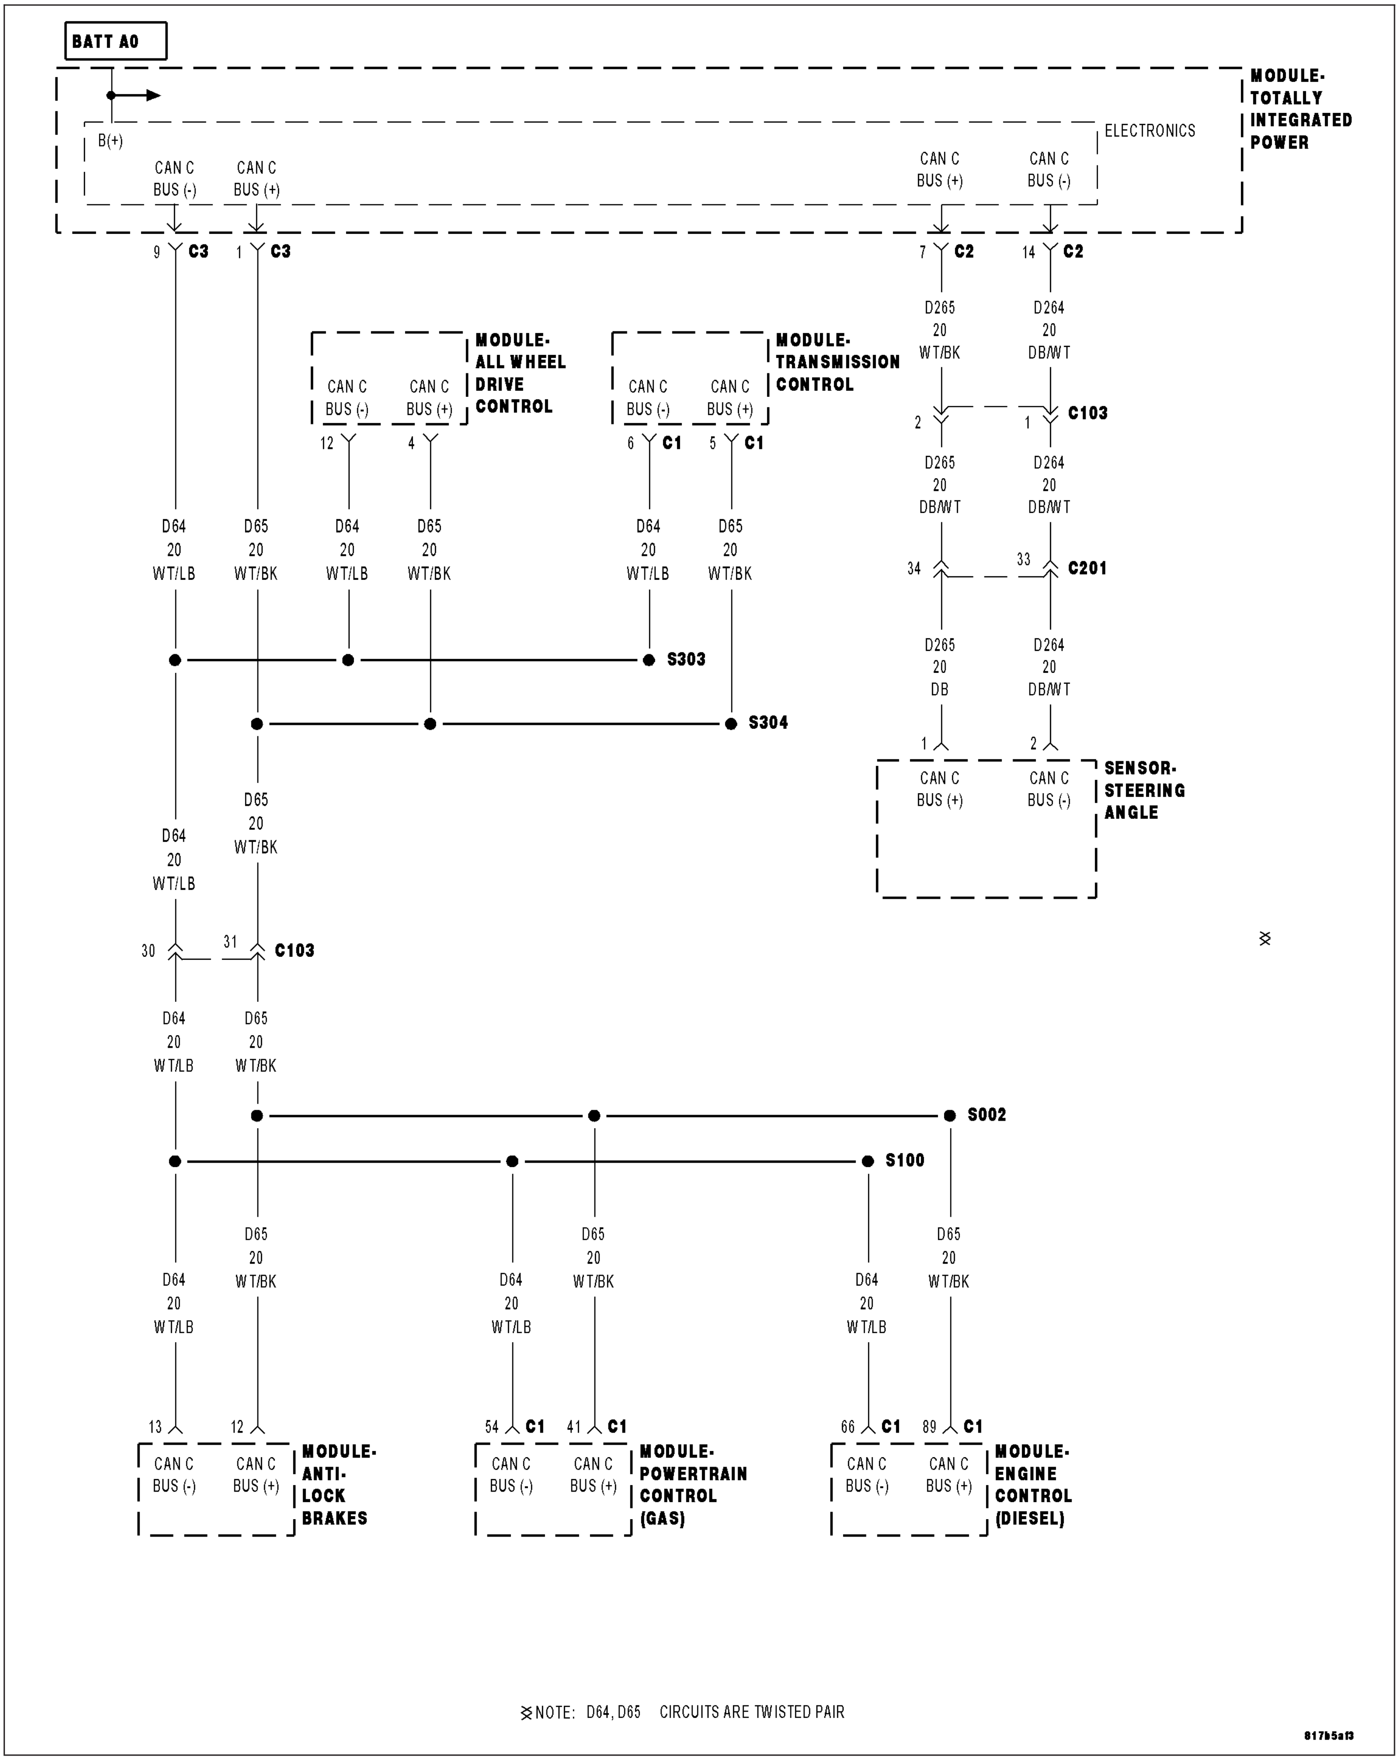
Verify that the ABS is active on the bus.

Is the ABS active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the ABS?

Yes >> Replace/update the Antilock Brake Module in accordance with the service information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR (SAS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM configured correctly.
- **Set Condition:**
  Bus messages not received from the SAS (steering angle sensor) for approximately 500ms.

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
STEERING ANGLE SENSOR
STEERING ANGLE SENSOR POWER AND GROUND
TIPM NOT CONFIGURED CORRECTLY
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
Turn the ignition on.

With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read all active DTC's from all CAN C Bus modules.

NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE SAS IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the SAS is active on the bus.

Is the SAS active on the bus?

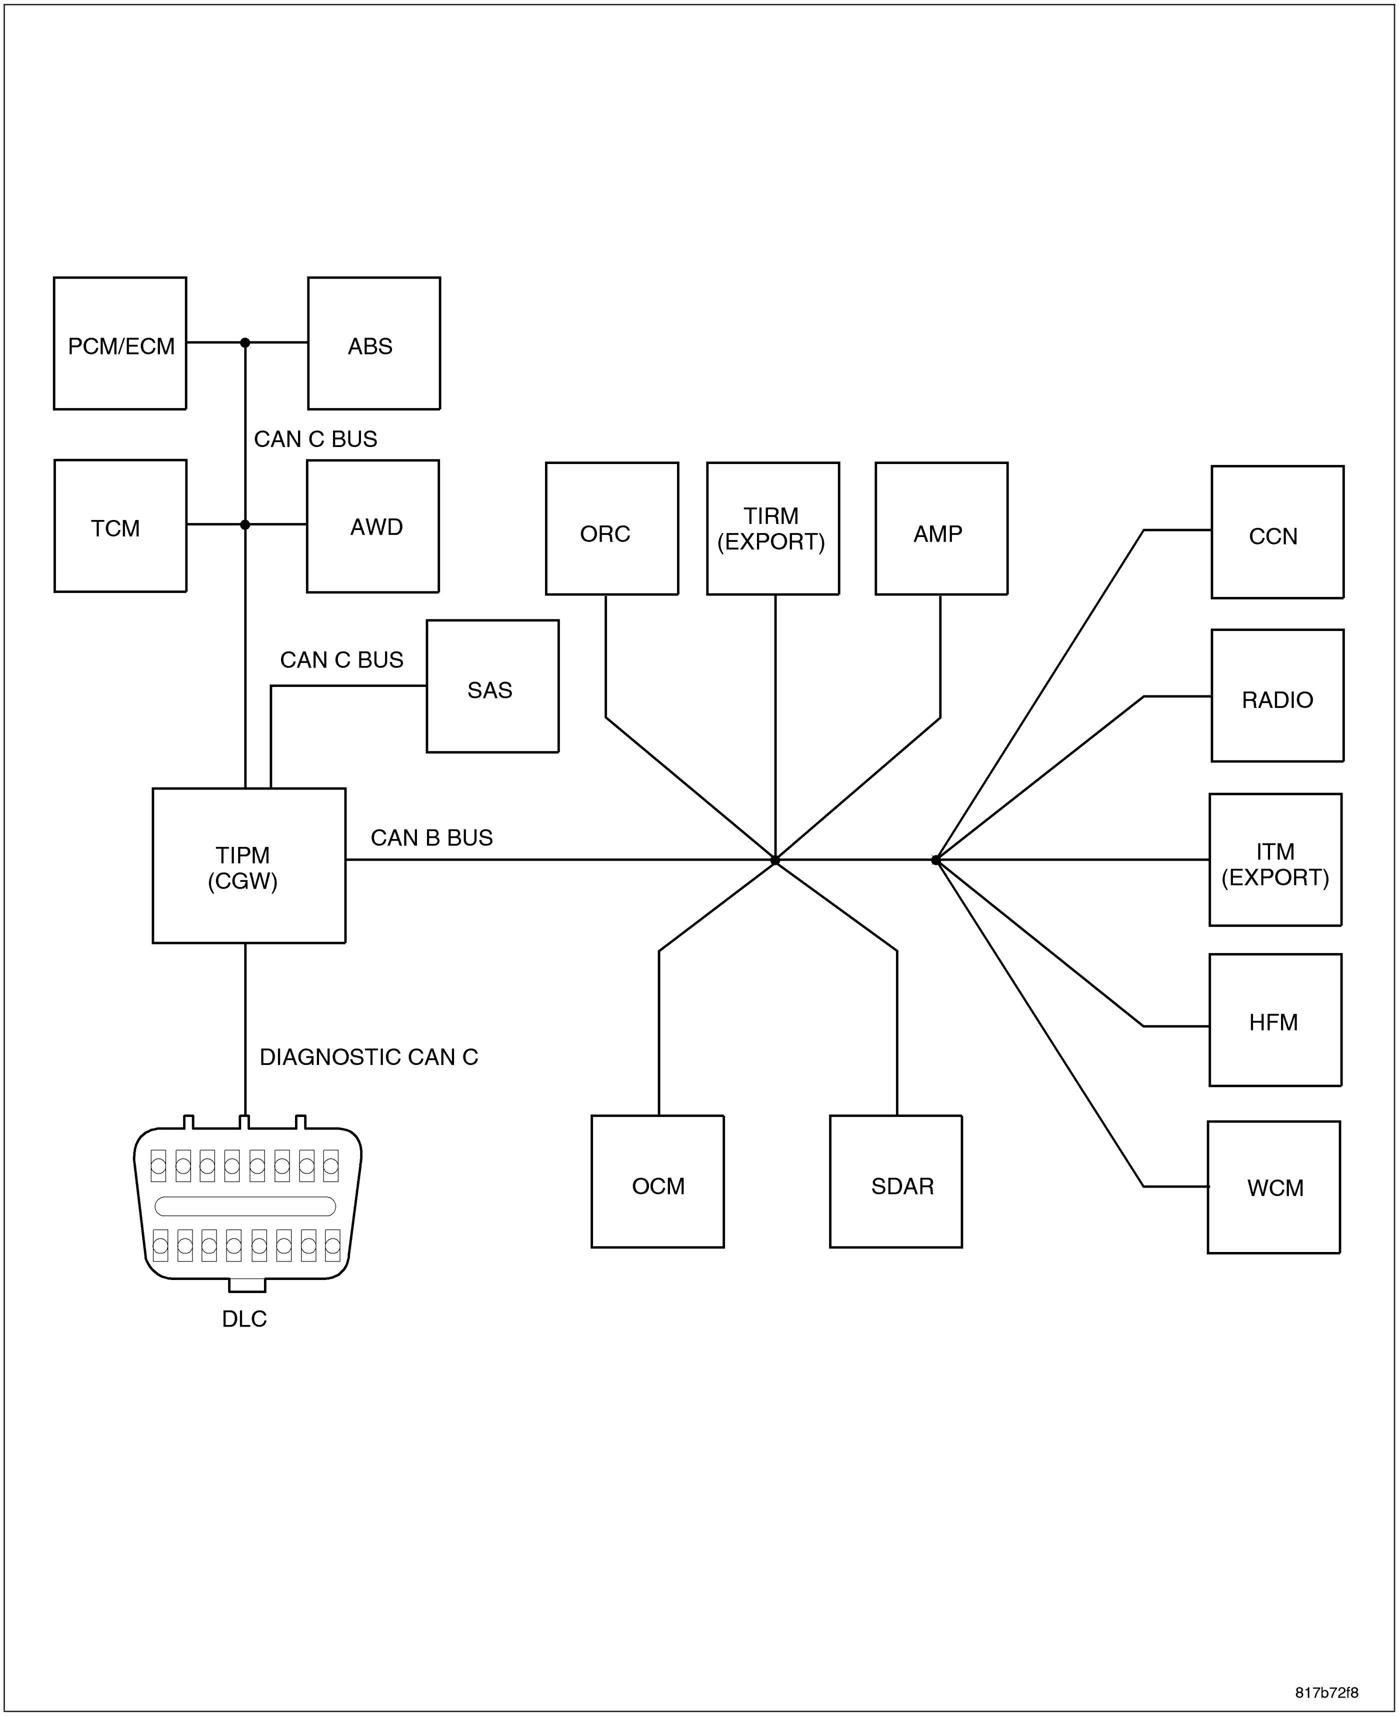
Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the SAS?



Yes >> Replace/update the Steering Angle Sensor (internal to the clockspring) in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM - TOTALLY INTEGRATED POWER MODULE)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the Front Control Module (on this vehicle, it is the Totally Integrated Power Module or TIPM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
TOTALLY INTEGRATED POWER MODULE POWER AND GROUND
TOTALLY INTEGRATED POWER MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read all active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE TIPM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

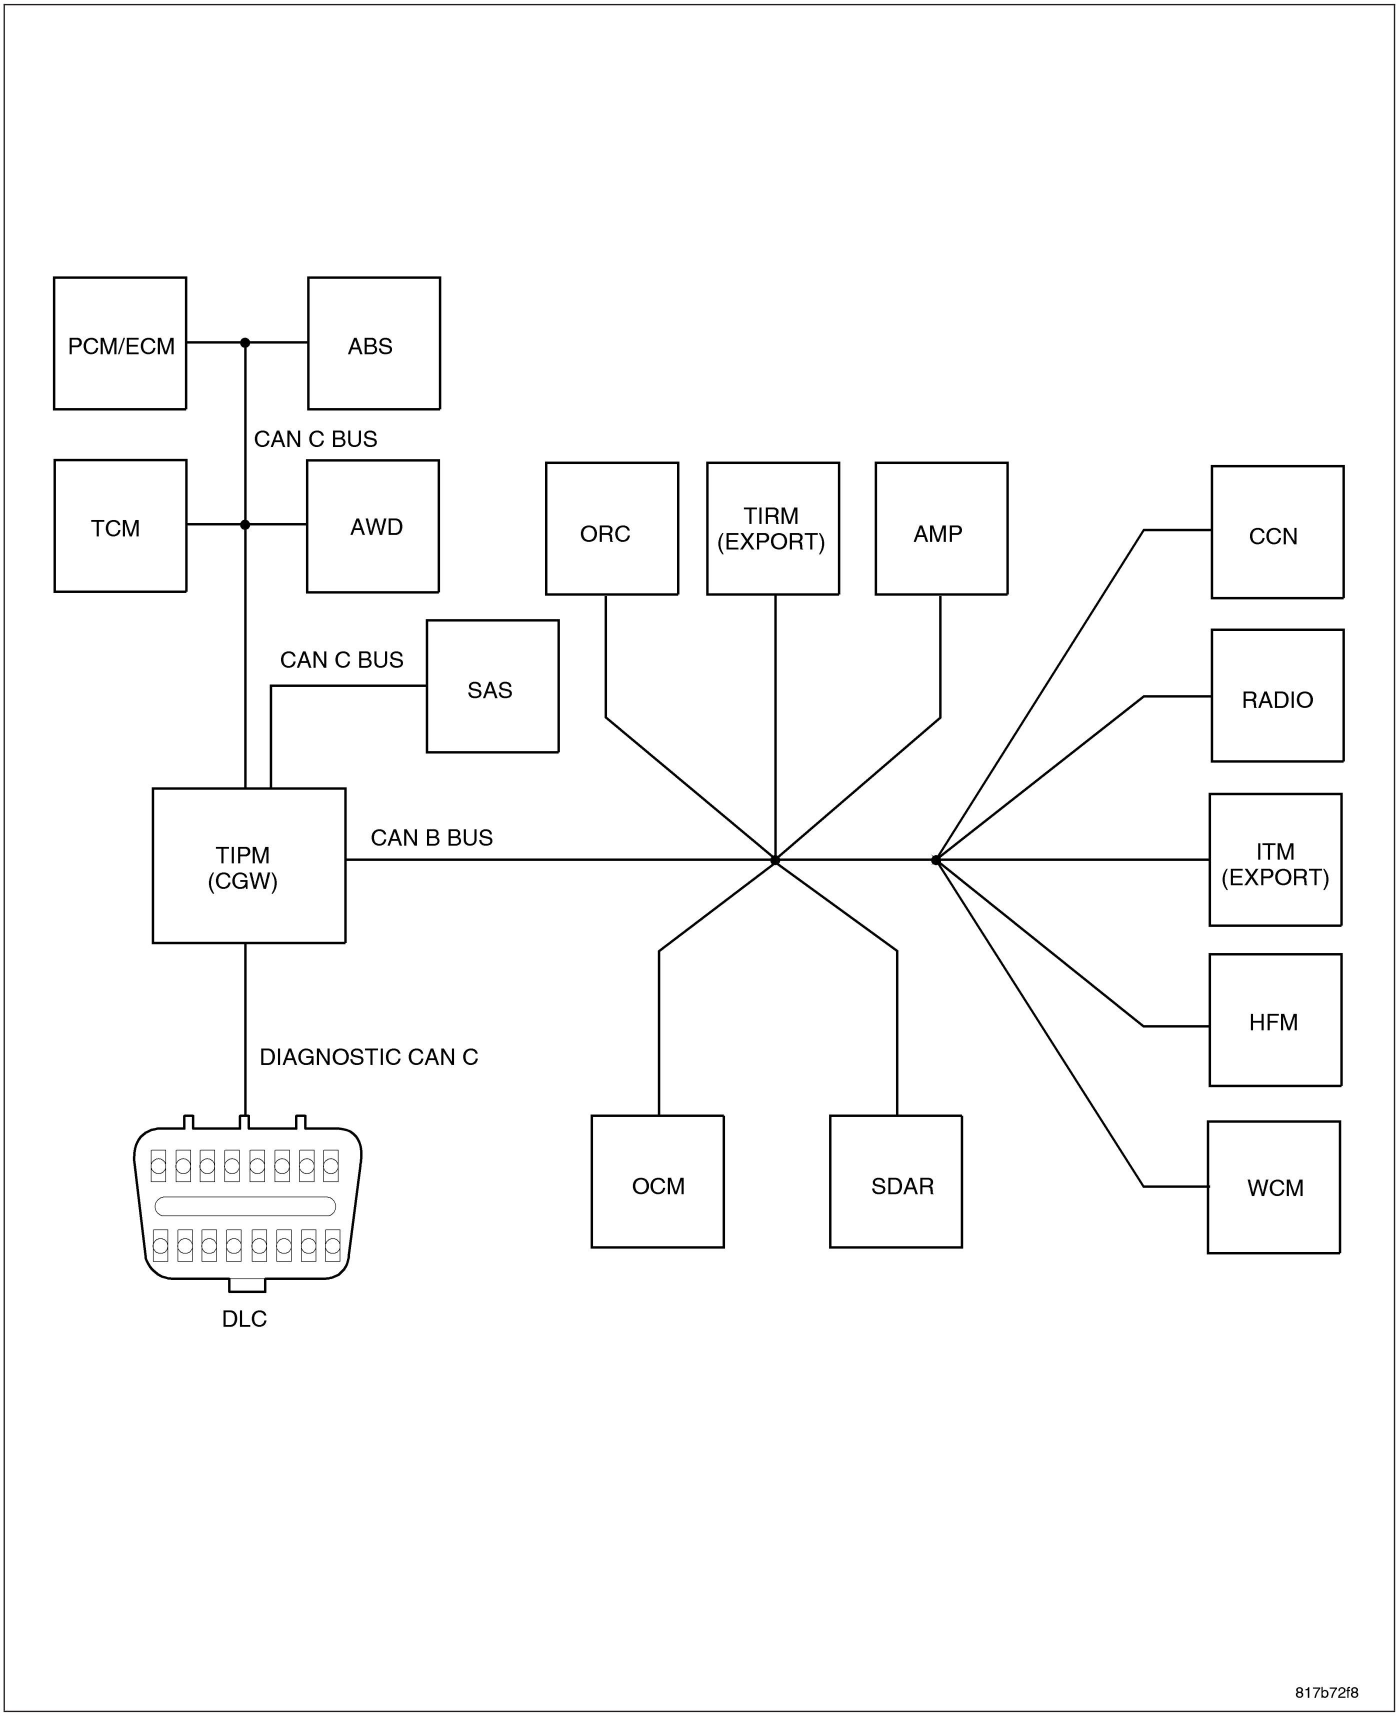
Verify that the TIPM is active on the bus.

Is the TIPM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network Diagnostics and select Advanced.

Is there more than one module with active DTC's "Logged Against" the TIPM?

Yes >> Replace/update the Totally Integrated Power Module (TIPM) in accordance with the service information. Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information Perform the appropriate VERIFICATION TEST.

U0151–LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  Airbag fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the Occupant Restraint Controller for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
AIRBAG FUSE NOT INSTALLED
OCCUPANT RESTRAINT CONTROLLER POWER AND GROUND
OCCUPANT RESTRAINT CONTROLLER
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read all active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE ORC IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

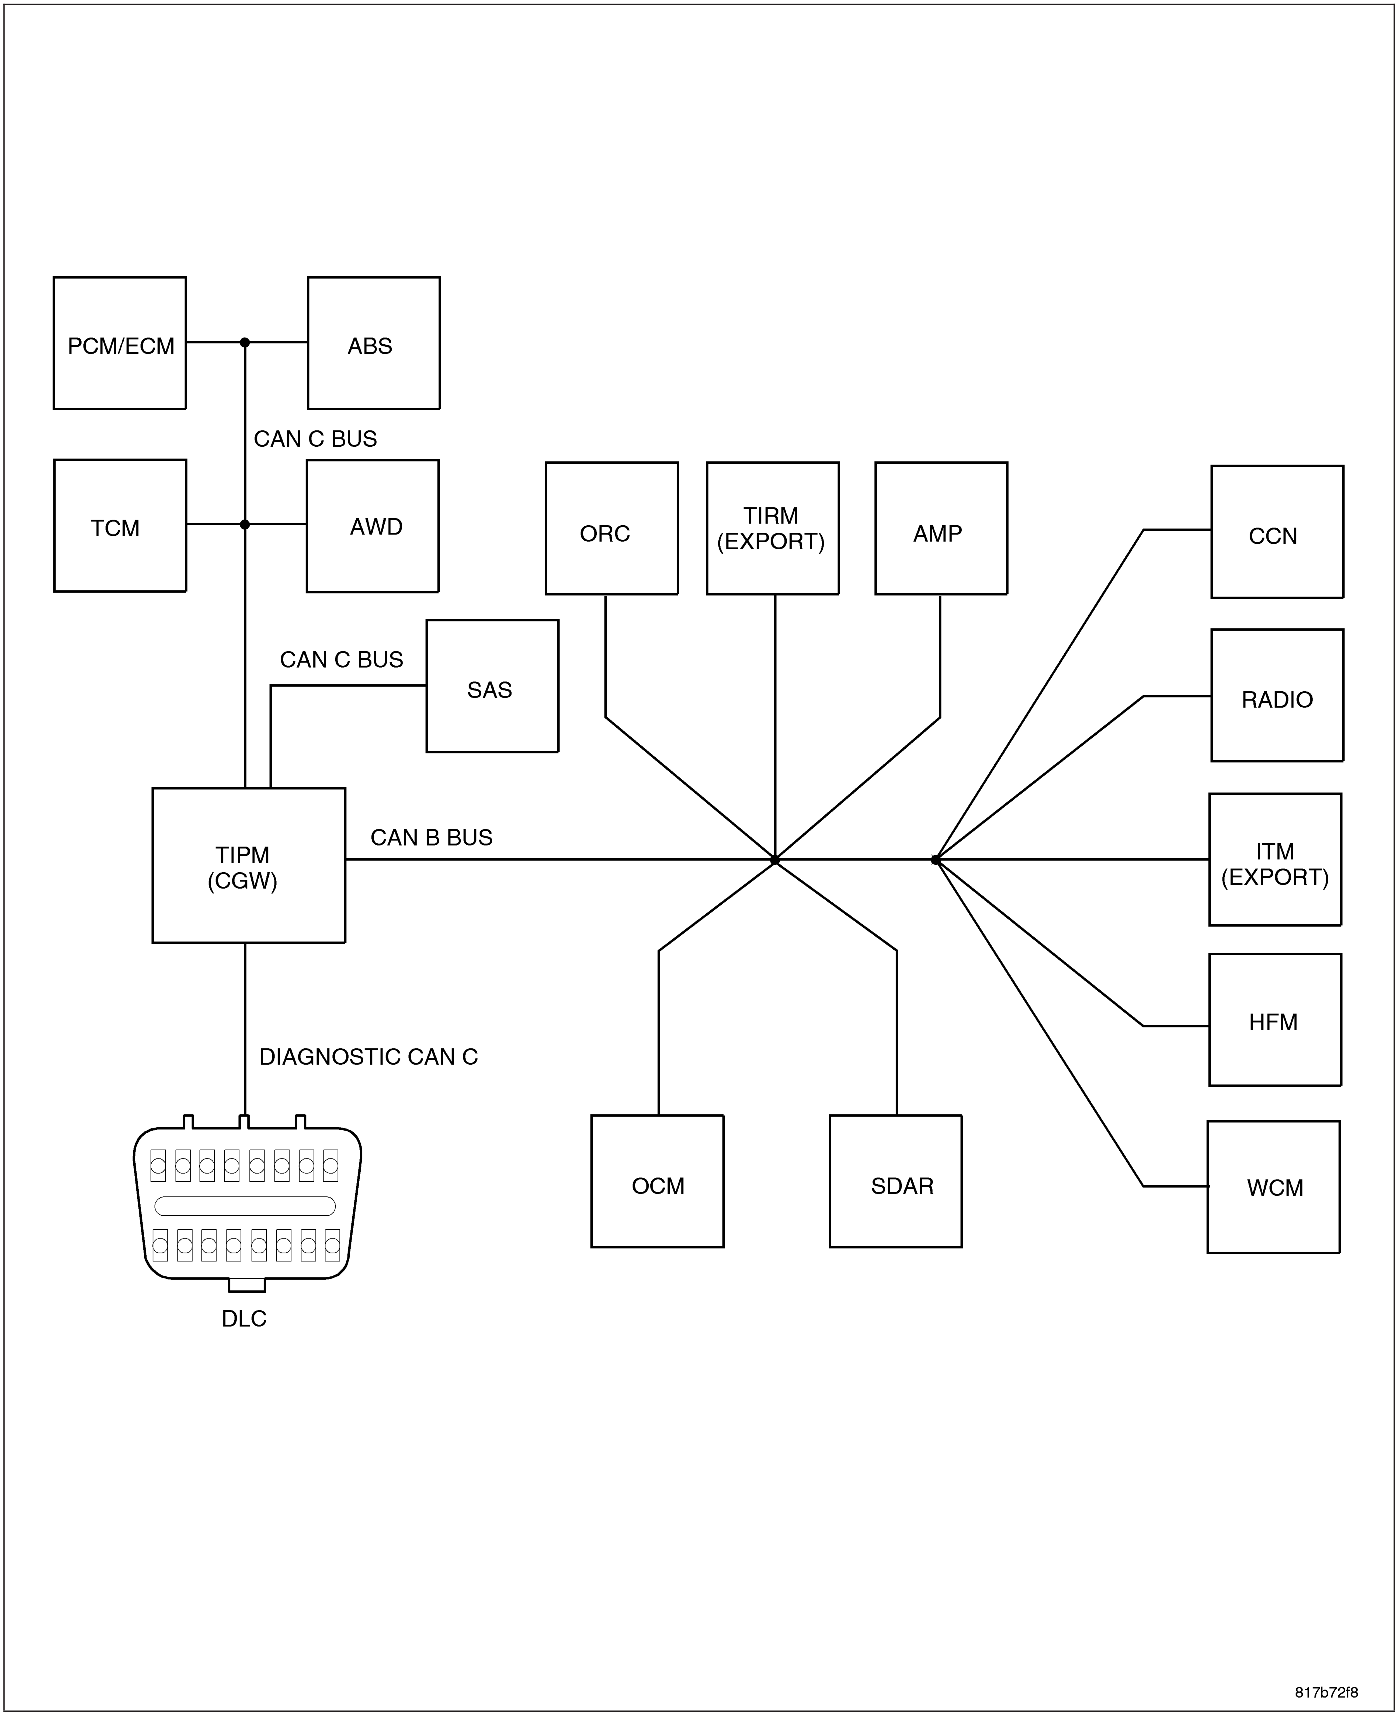
Verify that the ORC is active on the bus.

Is the ORC active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the ORC?

Yes >> Replace/update the Occupant Restraint Controller in accordance with the service information. Perform the AIRBAG VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information Perform the appropriate VERIFICATION TEST.

U0154–LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE (OCM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  Airbag fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the Occupant Classification Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
AIRBAG FUSE NOT INSTALLED
OCCUPANT CLASSIFICATION MODULE POWER AND GROUND
OCCUPANT CLASSIFICATION MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE OCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

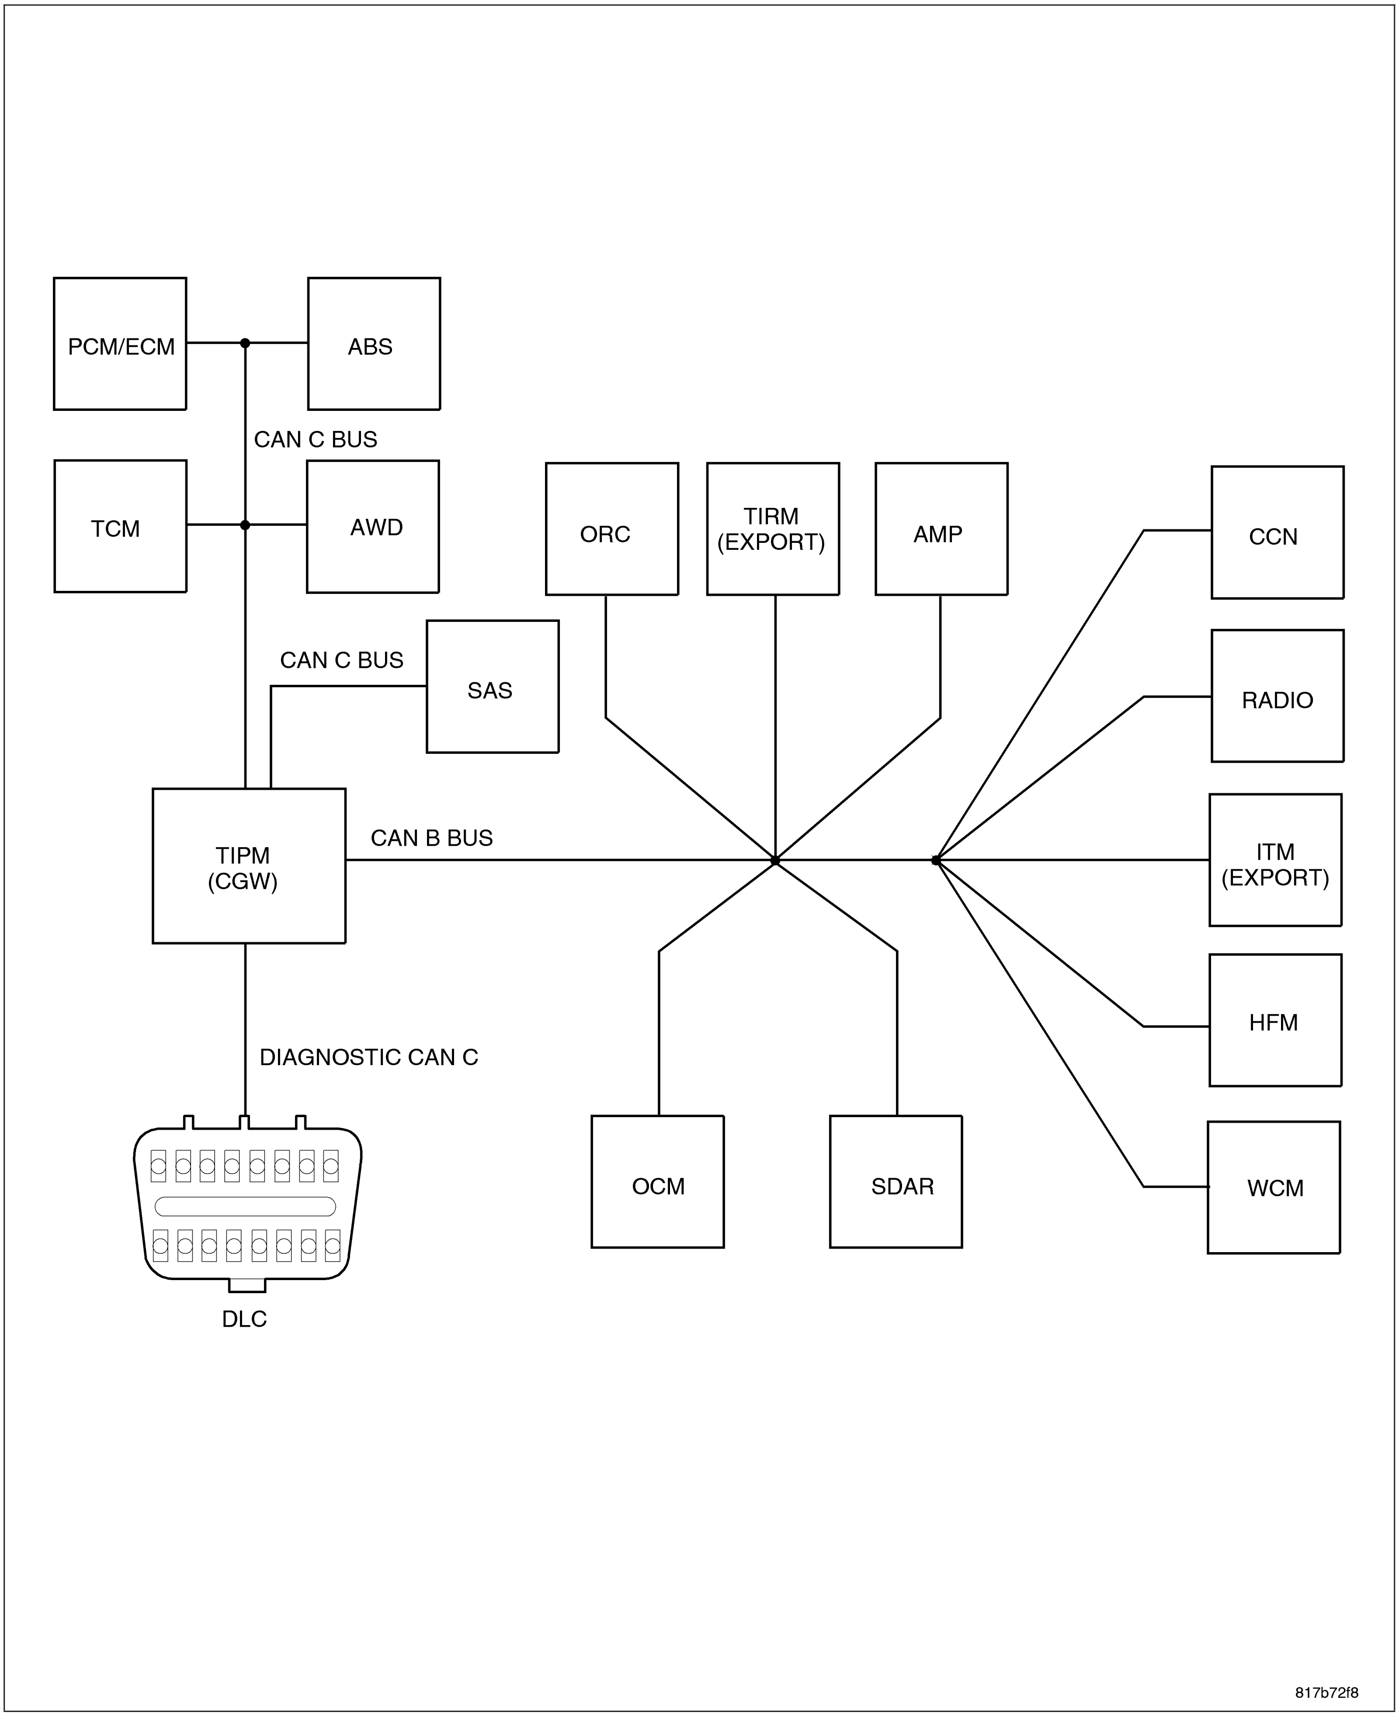
Verify that the OCM is active on the bus.

Is the OCM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the OCM?

Yes >> Replace/update the Occupant Classification Module in accordance with the service information. Perform the AIRBAG VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information Perform the appropriate VERIFICATION TEST.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
- **Set Condition:**
  Bus messages not received from the Cluster/CCN for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
CLUSTER/CCN
CLUSTER/CCN POWER AND GROUND
MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. VERIFY THAT THE CCN IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

Verify that the CCN is active on the bus.

Is the CCN active on the bus?

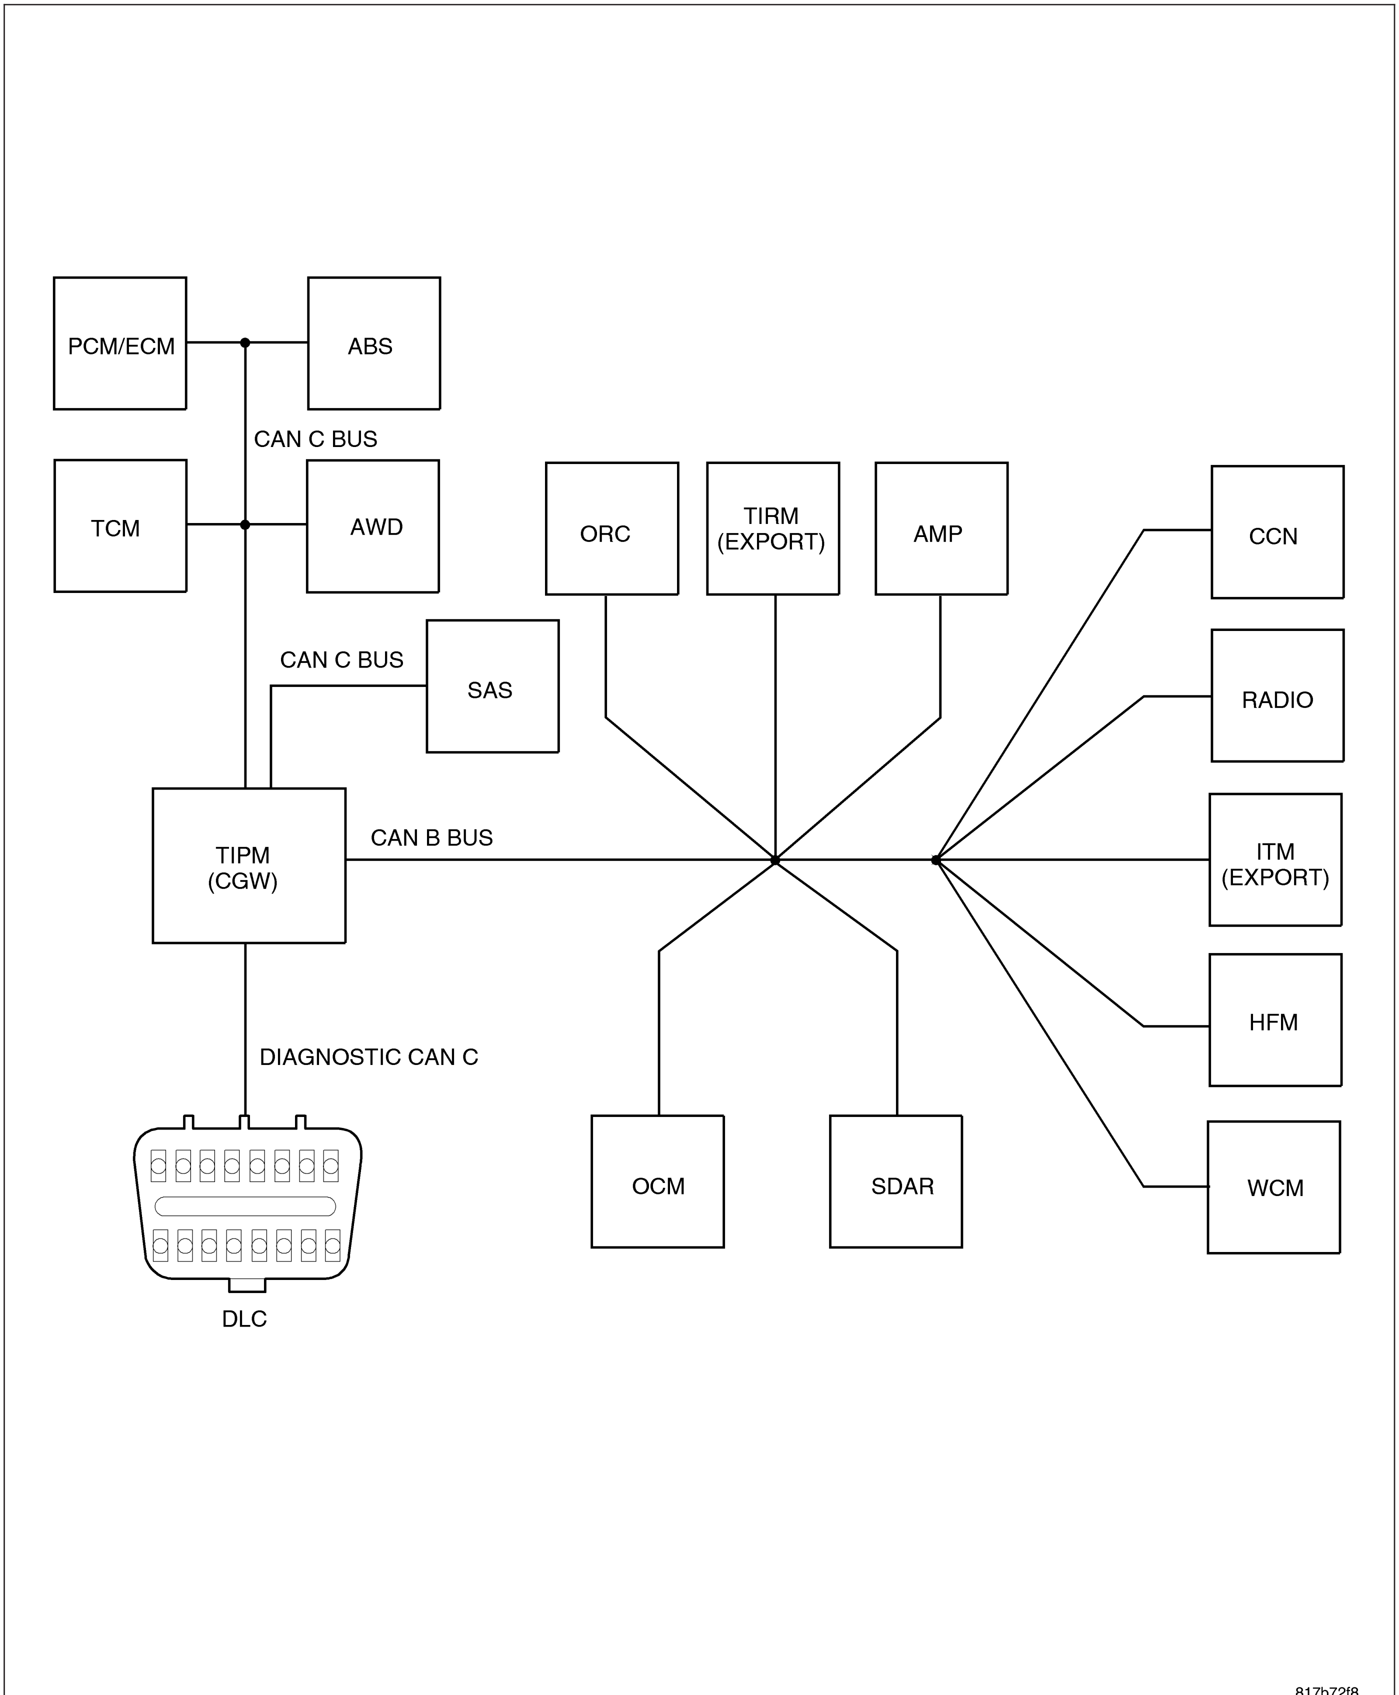
Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the CCN?



Yes >> Replace/update the Cluster (CCN) in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0167-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER CONTROL MODULE (ITM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the Intrusion Transceiver Control Module (ITM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
IOD FUSE NOT INSTALLED
INTRUSION TRANSCEIVER CONTROL MODULE POWER AND GROUND
INTRUSION TRANSCEIVER CONTROL MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE ITM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

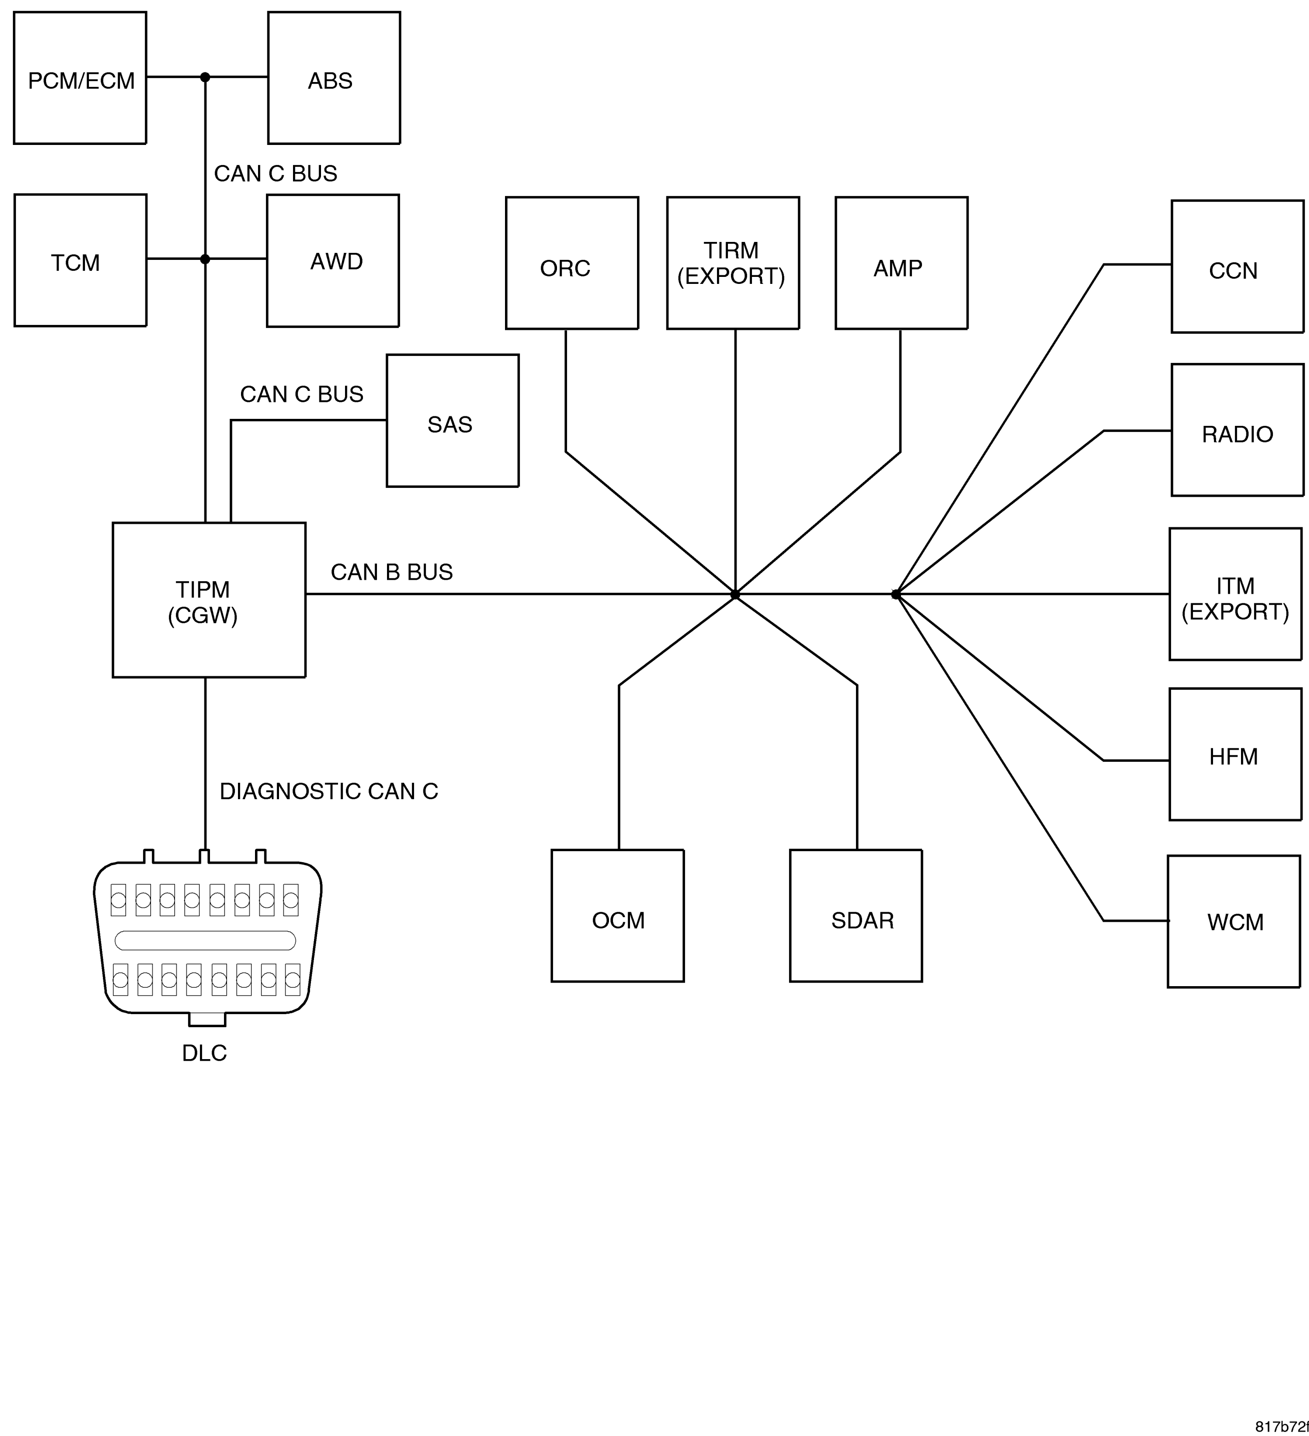
Verify that the ITM is active on the bus.

Is the ITM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the ITM?

Yes >> Replace/update the Intrusion Transceiver Control Module in accordance with the service information. Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set the DTC in accordance with the service information Perform the appropriate VERIFICATION TEST.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
- **Set Condition:**
  Bus messages not received from the Sentry Key Remote Entry Module (WCM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
SENTRY KEY REMOTE ENTRY MODULE POWER AND GROUND
SENTRY KEY REMOTE ENTRY MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read active DTC's from all modules.

NOTE: Check for CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE WCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

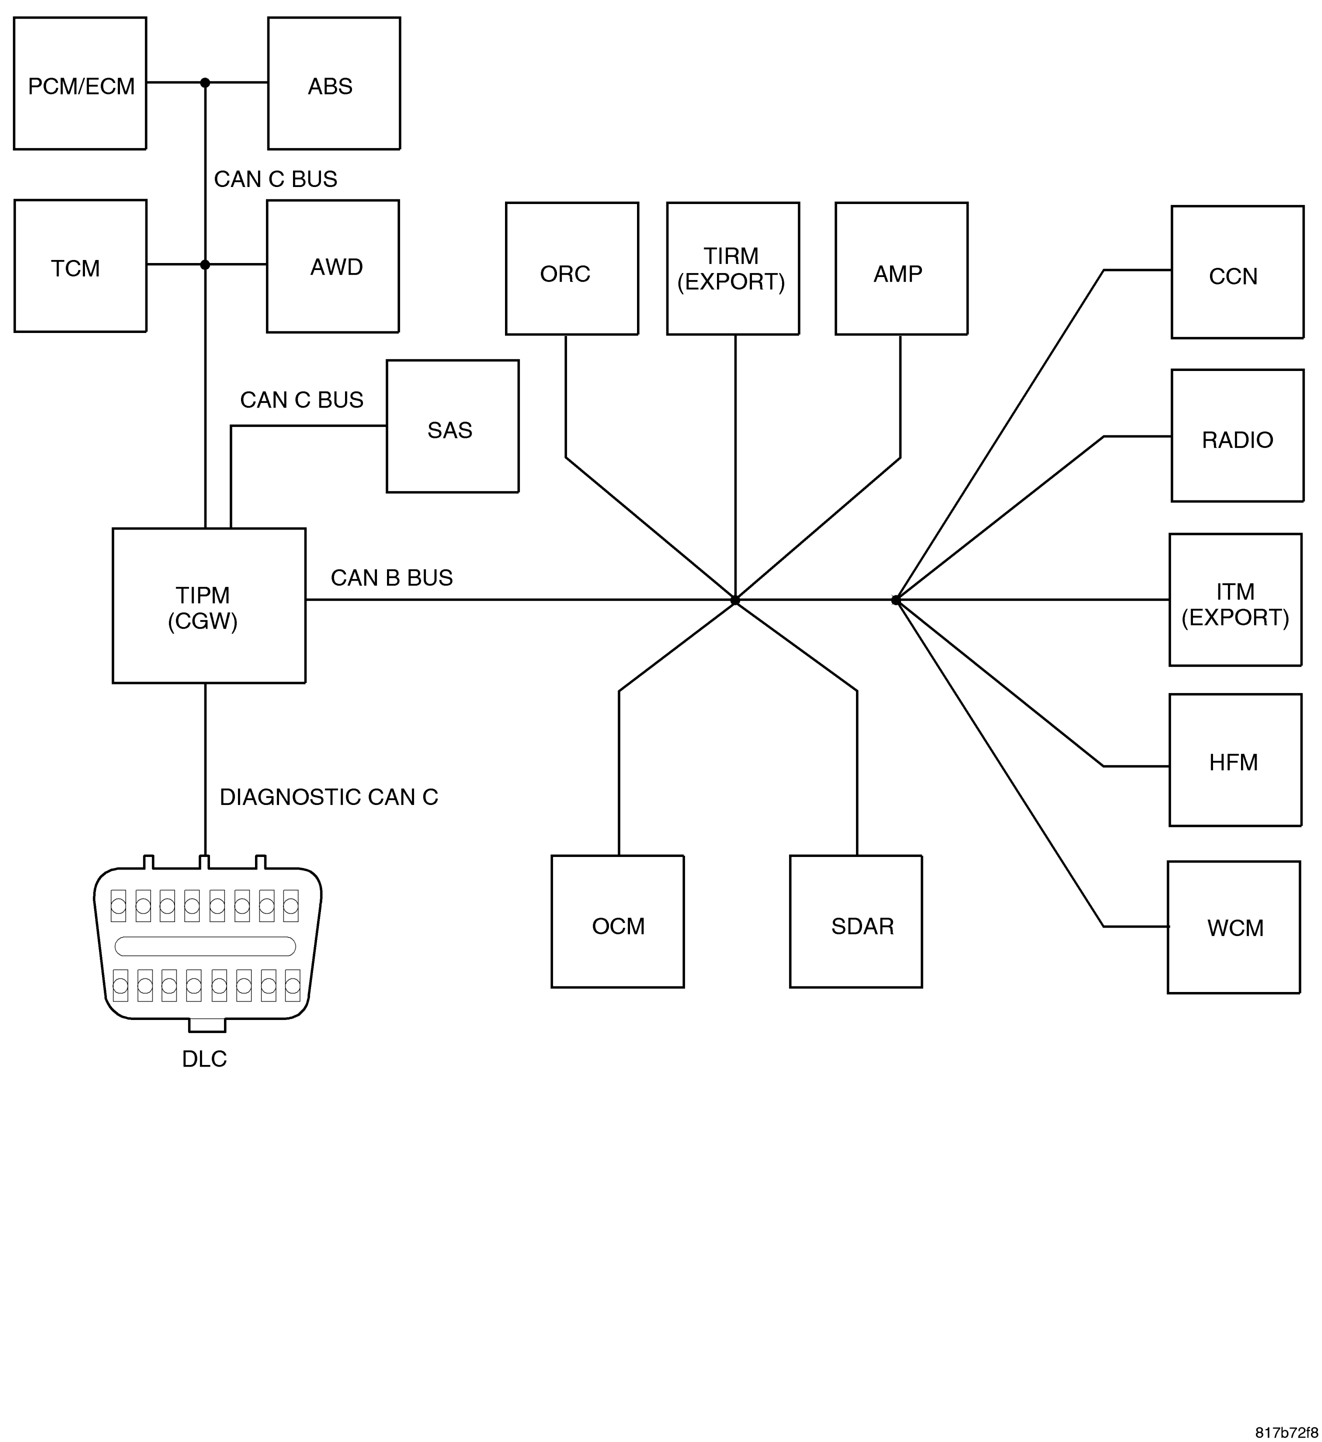
Verify that the WCM is active on the bus.

Is the WCM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the WCM?

Yes >> Replace/update the Sentry Key Remote Entry Module in accordance with the service information. Perform SKREEM VERIFICATION TEST

No >> Replace/update the module that set this DTC in accordance with the service information. Perform the appropriate VERIFICATION TEST.

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the Radio for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
RADIO POWER AND GROUND
RADIO
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE RADIO IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

Verify that the Radio is active on the bus.

Is the Radio active on the bus?

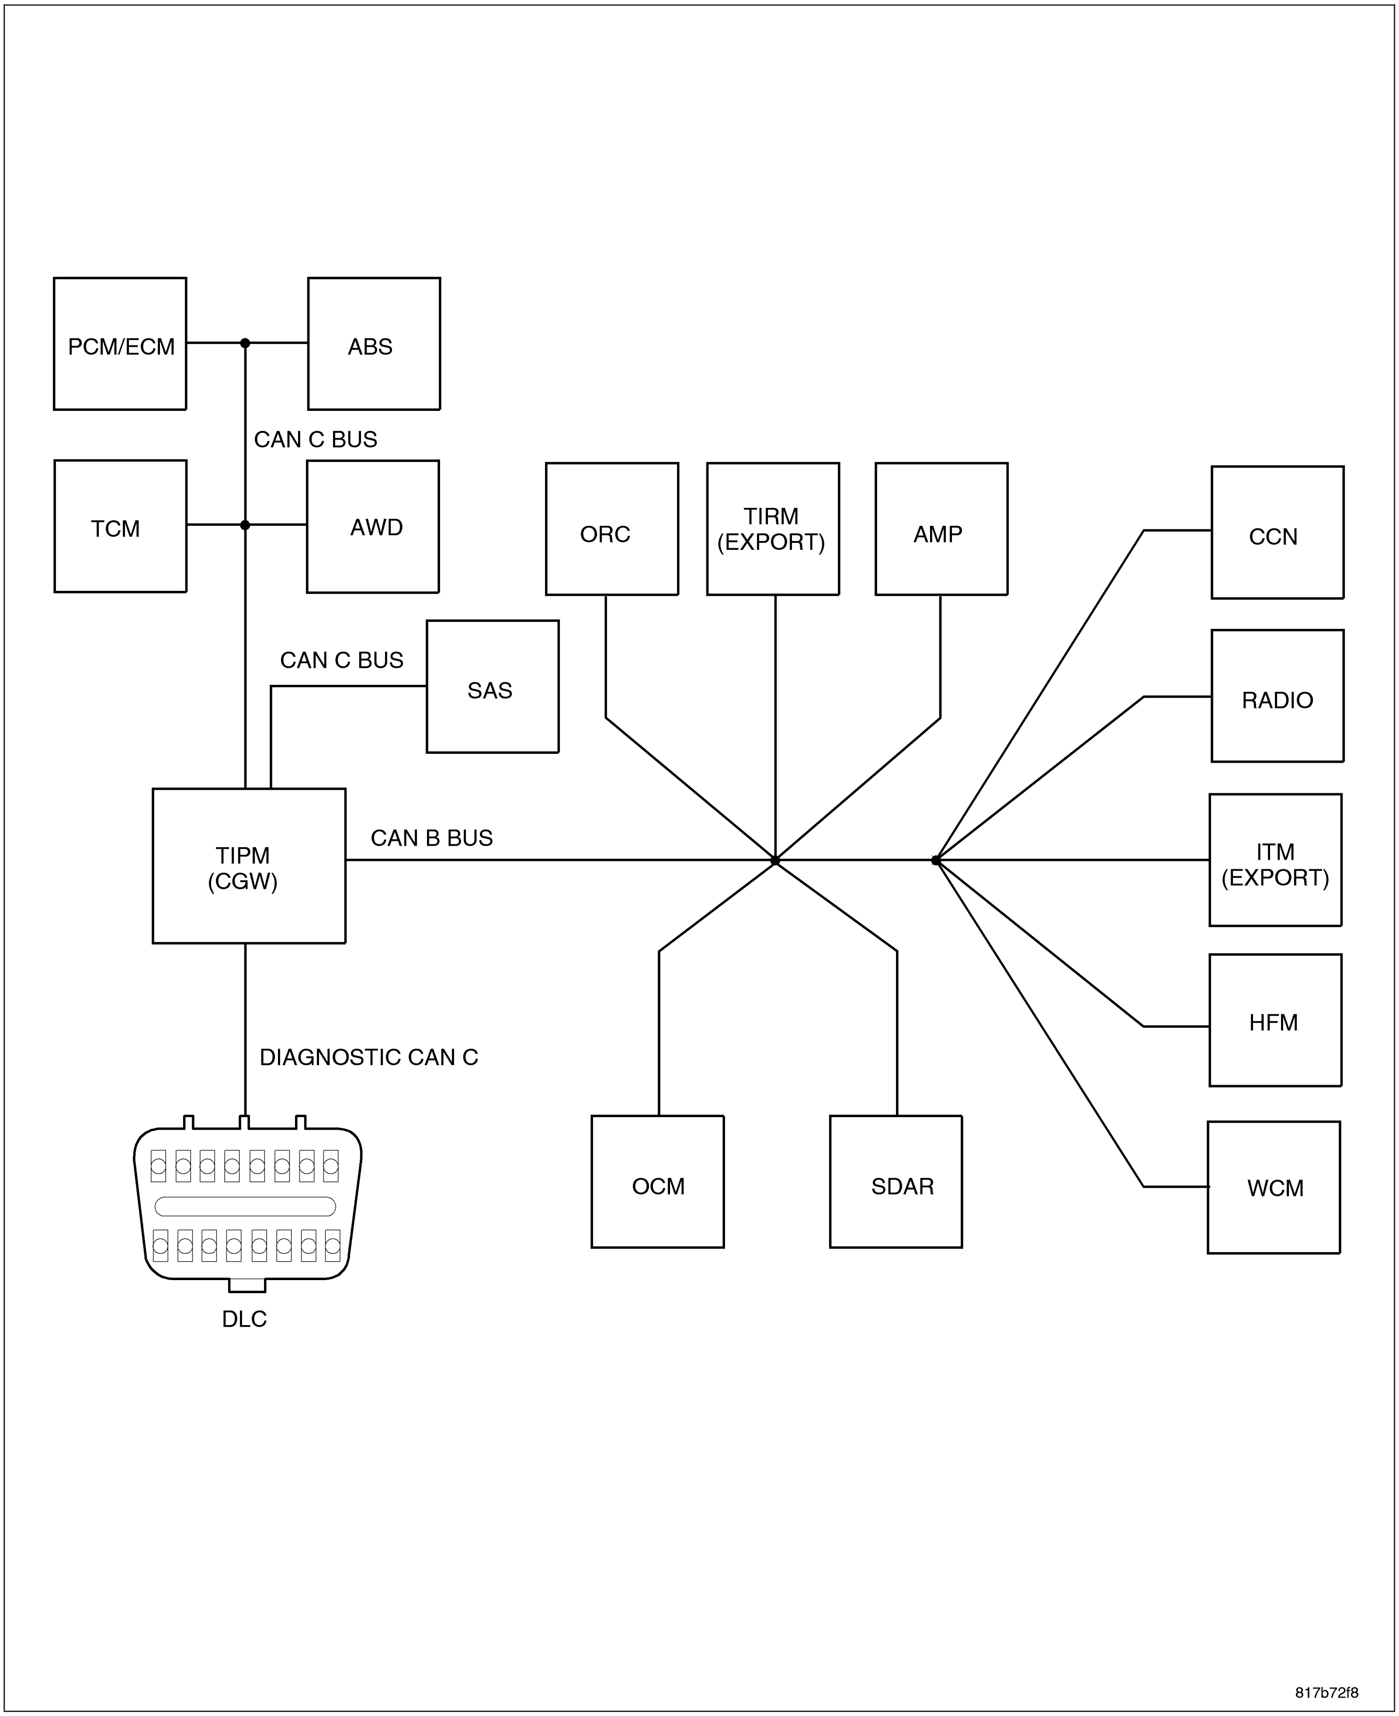
Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the Radio?



Yes >> Replace/update the Radio in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information.

Perform the appropriate VERIFICATION TEST.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER (AMP)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the Amplifier for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
AMPLIFIER POWER AND GROUND
AMPLIFIER
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE AMPLIFIER IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

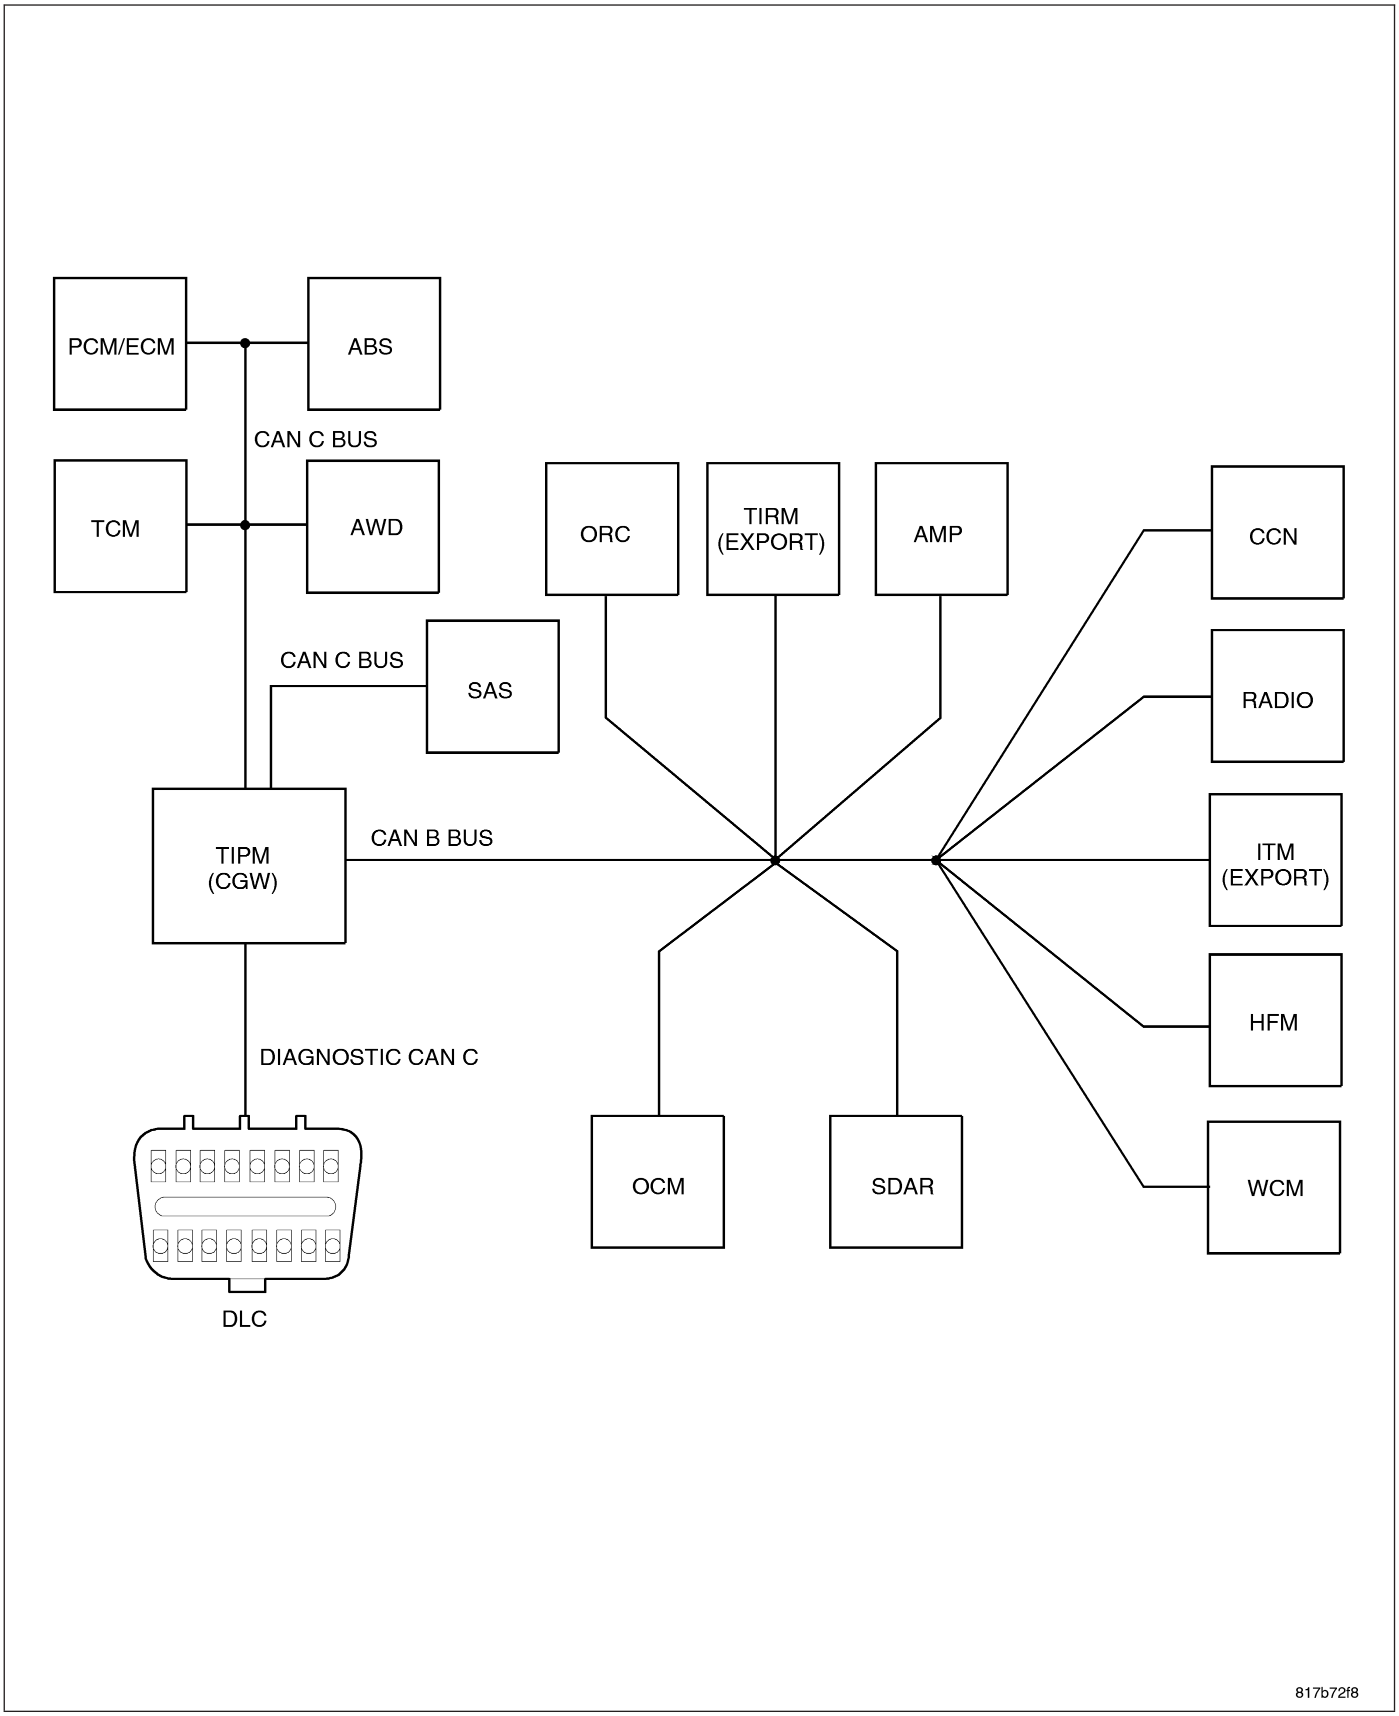
Verify that the Amplifier is active on the bus.

Is the Amplifier active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the Amplifier?

Yes >> Replace/update the Amplifier in accordance with the service information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

U0195-LOST COMMUNICATION WITH SDARS (SATELLITE RECEIVER)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the Satellite Receiver (SDAR) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
SATELLITE RECEIVER POWER AND GROUND
SATELLITE RECEIVER
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE SATELLITE RECEIVER IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

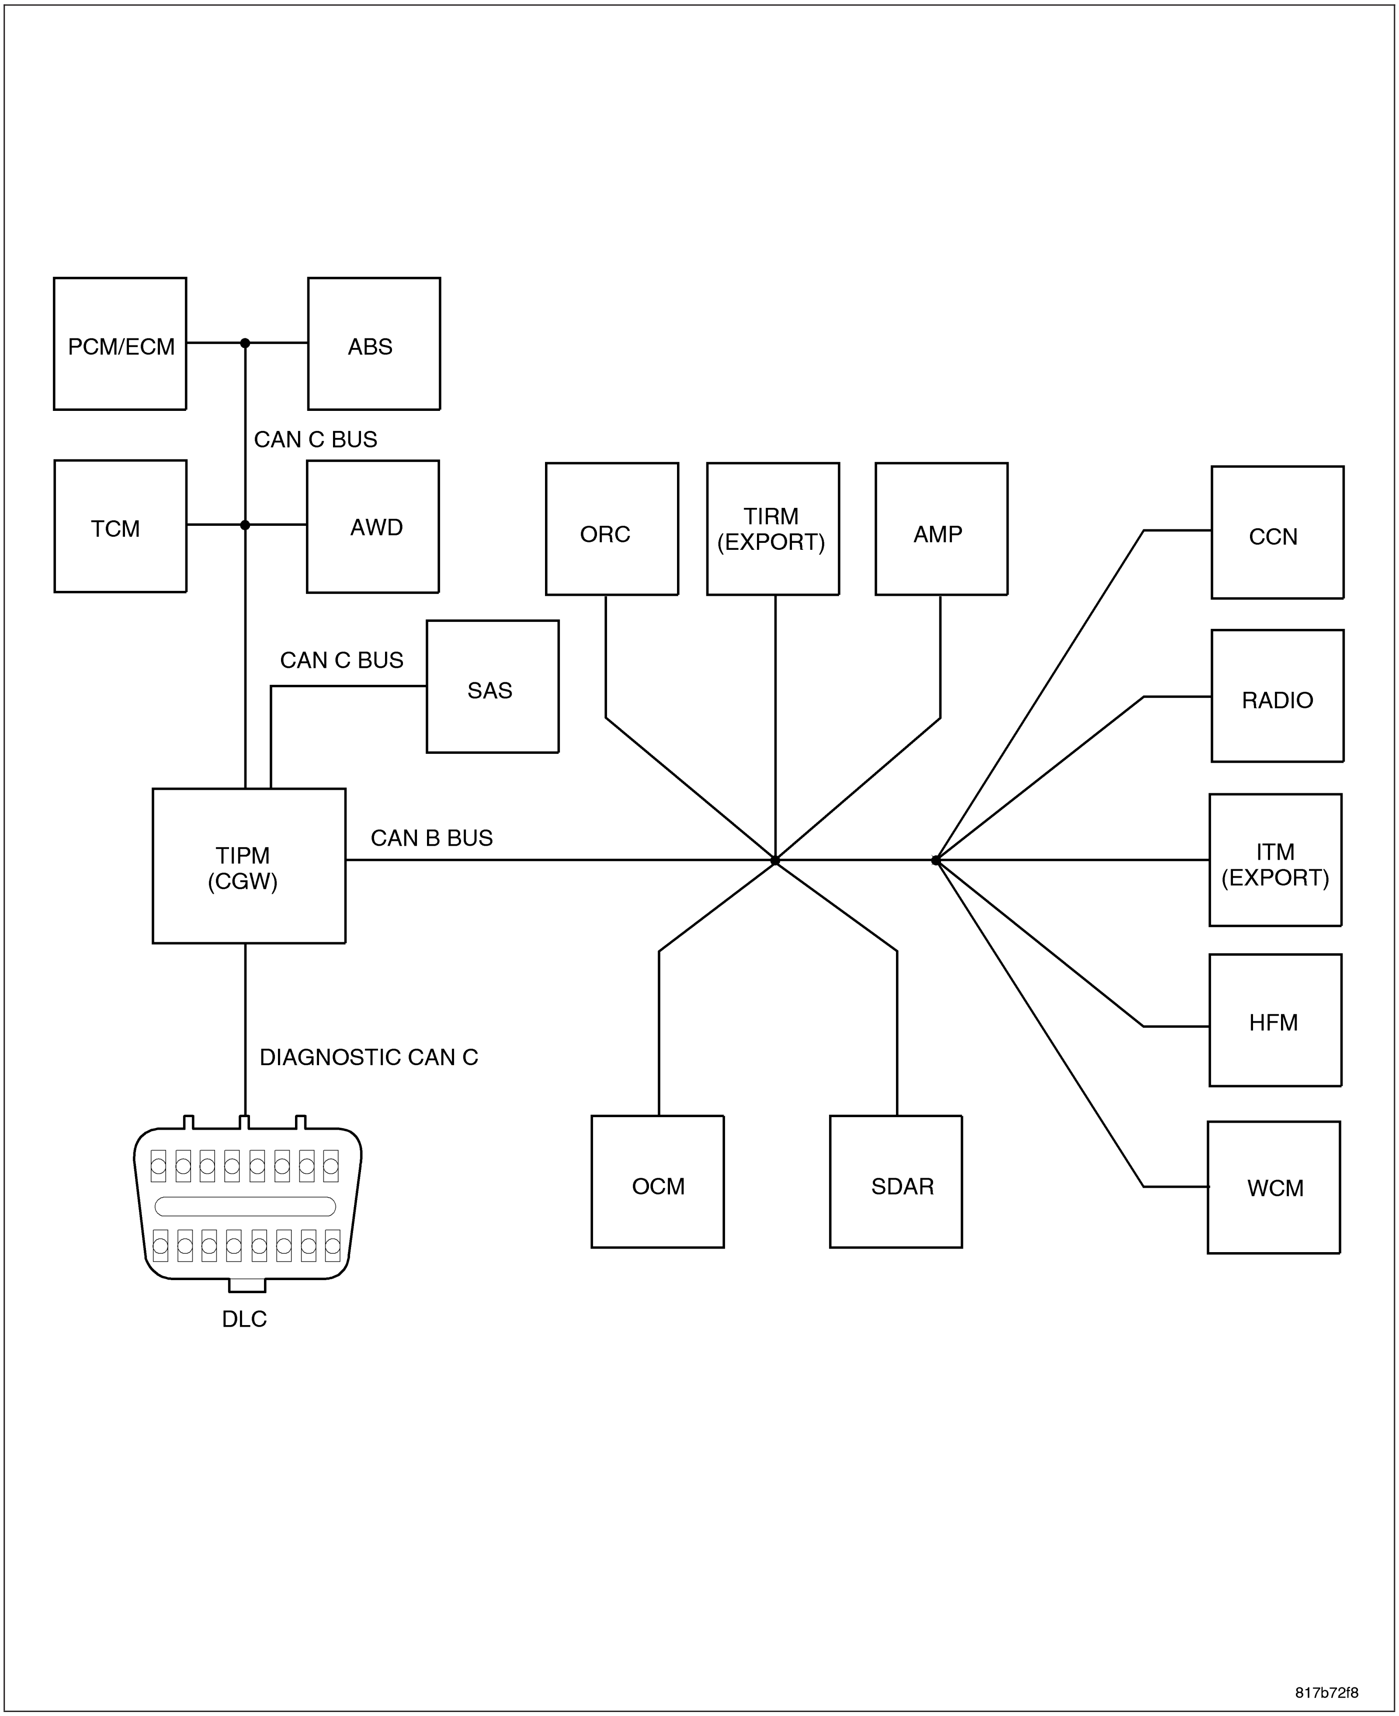
Verify that the SDARS is active on the bus.

Is the SDARS active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the SDARS?

Yes >> Replace/update the Satellite Receiver in accordance with the service information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set the DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (HFM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received from the HFM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTC'S RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
HANDS FREE MODULE POWER AND GROUND
HANDS FREE MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTC's.

Is this DTC active?

Yes >> Go To 2

No >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTC'S

With the scan tool, read active DTC's from all modules.

NOTE: Check for TIPM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTC's.

Does the scan tool display any active DTC's to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE HFM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select ECU View.

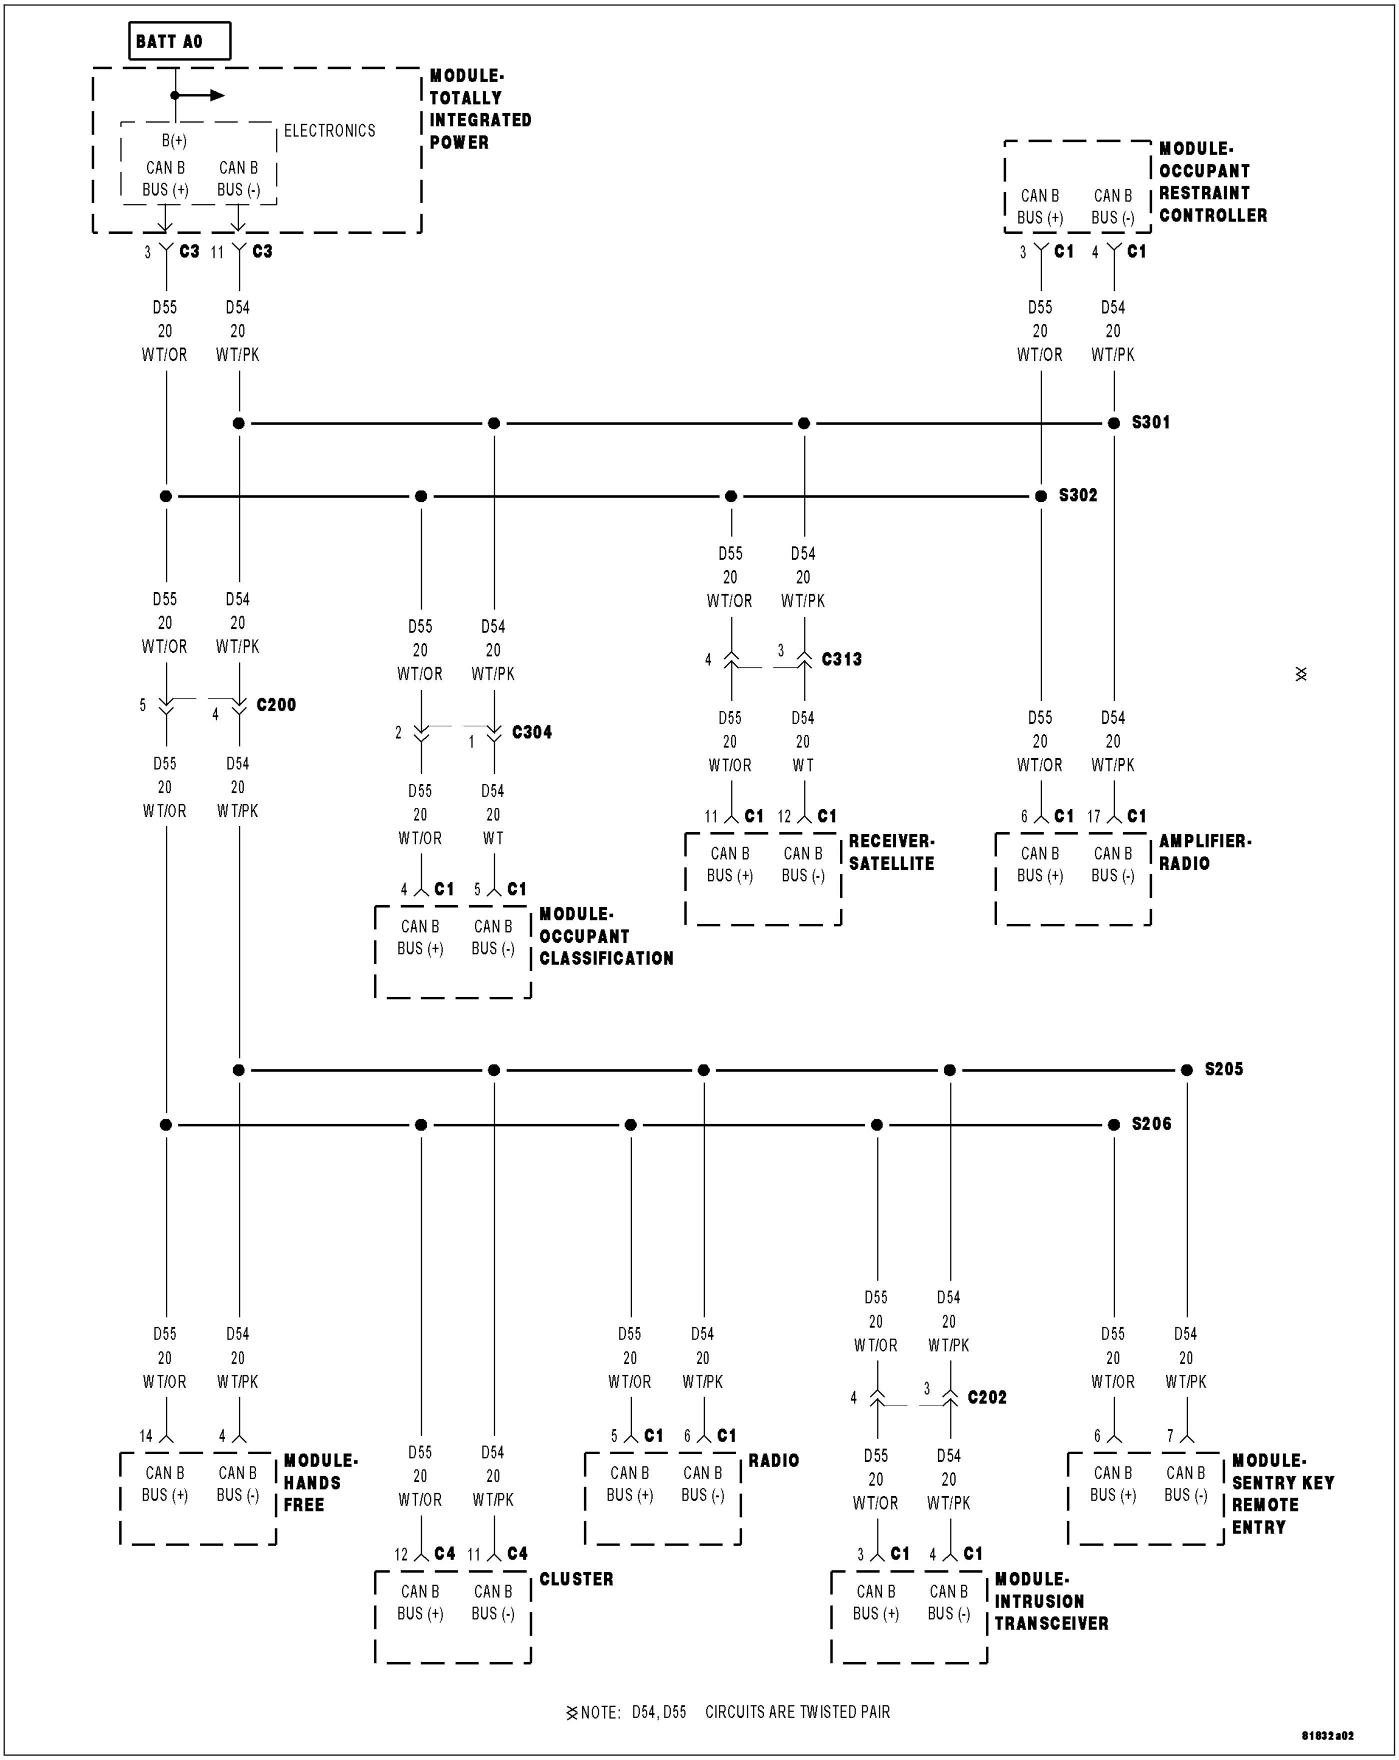
Verify that the HFM is active on the bus.

Is the HFM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTC'S



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTC's "Logged Against" the HFM?

Yes >> Replace/update the Hands Free Module in accordance with the service information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

U1105-CAN B SIGNAL MISSING

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the CAN B Bus messages are not received within 2 seconds.

Possible Causes
OTHER CAN B BUS DTC's SET IN TIPM
(D55) CAN B BUS (+) CIRCUIT OPEN
(D54) CAN B BUS (-) CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTCS

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

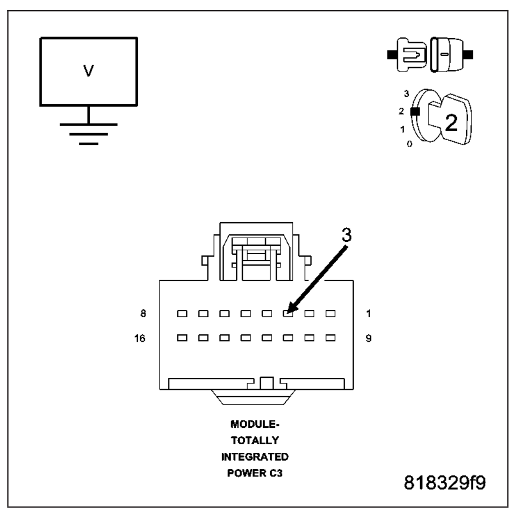
2. CHECK TIPM FOR U0019 DTC

With the scan tool, read TIPM active DTC's

Does the scan tool display U0019 CAN B BUS – ACTIVE?

Yes >> Refer to the table of contents in this section and perform the U0019 diagnostic procedure.

No >> Go To 3



3. (D55) CAN B BUS (+) CIRCUIT OPEN

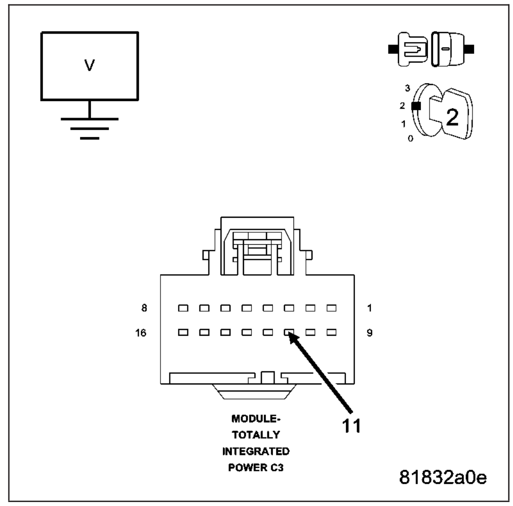
Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Turn the ignition on.

Measure the voltage of the (D55) CAN B Bus (+) circuit.

Is any voltage present on this circuit?



Yes >> Go To 4

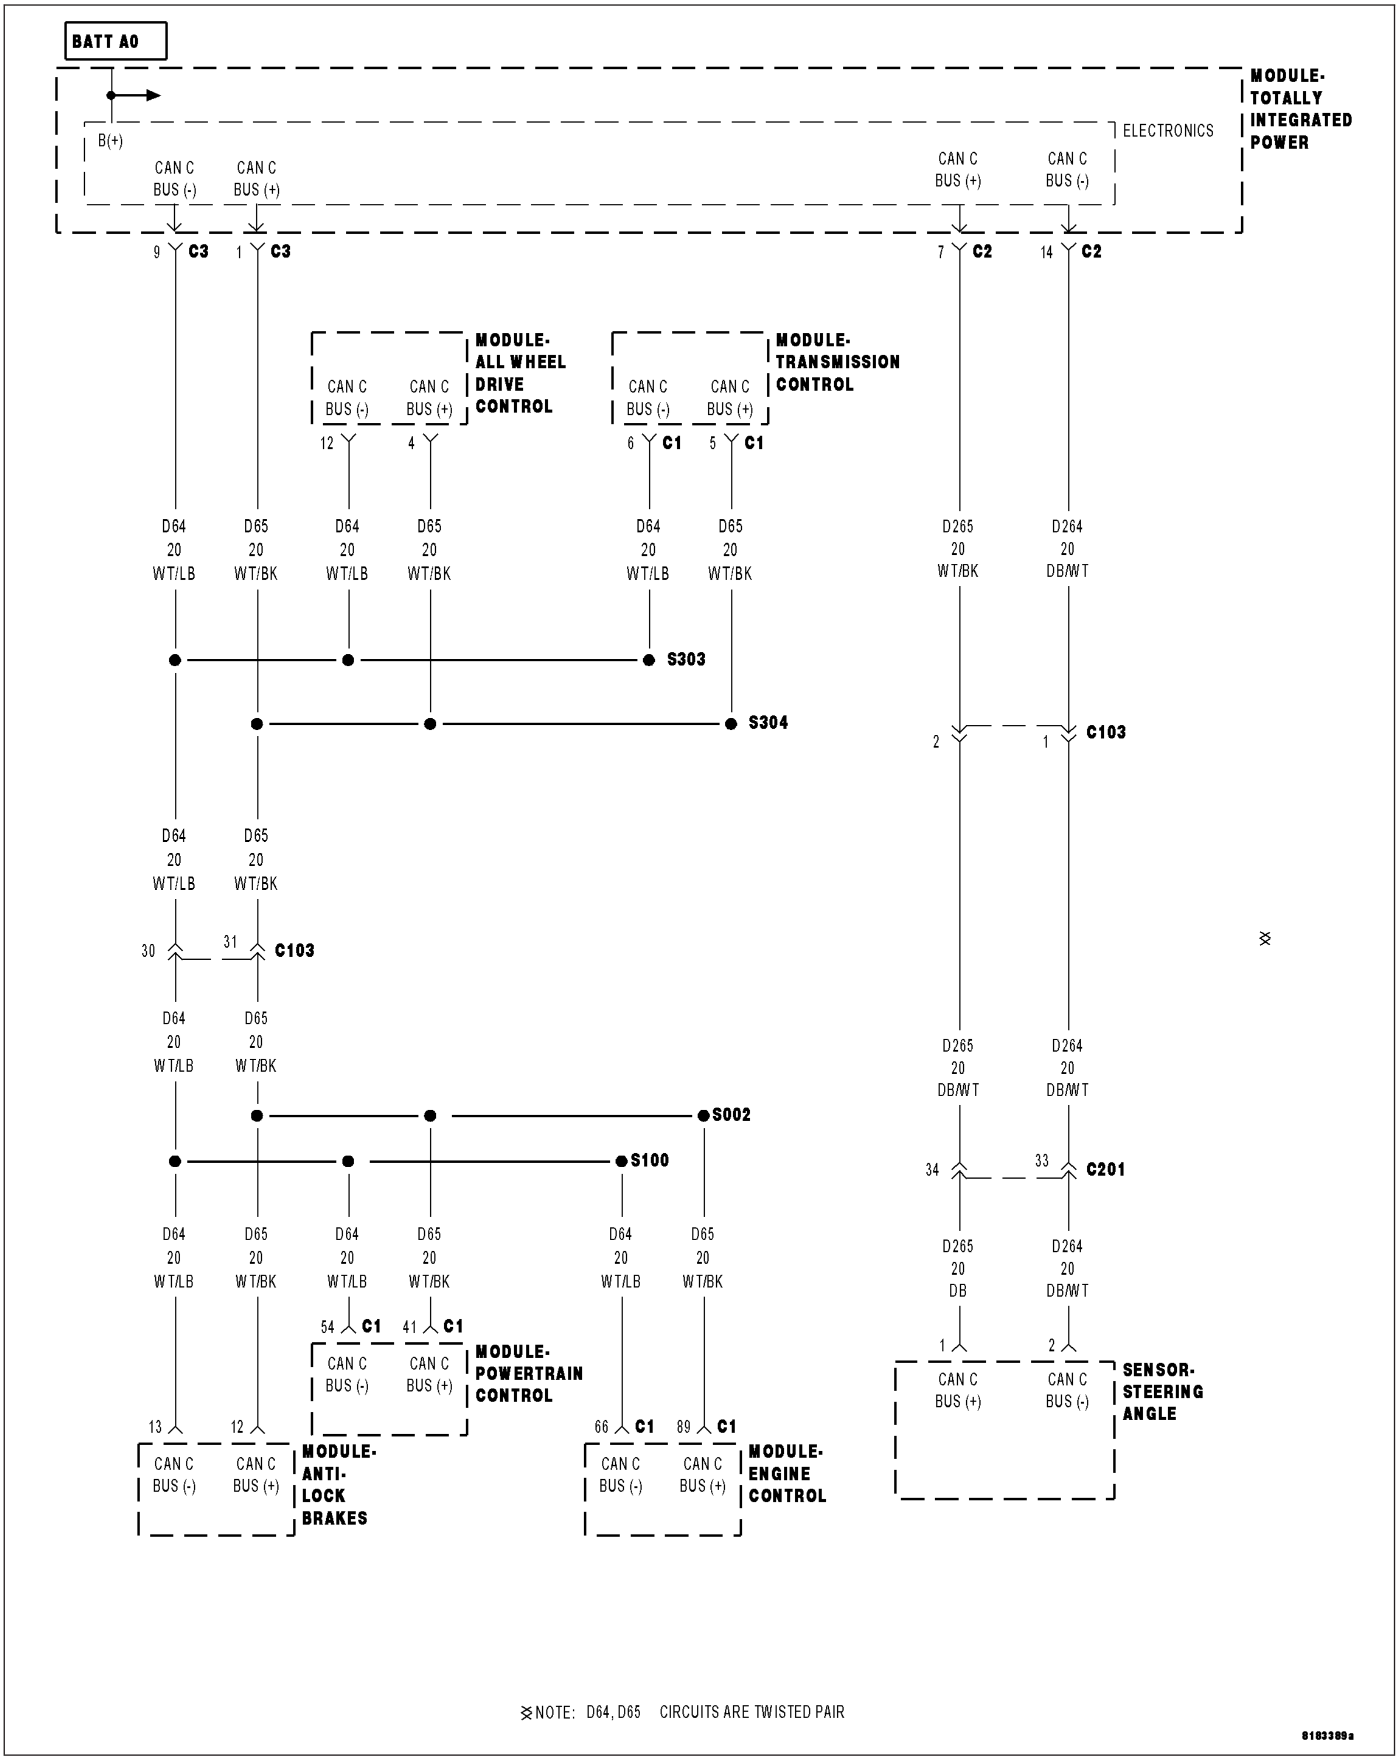
No >> Repair the (D55) CAN B Bus (+) circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D54) CAN B BUS (–) CIRCUIT OPEN

Measure the voltage of the (D54) CAN B Bus (-) circuit.

Is any voltage present on this circuit?



Yes >> Replace the TIPM in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D54) CAN B Bus (–) circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U1106-CAN C SIGNAL MISSING

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The TIPM detects a short in either CAN C Bus circuit.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE
POWERTRAIN or ENGINE CONTROL MODULE
TRANSMISSION CONTROL MODULE
ALL WHEEL DRIVE CONTROL MODULE
STEERING CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U1106–CAN C SIGNAL MISSING as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ANTILOCK BRAKE MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U1106–CAN C SIGNAL MISSING as active?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Antilock Brake Module in accordance with the service information.

Perform ABS VERIFICATION TEST — VER 1.

3. POWERTRAIN OR ENGINE CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Powertrain or Engine Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U1106–CAN C SIGNAL MISSING as active?

Yes >> Go To 4

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain or Engine Control Module in accordance with the service information.
Perform appropriate POWERTRAIN VERIFICATION TEST.

4. TRANSMISSION CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Transmission Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U1106–CAN C SIGNAL MISSING as active?

Yes >> Go To 5

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.
Perform the appropriate TRANSMISSION VERIFICATION TEST.

5. ALL WHEEL DRIVE CONTROL (AWD) MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the AWD Module harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U0001–CAN C BUS as active?

Yes >> Go To 6

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the All Wheel Drive Control (AWD) Module in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

6. STEERING CONTROL MODULE (SAS) — INTERNAL SHORT

Turn the ignition off.

Disconnect the Steering Control Module (SAS) harness connector.

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display U1106–CAN C SIGNAL MISSING as active?

Yes >> Go To 7

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Steering Control Module (SAS) in accordance with the service information.

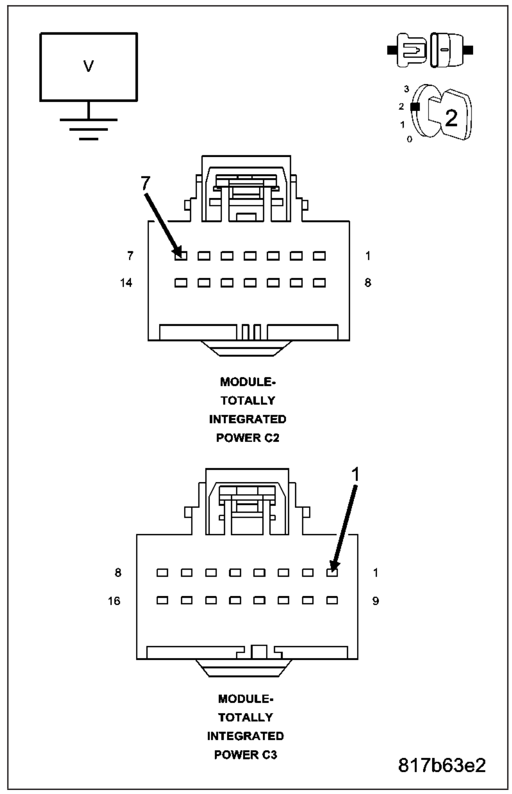
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

7. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

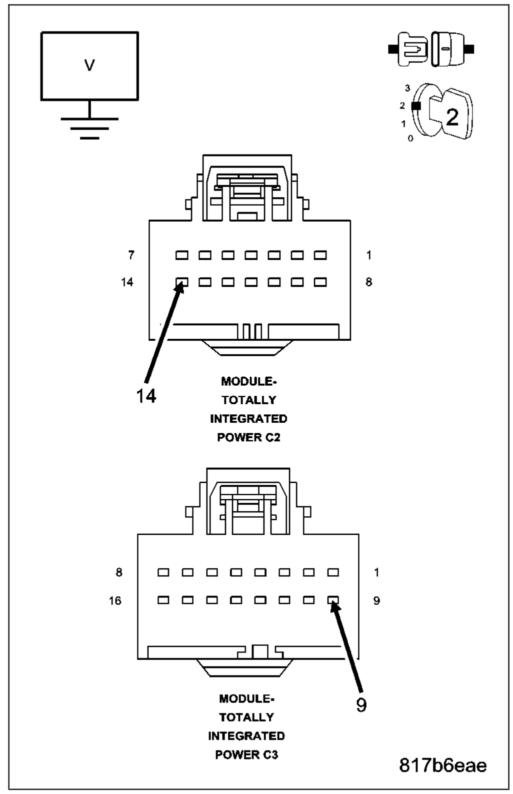
Turn the ignition on.



Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is there any voltage present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to voltage.



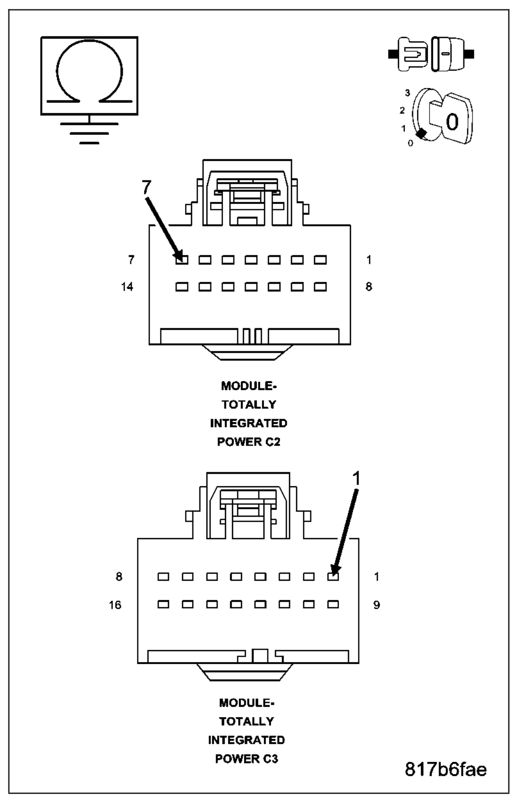
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 8

8. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?



Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 9

9. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND

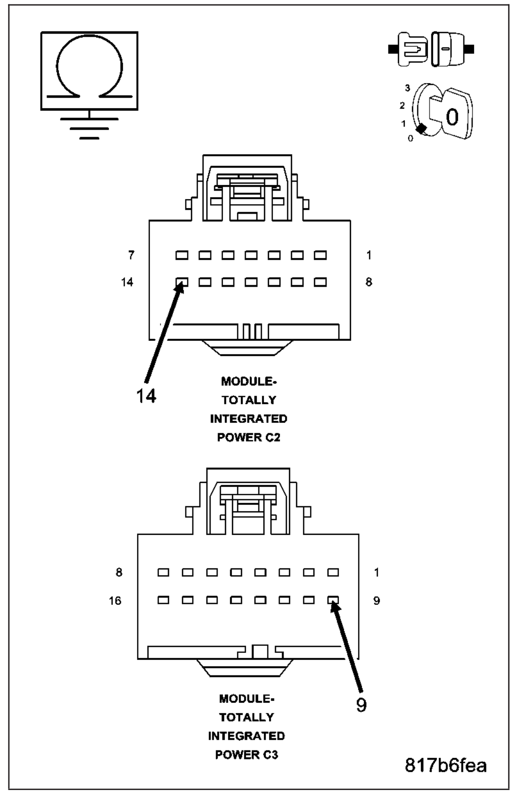
Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

Is any resistance present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 10



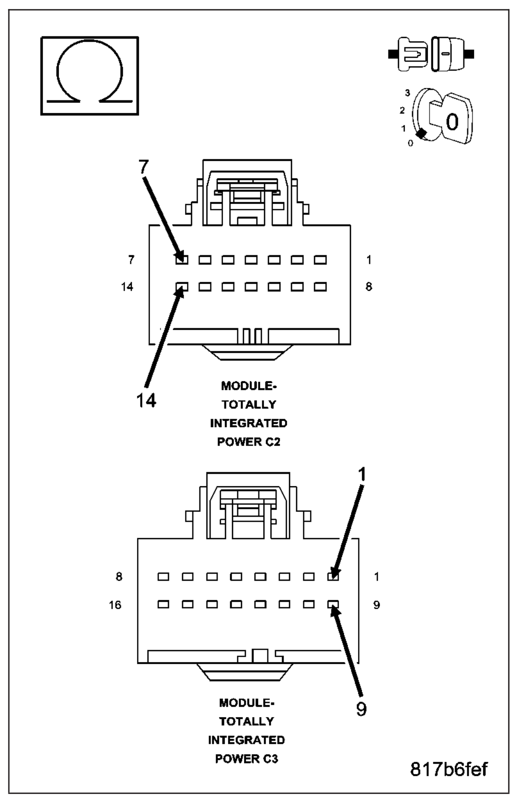
10. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

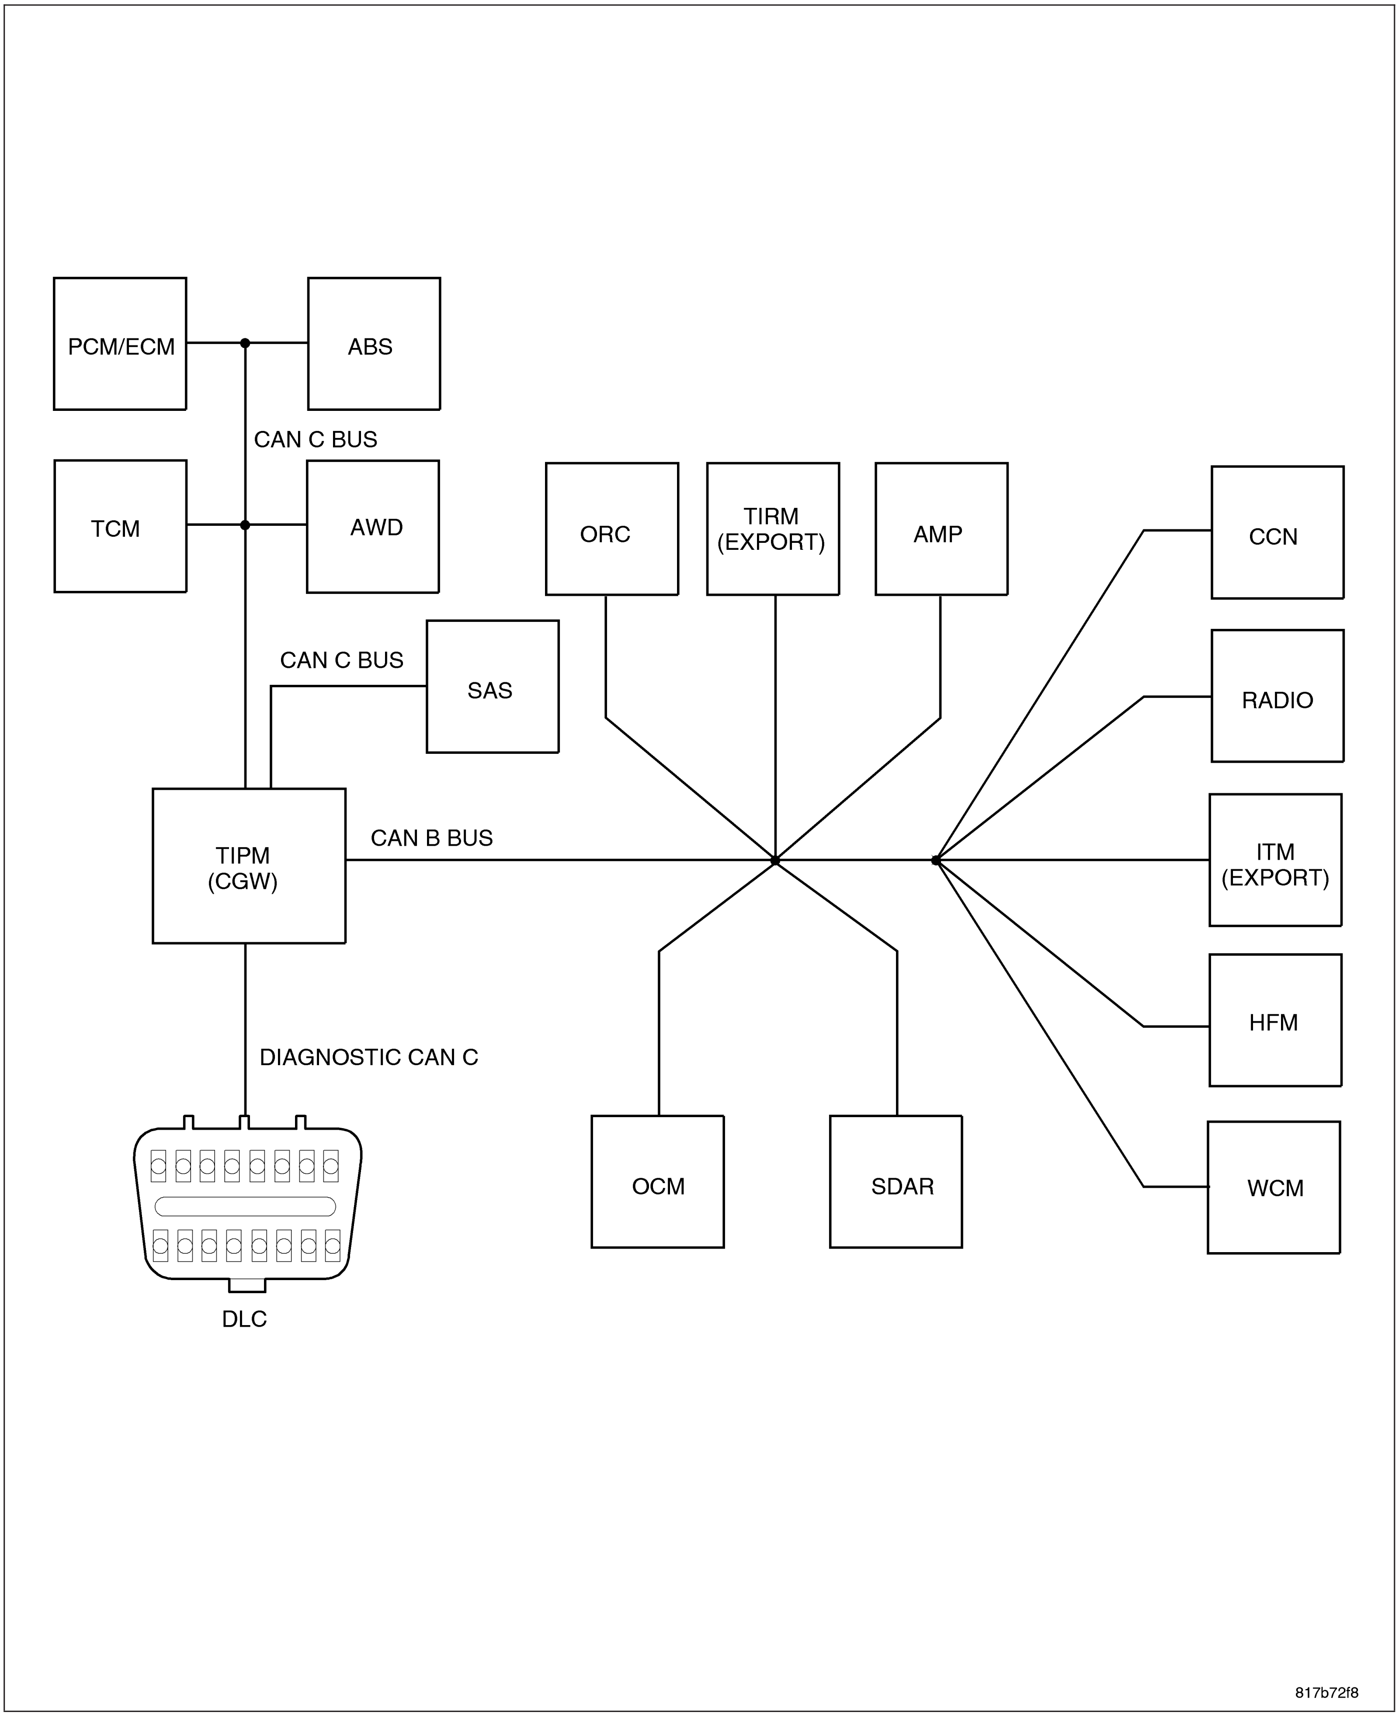
Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 11



11. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.



Is any resistance present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the TIPM in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U1107-ECU IN SINGLE-WIRE MODE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The TIPM detects an open, a short high, a short low or a short together in either of the CAN B Bus circuits.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND
(D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND
(D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D55) CAN B BUS (+) CIRCUIT SHORTED TO (D54) CAN B BUS (-) CIRCUIT
(D55) CAN B BUS (+) CIRCUIT OPEN
(D54) CAN B BUS (-) CIRCUIT OPEN
ANY CAN B BUS MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase TIPM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active TIPM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. ANY CAN B BUS MODULE— INTERNAL FAULT

Turn the ignition off.

With the scan tool, monitor the active TIPM DTC's.

While monitoring the scan tool, disconnect each CAN B Bus module one at a time.

NOTE: When performing the above step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

NOTE: This is to determine if the fault is internal within a module.

Check for this DTC to become active after disconnecting each CAN B Bus module the vehicle is equipped with.

NOTE: If the DTC becomes stored when a particular CAN B Bus module is disconnected, that module is causing the DTC to set.

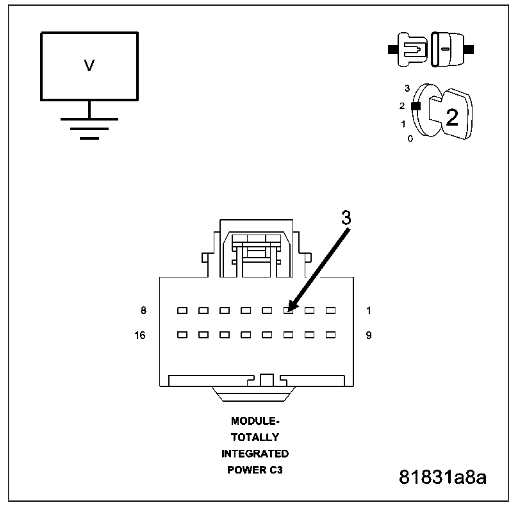
With all the CAN B Bus modules disconnected did the TIPM still set this DTC as active?

Yes >> Go To 3

No >> Replace the module that when disconnected the DTC became stored.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE



Turn the ignition off.

Disconnect the TIPM C3 harness connector.

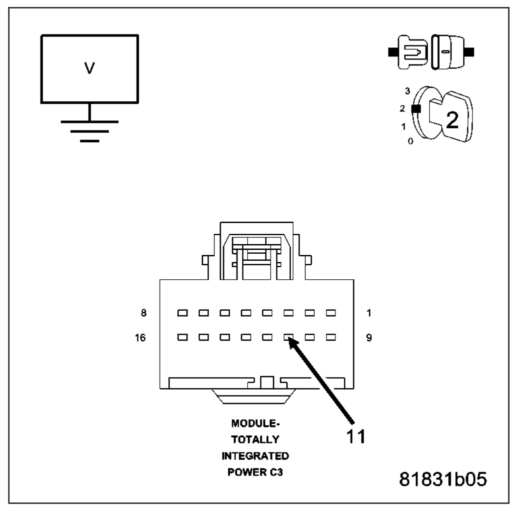
NOTE: Ensure each CAN B Bus module is disconnected at this time.

Turn the ignition on.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is the voltage above 10.0 volts?

Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to voltage.



Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE

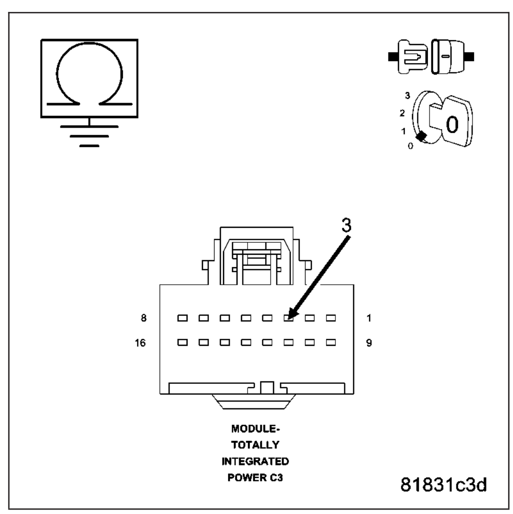
NOTE: Ensure each CAN B Bus module is disconnected at this time.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Is the voltage above 10.0 volts?

Yes >> Repair the (D54) CAN B Bus (-) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



No >> Go To 5

5. (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO GROUND

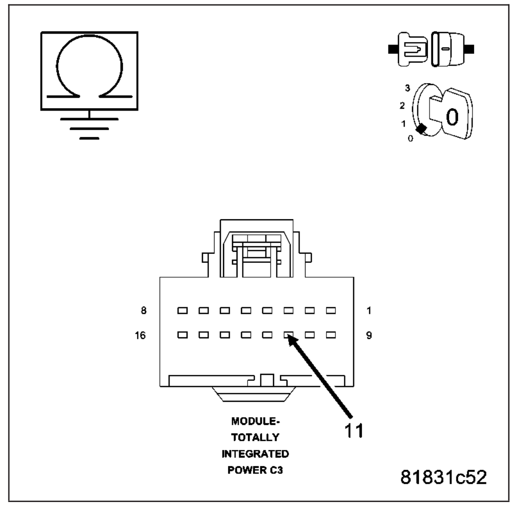
Turn the ignition off.

NOTE: Ensure each CAN B Bus module is disconnected at this time.

Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.

Is the resistance above 1000.0 ohms?

Yes >> Go To 6



No >> Repair the (D55) CAN B Bus (+) circuit for a short to ground.

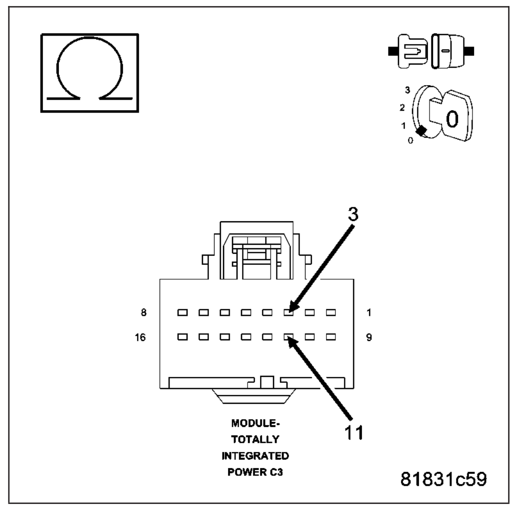
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

6. (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO GROUND

NOTE: Ensure each CAN B Bus module is disconnected at this time.

Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.

Is the resistance above 1000.0 ohms?



Yes >> Go To 7

No >> Repair the (D54) CAN B Bus (-) circuit for a short to ground.

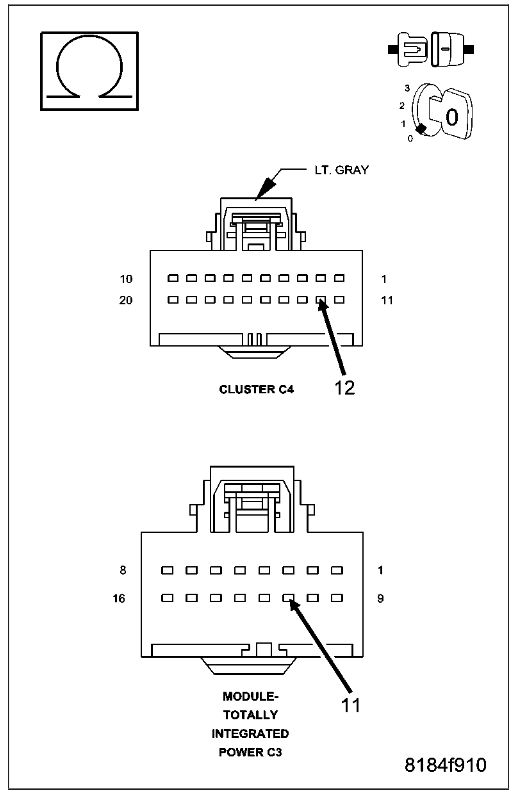
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

7. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

NOTE: Ensure each CAN B Bus module is disconnected at this time.

Is any resistance present?



Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.

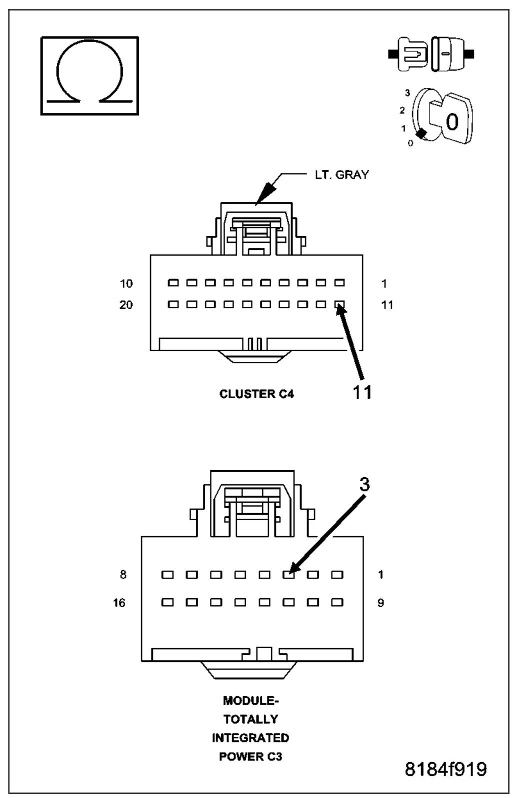
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 8

8. (D55) CAN B BUS (+) CIRCUIT OPEN

Measure the resistance of the (D55) CAN B Bus (+) circuit between the TIPM C3 harness connector and the Cluster C4 harness connector.

Is the resistance above 10.0 ohms?



Yes >> Repair the (D55) CAN B Bus (+) circuit for an open or high resistance.

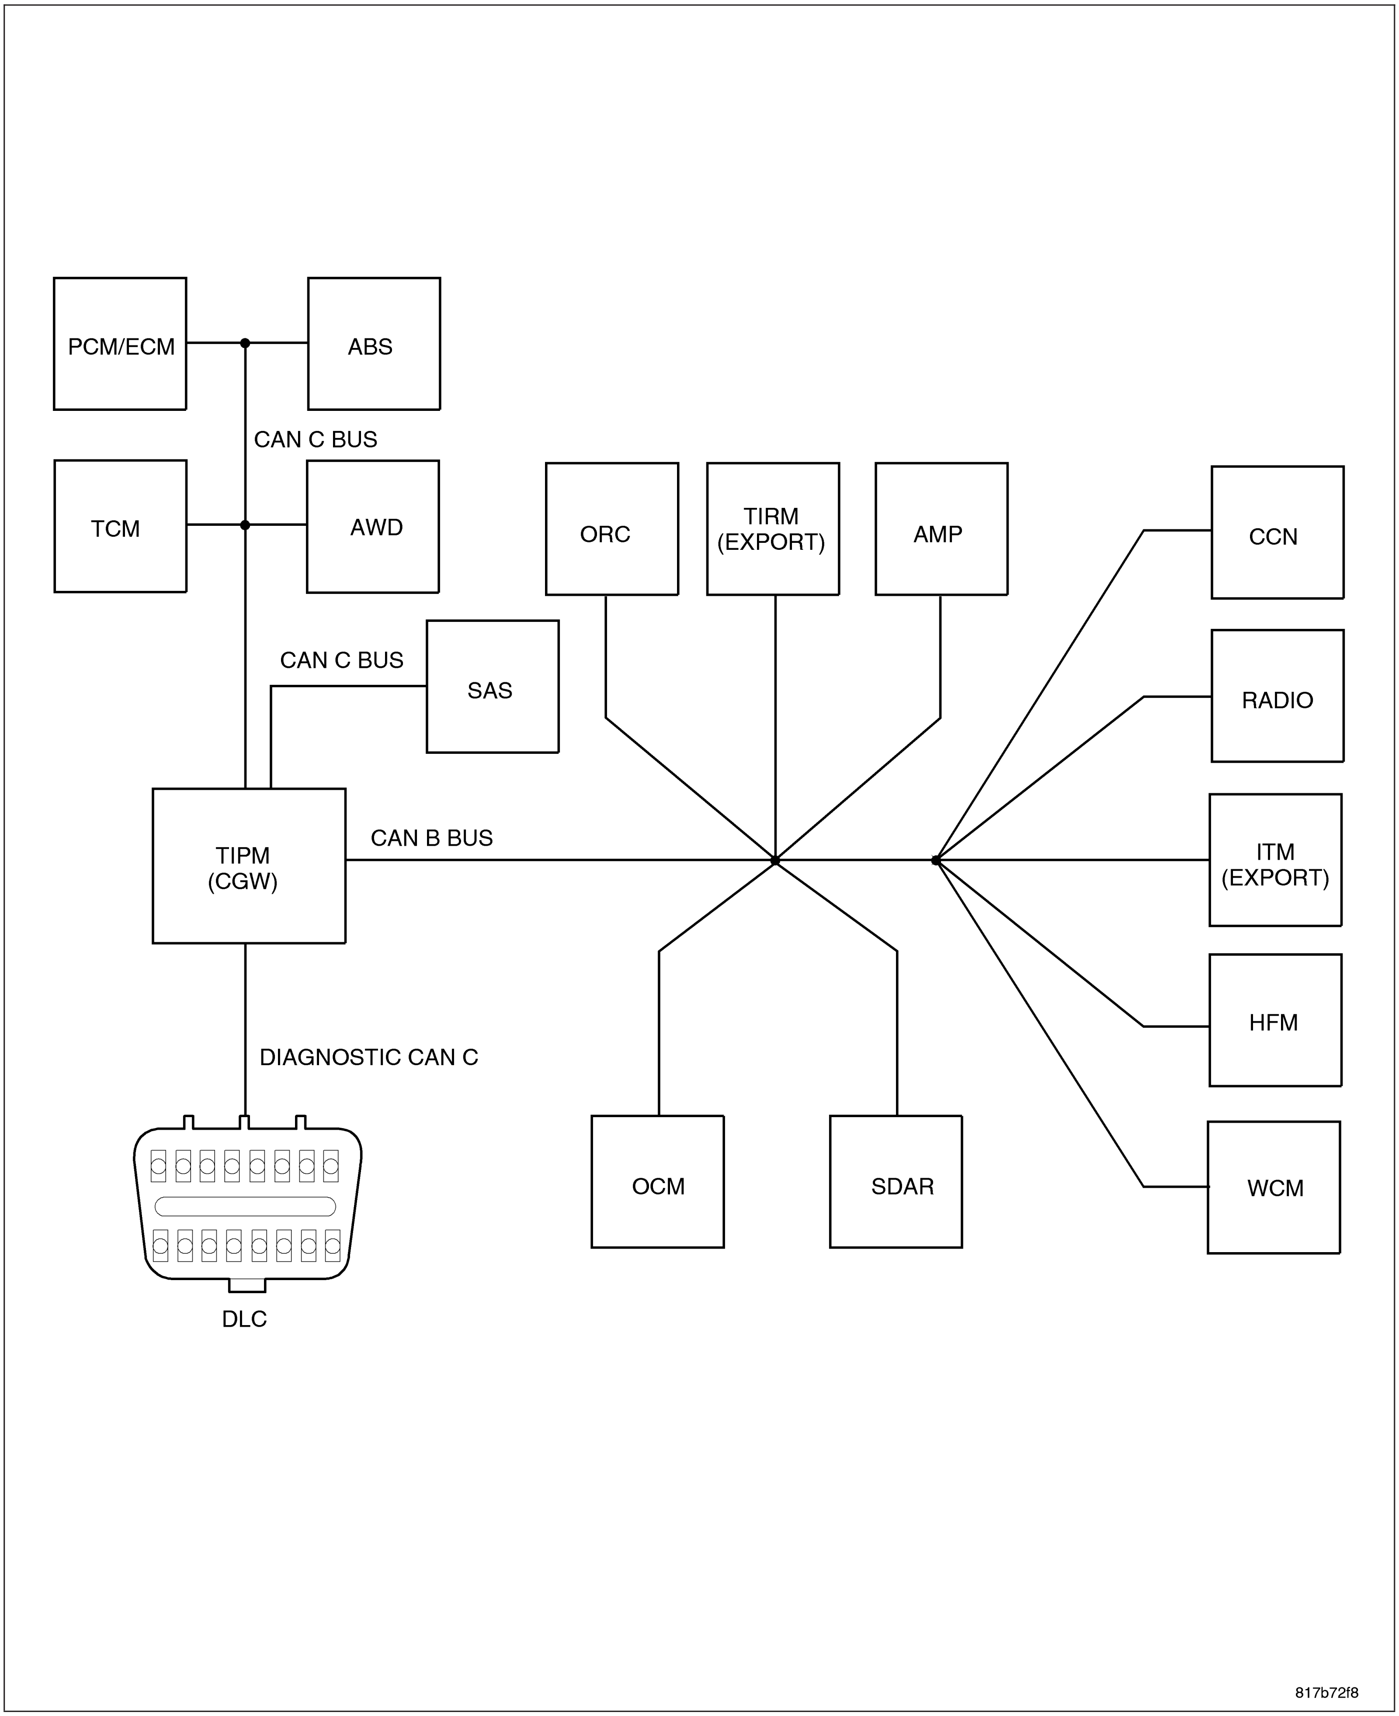
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 9

9. (D54) CAN B BUS (-) CIRCUIT OPEN

Measure the resistance of the (D54) CAN B Bus (-) circuit between the TIPM C3 harness connector and the Cluster C4 harness connector.

Is the resistance above 10.0 ohms?



Yes >> Repair the (D54) CAN B Bus (-) circuit for an open or high resistance.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace and program the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U1108-ADDITIONAL CAN B ECU DETECTED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The Totally Integrated Power Module (TIPM) detects an additional CAN B module and requires a reconfiguration.

Possible Causes
ADDITIONAL MODULE ADDED/REMOVED FROM THE CAN B BUS NETWORK

Diagnostic Test

1. RECONFIGURE THE TOTALLY INTEGRATED POWER MODULE

Turn the ignition on.

With the scan tool, select network view and press the gateway button. This will list the CAN modules on the vehicle. Read and record the listed modules.

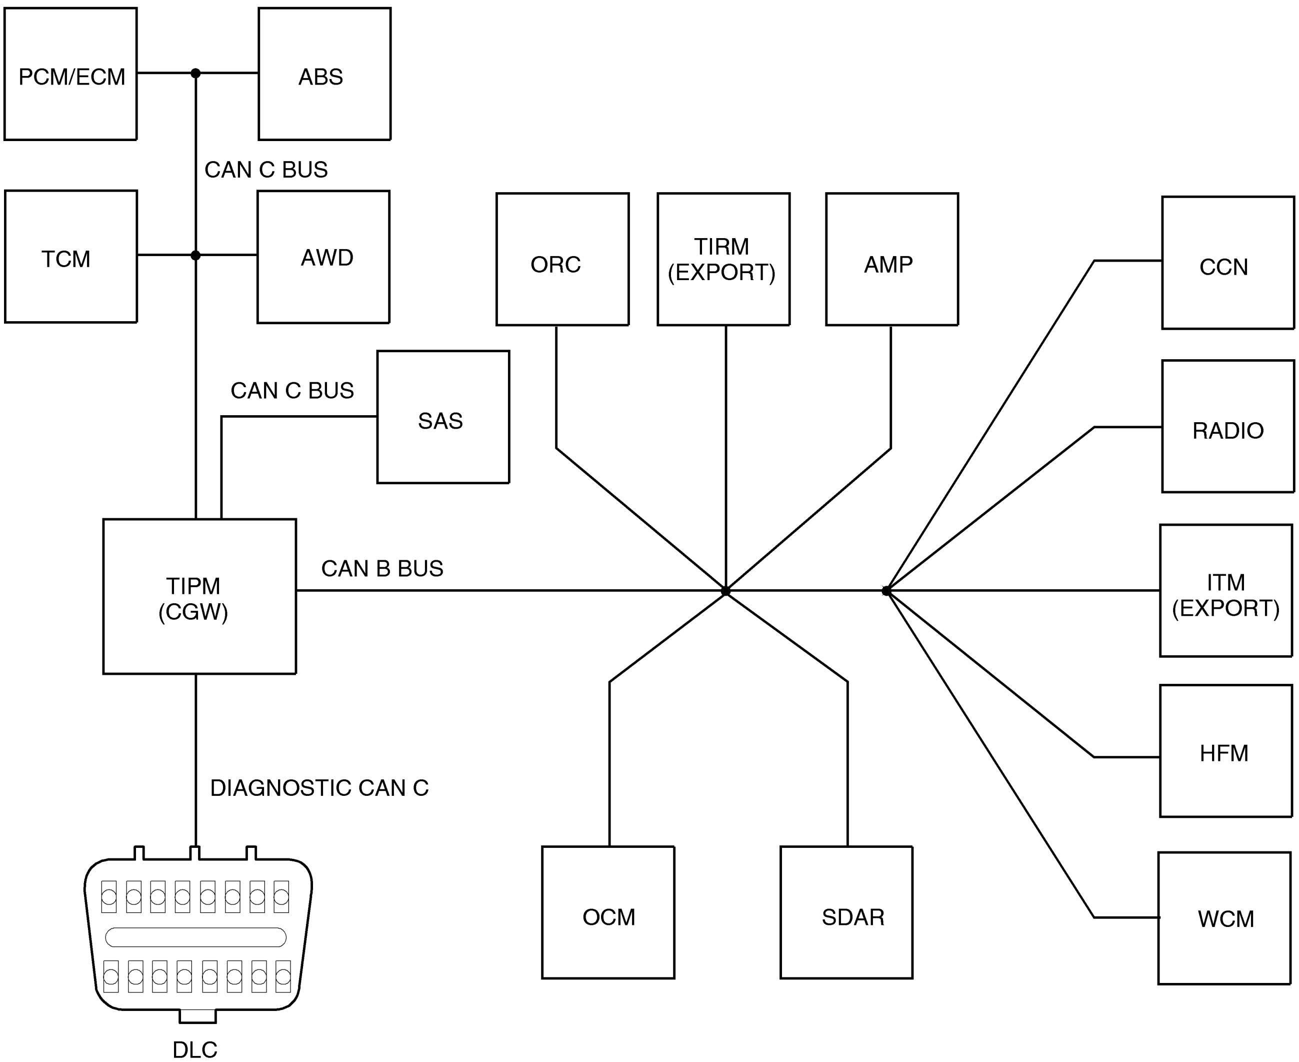
With the scan tool, select TIPM, miscellaneous functions then add/remove ECUs.

With the scan tool, add or remove the module that was not configured in the TIPM.

With the scan tool, erase DTC's.

Cycle the ignition from on to off 3 times and read the active TIPM DTC's.

Does the scan tool display this DTC as active?



Yes >> Retest system and attempt to reconfigure the TIPM.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair is complete.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*STORED LOST COMMUNICATION DTC'S

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
POWER OR GROUND FROM THE REPORTING MODULE
MODULE THAT SET THIS DTC
PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT)
LOW BATTERY/JUMP START CONDITION
IOD FUSE WAS REMOVED DURING SHIPPING
CHECK FOR RELATED TSB'S

Diagnostic Test

1. VERIFY DTC IS STORED

NOTE: Stored faults may indicate a customer perceived intermittent condition.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read stored DTC's.

Is this DTC stored?

Yes >> Go To 2

No >> Diagnose the active DTC. Refer to the Table of Contents for a list of the symptoms.

2. CHECK THE ENVIRONMENTAL DATA

With the scan tool, read the loss of communication environmental data.

Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are their any stored CAN B or C hardware electrical, battery, ignition voltage, VIN missing/mismatch, TIPM configuration DTC's present with matching environmental data?

Yes >> These DTC's may have been the result of other service procedures performed. Clear DTC's.

No >> Go To 3

3. VERIFY INTERMITTENT LOST COMMUNICATION DTC – WIRING CONCERNS

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there more than one ECU with stored DTC's "Logged Against" the module and one or more lost communication DTC's stored in the offending module?

Yes >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

No >> Go To 4

4. VERIFY INTERMITTENT LOST COMMUNICATION DTC – OFFENDING MODULE

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

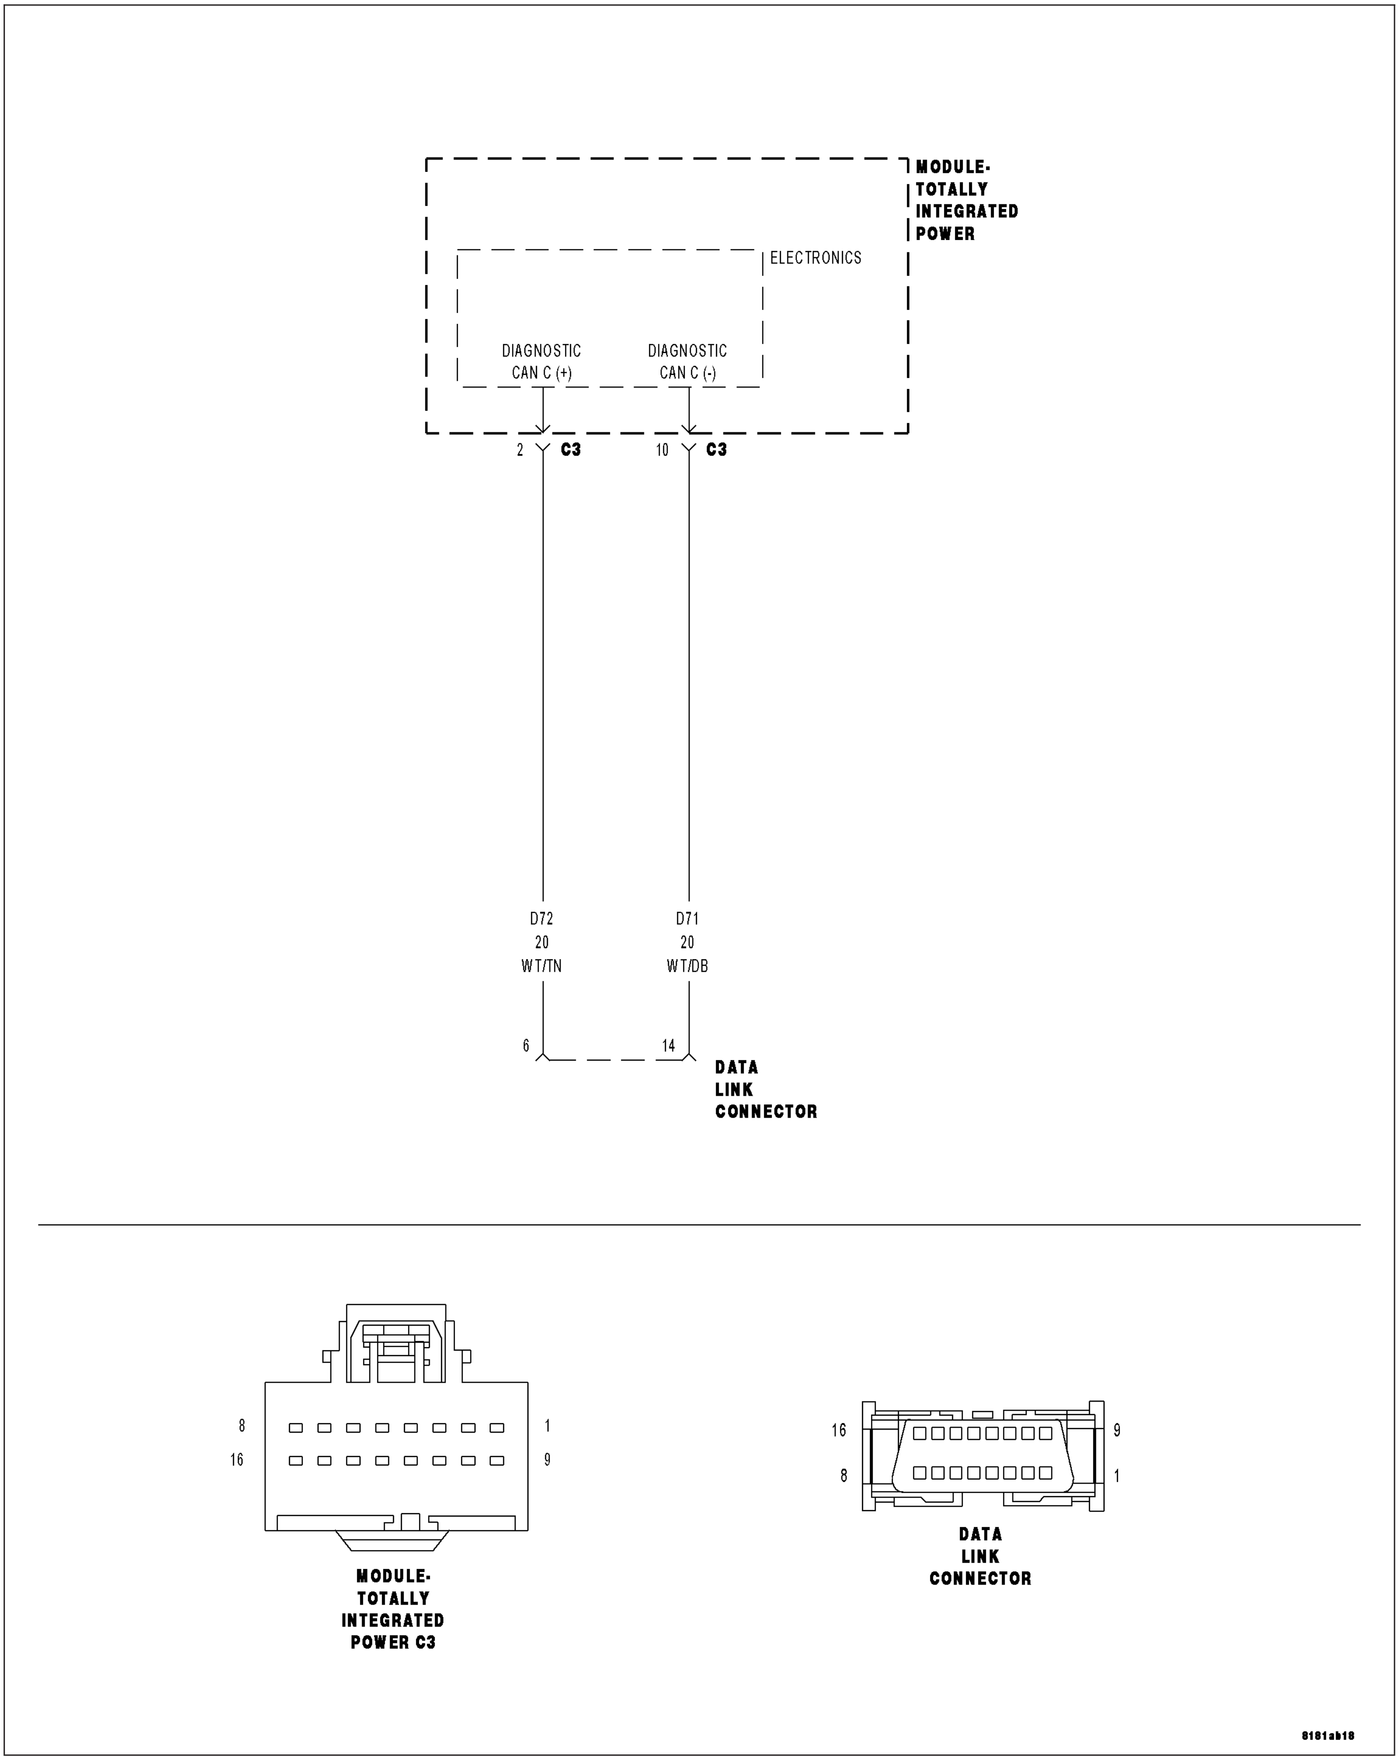
Is there more than one ECU with stored DTC's "Logged Against" the module and NO lost communication DTC's stored in the offending module?

Yes >> Check for TSB related to this offending module.

No >> Go To 5

5. VERIFY INTERMITTENT LOST COMMUNICATION DTC – REPORTING MODULE

Turn the ignition on.



With the scan tool, select Network View and select Advanced.

Is there ONLY ONE ECU with stored DTC's "Logged Against" the module?

Yes >> Check for TSB related to the module that set this DTC.

No >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

*DIAGNOSTIC CAN C (+) AND/OR DIAGNOSTIC CAN C (-) CIRCUITS HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the TIPM.
- **Set Condition:**
  The scan tool has detected a shorted high condition on either or both Diagnostic CAN C circuits.

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO VOLTAGE
(D71) DIAGNOSTIC CAN C (-) CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

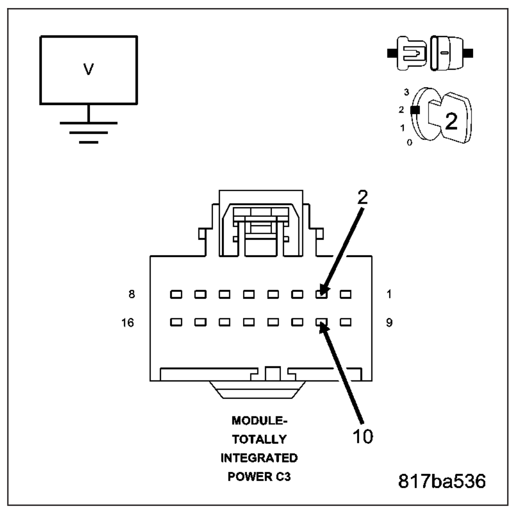
Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. DIAGNOSTIC CAN C CIRCUITS SHORTED TO VOLTAGE



Turn the ignition off.

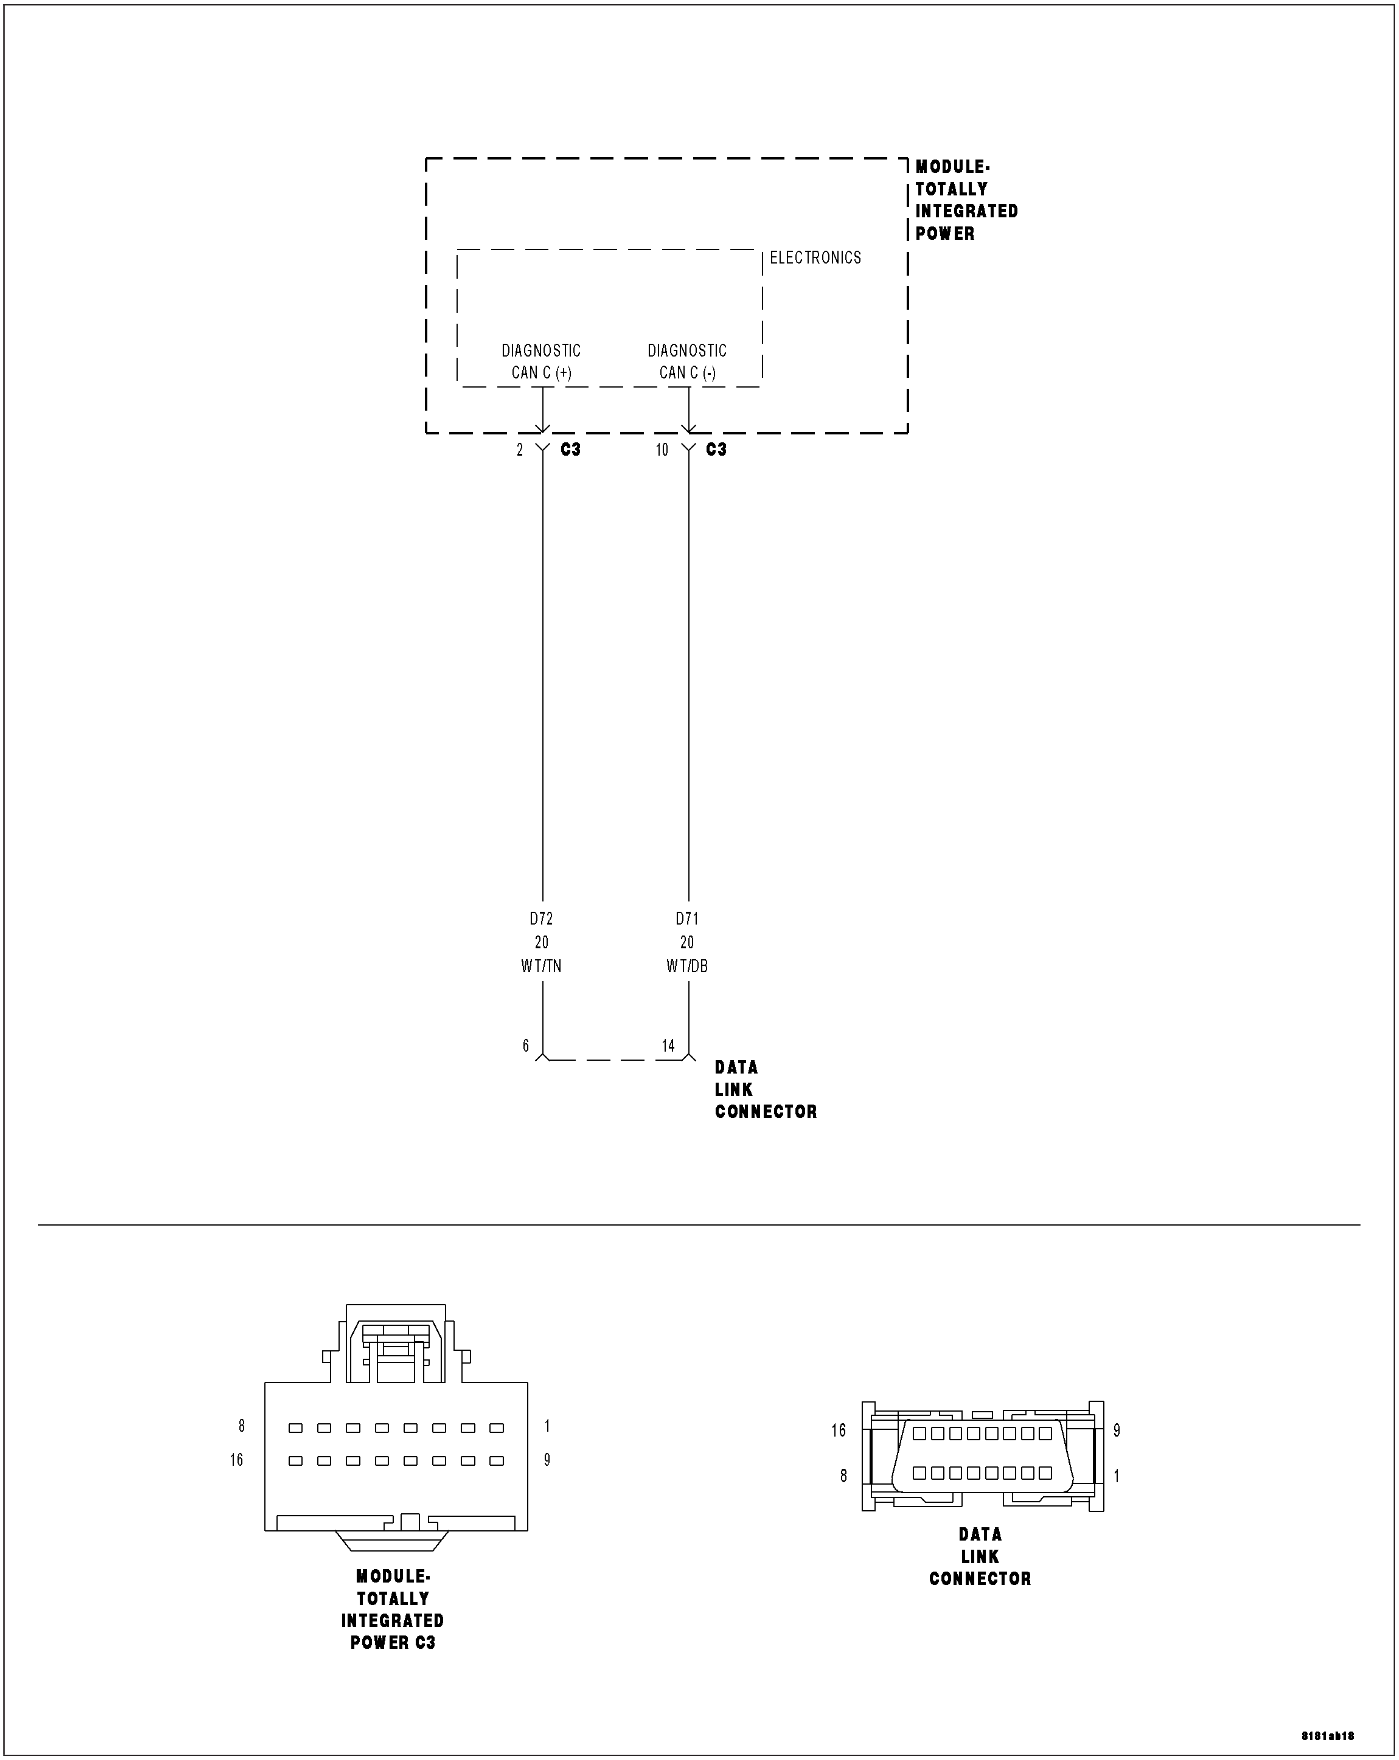
Disconnect the Totally Integrated Power Module (TIPM) C3 harness connector.

Disconnect the scan tool from the DLC.

Turn the ignition on.

Measure the voltage of the Diagnostic CAN C circuits at the TIPM C3 harness connector.

Is the voltage above 6.0 volts on either circuit?



Yes >> Repair the Diagnostic CAN C circuits for a short to voltage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*DIAGNOSTIC CAN C (+) SHORTED TO DIAGNOSTIC CAN C (-)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the TIPM.
- **Set Condition:**
  The scan tool has detected a shorted together condition on the Diagnostic CAN C circuits.

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO (D71) DIAGNOSTIC CAN C (-) CIRCUIT
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

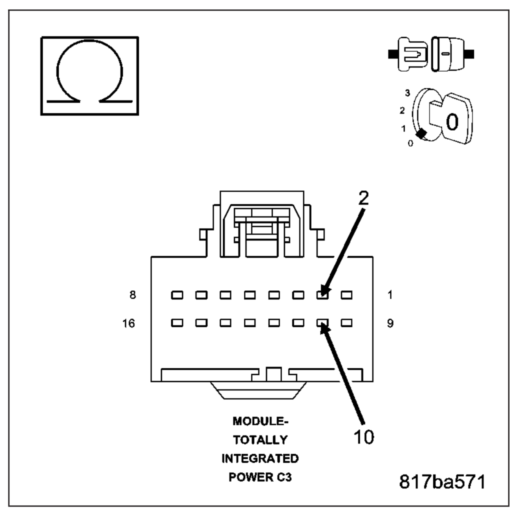
Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.



2. (D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO (D71) DIAGNOSTIC CAN C (-) CIRCUIT

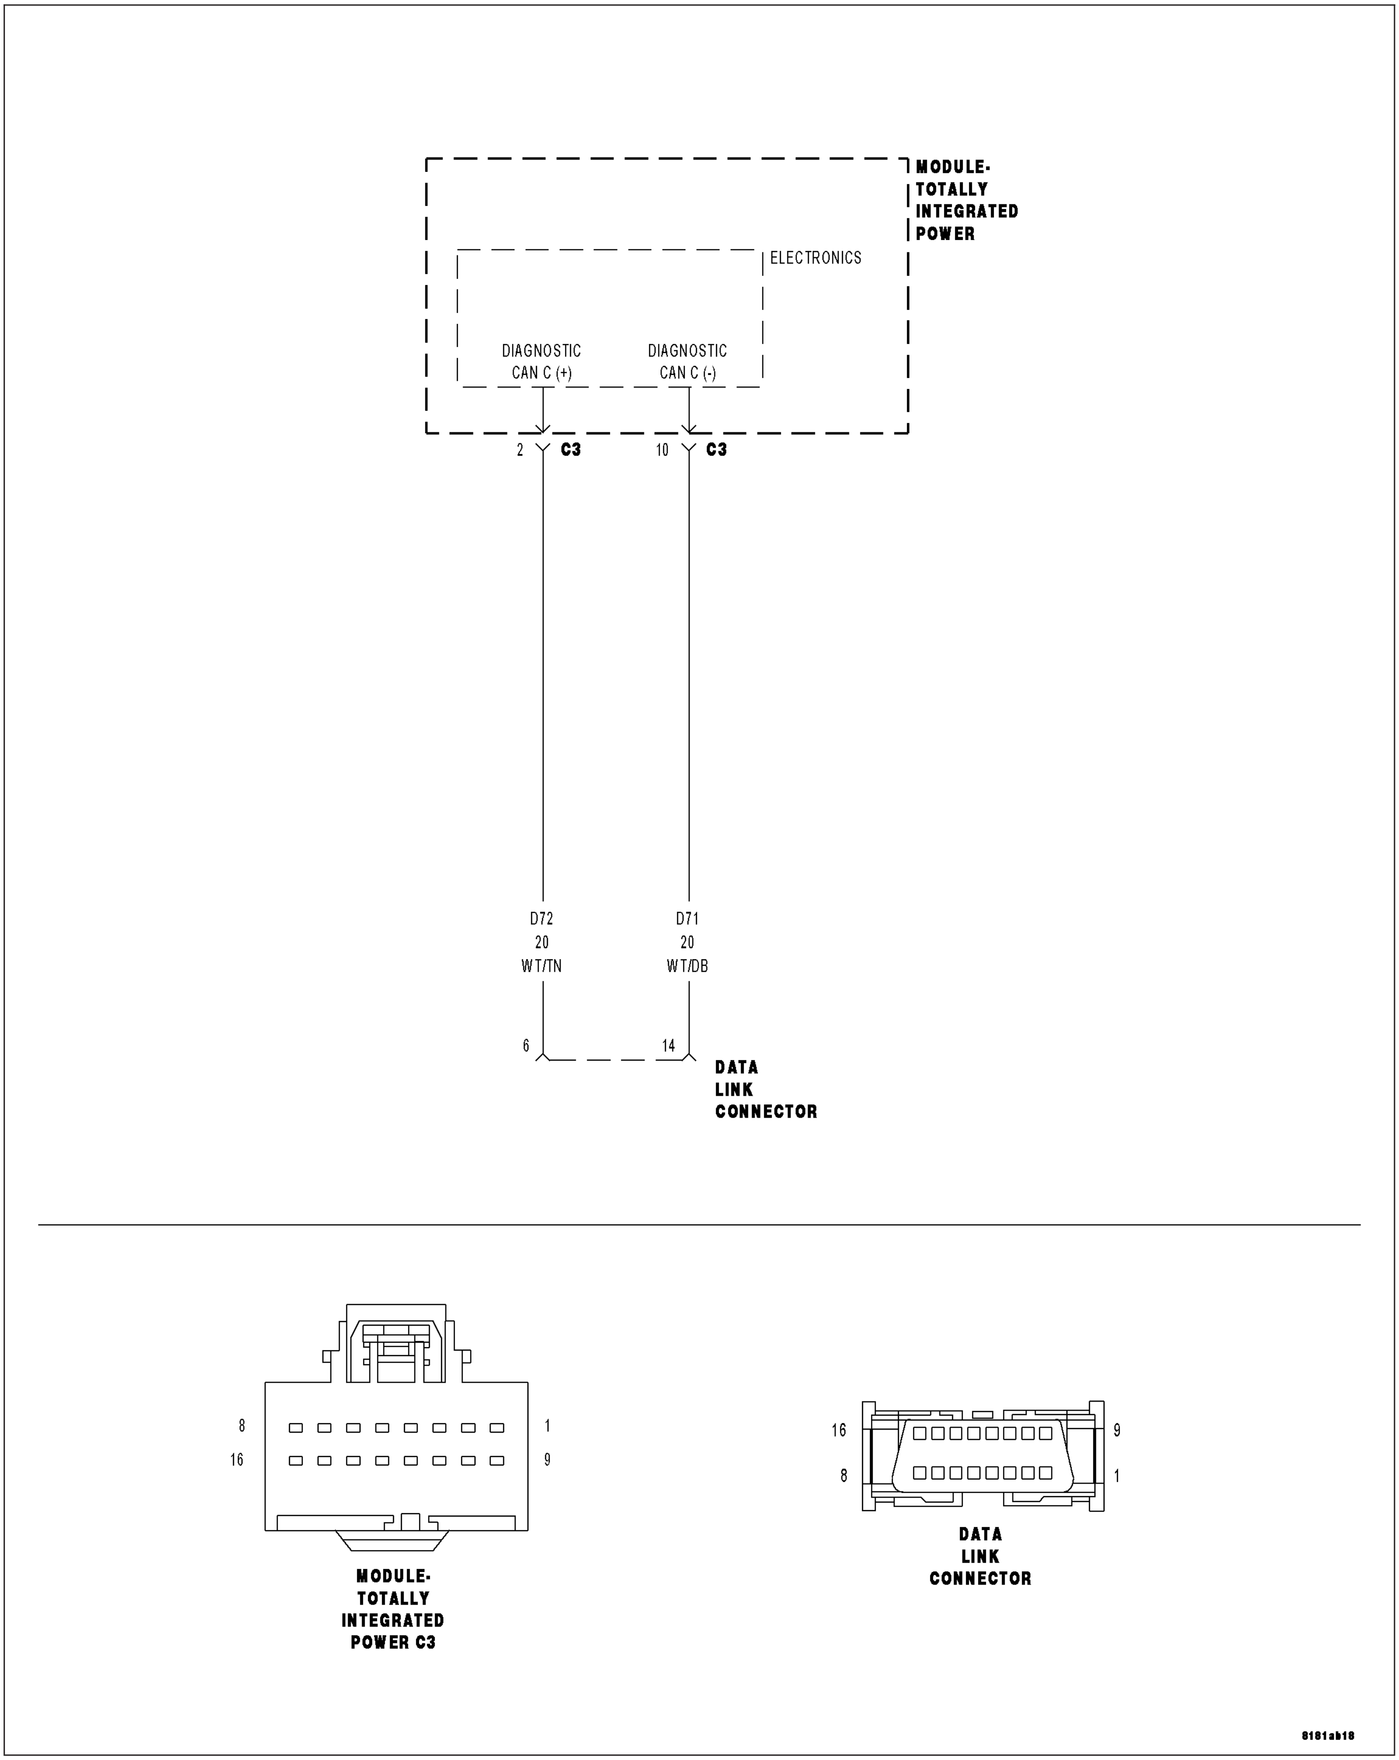
Turn the ignition off.

Disconnect the Totally Integrated Power Module (TIPM) C3 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between the (D72) Diagnostic CAN C (+) circuit and the (D71) Diagnostic CAN C (-) circuit at the TIPM C3 harness connector.

Is the resistance below 100.0 ohms?



Yes >> Repair the (D72) Diagnostic CAN C (+) circuit for a short to the (D71) Diagnostic CAN C (-) circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*DIAGNOSTIC CAN C (+) CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the TIPM.
- **Set Condition:**
  The scan tool has detected a shorted low condition on the (D72) Diagnostic CAN C (+) circuit.

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

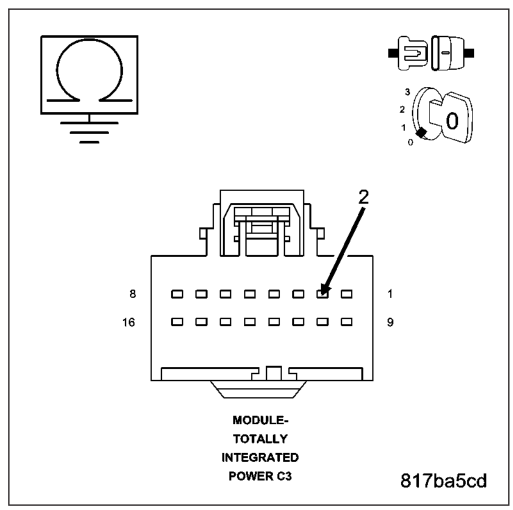
Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.



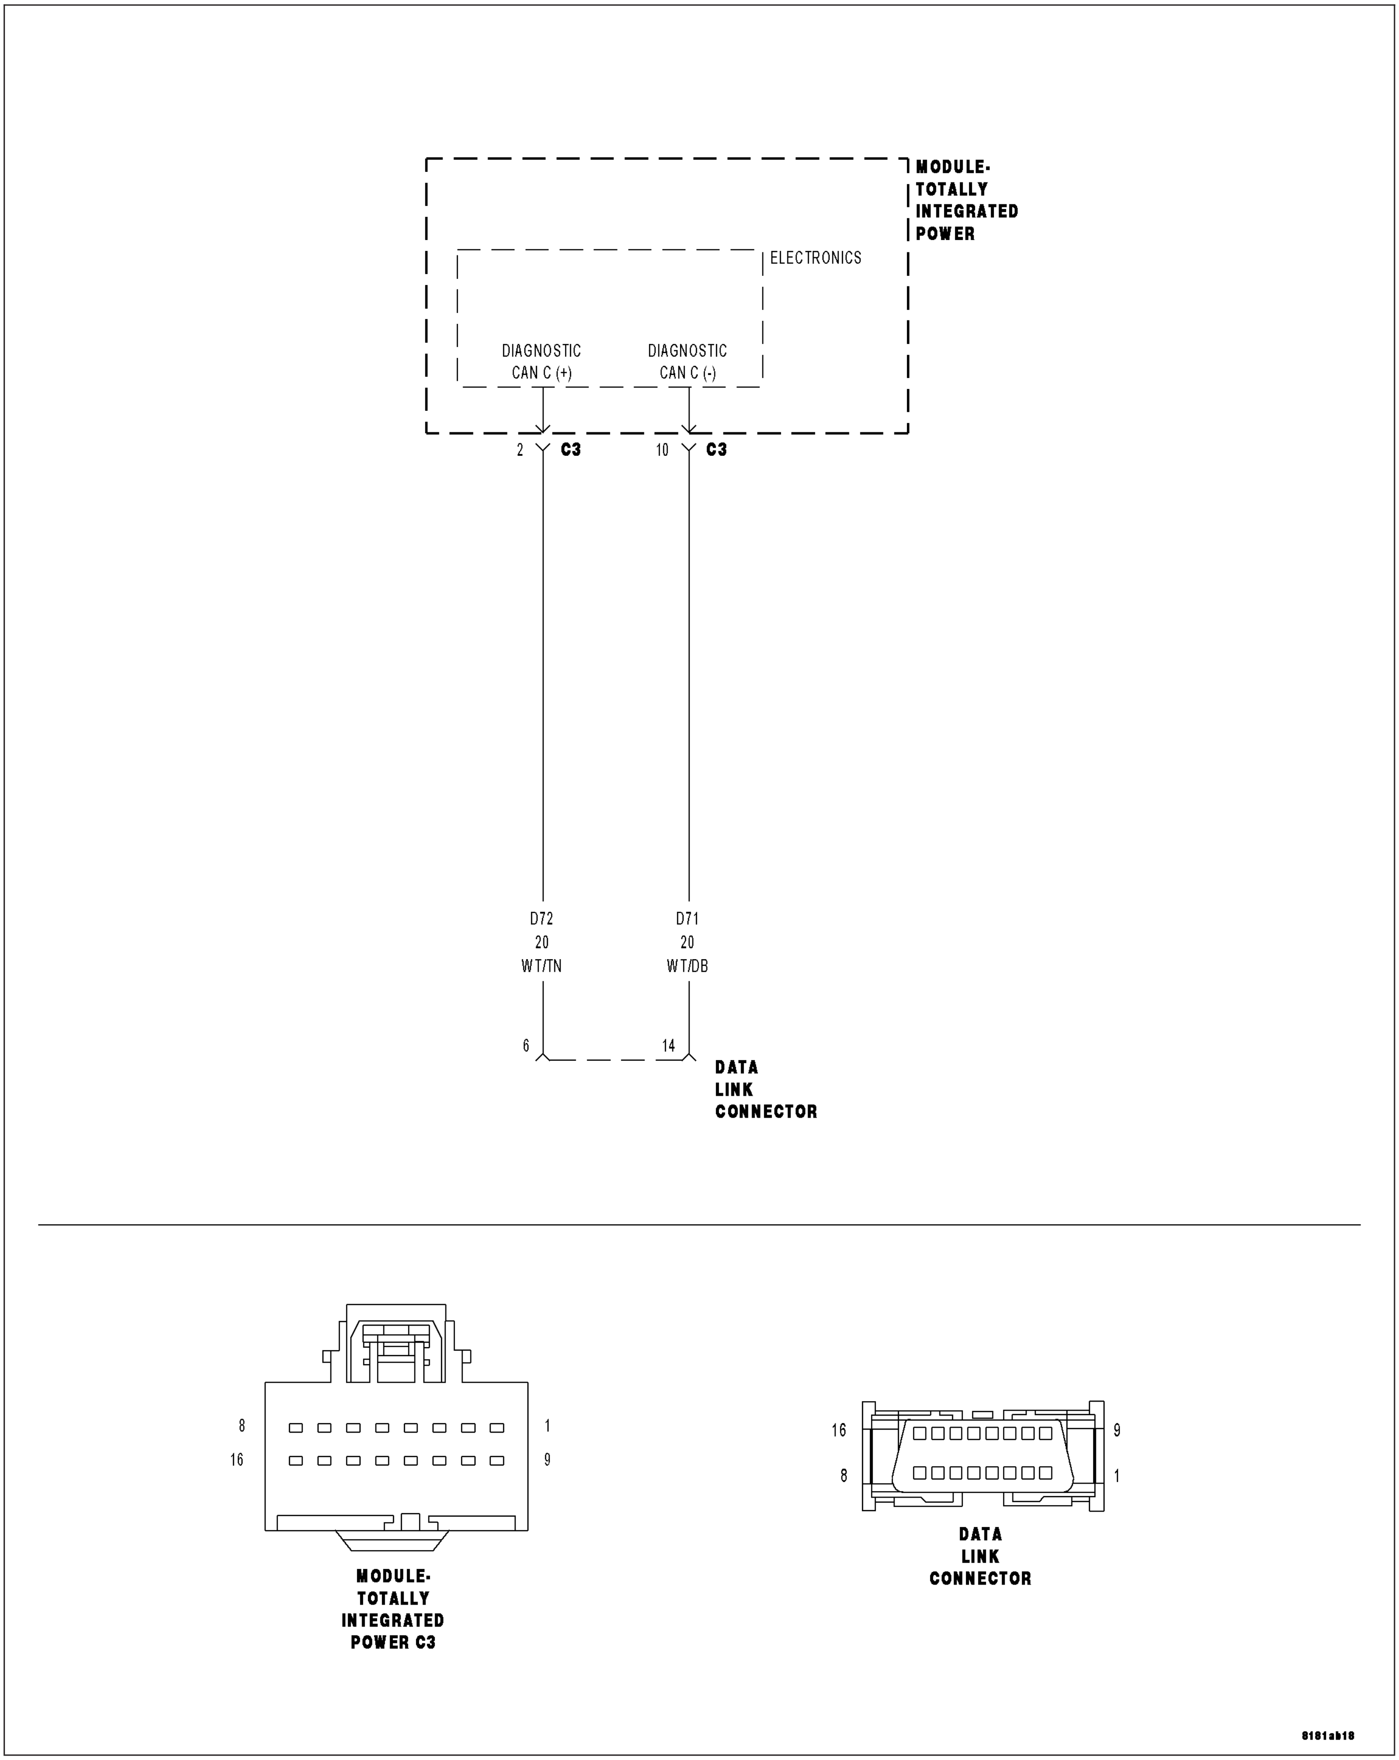
2. (D72) DIAGNOSTIC CAN C (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Totally Integrated Power Module (TIPM) C3 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between ground and the (D72) Diagnostic CAN C (+) circuit at the TIPM C3 harness connector.



Is the resistance below 100.0 ohms?

Yes >> Repair the (D72) Diagnostic CAN C (+) circuit for a short to ground.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*DIAGNOSTIC CAN C (-) CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the TIPM.
- **Set Condition:**
  The scan tool has detected a shorted low condition on the (D71) Diagnostic CAN C (-) circuit.

Possible Causes
(D71) DIAGNOSTIC CAN C (-) CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

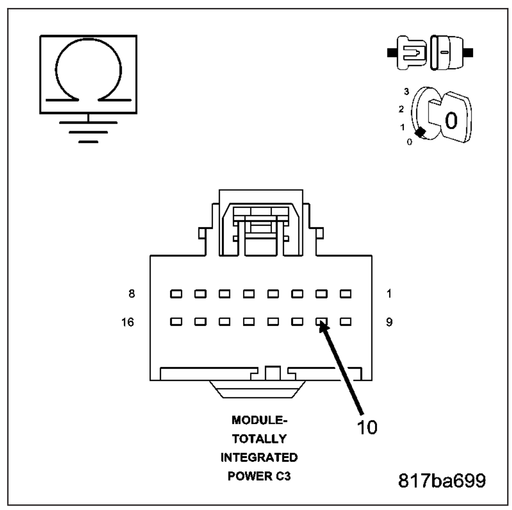
Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.



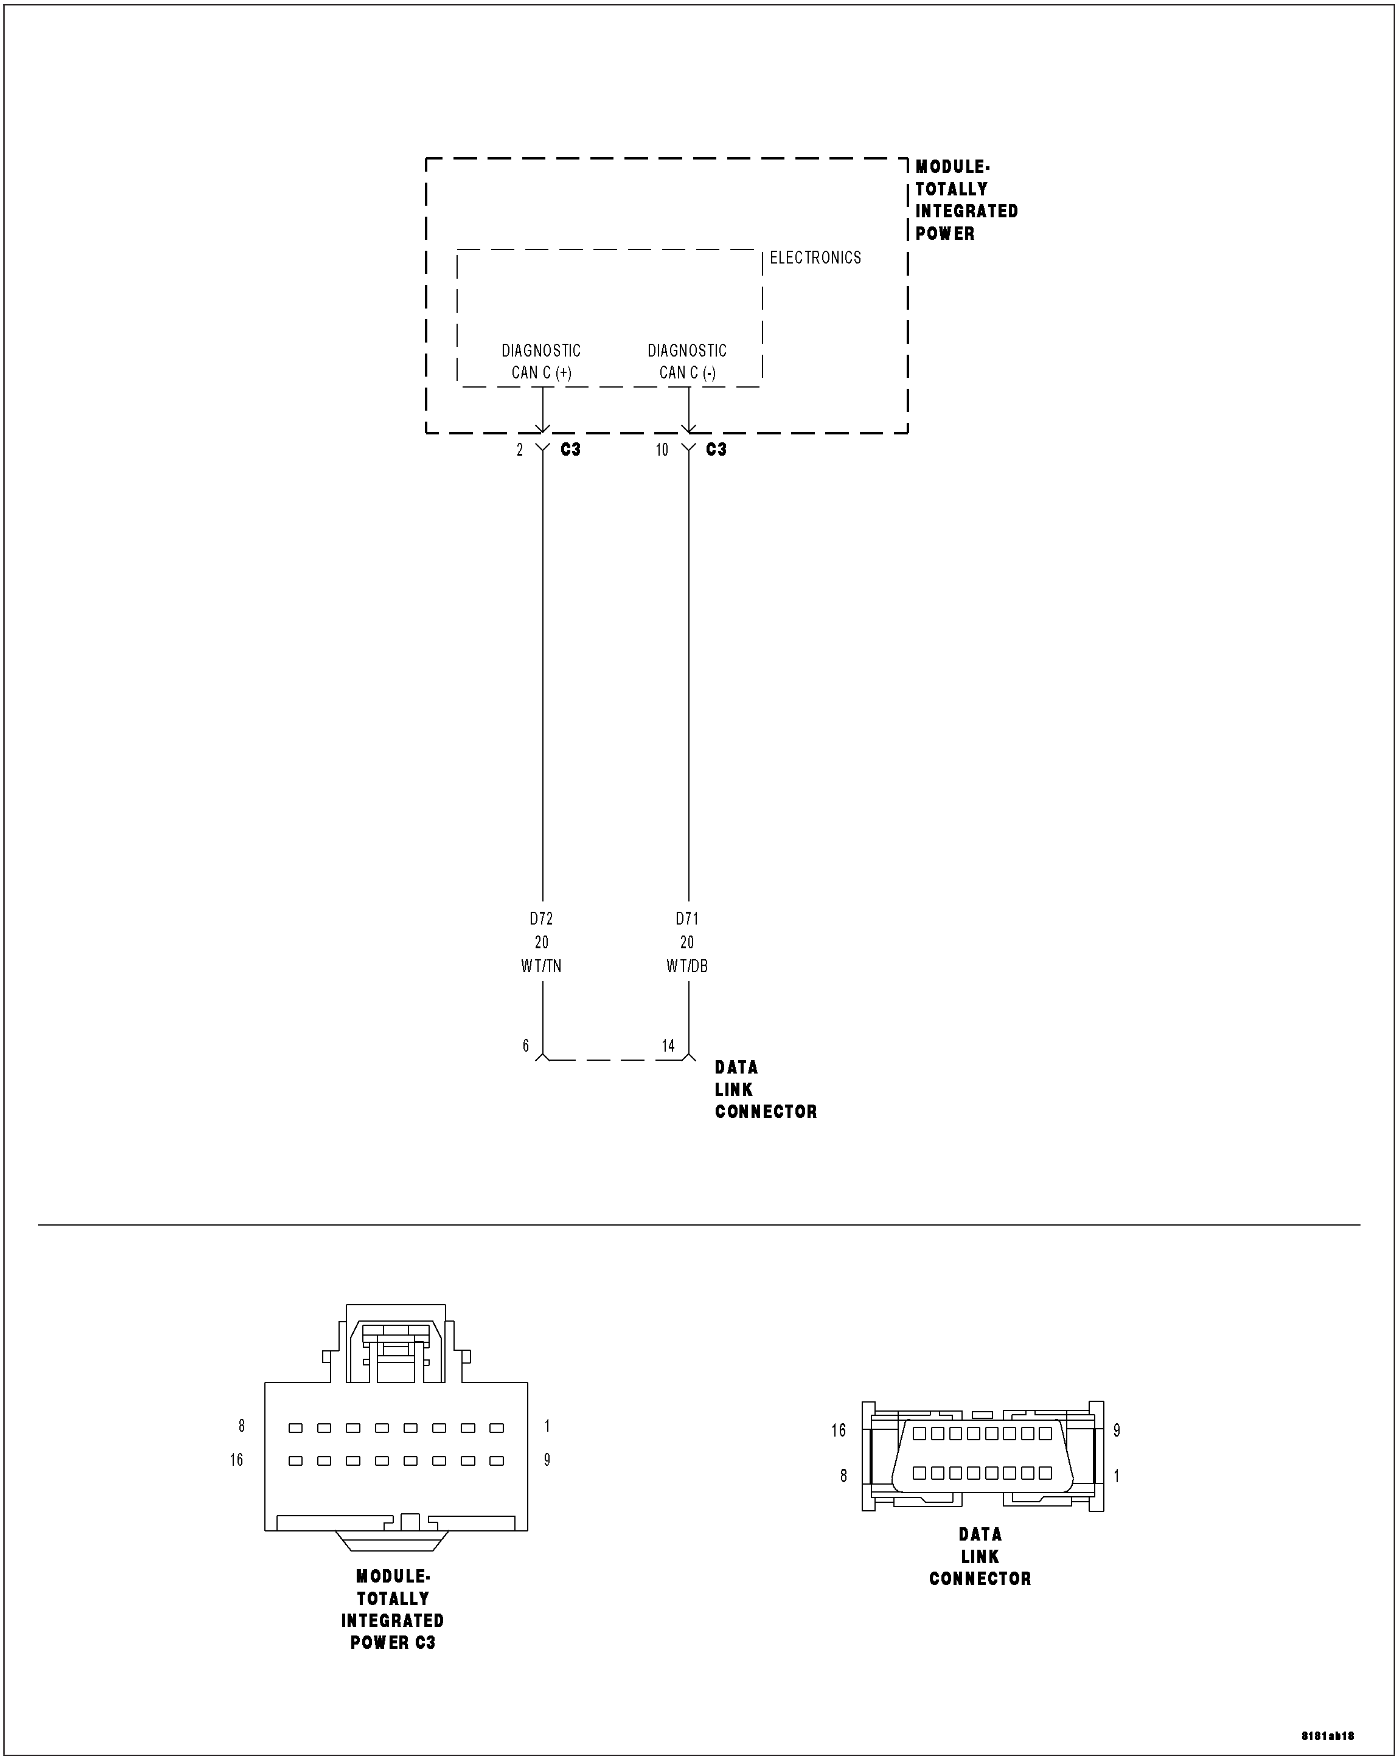
2. (D71) DIAGNOSTIC CAN C (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Totally Integrated Power Module (TIPM) C3 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between ground and the (D71) Diagnostic CAN C (-) circuit at the TIPM C3 harness connector.



Is the resistance below 100.0 ohms?

Yes >> Repair the (D71) Diagnostic CAN C (-) circuit for a short to ground.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*DIAGNOSTIC CAN C (+) CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the TIPM.
- **Set Condition:**
  The scan tool has detected an open condition on the (D72) Diagnostic CAN C (+) circuit.

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

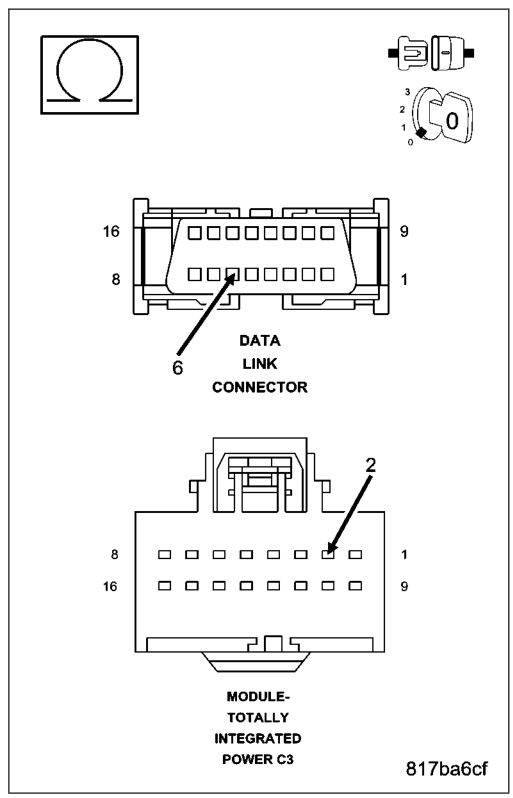
2. (D72) DIAGNOSTIC CAN C (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Totally Integrated Power Module (TIPM) C3 harness connector.

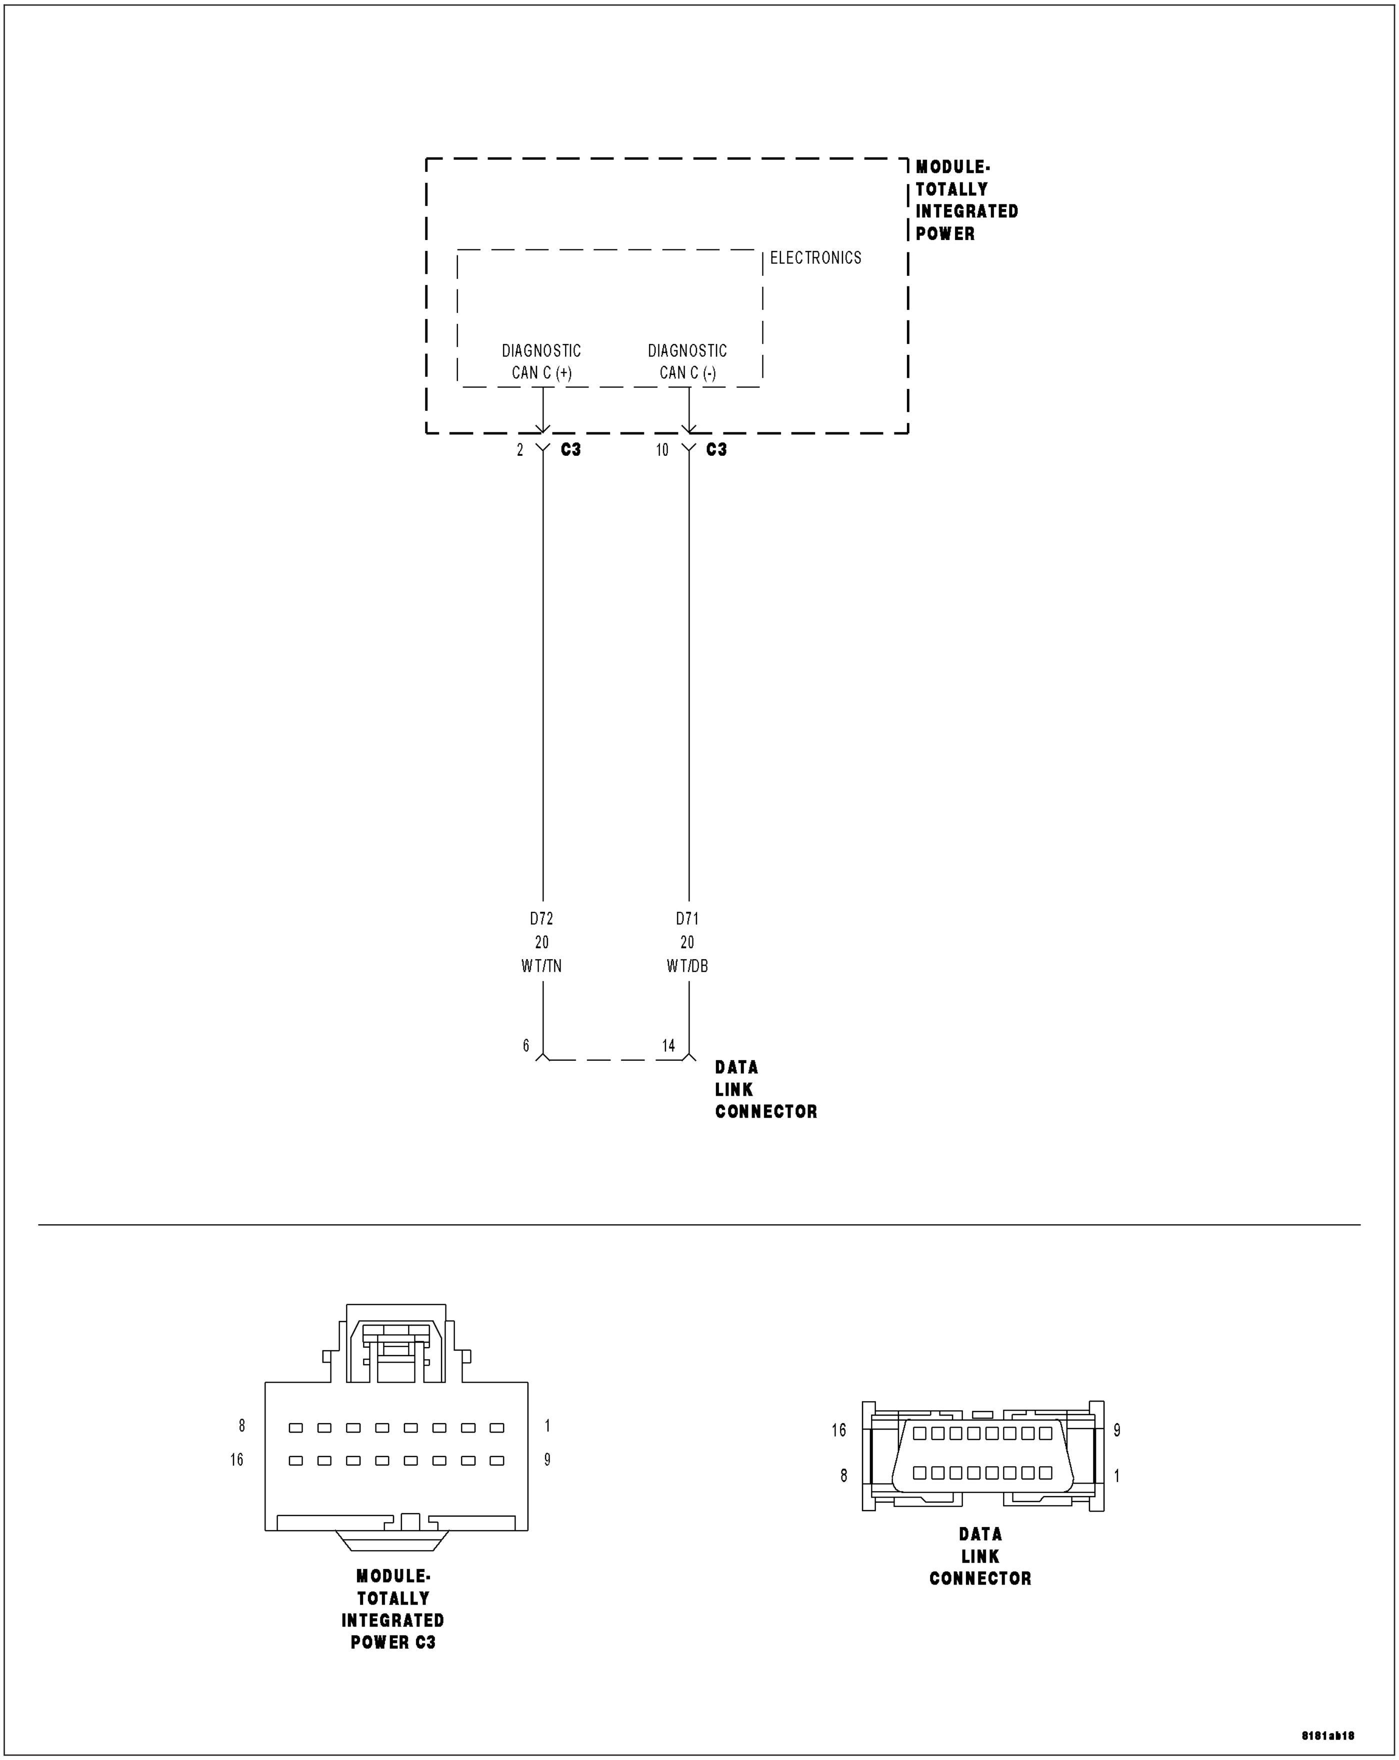
Disconnect the scan tool from the DLC.

Measure the resistance of the (D72) Diagnostic CAN C (+) circuit between the TIPM C3 harness connector and the DLC.



Is the resistance below 5.0 ohms?

Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.



Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D72) Diagnostic CAN C (+) circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*DIAGNOSTIC CAN C (-) CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the TIPM.
- **Set Condition:**
  The scan tool has detected an open condition on the (D71) Diagnostic CAN C (-) circuit.

Possible Causes
(D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

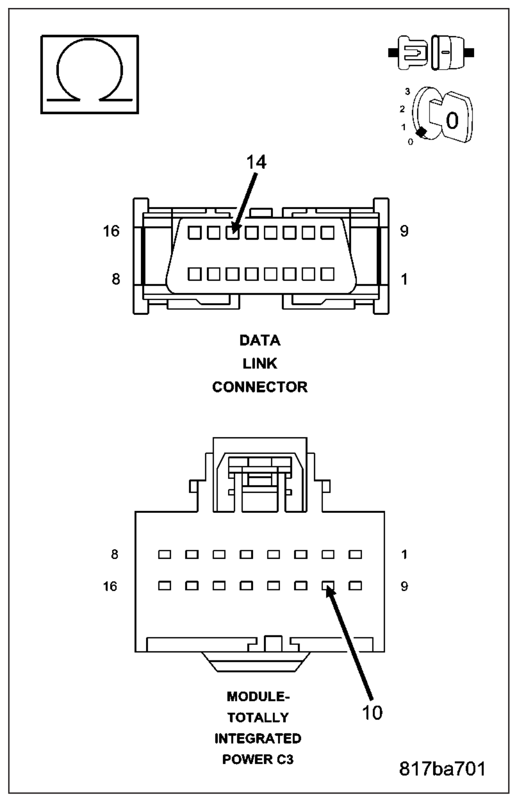
Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.



2. (D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN

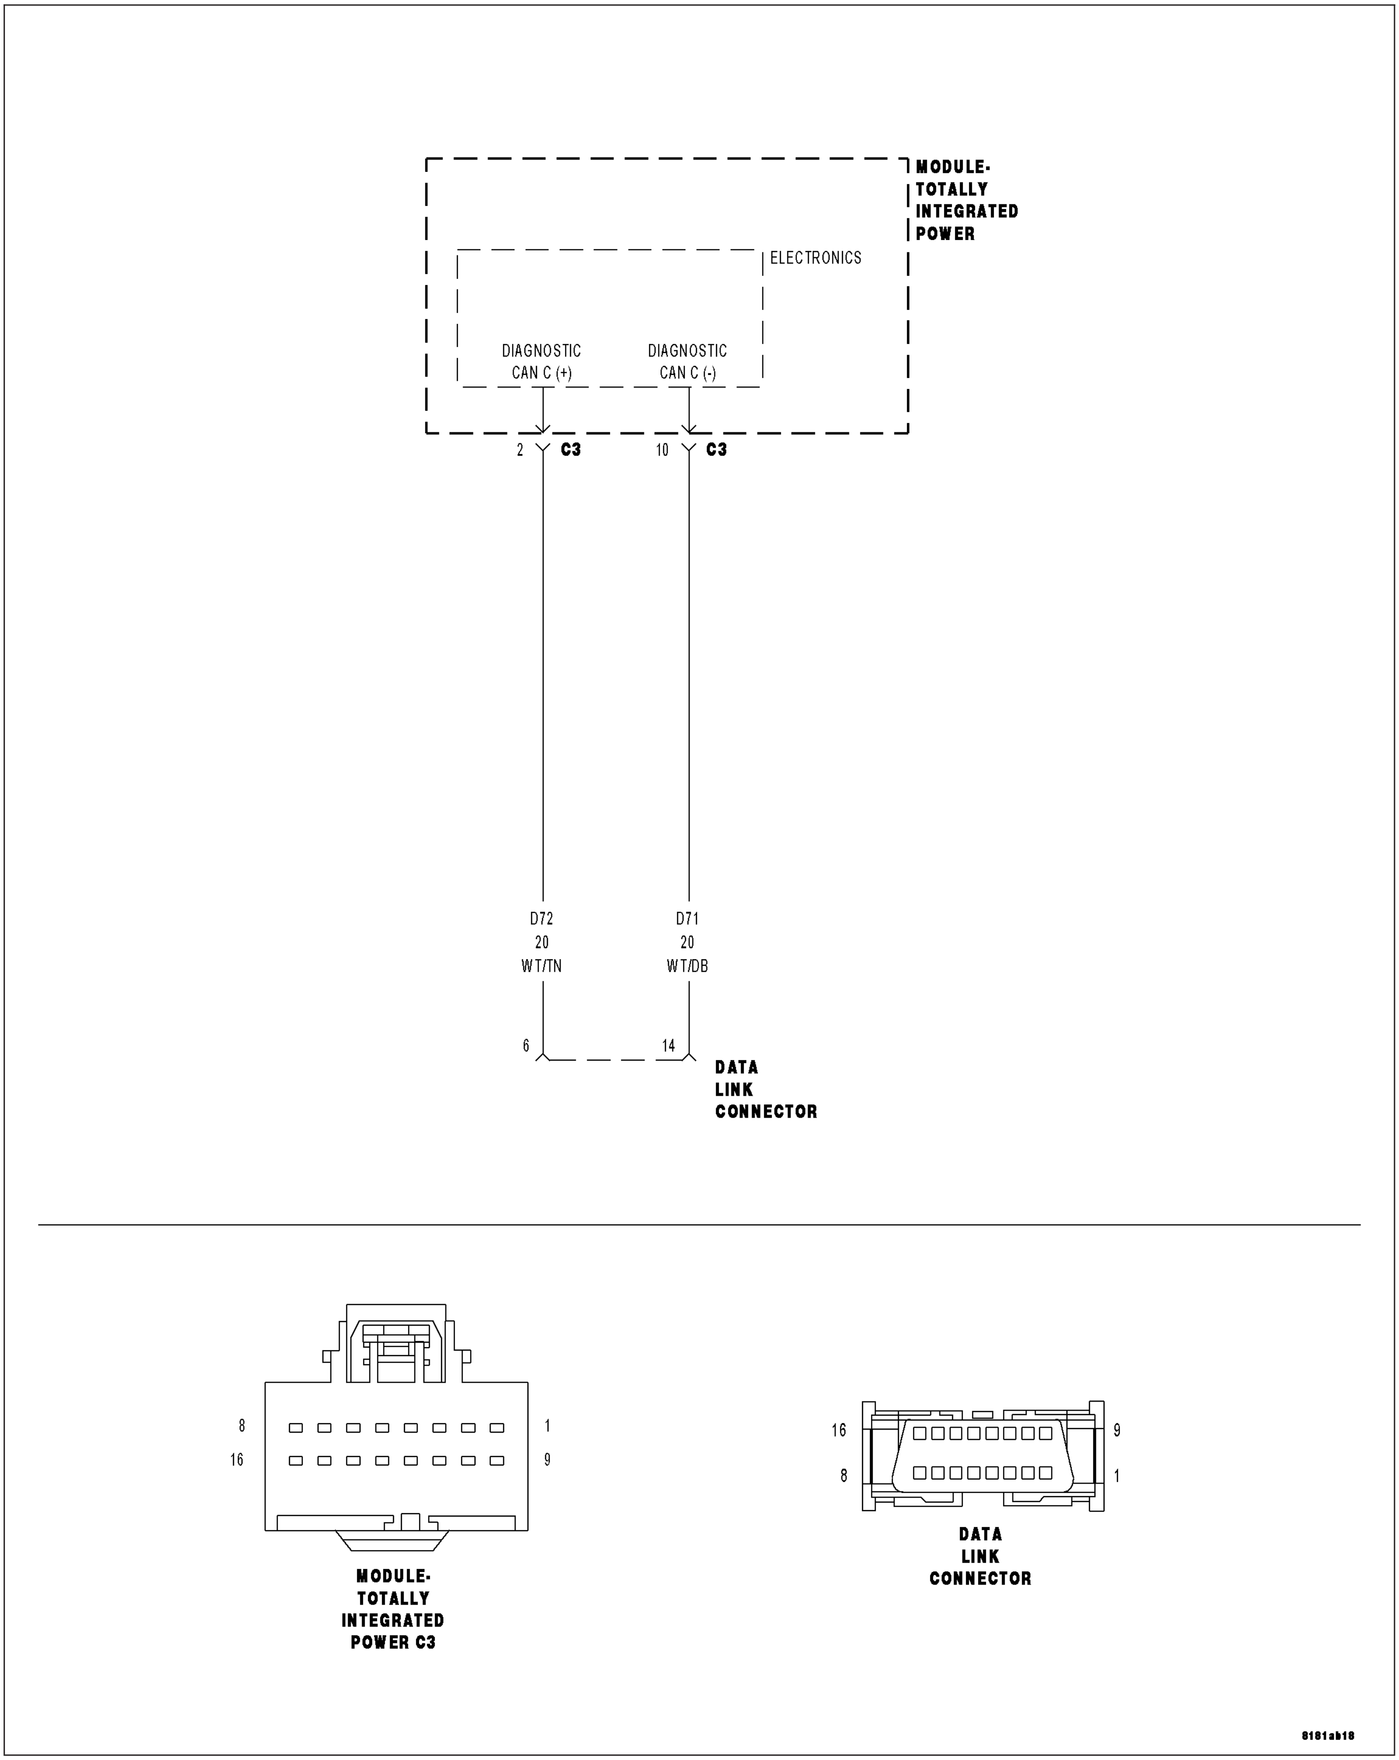
Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance of the (D71) Diagnostic CAN C (-) circuit between the TIPM C3 harness connector and the DLC.

Is the resistance below 5.0 ohms?



Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D71) Diagnostic CAN C (-) circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*BOTH DIAGNOSTIC CAN C (+) AND DIAGNOSTIC CAN C (-) CIRCUITS OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the TIPM.
- **Set Condition:**
  The scan tool has detected an open condition on both Diagnostic CAN C circuits.

Possible Causes
(D72) DIAGNOSTIC CAN C (+) CIRCUIT OPEN
(D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

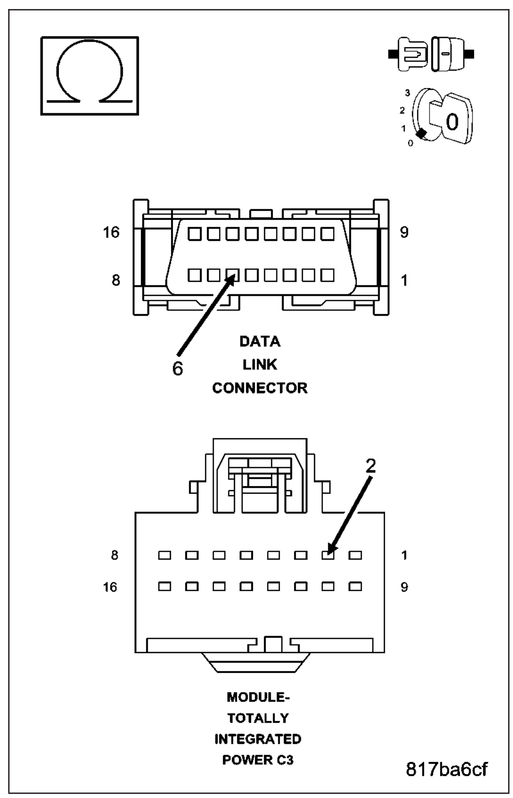
No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. (D72) CAN C DIAGNOSTIC (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

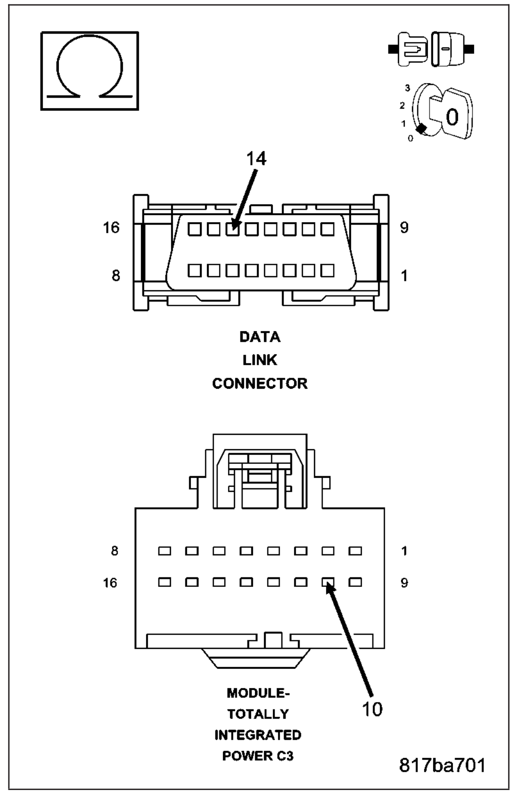
Disconnect the scan tool from the DLC.



NOTE: Check the connectors at both the DLC and the TIPM.

Measure the resistance of the (D72) Diagnostic CAN C (+) circuit between the TIPM connector and the DLC.

Is the resistance below 5.0 ohms?



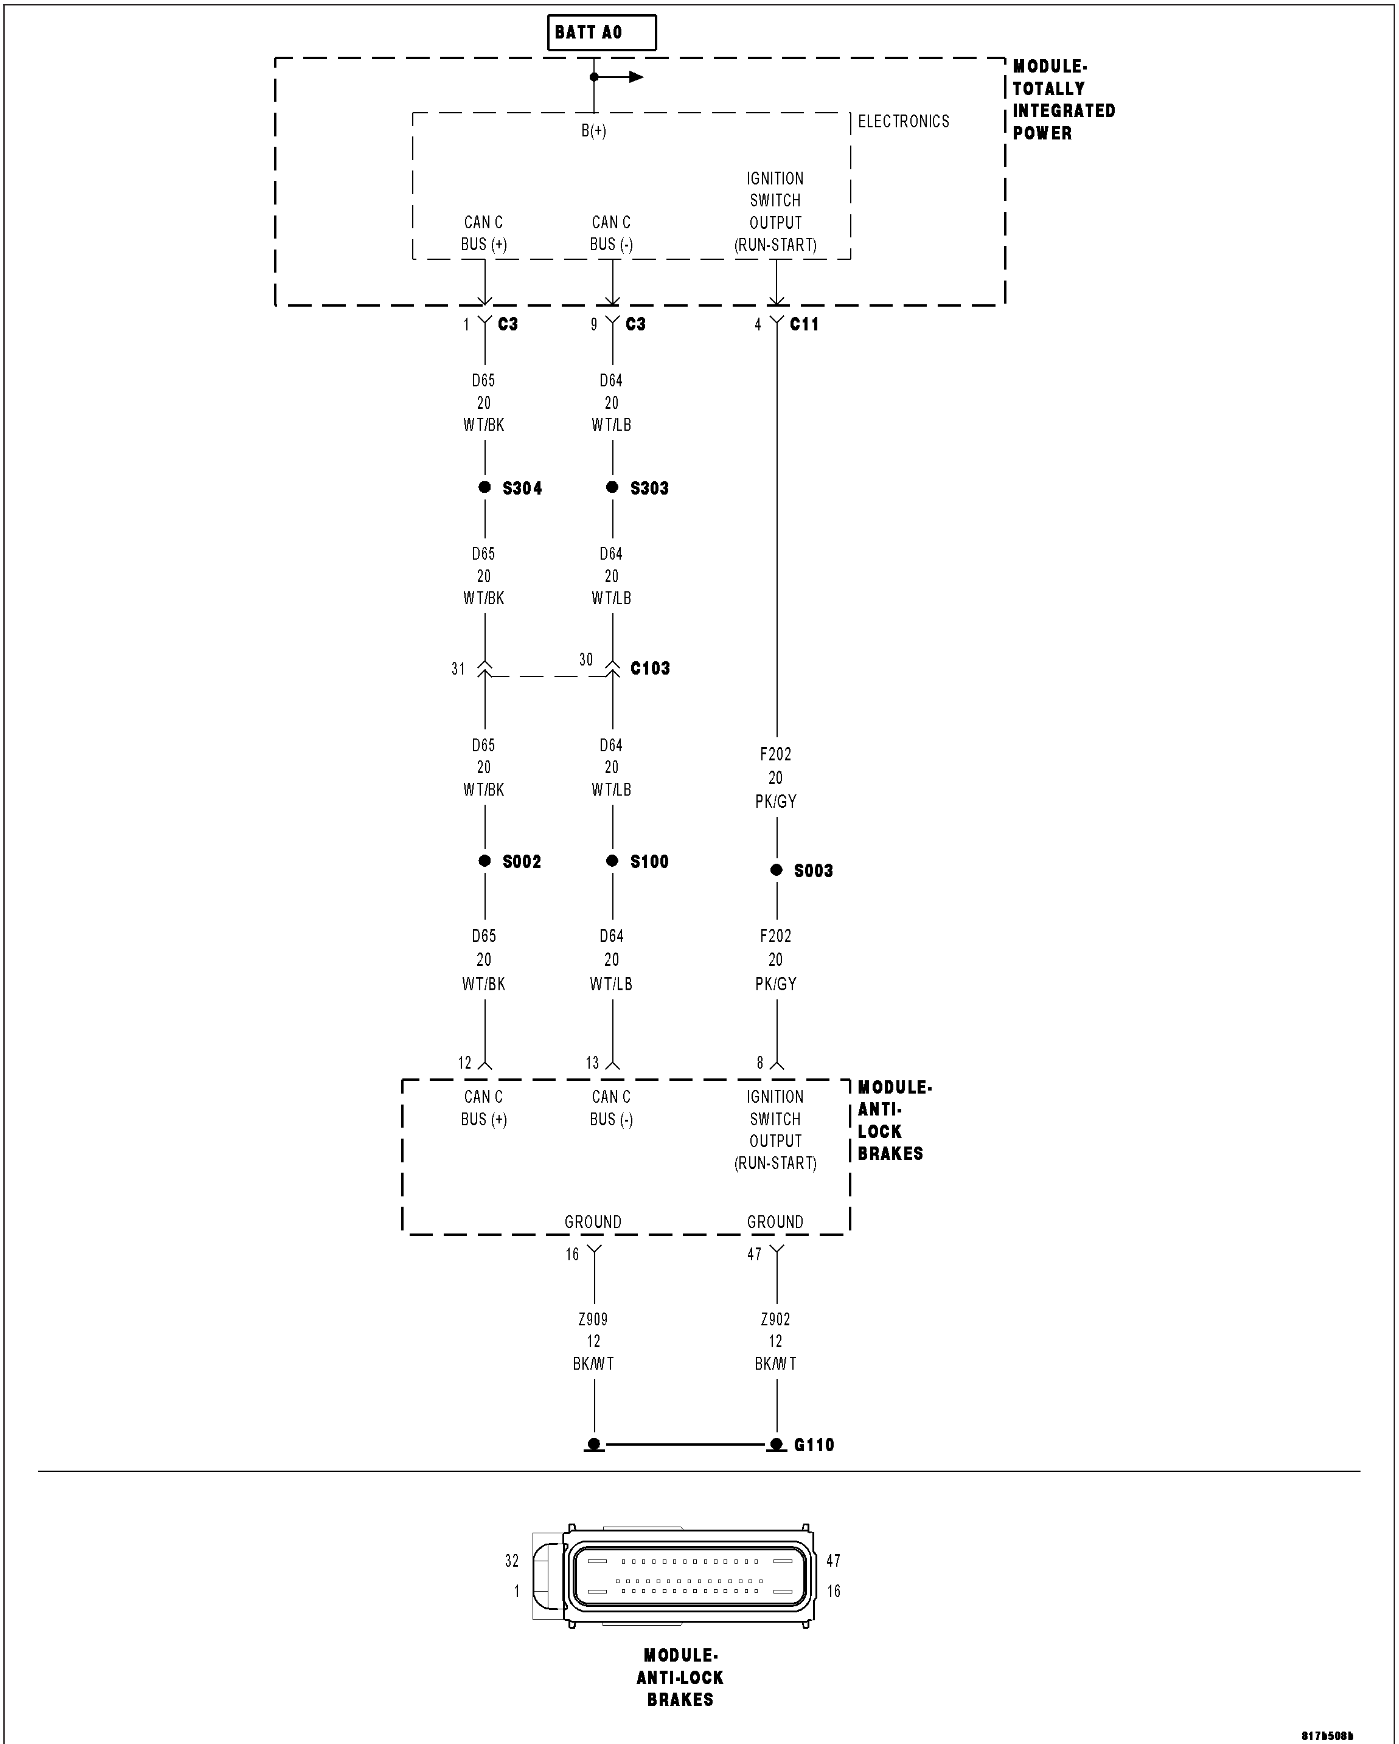
Yes >> Go To 3

No >> Repair the (D72) Diagnostic CAN C (+) circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN

Measure the resistance of the (D71) Diagnostic CAN C (-) circuit between the TIPM C3 harness connector and the DLC.

Is the resistance below 5.0 ohms?



Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D71) Diagnostic CAN C (-) circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(Z902) (Z909) GROUND CIRCUITS OPEN
(F202) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
ANTILOCK BRAKE MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

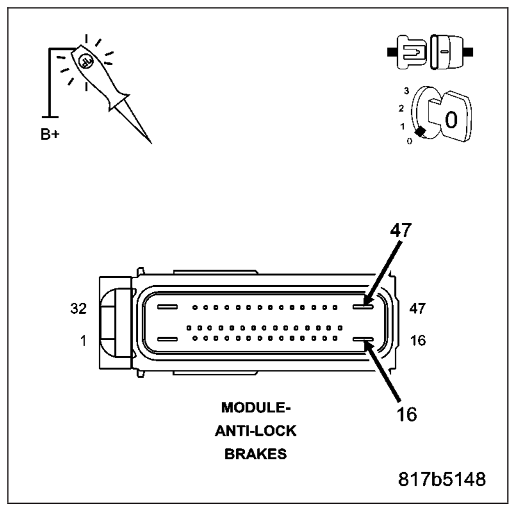
NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.



2. (Z902) (Z909) GROUND CIRCUITS OPEN

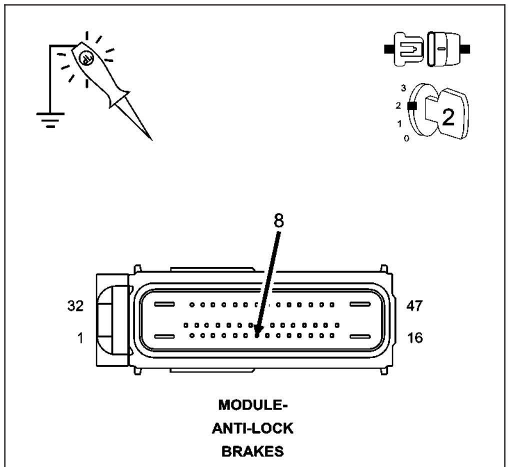
Using a 12-volt test light connected to 12-volts, check each (Z902) and (Z909) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 3

No >> Repair the (Z902) or (Z909) ground circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

3. (F202) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR SHORTED



Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Ignition Switch Output (Run-Start) circuit.

Does the test light illuminate brightly?

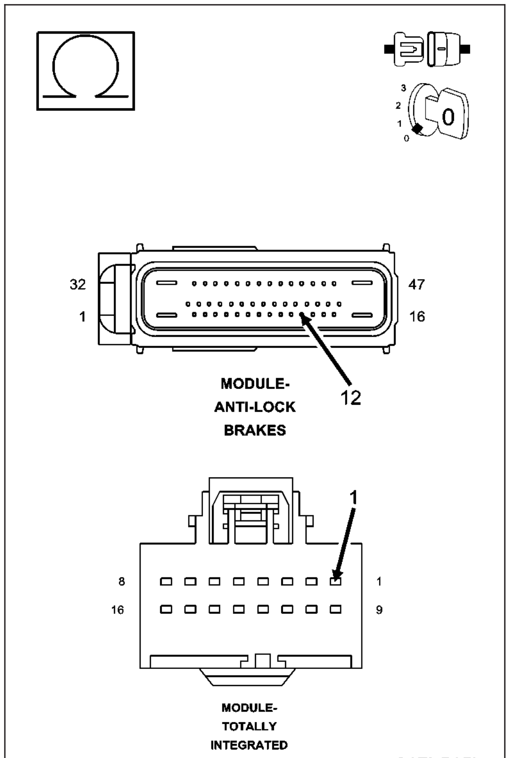
Yes >> Go To 4

No >> Repair the (F202) Ignition Switch Output (Run-Start) circuit for an open or short.
Perform ABS VERIFICATION TEST - VER 1.

817b5157

4. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

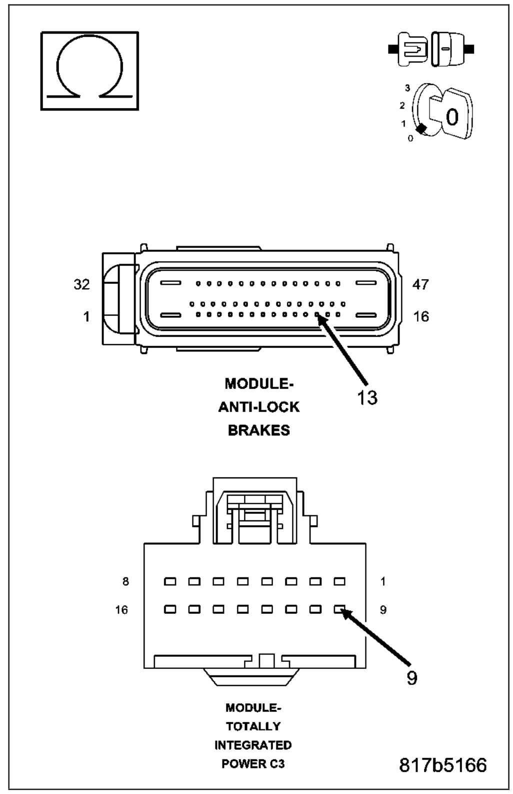


Disconnect the TIPM C3 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM connector and the Antilock Brake Module connector.

Is resistance below 5.0 ohms?

Yes >> Go To 5

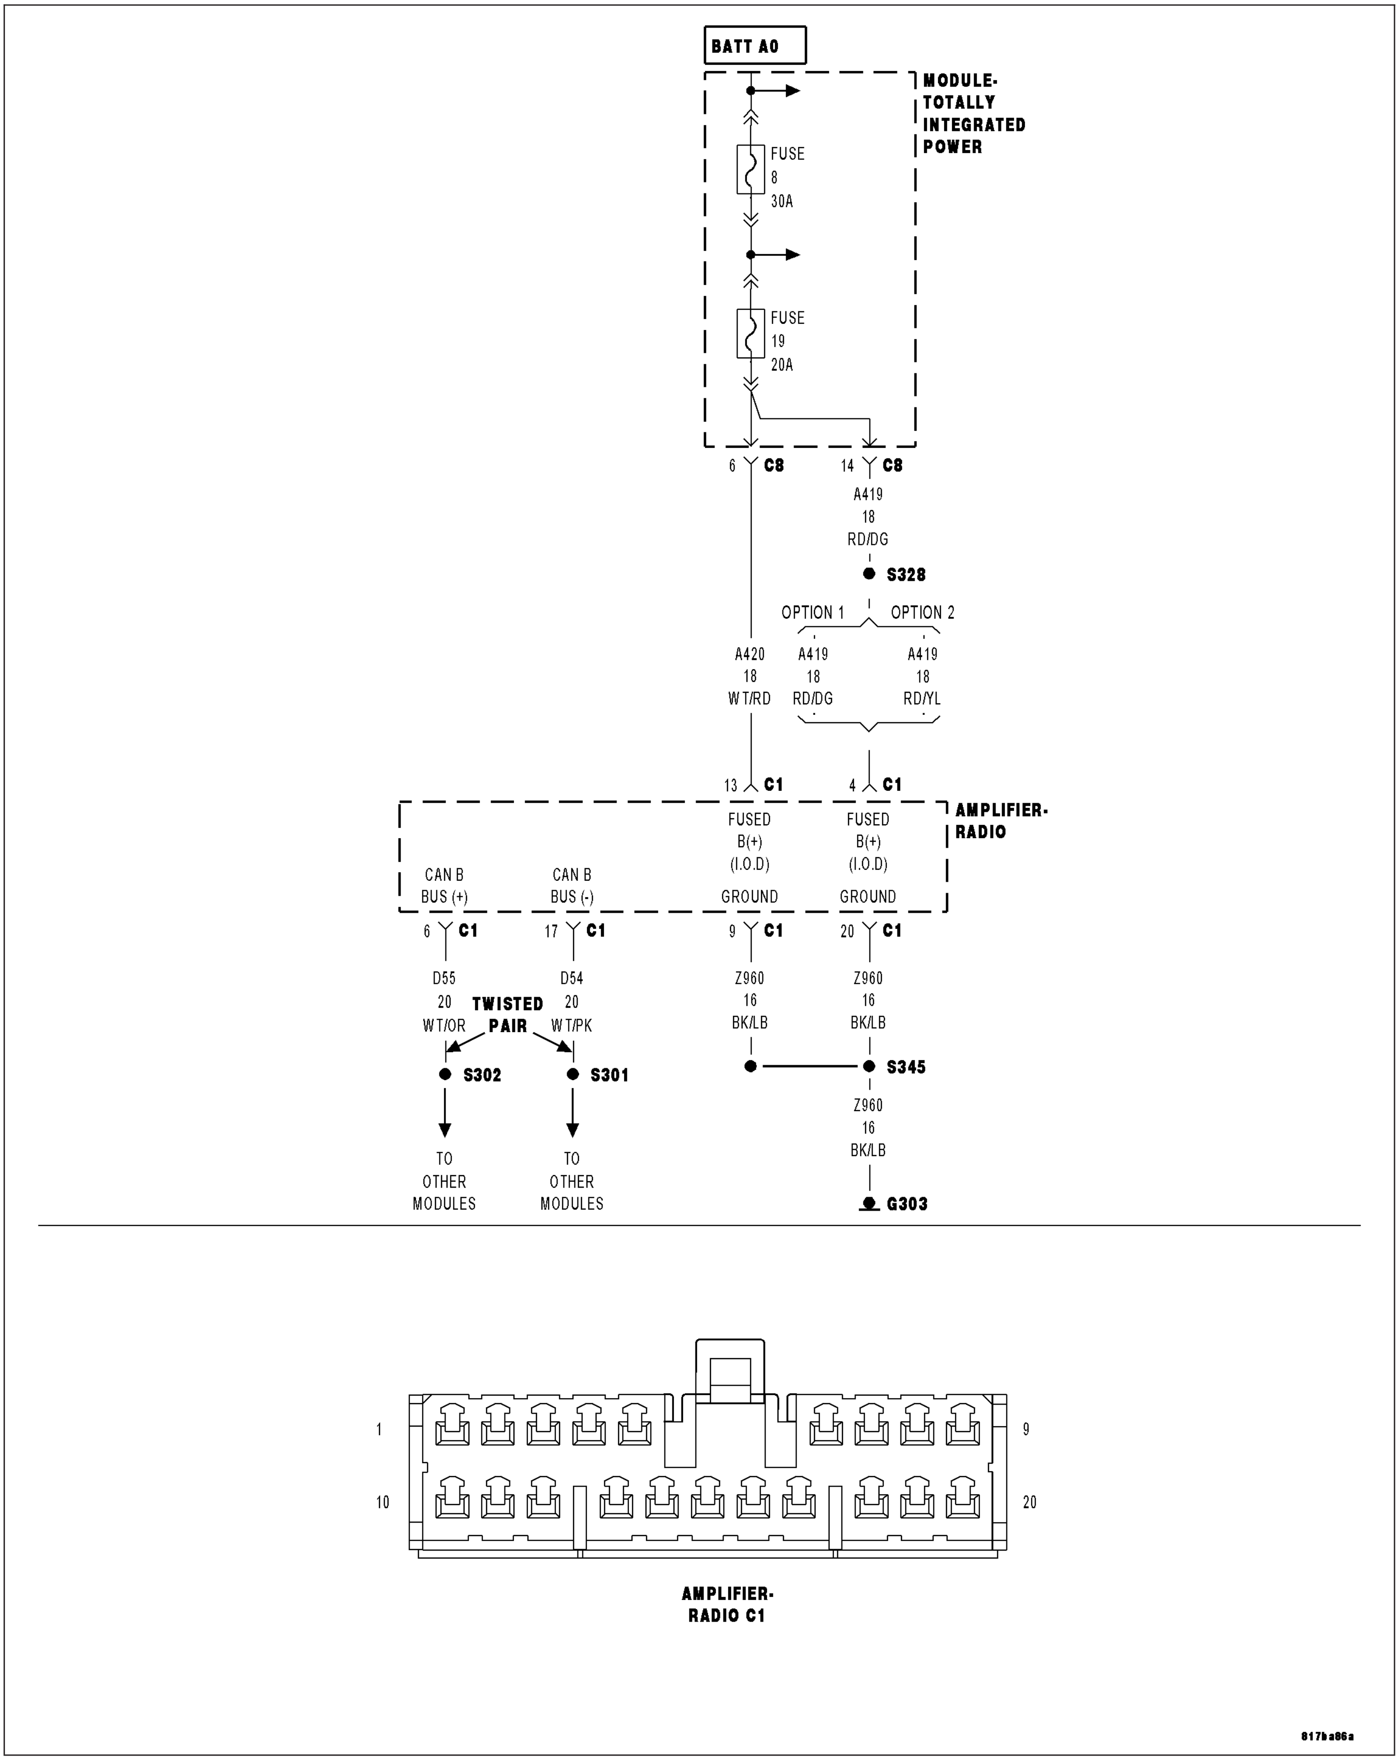


No >> Repair the (D65) CAN C Bus (+) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

817b515b

5. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM connector and the Antilock Brake Module connector.



Is resistance below 5.0 ohms?

Yes >> Replace the Antilock Brake Module in accordance with the service information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (D64) CAN C Bus (-) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

*NO RESPONSE FROM AMP (AMPLIFIER)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A419) (A420) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z960) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

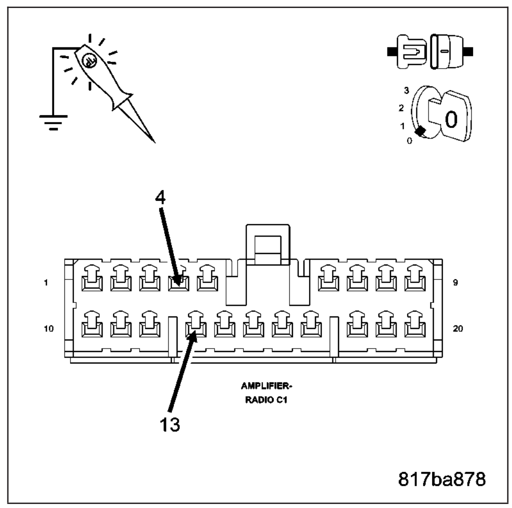
Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A419) (A420) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

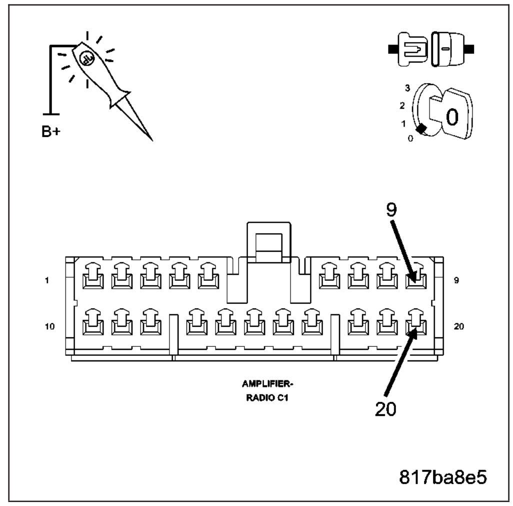
Disconnect the Radio Amplifier C1 harness connector.



Using a 12-volt test light connected to ground, check each (A419) and (A420) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 3



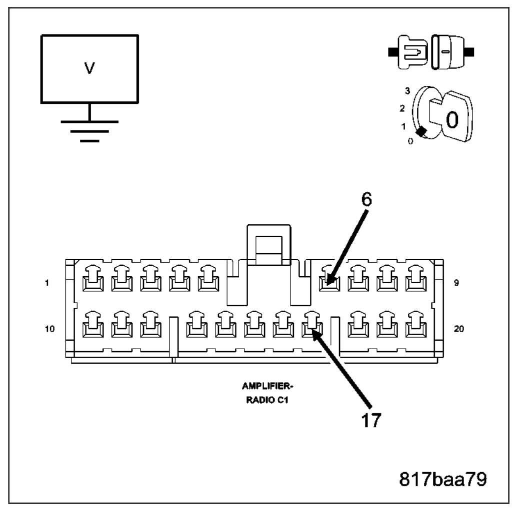
No >> Repair the (A419) or (A420) Fused B(+) circuit for an open or short.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (Z960) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z960) ground circuit.

Does the test light illuminate brightly for each circuit?



Yes >> Go To 4

No >> Repair the (Z960) ground circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

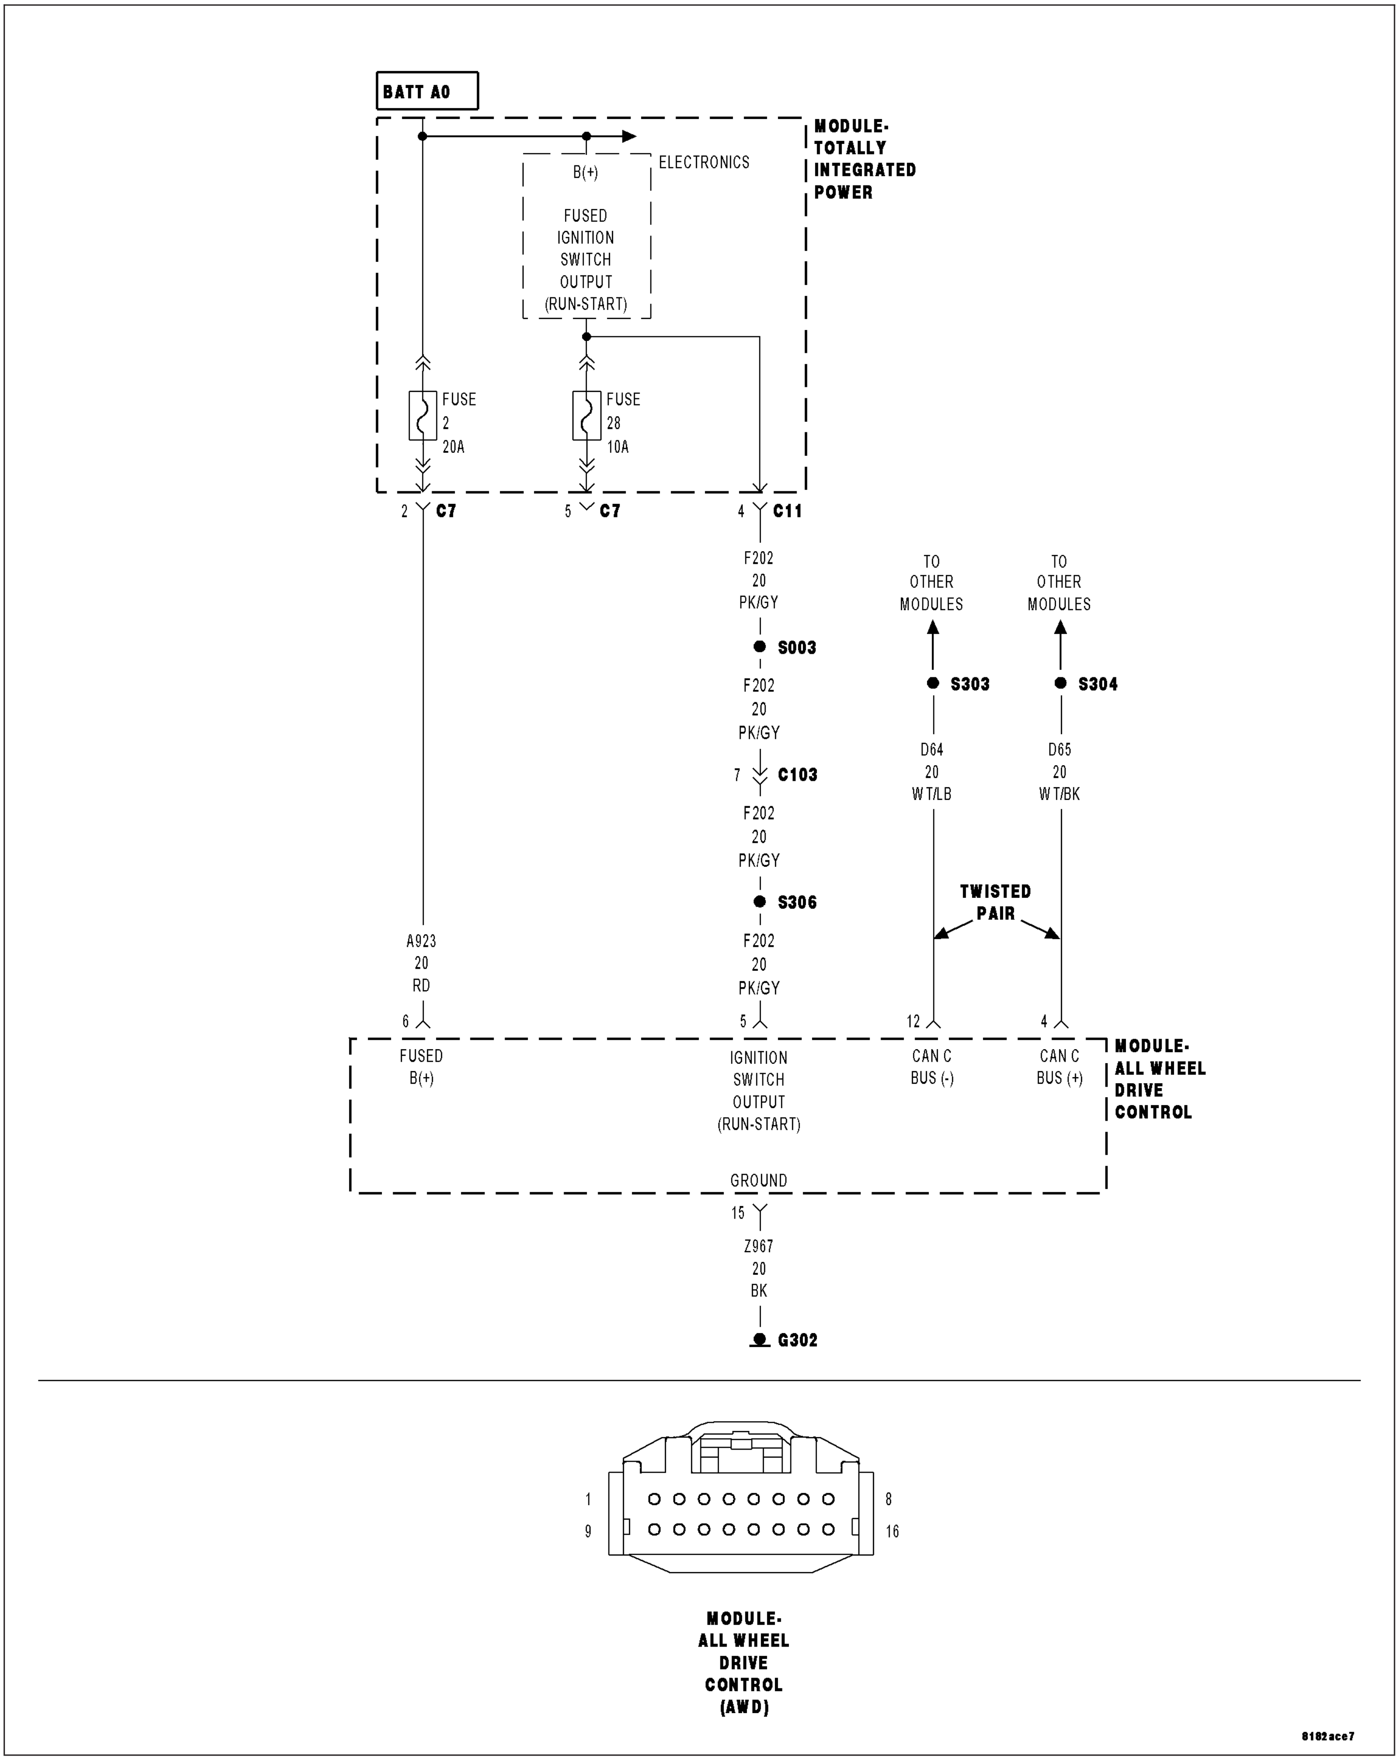
Turn the ignition on.

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?



Yes >> Replace the Radio Amplifier in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*NO RESPONSE FROM ALL WHEEL DRIVE CONTROL (AWD) MODULE

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(F202) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR SHORTED
(A923) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z967) GROUND CIRCUIT OPEN
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
ALL WHEEL DRIVE CONTROL (AWD) MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

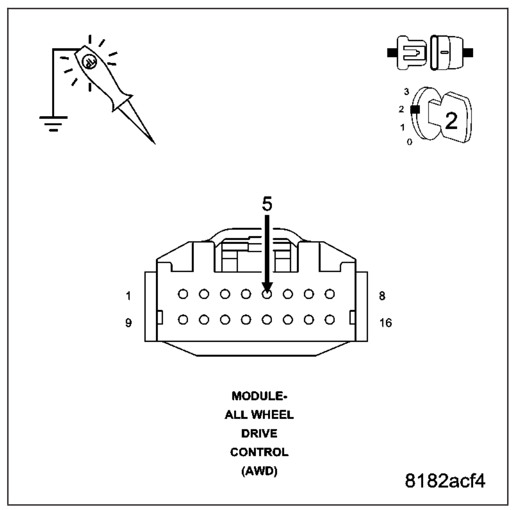
With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTC's, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2



No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

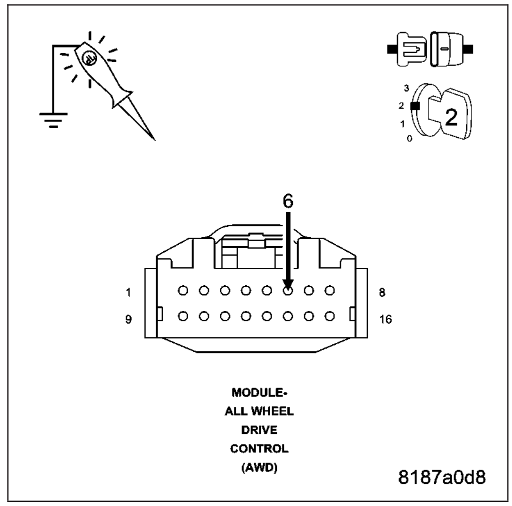
2. (F202) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Disconnect the AWD harness connector.

Using a 12-volt test light connected to ground, check the (F202) Ignition Switch Output (Run-Start) circuit.

Does the test light illuminate brightly?



Yes >> Go To 3

No >> Repair the (F202) Ignition Switch Output (Run-Start) circuit for an open or short.

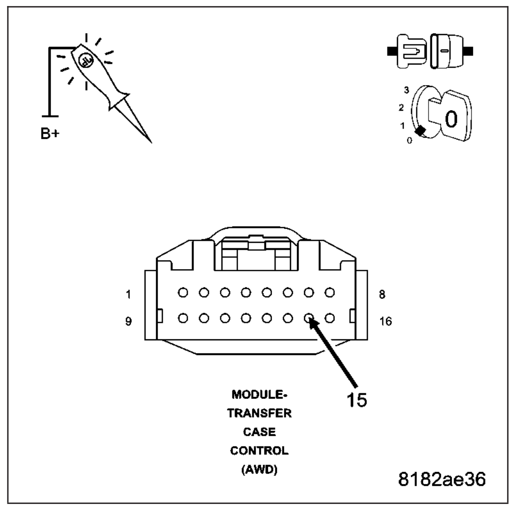
Perform the appropriate VERIFICATION TEST.

3. (A923) FUSED B(+) CIRCUIT OPEN OR SHORTED

Using a 12-volt test light connected to ground, check the (F202) Ignition Switch Output (Run-Start) circuit.

Does the test light illuminate brightly?

Yes >> Go To 4



No >> Repair the (F202) Ignition Switch Output (Run-Start) circuit for an open or short.

Perform the appropriate VERIFICATION TEST.

4. (Z967) GROUND CIRCUIT OPEN

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z967) ground circuit.

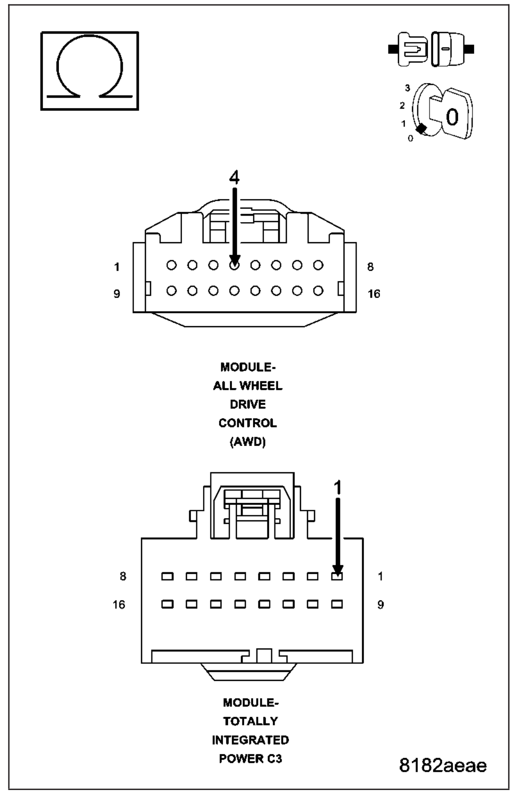
Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (Z967) ground circuit for an open.

Perform the appropriate VERIFICATION TEST.

5. (D65) CAN C BUS (+) CIRCUIT OPEN



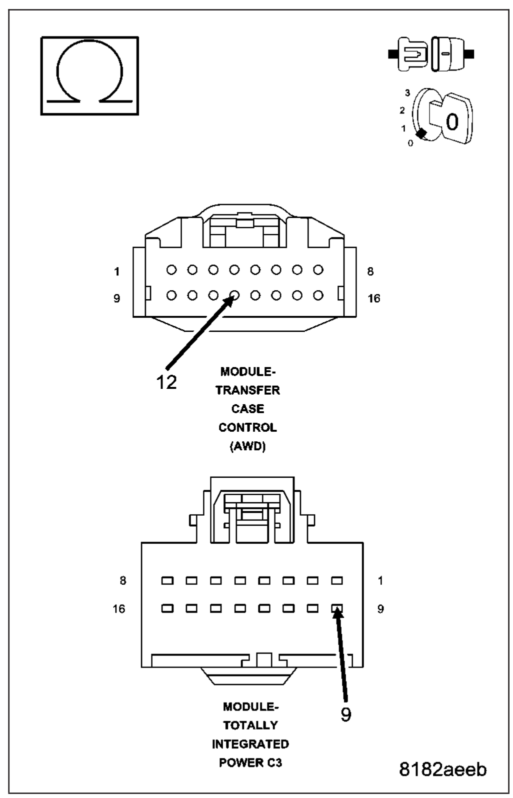
Disconnect the TIPM C3 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C3 harness connector and the AWD harness connector.

Is the resistance below 5.0 ohms?

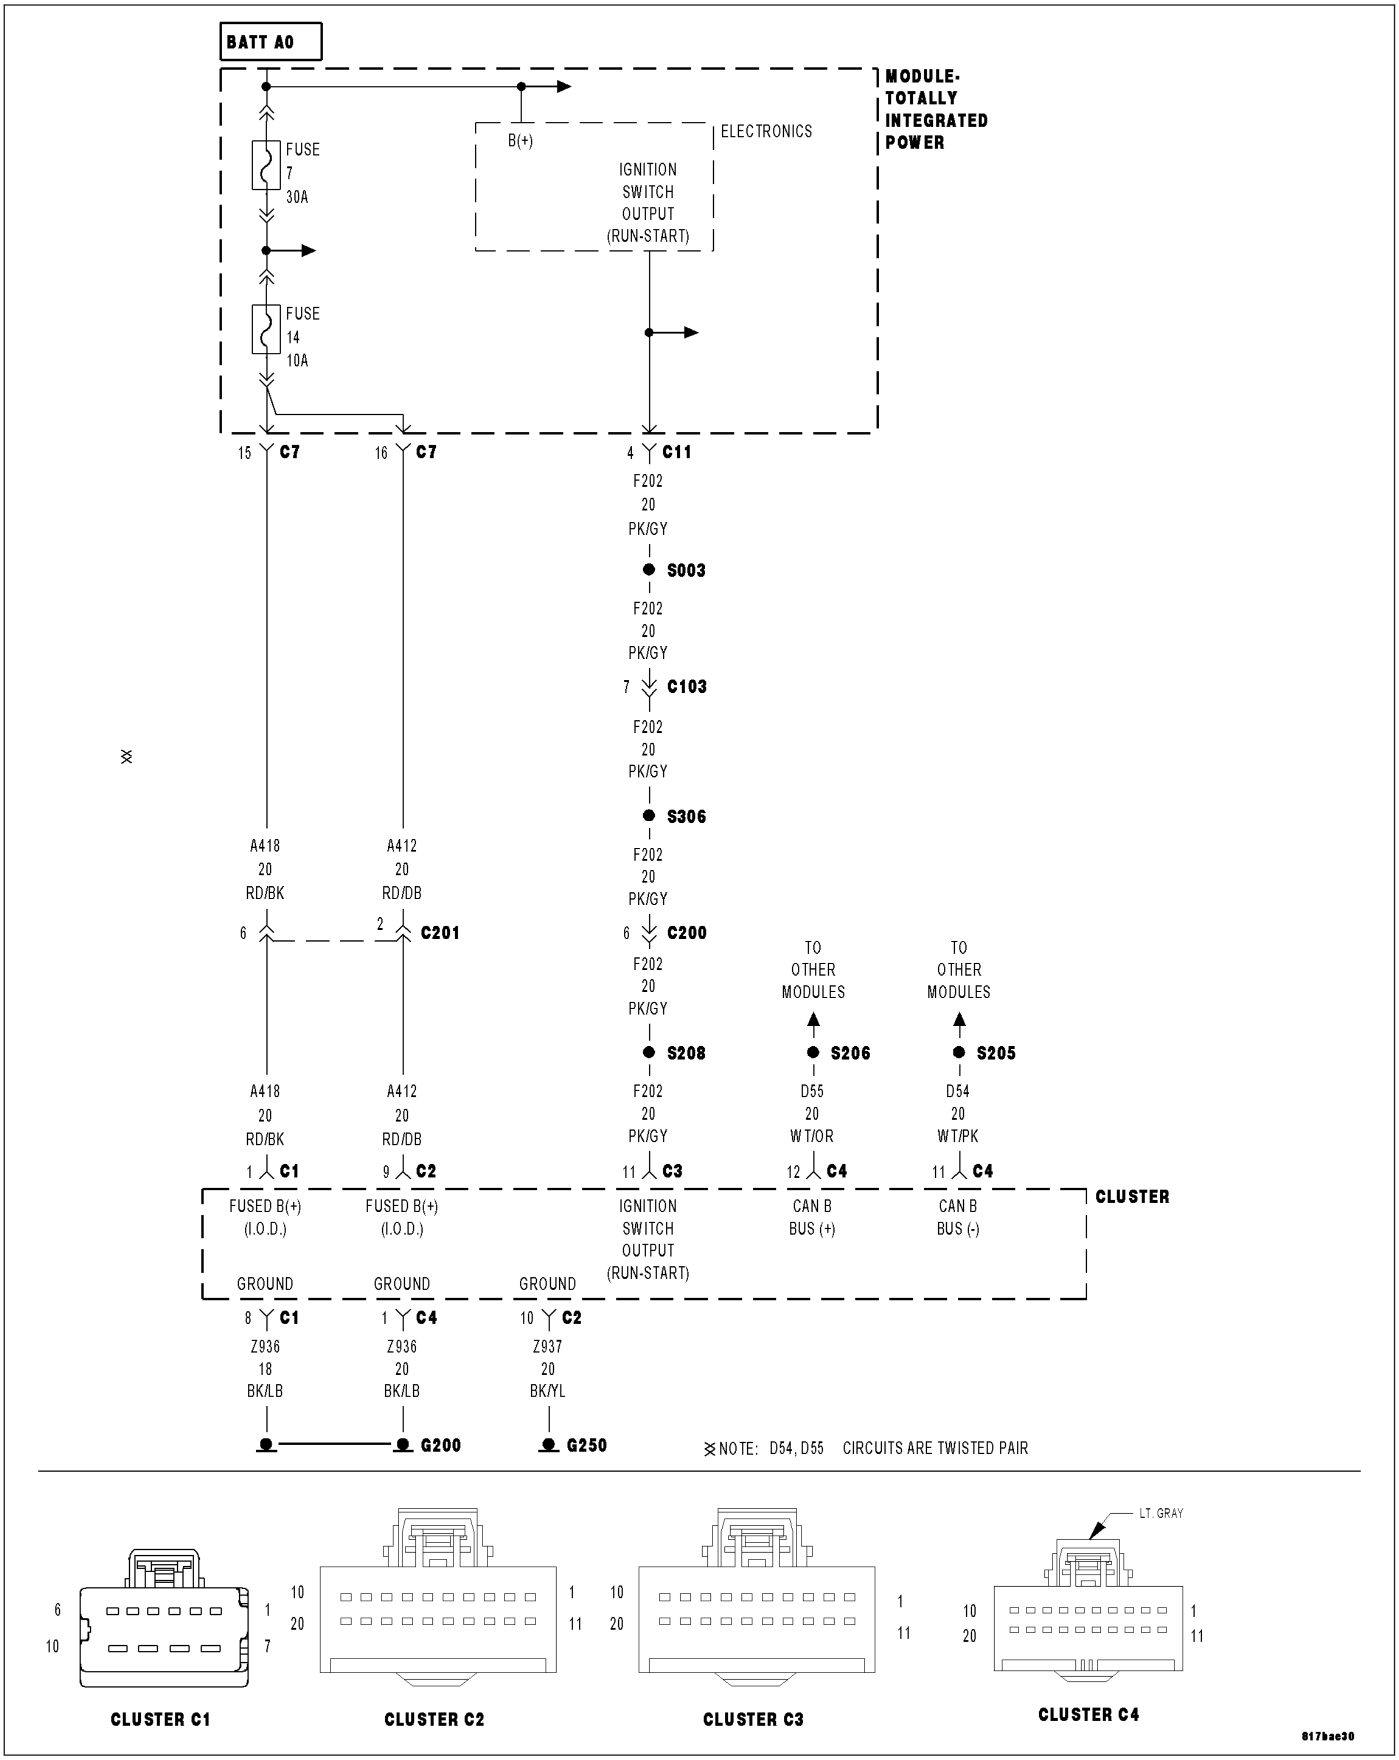
Yes >> Go To 6

No >> Repair the (D65) CAN C Bus (+) circuit for an open. Perform the appropriate VERIFICATION TEST.



6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C3 harness connector and the AWD harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace and program the All Wheel Drive Control (AWD) Module in accordance with the service information. Perform the appropriate VERIFICATION TEST.

No >> Repair the (D64) CAN C Bus (-) circuit for an open. Perform the appropriate VERIFICATION TEST.

*NO RESPONSE FROM CCN (CLUSTER)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A418) (A412) FUSED B(+) CIRCUITS OPEN OR SHORTED
(Z936) (Z937) GROUND CIRCUITS OPEN
(F202) IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
CLUSTER (CCN)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

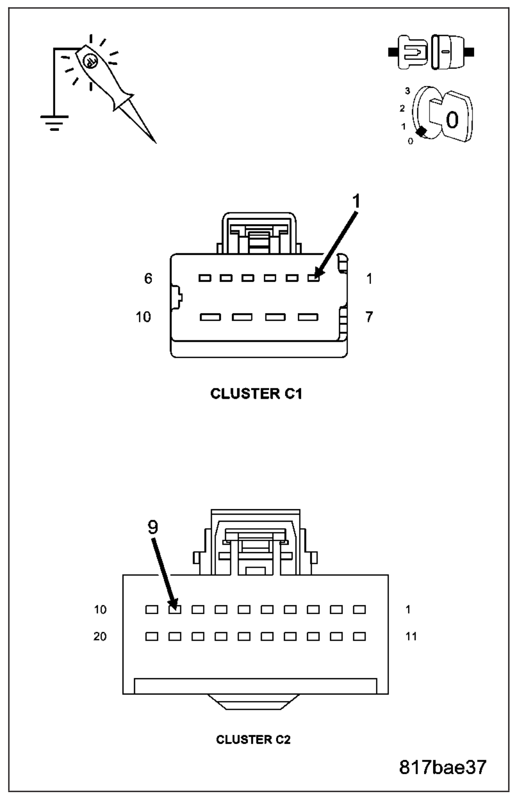
NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2



No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

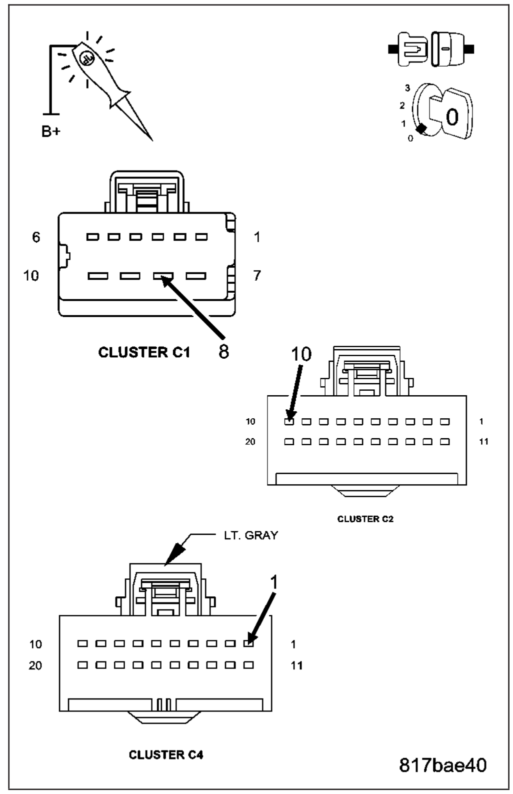
2. (A418) (A412) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Cluster C1 and C2 harness connectors.

Using a 12-volt test light connected to ground, check each (A418) and (A412) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?



Yes >> Go To 3

No >> Repair the Fused B(+) circuit for an open or short.

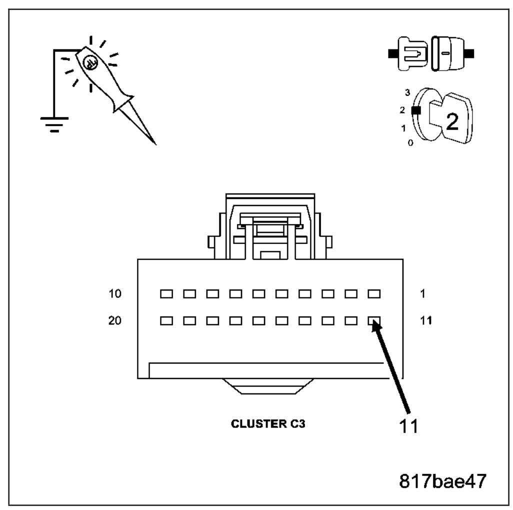
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (Z936) (Z937) GROUND CIRCUITS OPEN

Using a 12-volt test light connected to 12-volts, check each (Z936) and (Z937) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4



No >> Repair the (Z936) or (Z937) ground circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (F202) IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

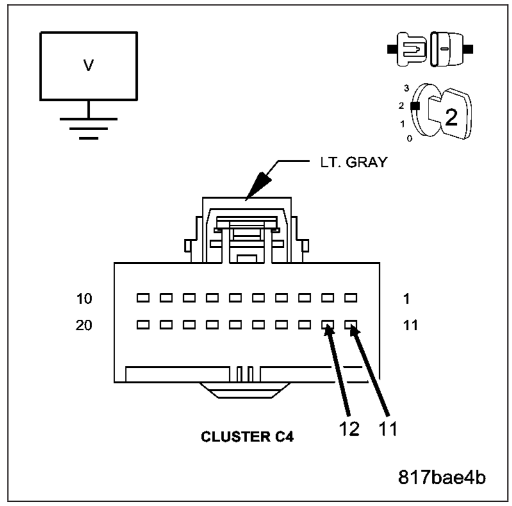
Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (F202) Ignition Switch Output circuit for an open or short.



Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

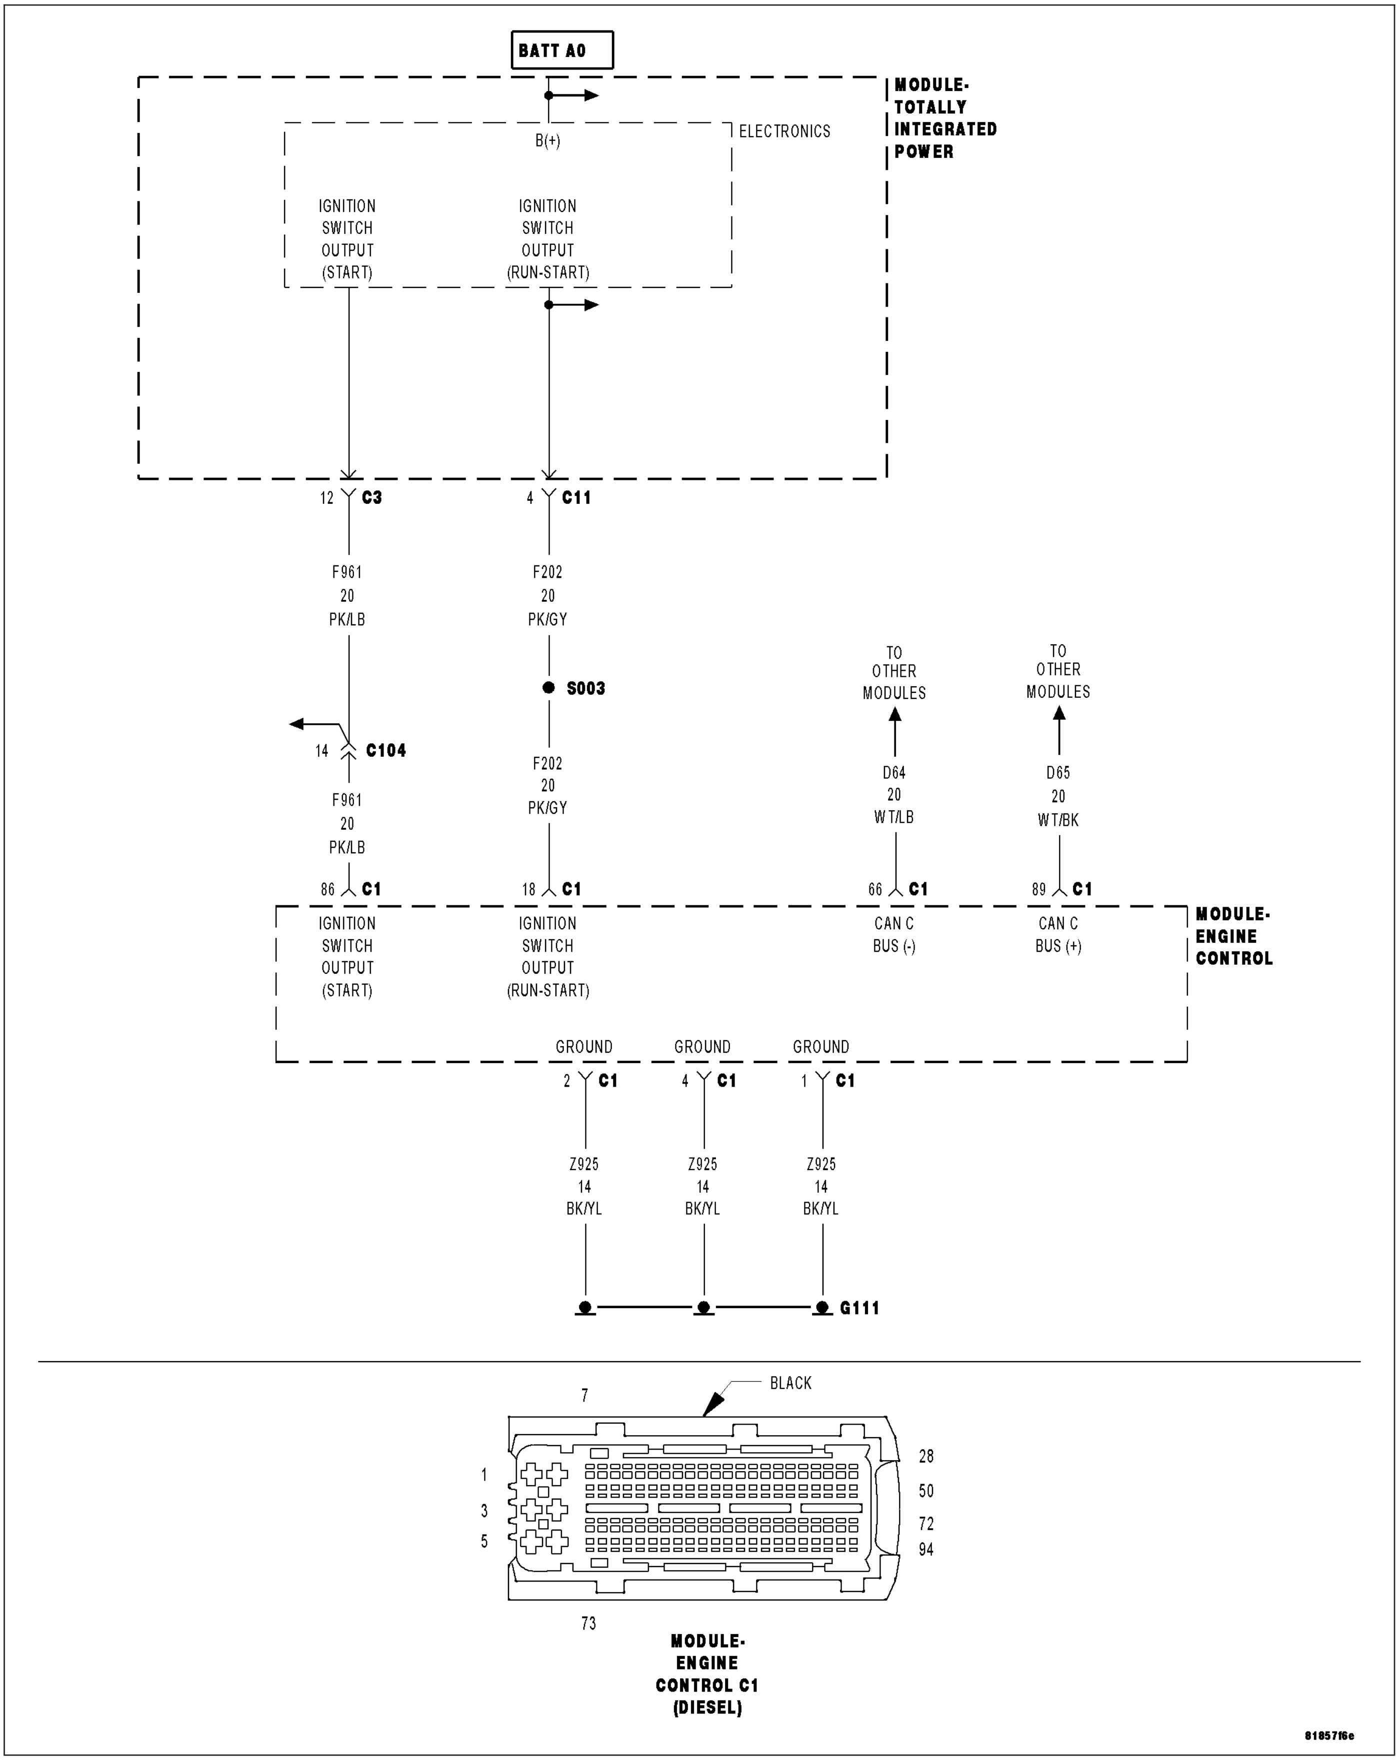
5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?



Yes >> Replace the Cluster in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*NO RESPONSE FROM ECM (ENGINE CONTROL MODULE) - DIESEL

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
ENGINE CONTROL MODULE POWER AND GROUND
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
ENGINE CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware and any ignition related DTC's, perform DTC's before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. CHECK ECM POWER AND GROUND

Check the ECM power and ground circuits. Refer to 9 - ENGINE ELECTRICAL DIAGNOSTICS - DIESEL for the diagnostic test procedure.

Were any problems found?

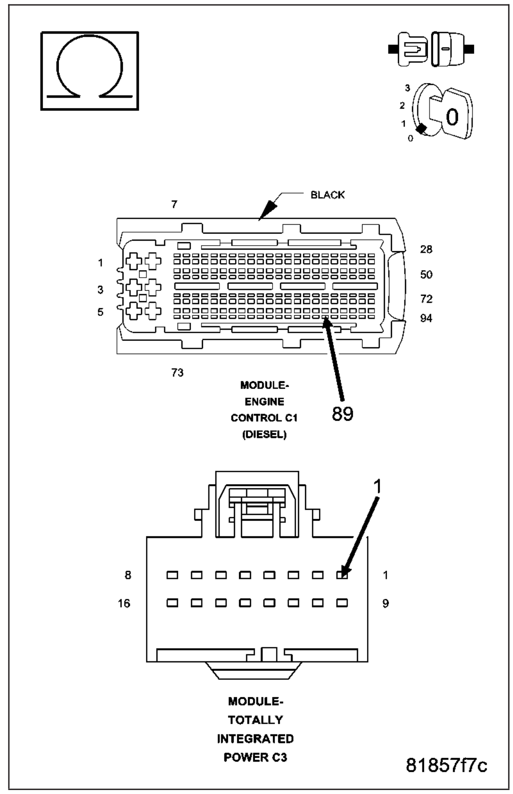
Yes >> Repair as necessary.
Perform the ECM VERIFICATION TEST.

No >> Go To 3

3. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.



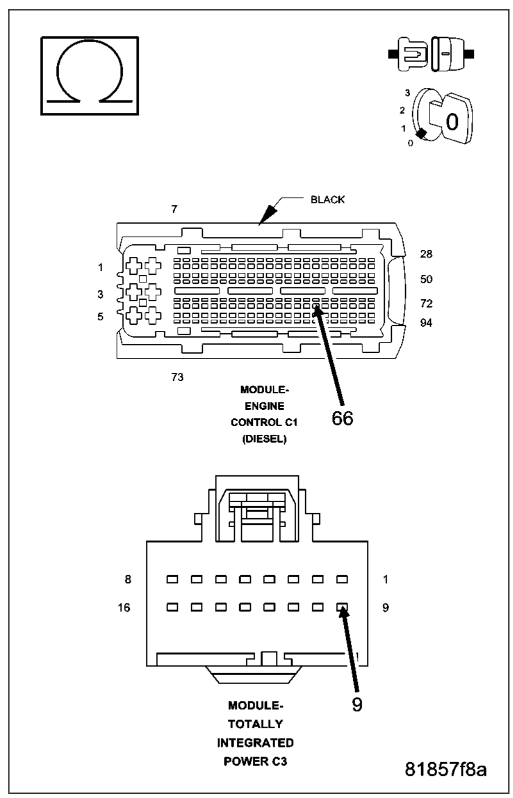
Disconnect the ECM C2 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM connector and the ECM connector.

Is resistance below 5.0 ohms?

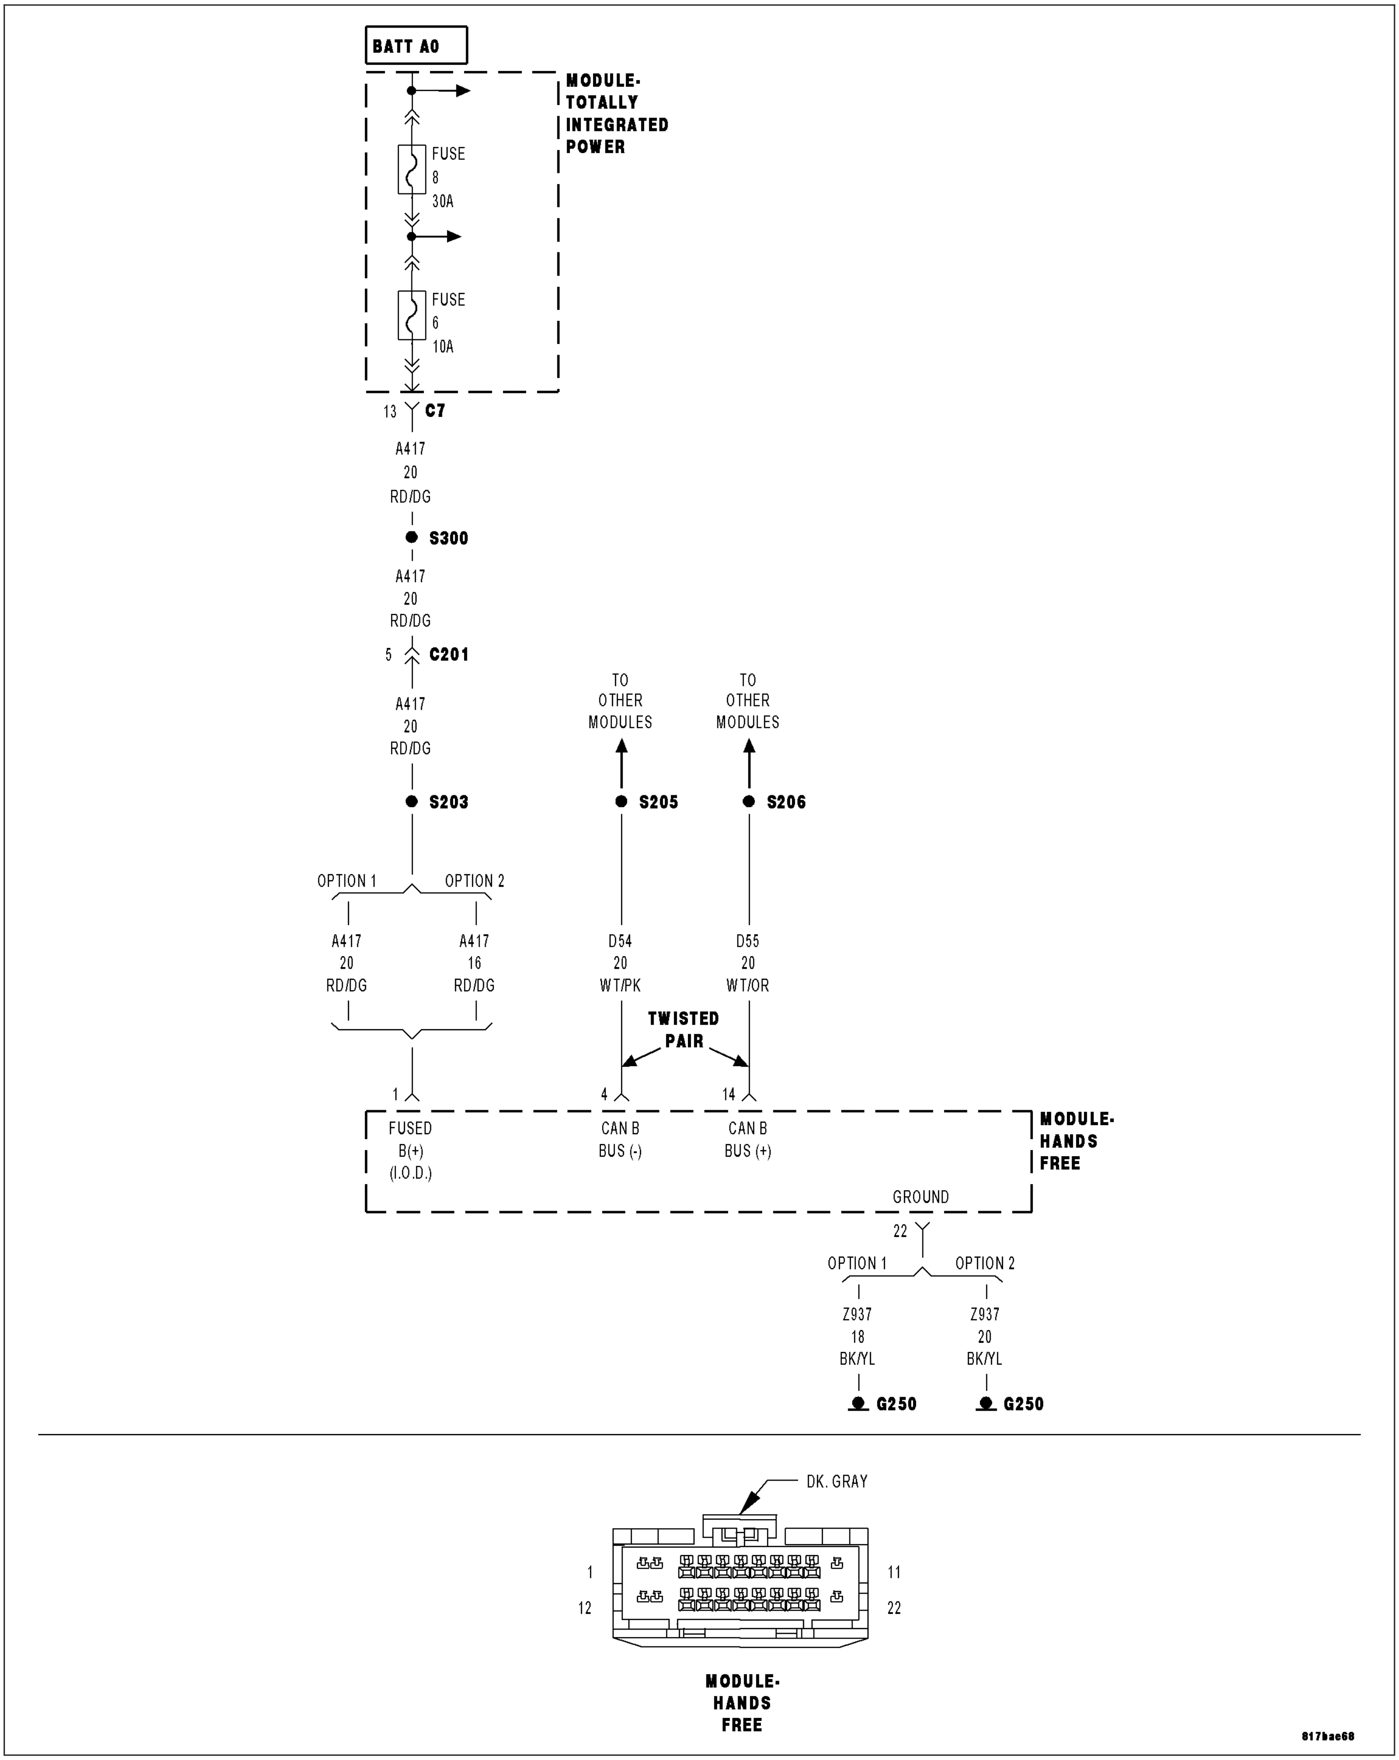
Yes >> Go To 4

No >> Repair the (D65) CAN C Bus (+) circuit for an open.
Perform the ECM VERIFICATION TEST.



4. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM connector and the ECM connector.



Is resistance below 5.0 ohms?

Yes >> Replace and program the Engine Control Module in accordance with the service information.
Perform the ECM VERIFICATION TEST.

No >> Repair the (D64) CAN C Bus (-) circuit for an open.
Perform the ECM VERIFICATION TEST.

*NO RESPONSE FROM HFM (HANDS FREE MODULE)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A417) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z937) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
HANDS FREE MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

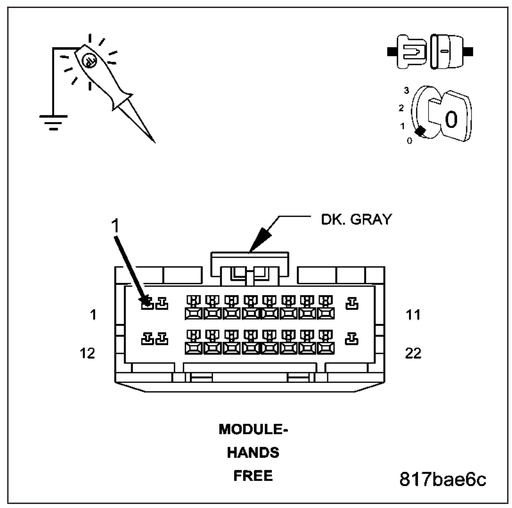
NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2



No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

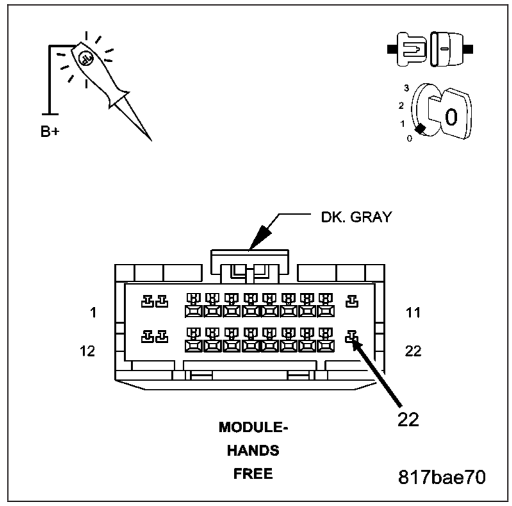
2. (A417) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Using a 12-volt test light connected to ground, check the (A417) Fused B(+) circuit.

Does the test light illuminate brightly?



Yes >> Go To 3

No >> Repair the (A417) Fused B(+) circuit for an open or short.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

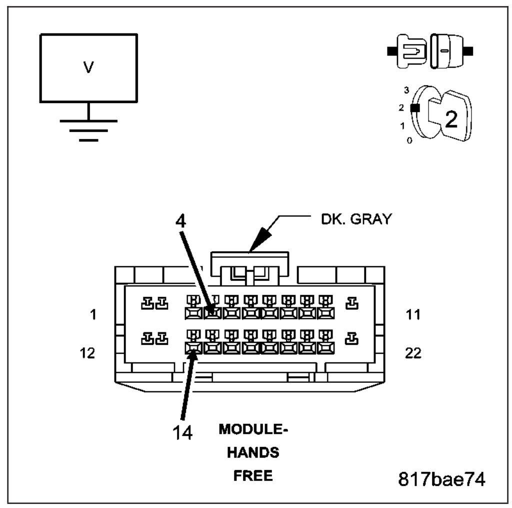
3. (Z937) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z937) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z937) ground circuit for an open.



Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

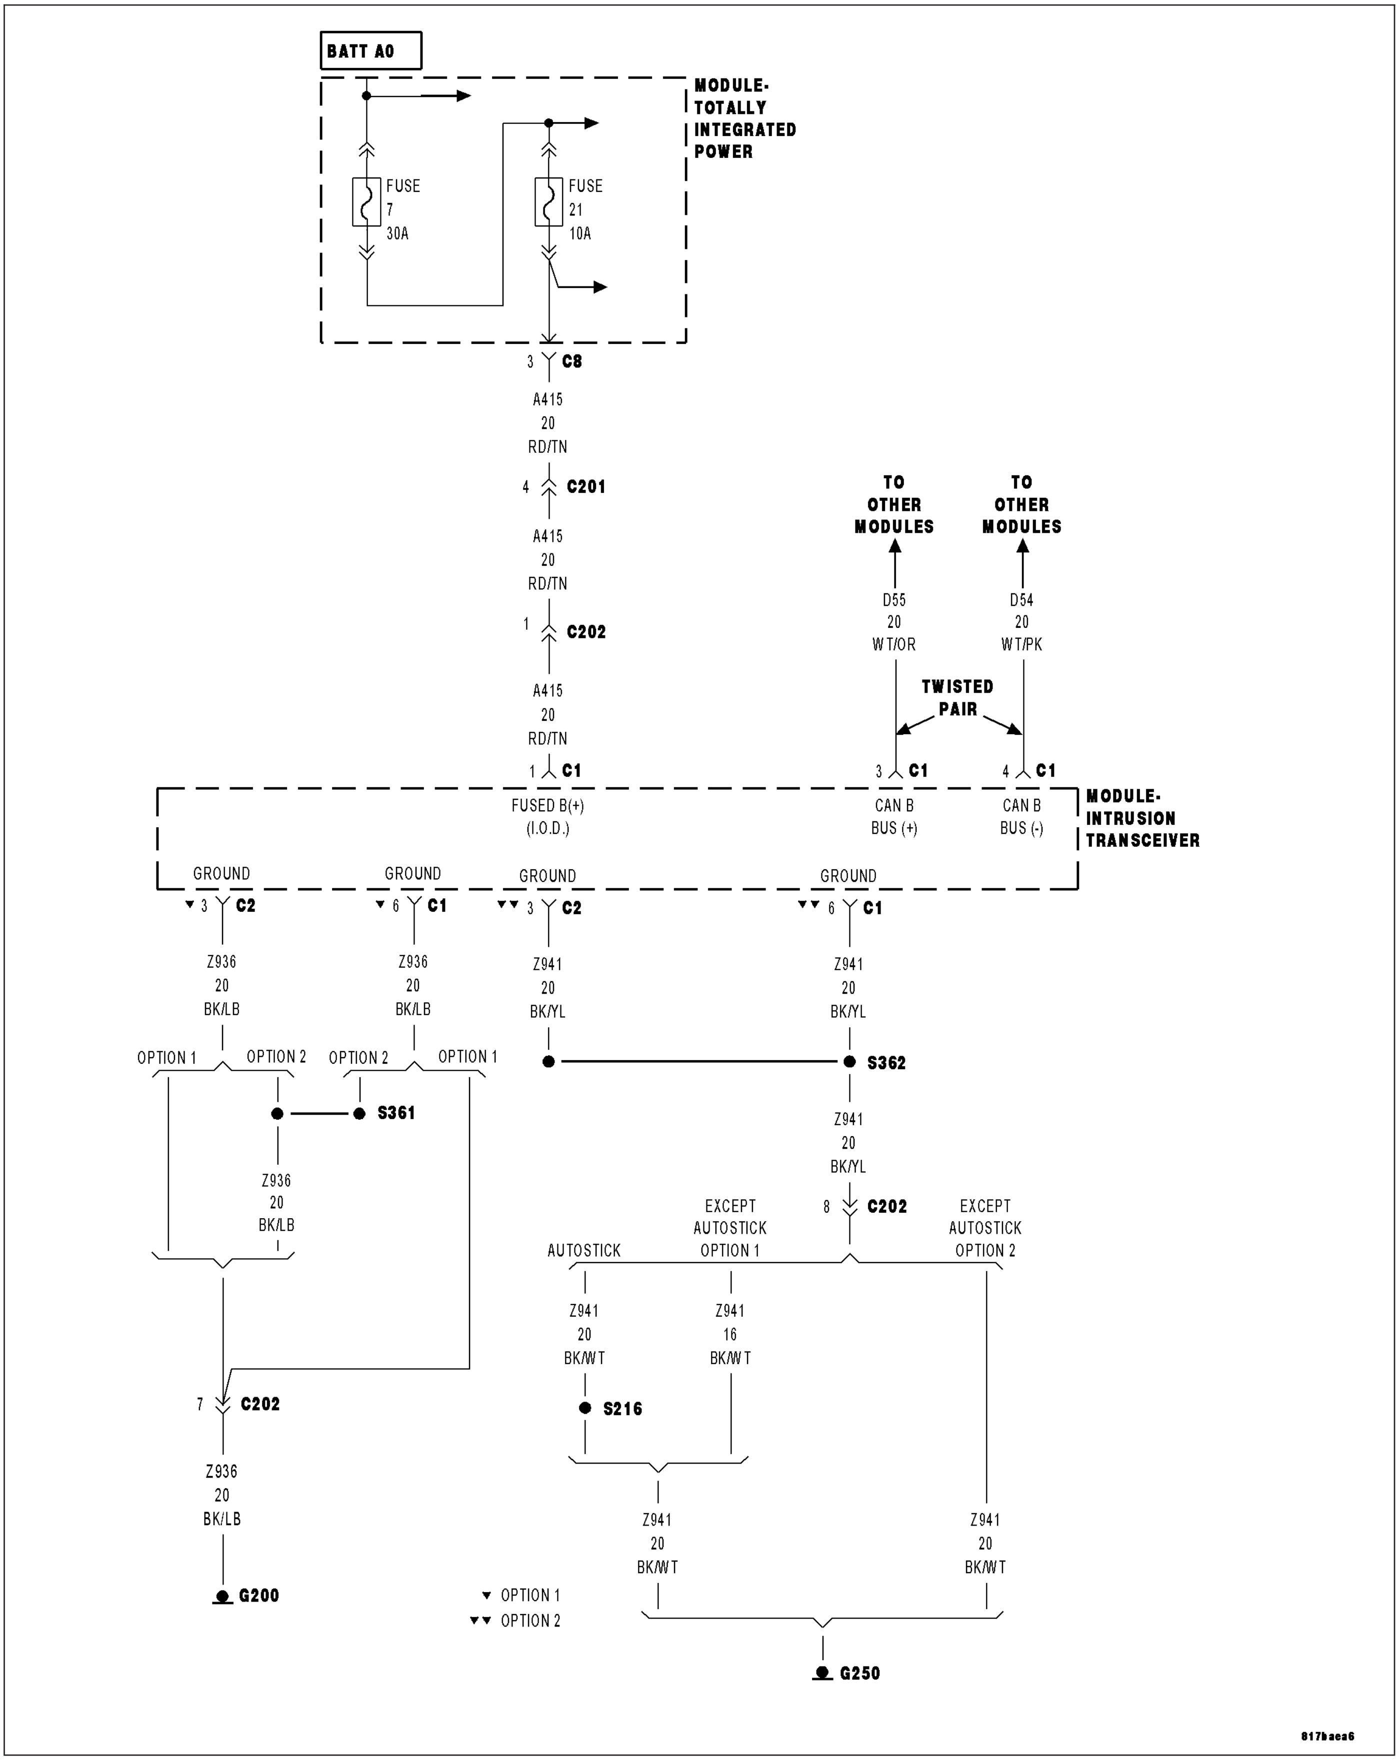
4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?



Yes >> Replace the Hands Free Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*NO RESPONSE FROM ITM (INTRUSION TRANSCEIVER MODULE)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A415) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z936) (Z941) GROUND CIRCUITS OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
INTRUSION TRANSCEIVER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

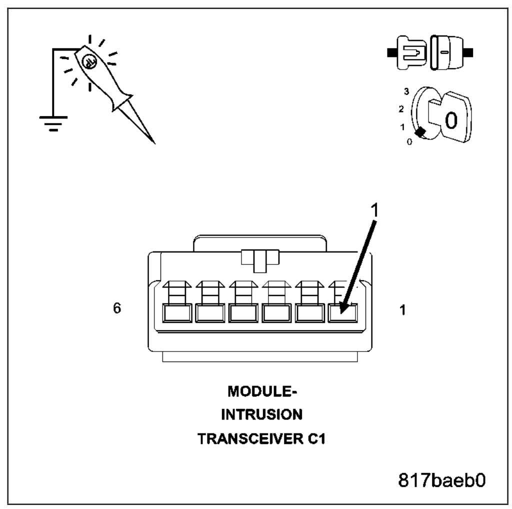
NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2



No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

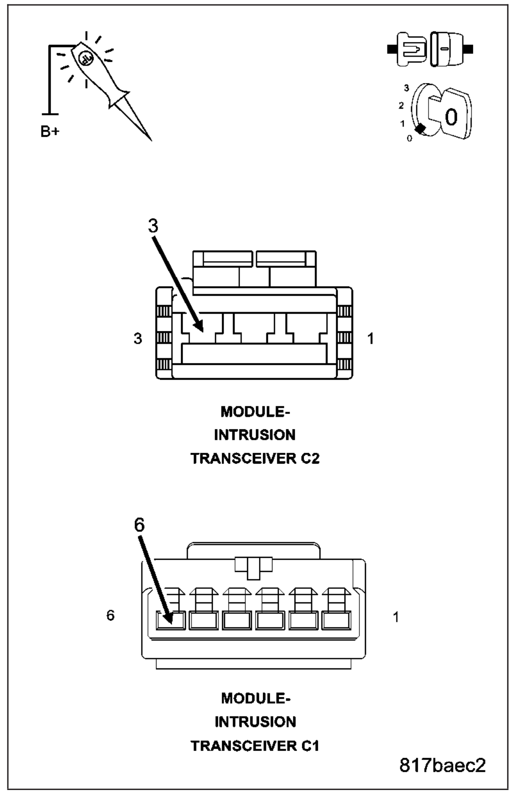
2. (A415) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Intrusion Transceiver Module C1 and C2 harness connectors.

Using a 12-volt test light connected to ground, check the (A415) Fused B(+) circuit.

Does the test light illuminate brightly?



Yes >> Go To 3

No >> Repair the (A415) Fused B(+) circuit for an open or short.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

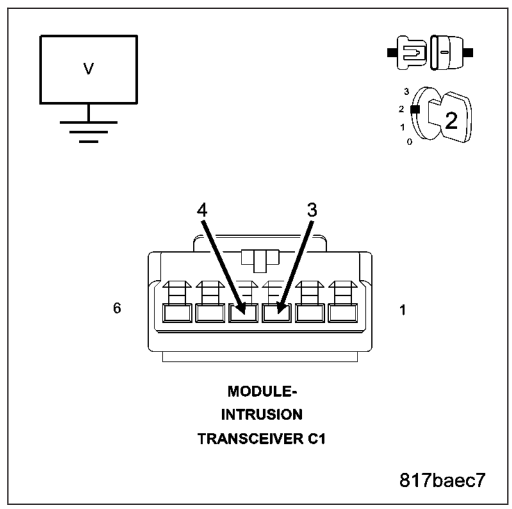
3. (Z936) (Z937) GROUND CIRCUITS OPEN

Using a 12-volt test light connected to 12-volts, check the (Z936) and (Z941) ground circuits.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the (Z936) or (Z941) ground circuit for an open.



Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

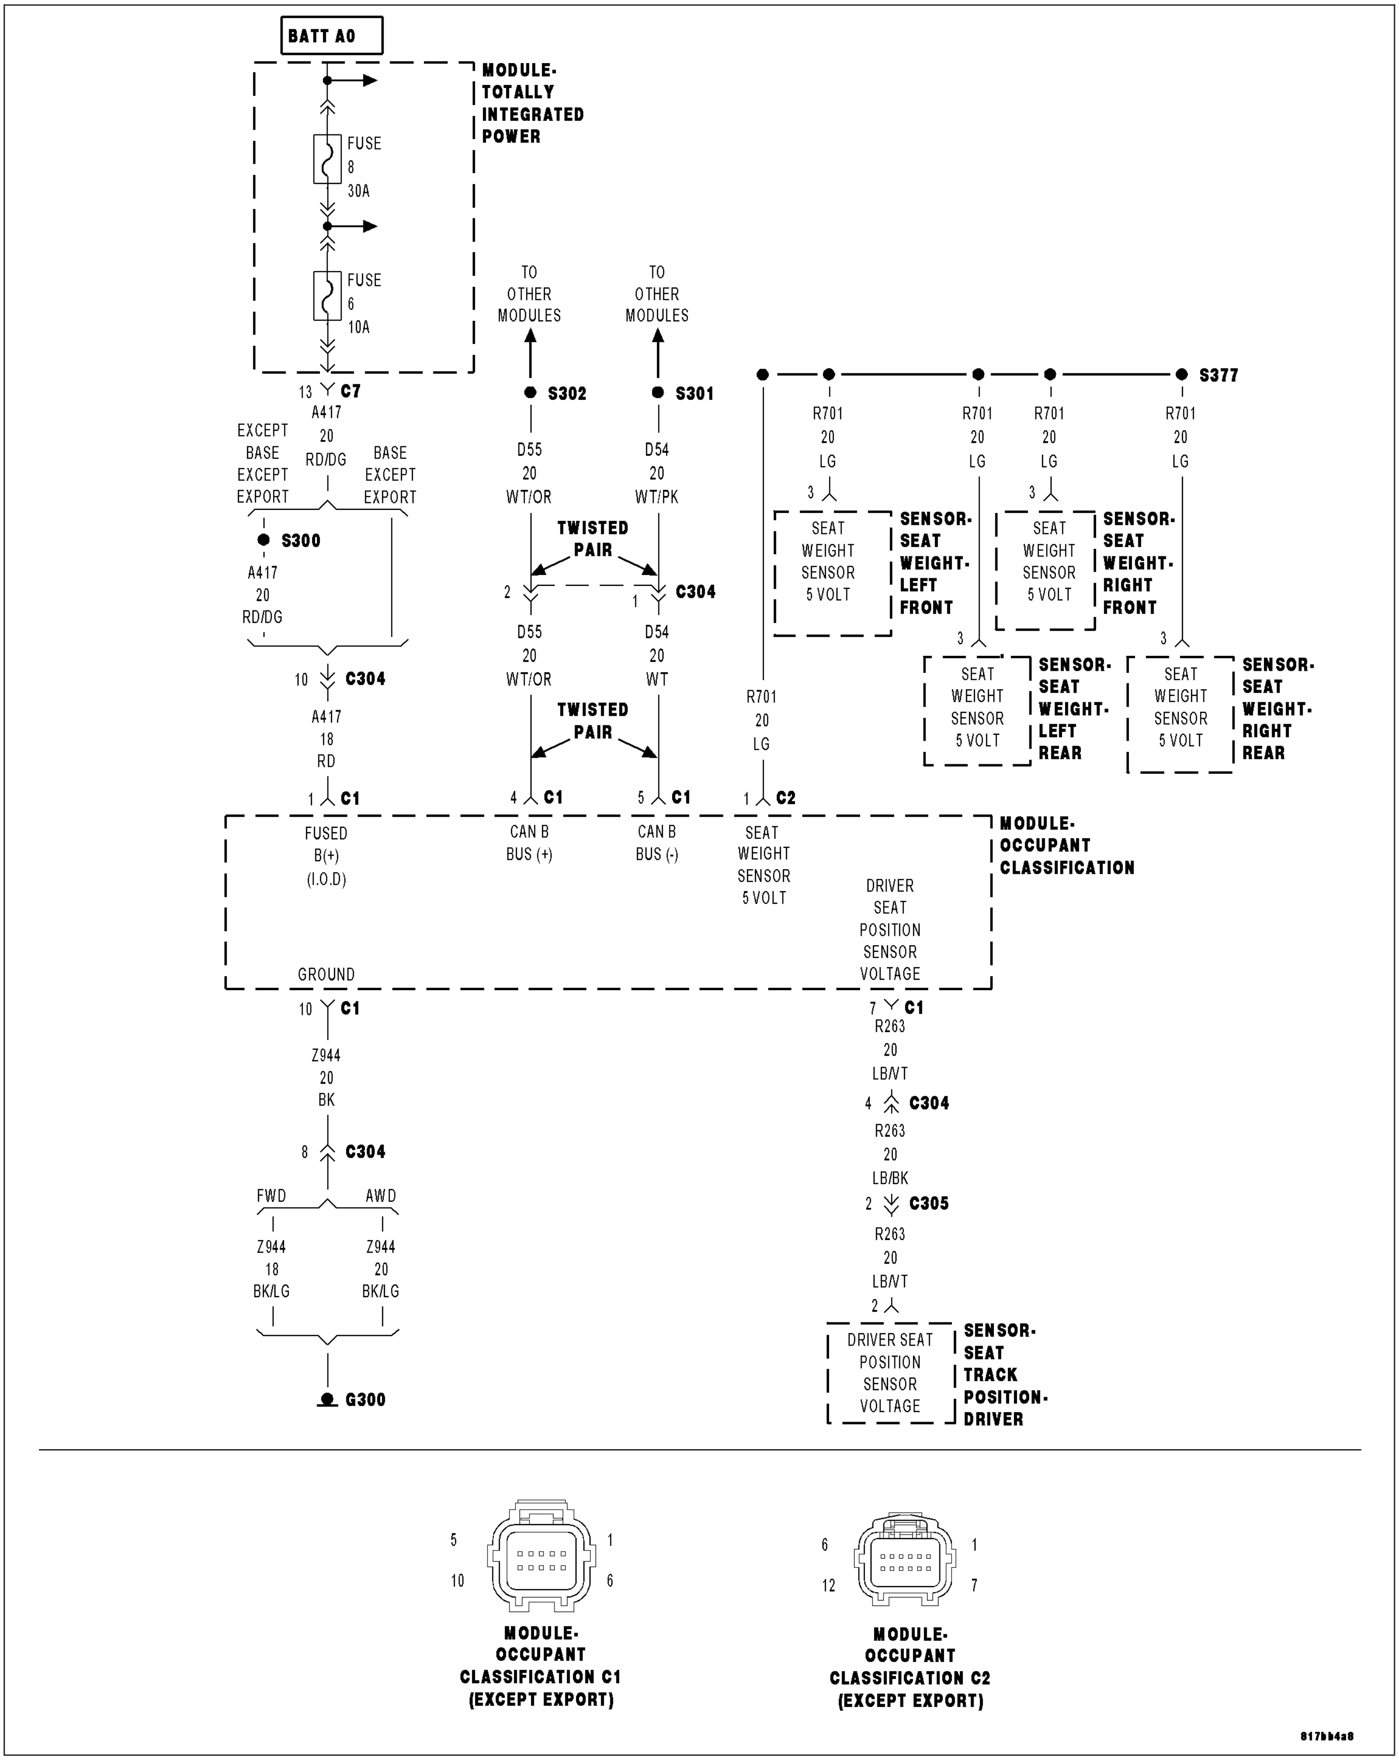
4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?



Yes >> Replace the Intrusion Transceiver Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*NO RESPONSE FROM OCM (OCCUPANT CLASSIFICATION MODULE)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A417) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z944) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
(R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO GROUND
(R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR A SHORT TO GROUND
OCCUPANT CLASSIFICATION MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU View.

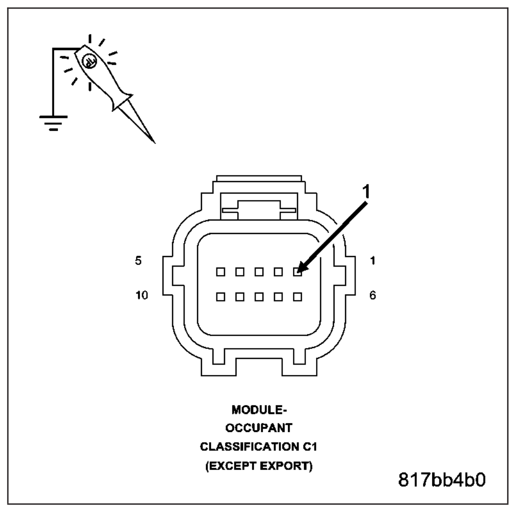
NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A417) FUSED B(+) CIRCUIT OPEN OR SHORTED

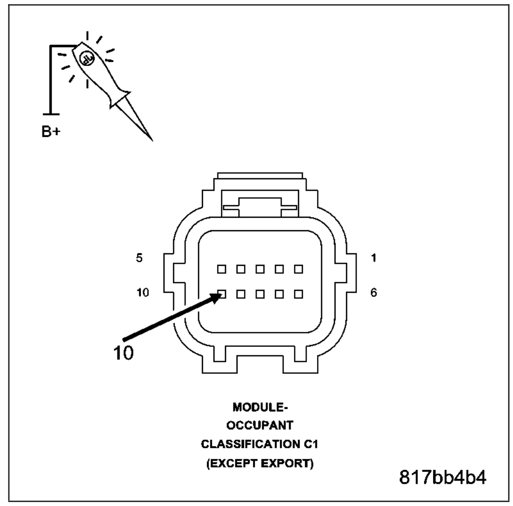


WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.
Disconnect the Occupant Classification Module C1 harness connector.

WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.
Using a 12-volt test light connected to ground, check the (A417) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3



No >> Repair the (A417) Fused B(+) circuit for an open or short.
Perform the OCS VERIFICATION TEST-VER 1.

3. (Z944) GROUND CIRCUIT OPEN

Turn the ignition off.

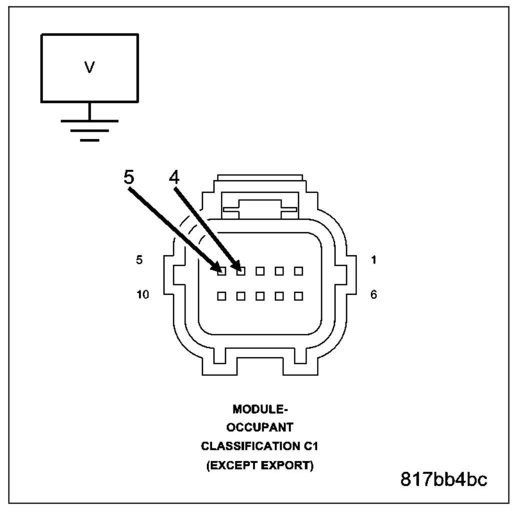
Using a 12-volt test light connected to 12-volts, check the (Z944) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z944) ground circuit for an open.
Perform the OCS VERIFICATION TEST-VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN



WARNING: If the Occupant Classification Module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

NOTE: One open circuit will not cause this condition.

Turn the ignition on.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Go To 5

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open.
Inspect the connector for damage.
Perform the OCS VERIFICATION TEST-VER 1.

5. CHECK (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (R263) Driver Seat Position Sensor Voltage-Driver circuit.

Is the resistance below 10k ohms?

Yes >>

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

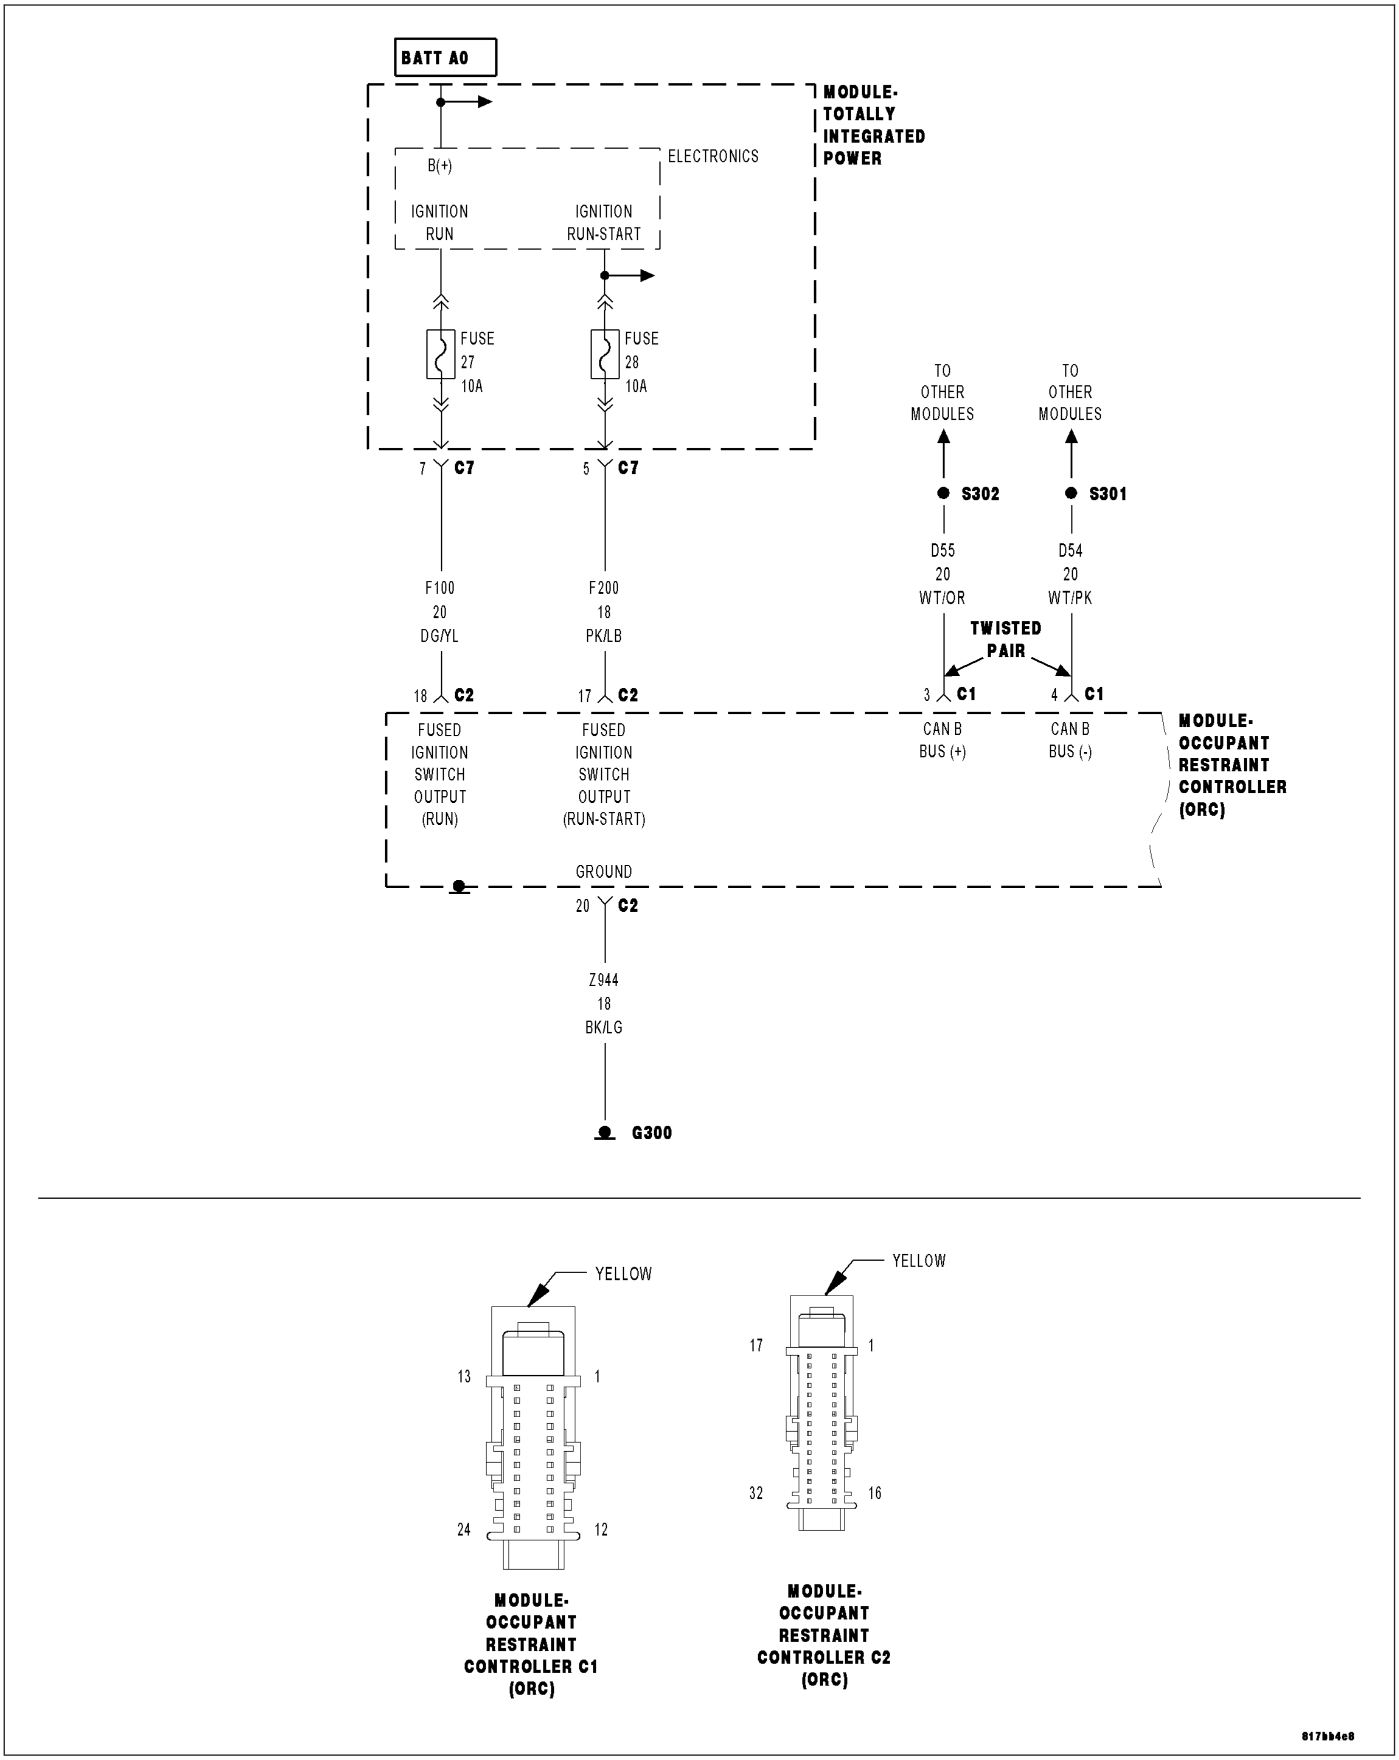
Replace the OCM and Driver Seat Position Sensor Harness in accordance with the service information.
Perform the OCS VERIFICATION TEST-VER 1.

No >> Go To 6

6. CHECK (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR A SHORT TO GROUND

Disconnect the Occupant Classification Module C2 harness connector.
Measure the resistance between ground and the (R701) Seat Weight Sensor 5 volt circuit.

Is the resistance below 10k ohms?



Yes >>

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition is present.

Replace the OCM and Driver Seat Position Sensor Harness in accordance with the service information.
Perform the OCS VERIFICATION TEST-VER 1.

No >> Replace the Occupant Classification Module in accordance with the service information.
Perform the OCS VERIFICATION TEST-VER 1.

*NO RESPONSE FROM ORC (OCCUPANT RESTRAINT CONTROLLER)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(Z944) GROUND CIRCUIT OPEN
(F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR SHORTED
(F200) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
OCCUPANT RESTRAINT CONTROLLER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

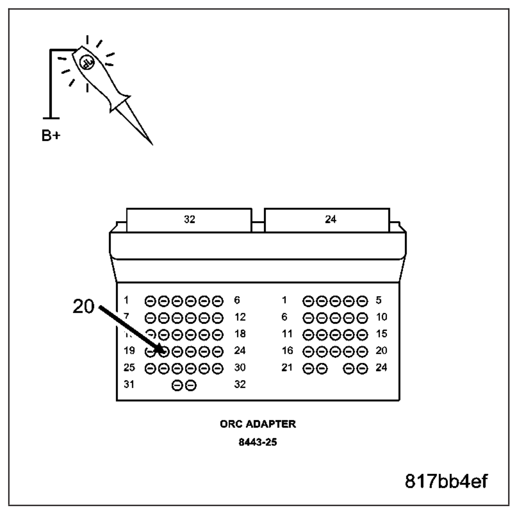
With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.



2. (Z944) GROUND CIRCUIT OPEN

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

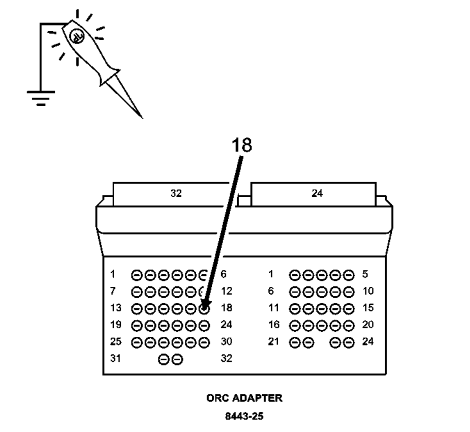
Disconnect the Occupant Restraint Controller Module C1 and C2 harness connectors.

Connect the appropriate Load Tool ACM Adaptor to the ORC connectors.

Using a 12-volt test light connected to 12-volts, check the (Z944) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 3



No >> Repair the (Z944) ground circuit for an open.
Perform the AIRBAG VERIFICATION TEST - VER 1.

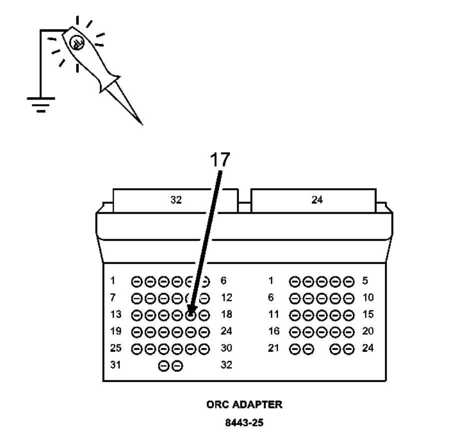
3. (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR SHORTED

NOTE: Check the TIPM for any ignition related DTCs before proceeding. If set (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING).

WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Using a 12-volt test light connected to ground, check the (F100) Fused Ignition Switch Output (RUN) circuit.

817bb4f7



Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (F100) Fused Ignition Switch Output (RUN) circuit for an open or short.
Perform the AIRBAG VERIFICATION TEST - VER 1.

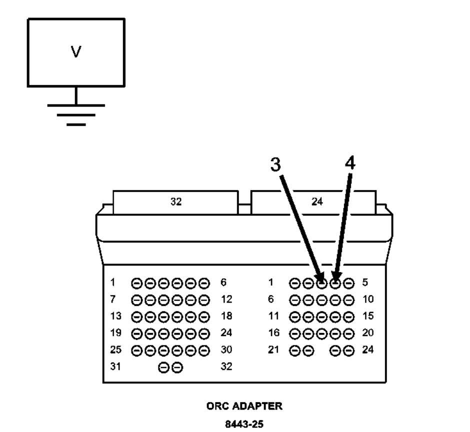
4. (F200) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED

Using a 12-volt test light connected to ground, check the (F200) Fused Ignition Switch Output (RUN/START) circuit.

817bb50d

Does the test light illuminate brightly?

Yes >> Go To 5



No >> Repair the (F200) Fused Ignition Switch Output (RUN/START) circuit for an open or short.
Perform the AIRBAG VERIFICATION TEST - VER 1.

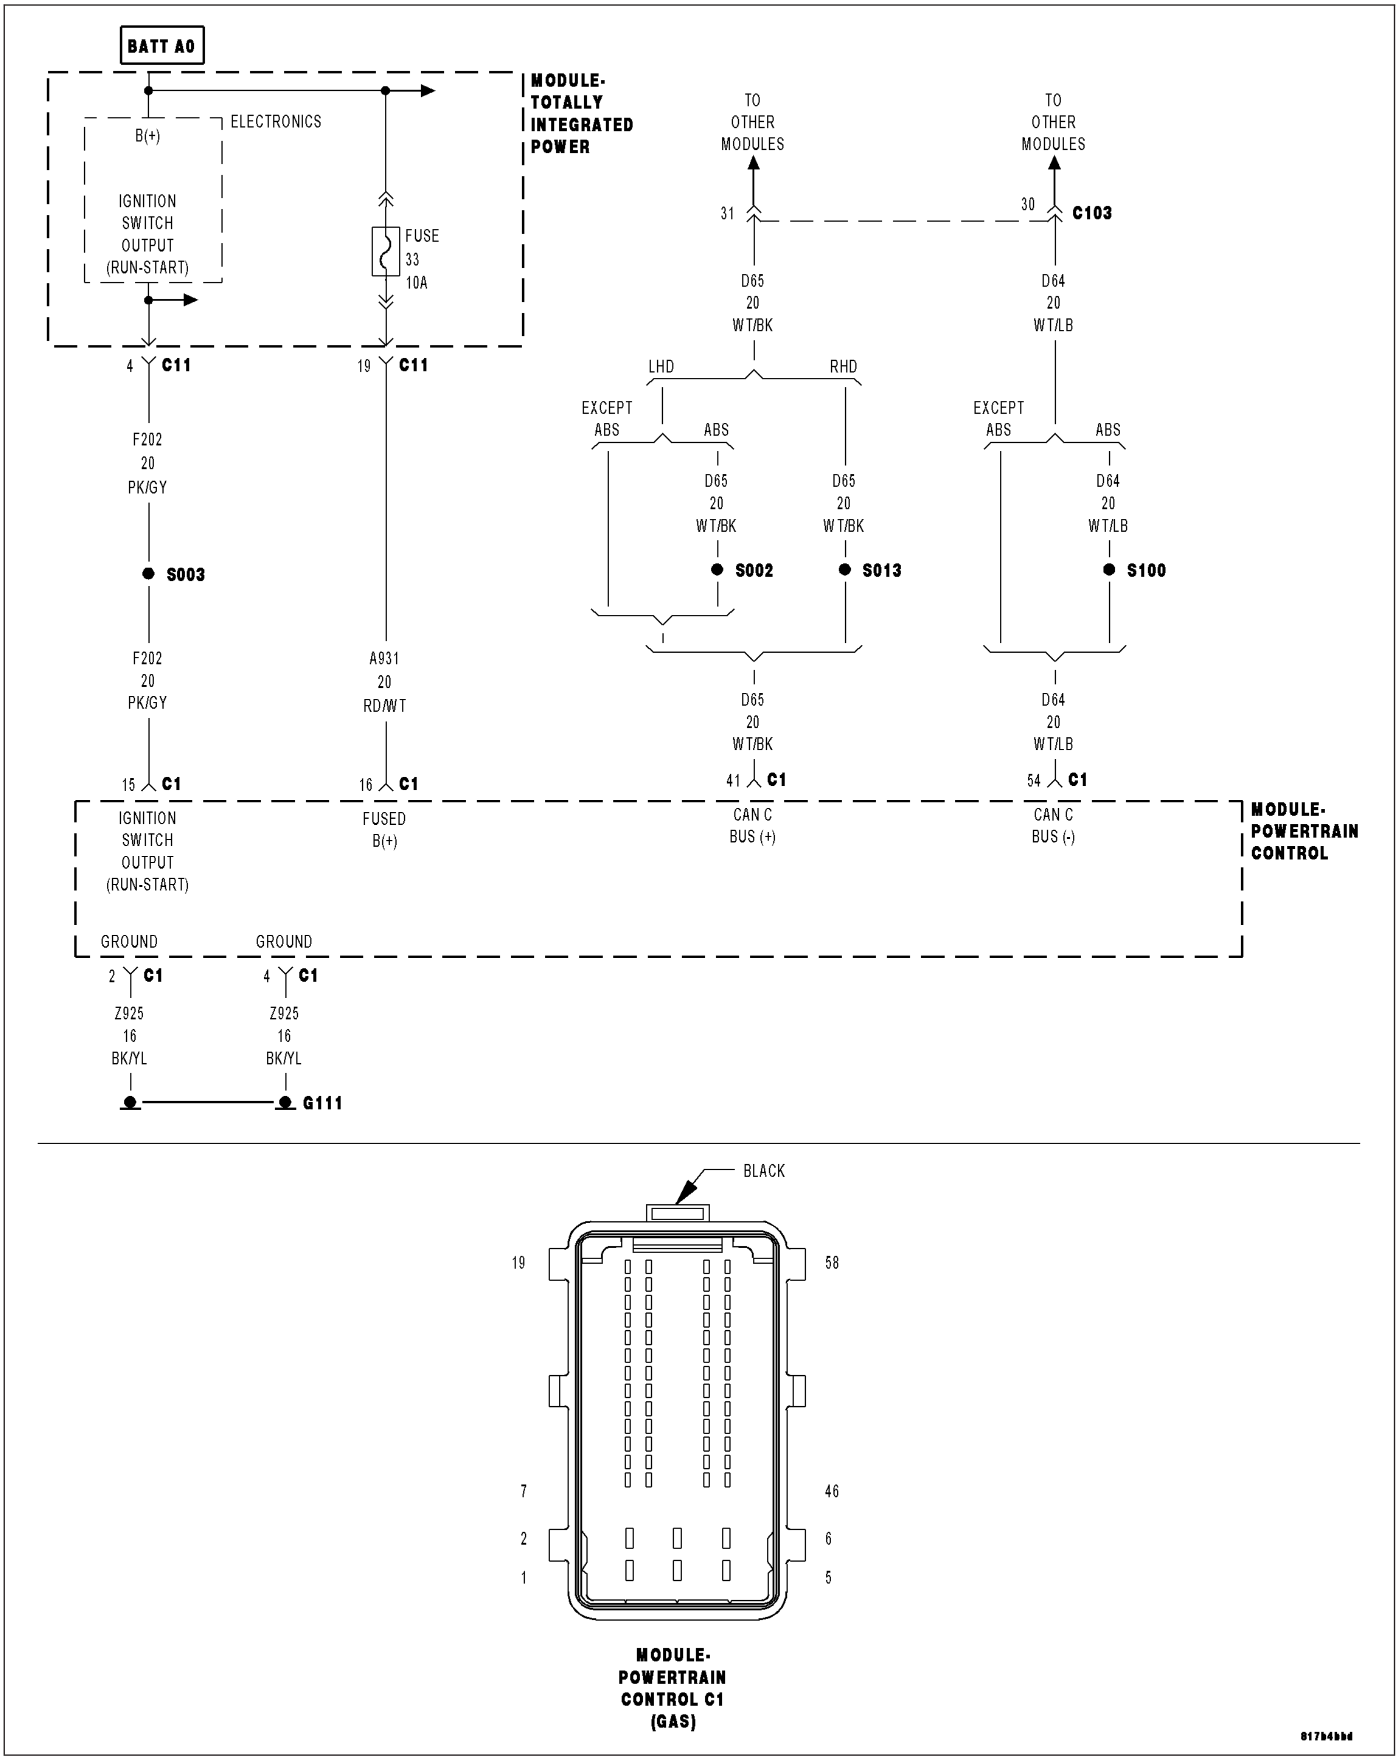
5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

817bb518



Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Replace the Occupant Restraint Controller Module in accordance with the service information. Perform the AIRBAG VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage. Perform the AIRBAG VERIFICATION TEST - VER 1.

*NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) (GPEC)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A931) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z925) GROUND CIRCUIT OPEN
(F202) IGNITION SW OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

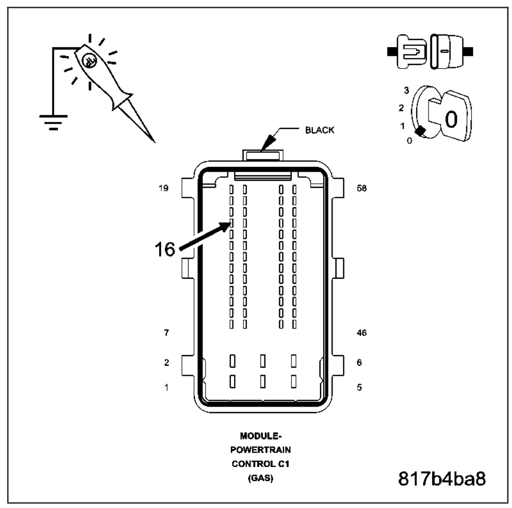
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTC's, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2



No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

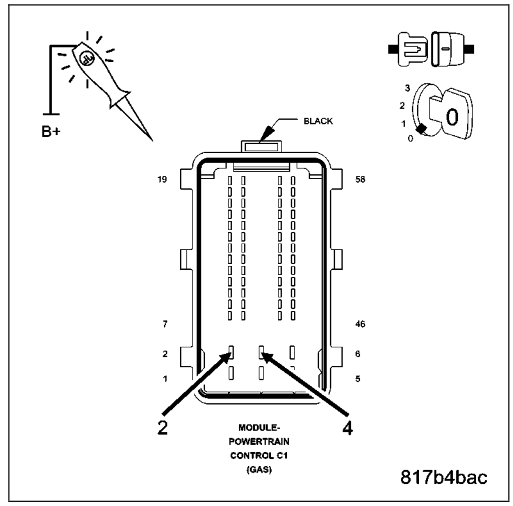
2. (A931) B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the PCM C1 harness connector.

Using a 12-volt test light connected to ground, check the (A931) B(+) circuit.

Does the test light illuminate brightly?



Yes >> Go To 3

No >> Repair the (A931) B(+) circuit for an open or short.

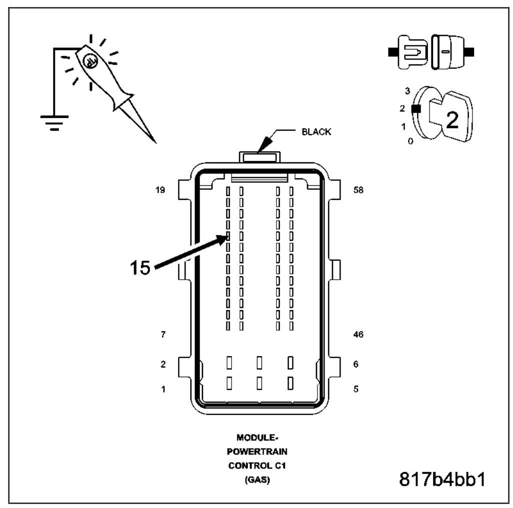
Perform the appropriate POWERTRAIN VERIFICATION TEST.

3. (Z925) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z925) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4



No >> Repair the ground circuit for an open.

Perform the appropriate POWERTRAIN VERIFICATION TEST.

4. (F202) IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

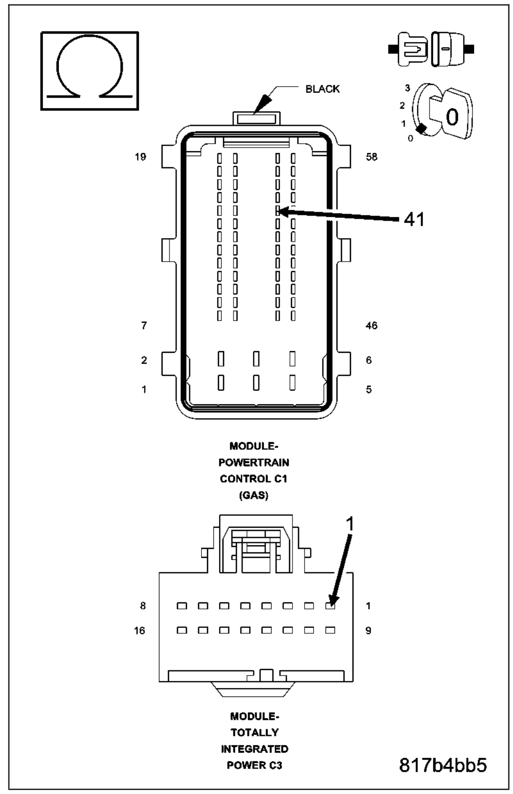
No >> Repair the (F202) Ignition Switch Output circuit for an open or short.

Perform the appropriate POWERTRAIN VERIFICATION TEST.

5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.



Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C3 harness connector and the PCM C1 harness connector.

Is the resistance below 5.0 ohms?

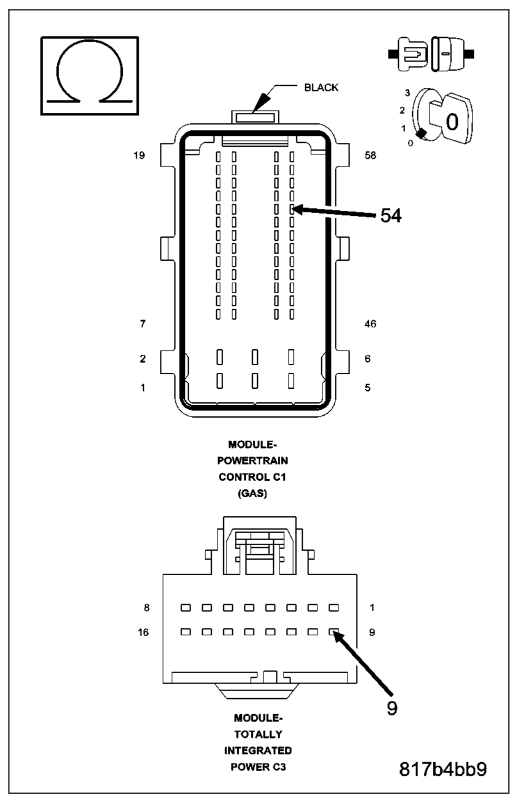
Yes >> Go To 6

No >> Repair the (D65) CAN C Bus (+) circuit for an open.

Perform the appropriate POWERTRAIN VERIFICATION TEST.

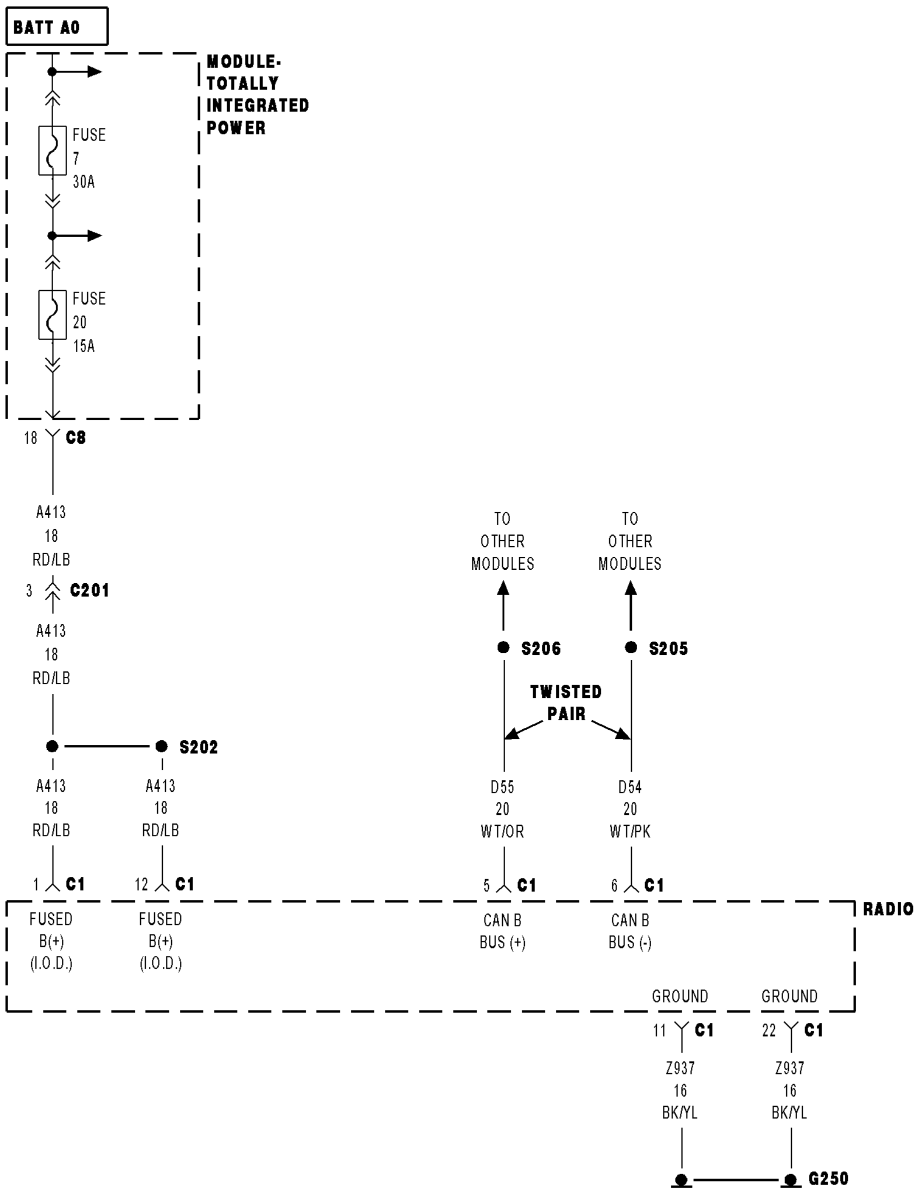
6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C3 harness connector and the PCM C1 harness connector.

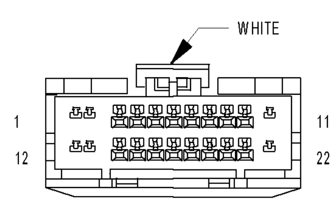


Is the resistance below 5.0 ohms?

Yes >> Replace and program the Powertrain Control Module in accordance with the service information.



Perform the appropriate POWERTRAIN VERIFICATION TEST.



No >> Repair the (D64) CAN C Bus (-) circuit for an open.

Perform the appropriate POWERTRAIN VERIFICATION TEST.

*NO RESPONSE FROM RADIO

RADIO C1

817bb795

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A413) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z937) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
RADIO

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

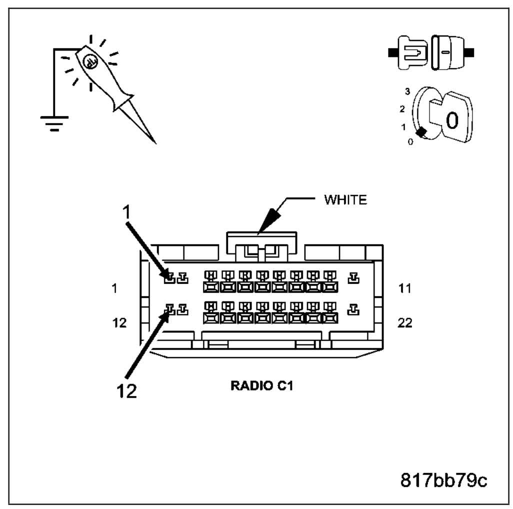
NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2



No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

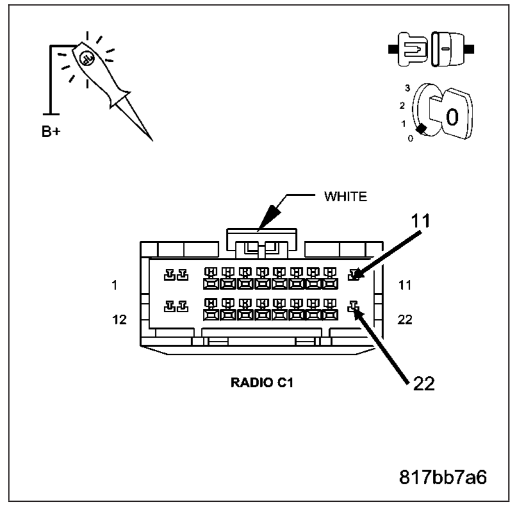
2. (A413) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Using a 12-volt test light connected to ground, check each (A413) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?



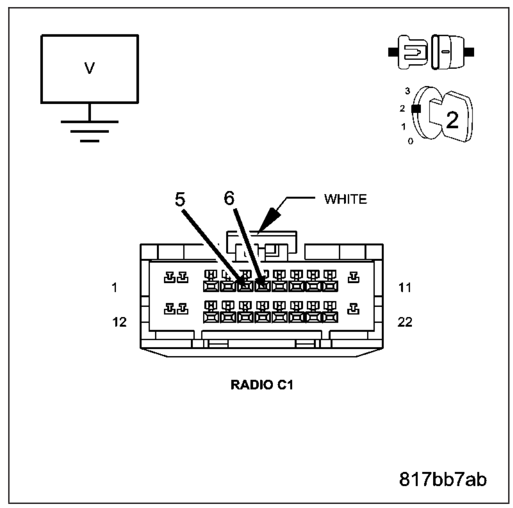
Yes >> Go To 3

No >> Repair the (A413) Fused B(+) circuit for an open or short.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (Z937) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z937) ground circuit.



Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

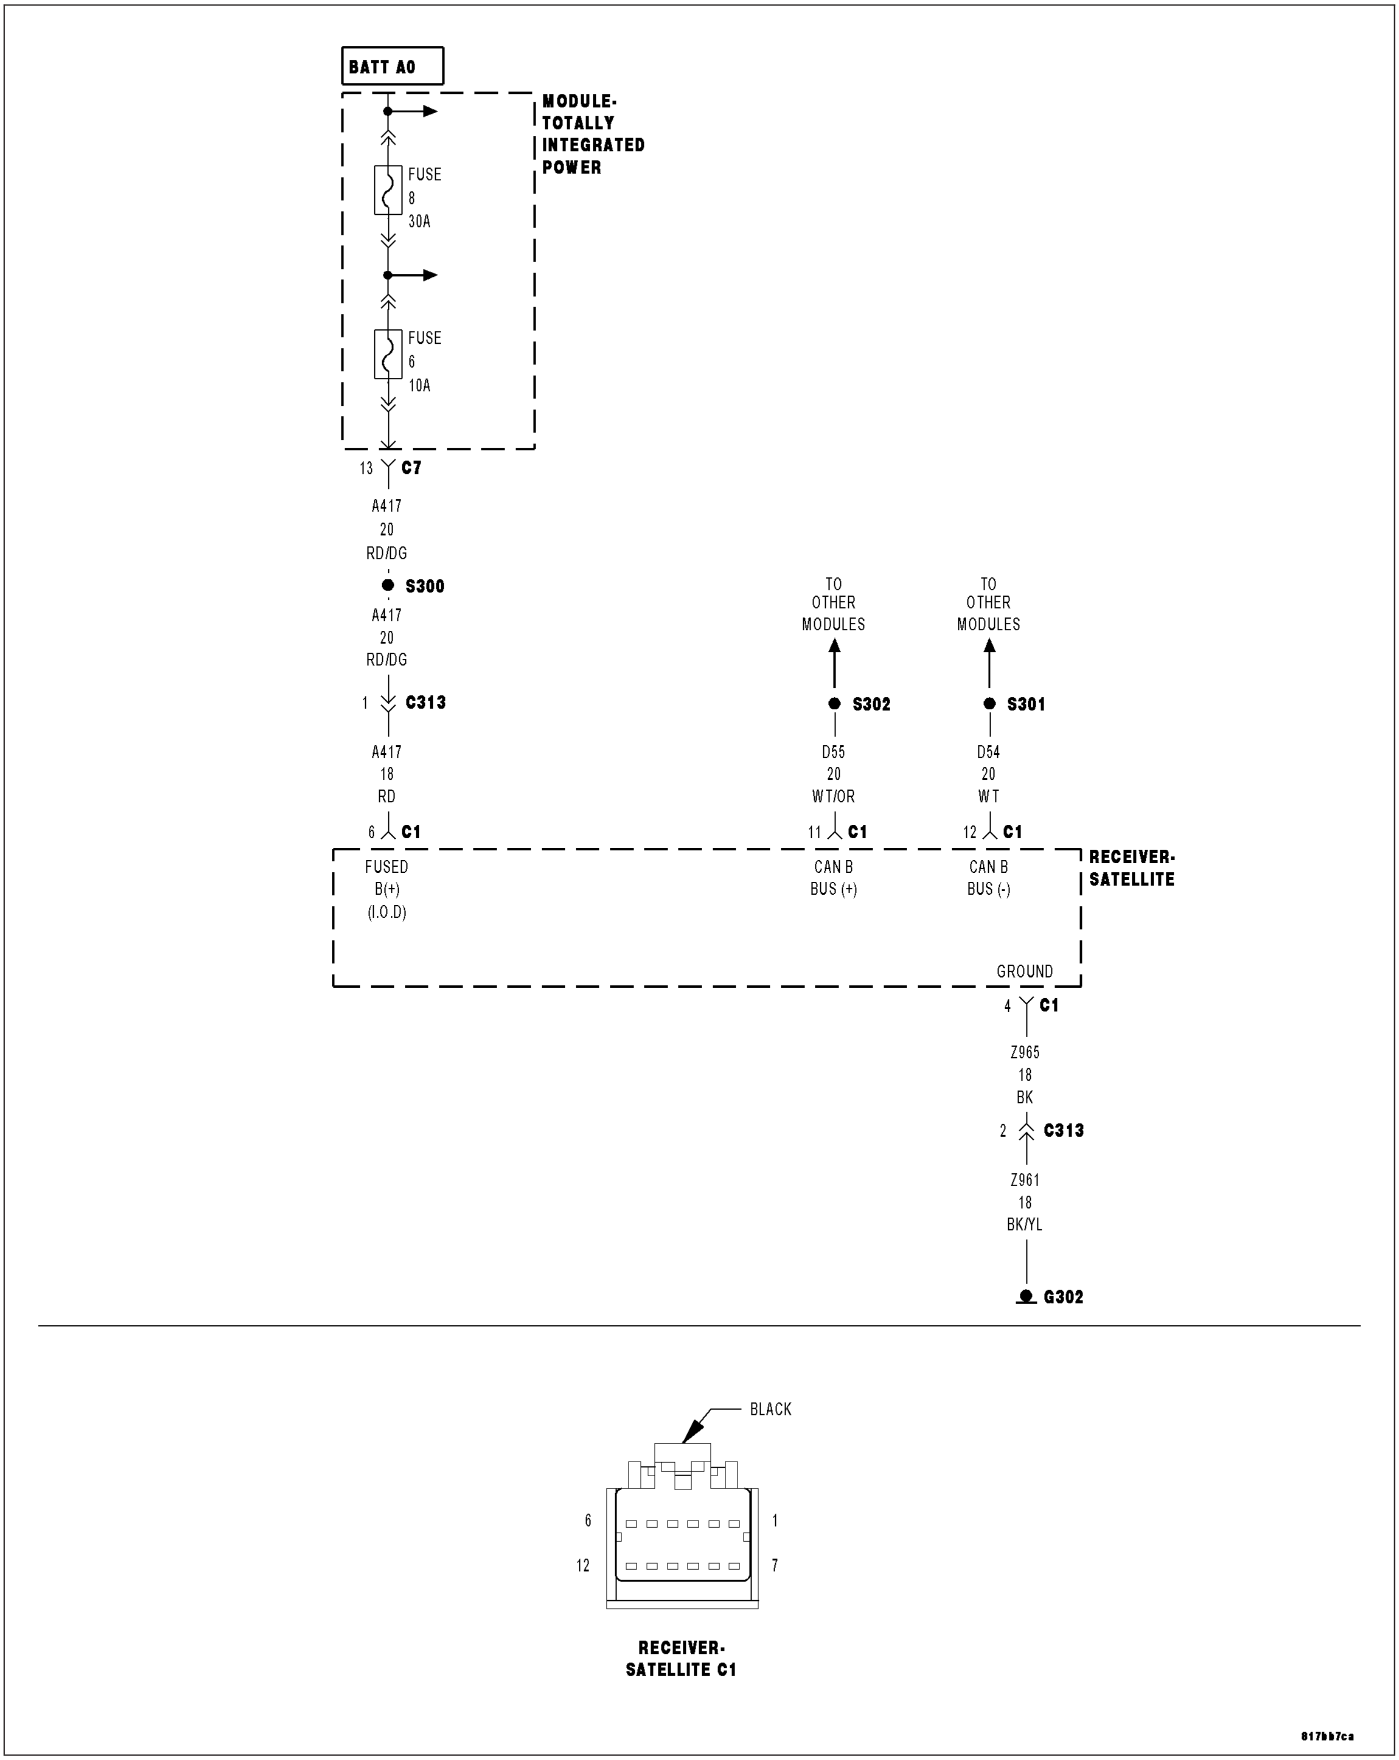
No >> Repair the (Z937) ground circuit for an open.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

Turn the ignition on.

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.



Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Replace the Radio in accordance with the service information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*NO RESPONSE FROM SDAR (SATELLITE RECEIVER)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A417) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z965) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
SATELLITE RECEIVER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

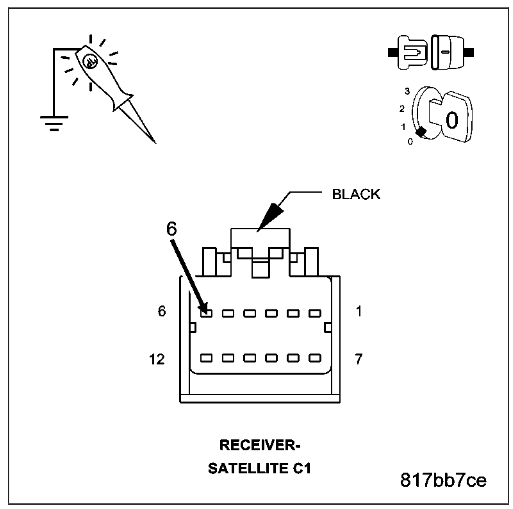
NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2



No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

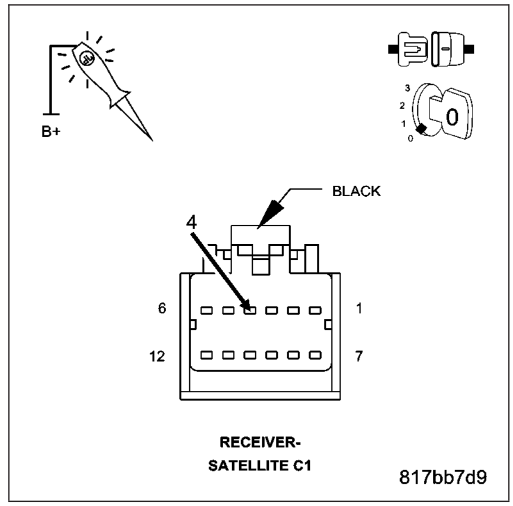
2. (A417) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Satellite Receiver harness connector.

Using a 12-volt test light connected to ground, check the (A417) Fused B(+) circuit.

Does the test light illuminate brightly?



Yes >> Go To 3

No >> Repair the (A417) Fused B(+) circuit for an open or short.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (Z965) GROUND CIRCUIT OPEN

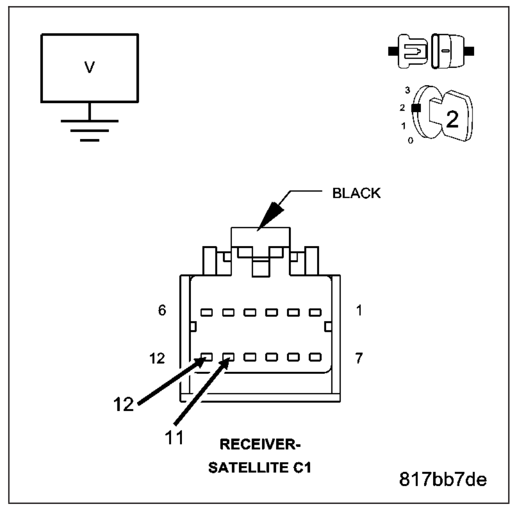
Using a 12-volt test light connected to 12-volts, check the (Z965) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z965) ground circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

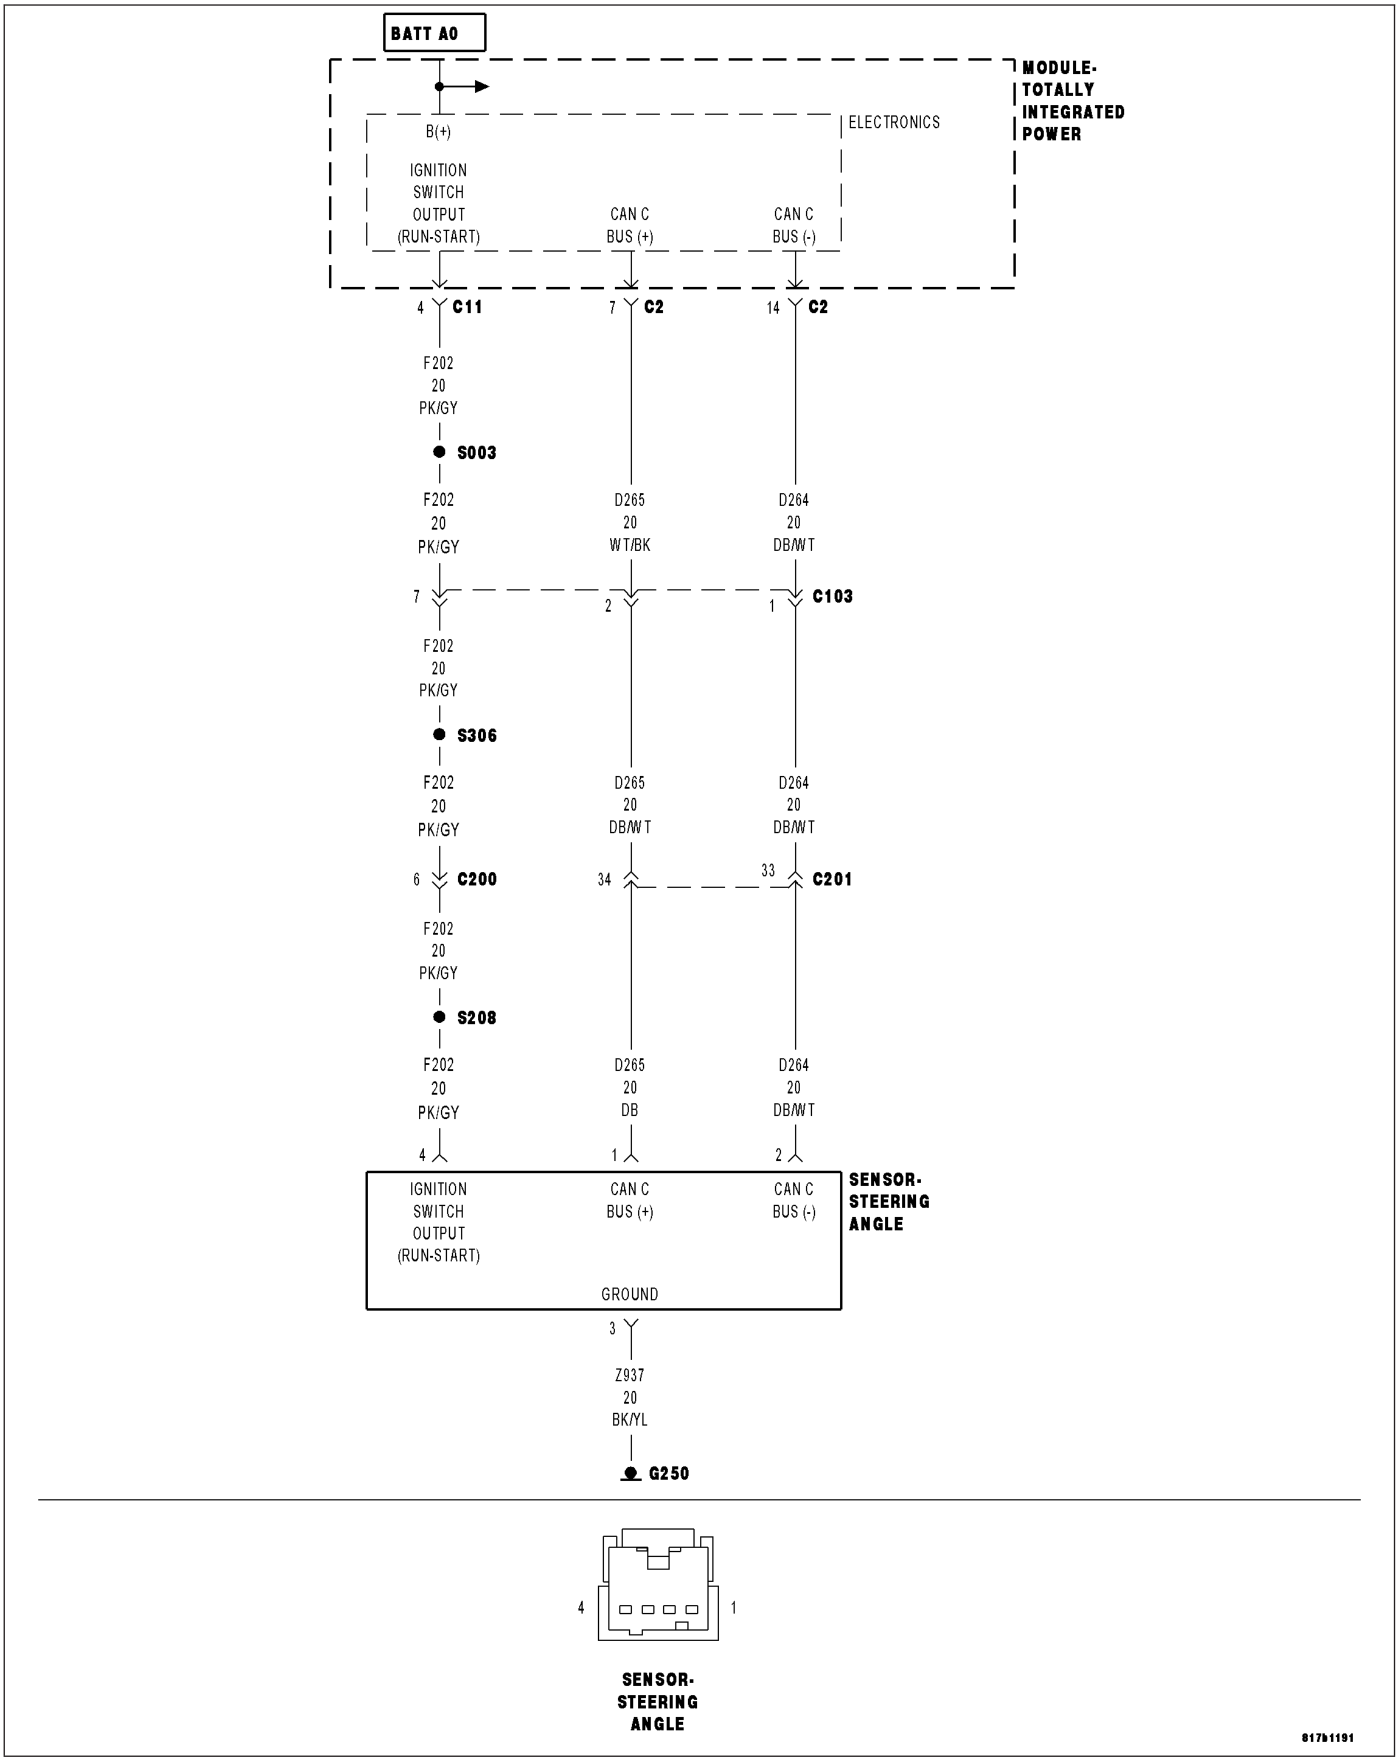
Turn the ignition on.

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?



Yes >> Replace the Satellite Receiver in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*NO RESPONSE FROM THE STEERING ANGLE SENSOR (SAS)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(F202) IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED
(Z937) GROUND CIRCUIT OPEN
(D265) CAN C BUS (+) CIRCUIT OPEN
(D264) CAN C BUS (-) CIRCUIT OPEN
STEERING ANGLE SENSOR

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

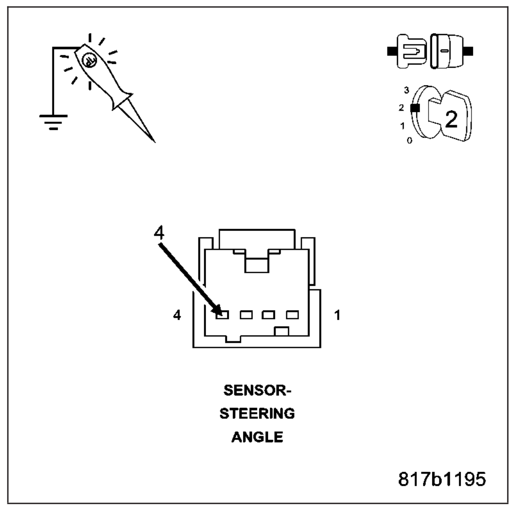
With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the sensor?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.



2. (F202) IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition off.

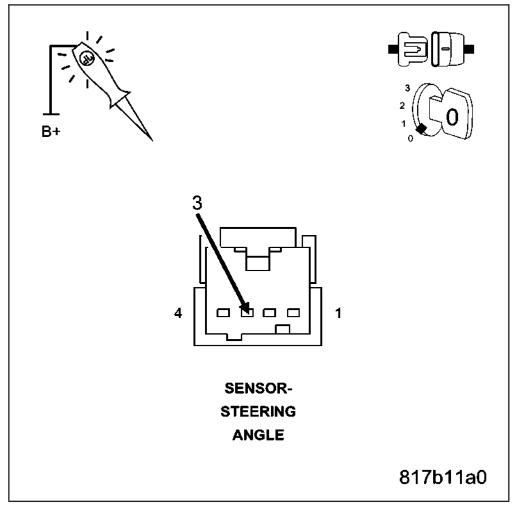
Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 3



No >> Repair the (F202) Ignition Switch Output circuit for an open or short.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

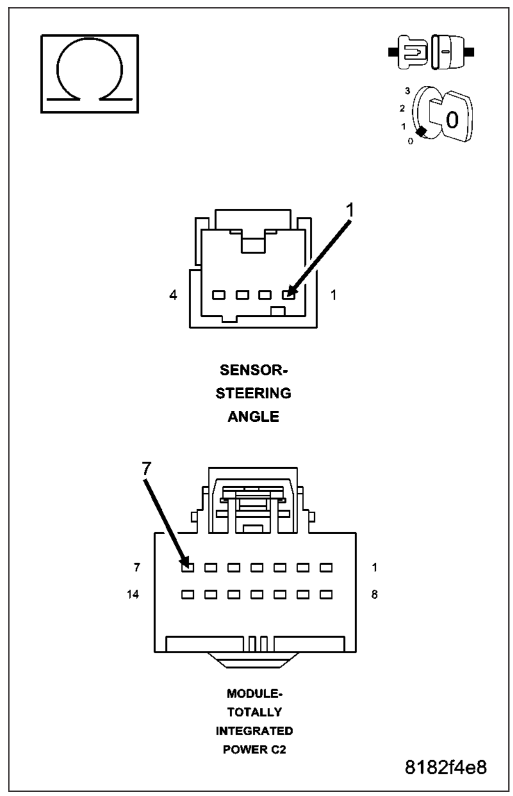
3. (Z937) GROUND CIRCUIT OPEN

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z937) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4



No >> Repair the (Z937) ground circuit for an open.

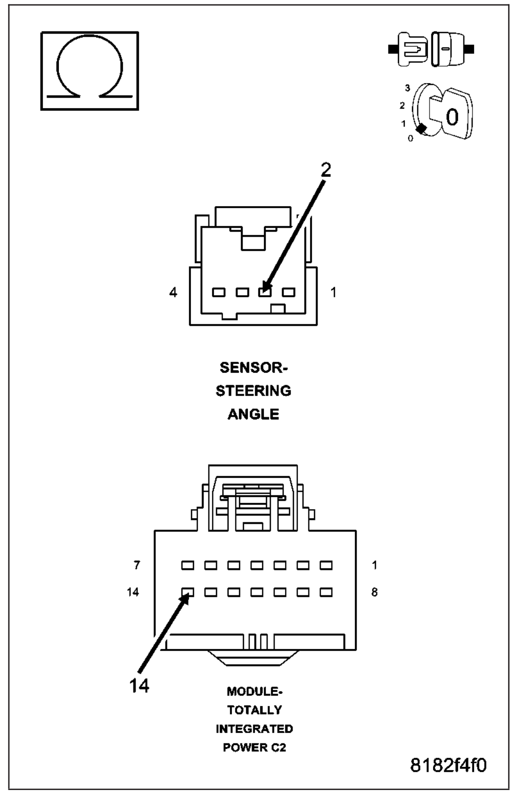
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (D265) CAN C BUS (+) CIRCUIT OPEN

Disconnect the TIPM C2 harness connector.

Measure the resistance of the (D265) CAN C Bus (+) circuit between the TIPM C2 harness connector and the Steering Angle Sensor connector.

Is resistance below 5.0 ohms?



Yes >> Go To 5

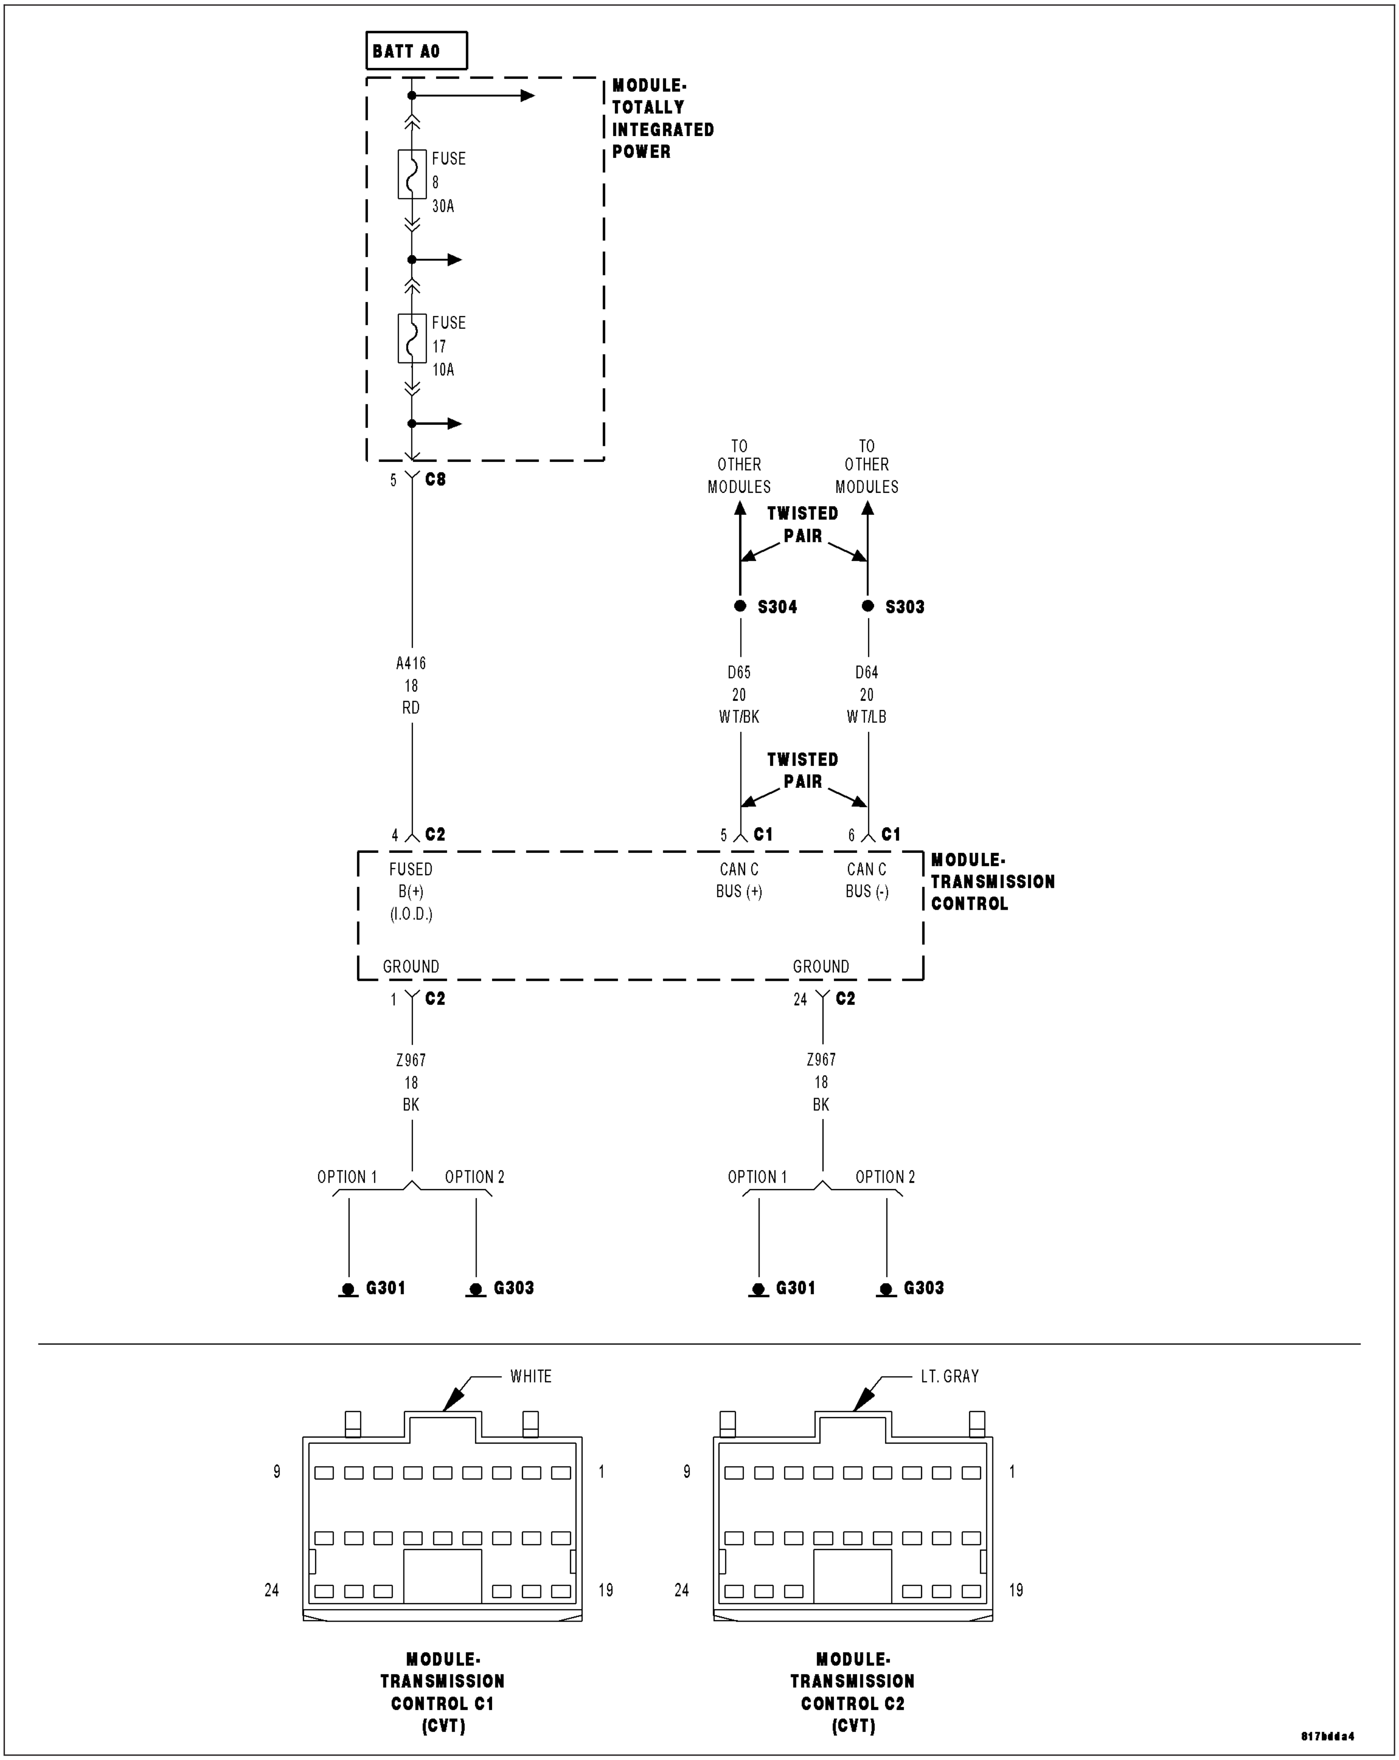
No >> Repair the (D265) CAN C Bus (+) circuit for an open.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. (D264) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D264) CAN C Bus (-) circuit between the TIPM C2 harness connector and the Steering Angle Sensor connector.

Is resistance below 5.0 ohms?



Yes >> Replace the Steering Angle Sensor in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the (D264) CAN C Bus (-) circuit for an open.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

*NO RESPONSE FROM TCM (TRANSMISSION CONTROL MODULE) (CVT)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A416) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z967) GROUND CIRCUIT OPEN
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
TRANSMISSION CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the TIPM for any active CAN C hardware DTC's, perform DTC before proceeding.

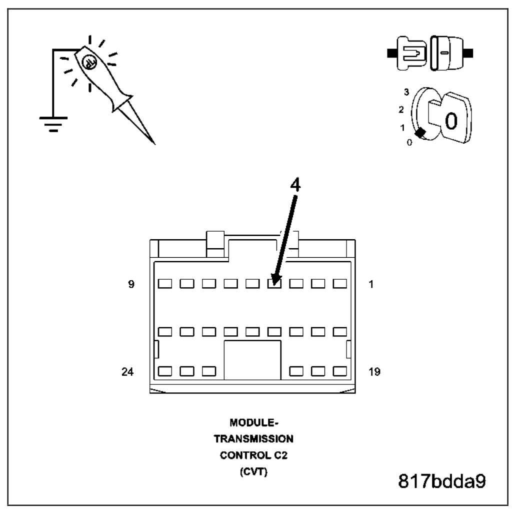
Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A416) FUSED B(+) CIRCUIT OPEN OR SHORTED

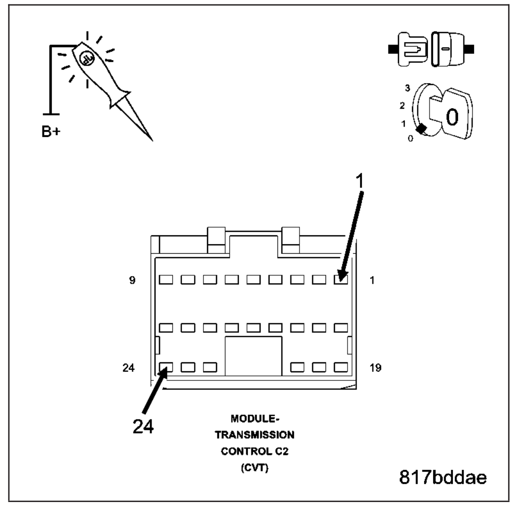
Turn the ignition off.



Disconnect the TCM C2 harness connector.

Using a 12-volt test light connected to ground, check the (A416) Fused B(+) circuit.

Does the test light illuminate brightly?



Yes >> Go To 3

No >> Repair the (A416) Fused B(+) circuit for an open or short. Perform the CVT VERIFICATION TEST.

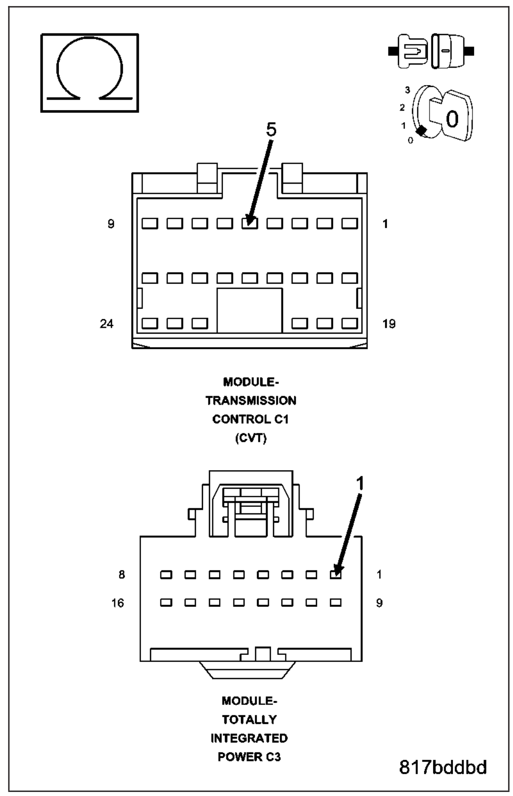
3. (Z967) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z967) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z967) ground circuit for an open. Perform the CVT VERIFICATION TEST.



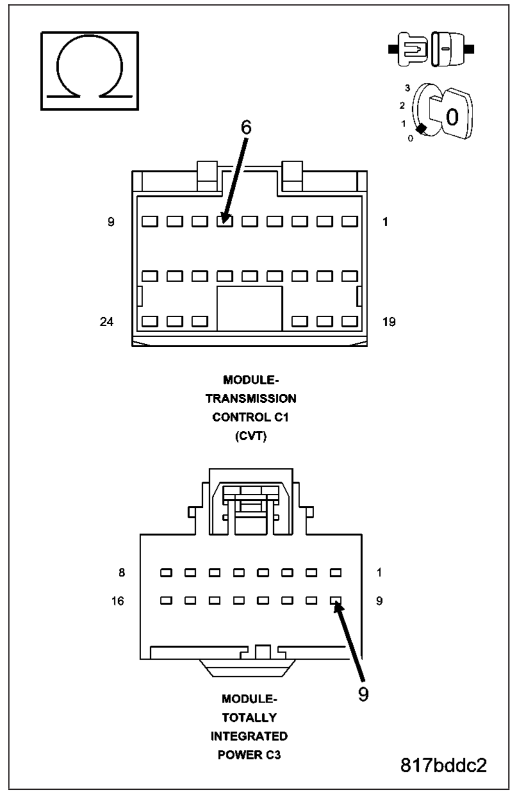
4. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the TCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM C3 harness connector and the TCM C1 harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the (D65) CAN C Bus (+) circuit for an open. Perform the CVT VERIFICATION TEST.

5. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM C3 harness connector and the TCM C1 harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace and program the Transmission Control Module in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

No >> Repair the (D64) CAN C Bus (-) circuit for an open.
Perform the CVT VERIFICATION TEST.

*NO RESPONSE FROM TIPM (TOTALLY INTEGRATED POWER MODULE)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
DIRECT BATTERY FEED CIRCUIT OPEN
GROUND CIRCUITS OPEN
DIAGNOSTIC CAN C CIRCUITS OPEN
DIAGNOSTIC CAN C CIRCUITS SHORTED TO GROUND
DIAGNOSTIC CAN C CIRCUITS SHORTED TOGETHER
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

NOTE: Ensure the scan tool is updated to the latest software.

NOTE: If the scan tool displays any error messages involving the Diagnostic CAN C circuits, diagnose and repair the errors before proceeding. Refer to the Table of Contents.

NOTE: A loss of communication with the TIPM can cause the ECU View button on the scan tool to be inoperative (not highlighted).

With the scan tool, attempt to select ECU View.

Can the scan tool communicate with the TIPM?

Yes >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

No >> Go To 2

2. DIRECT BATTERY FEED CIRCUIT OPEN AT TIPM

Disconnect the scan tool from the DLC.

Using a 12-volt test light connected to ground, and using the wiring diagram as a guide, check the direct battery feed circuit at the TIPM.

Does the test light illuminate brightly?

Yes >> Go To 3

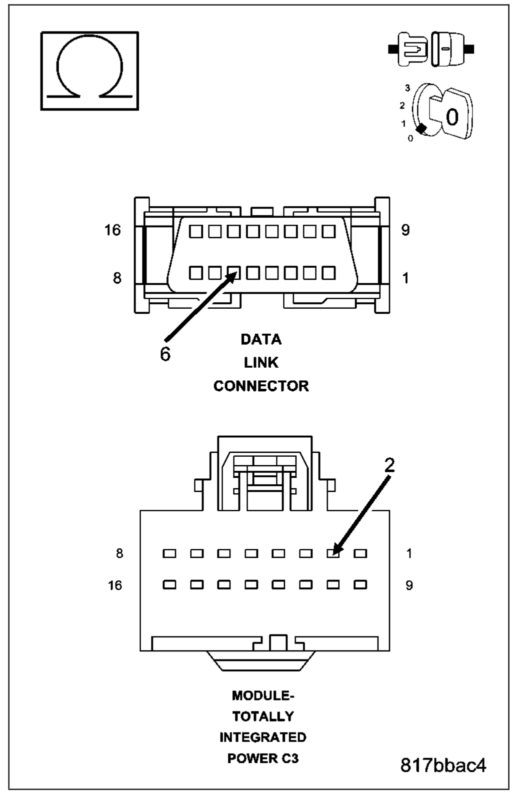
No >> Repair the direct battery feed circuit for an open.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. GROUND CIRCUITS OPEN AT TIPM

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, and using the wiring diagram as a guide, check all ground circuits at the TIPM.

Does the test light illuminate brightly on each circuit?



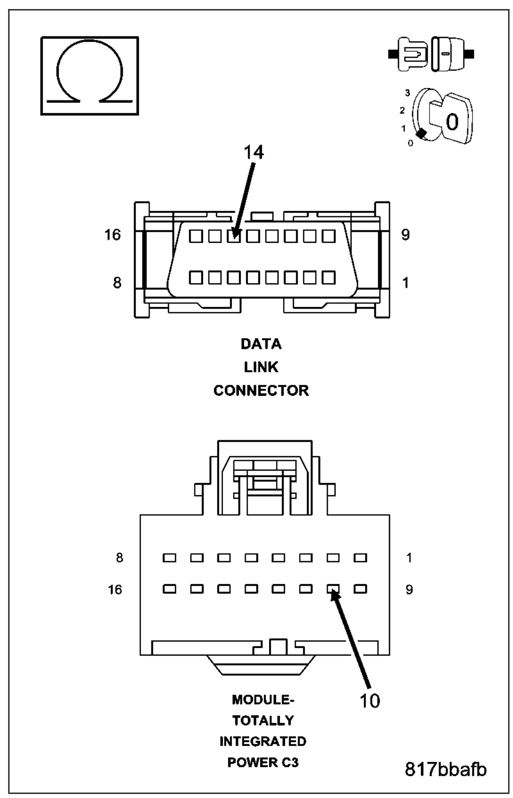
Yes >> Go To 4

No >> Repair the ground circuit that did not light the test light for an open.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK FOR (D72) DIAGNOSTIC CAN C (+) CIRCUIT OPEN AT DLC

Disconnect the TIPM C3 harness connector.

Measure the resistance on the (D72) Diagnostic CAN C (+) circuit between the TIPM C3 harness connector and the DLC.



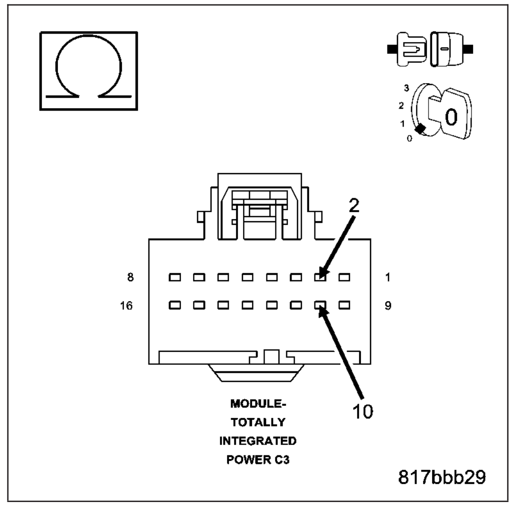
Is the resistance above 10.0 ohms?

Yes >> Repair the (D72) Diagnostic CAN C (+) circuit for an open. Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK FOR (D71) DIAGNOSTIC CAN C (-) CIRCUIT OPEN AT DLC

Measure the resistance on the (D71) Diagnostic CAN C (-) circuit between the TIPM C3 harness connector and the DLC.



Is the resistance above 10.0 ohms?

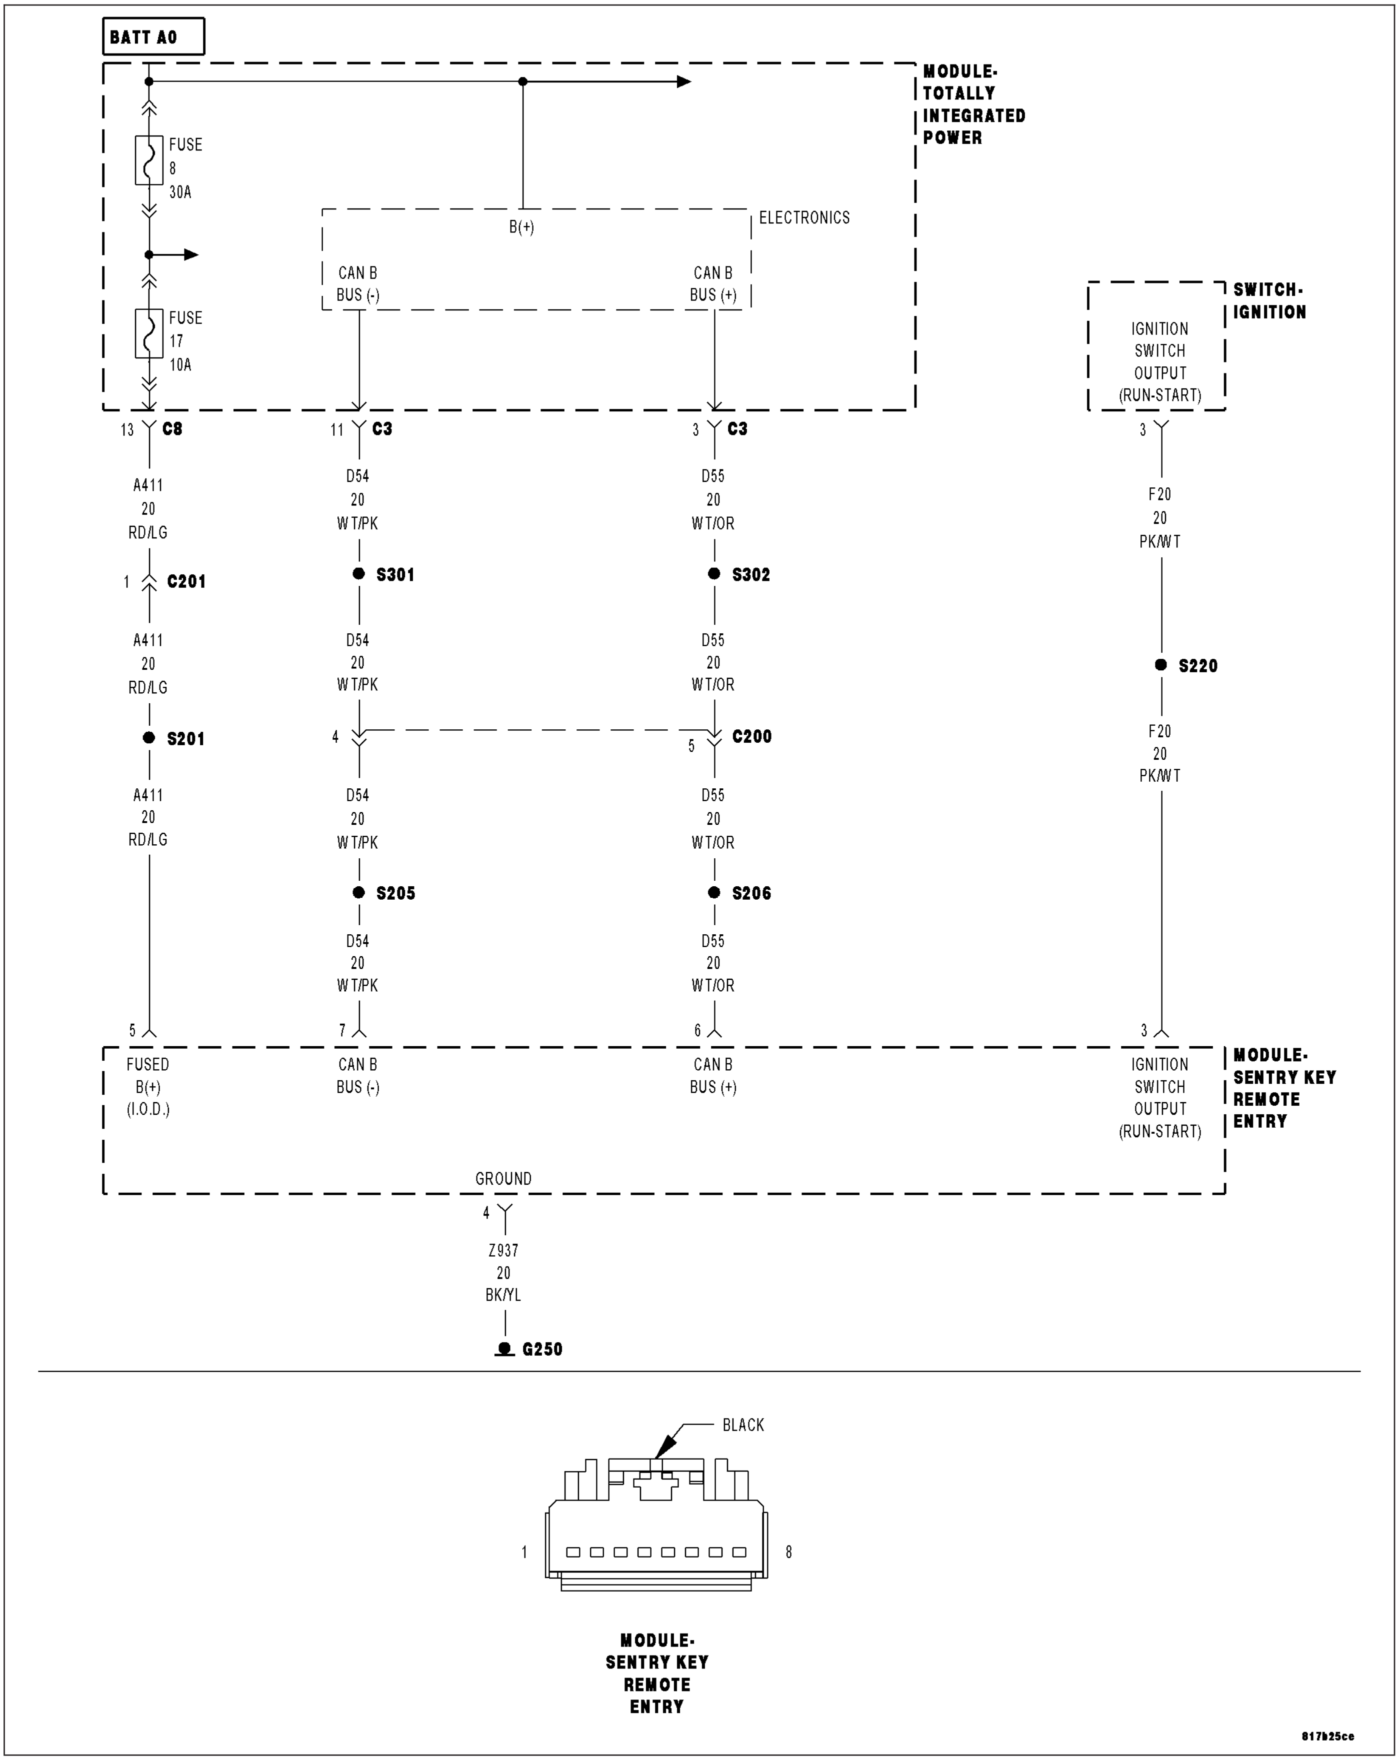
Yes >> Repair the (D71) Diagnostic CAN C (-) circuit for an open. Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 6

6. CHECK FOR DIAGNOSTIC CAN C CIRCUITS SHORTED TOGETHER

Measure the resistance between the (D72) Diagnostic CAN C (+) circuit and the (D71) Diagnostic CAN C (-) circuit at the TIPM C3 harness connector.

Is the resistance below 100.0 ohms?



Yes >> Repair the (D72) Diagnostic CAN C (+) circuit for a short to the (D71) Diagnostic CAN C (-) circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

*NO RESPONSE FROM WCM (SENTRY KEY REMOTE ENTRY MODULE)

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A411) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z937) GROUND CIRCUIT OPEN
(F20) IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
SENTRY KEY REMOTE ENTRY MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU View.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

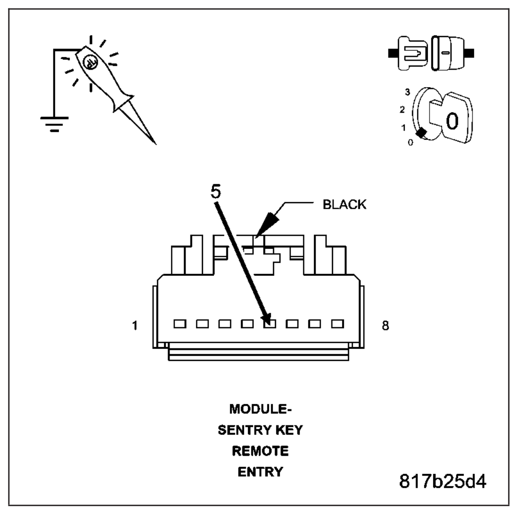
Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A411) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.



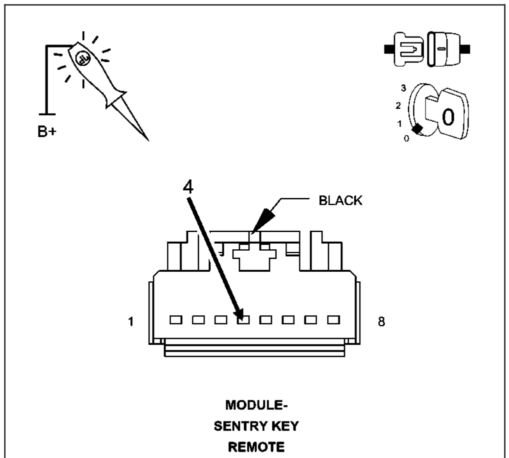
Disconnect the Sentry Key Remote Entry Module harness connector.

Using a 12-volt test light connected to ground, check the (A411) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A411) Fused B(+) circuit for an open or short. Perform SKREEM VERIFICATION TEST.



3. (Z937) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z937) ground circuit.

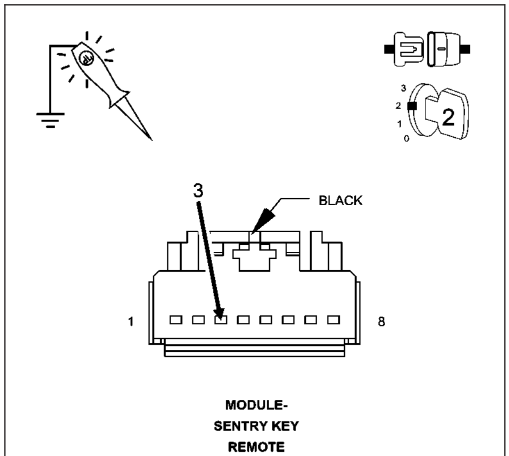
Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z937) ground circuit for an open.
Perform SKREEM VERIFICATION TEST.

817b25d9

4. (F20) IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED



Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F20) Ignition Switch Output circuit.

Does the test light illuminate brightly?

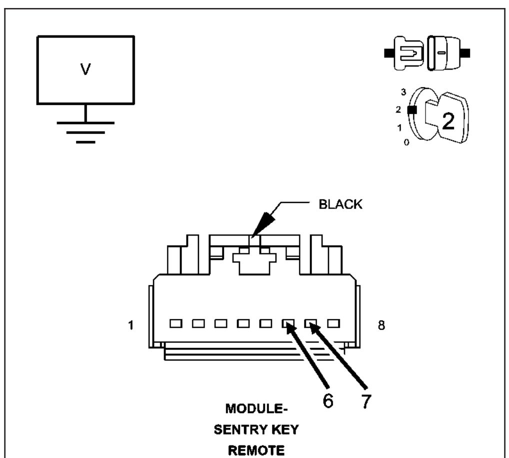
Yes >> Go To 5

No >> Repair the (F20) Ignition Switch Output circuit for an open or short.
Perform SKREEM VERIFICATION TEST.

817b25e3

5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.



Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Replace the Sentry Key Remote Entry Module in accordance with the service information.
Perform SKREEM VERIFICATION TEST.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform SKREEM VERIFICATION TEST.

817b25e7

STANDARD PROCEDURE

BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. Perform Body Verification Test

NOTE: If the SKREEM or PCM/ECM was replaced, refer to the service information for proper programming procedures.

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Ensure that all accessories are turned off.
3. Ensure that the battery is fully charged.
4. Turn the ignition on.
5. With the scan tool, record and erase DTC's from all modules.
6. If an electronic control module was replaced, select the applicable module from the scan tool menu and press "Misc. Functions". If the module has programmable features, program as necessary.
7. (Export only) If the Intrusion Transceiver Module (ITM) and/or Siren was replaced, select ITM from the scan tool ECU View menu then "Misc. Functions" and perform the applicable replacement procedure.
8. Turn the ignition off, wait 10 seconds, and then turn the ignition on.
9. Operate all functions of the system that caused the original concern.
10. With the scan tool, select ECU View and check for DTC's in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No >> The repair is complete.

ELECTRONIC CONTROL MODULES - SERVICE INFORMATION

TABLE OF CONTENTS

ELECTRONIC CONTROL MODULES - SERVICE INFORMATION

STANDARD PROCEDURE

PCM/ECM/SKREEM PROGRAMMING

NOTE: Before replacing the Powertrain Control Module (PCM) or Engine Control Module (ECM), be certain to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM/ECM driver/control circuit failures are caused by internal component failures (i.e. relays and solenoids) and shorted circuits (i.e. pull-ups, drivers, and switched circuits). These failures are difficult to detect when a double fault has occurred and only one DTC has been set.

When a PCM, or ECM, and the Sentry Key REmote Entry Module (SKREEM) on vehicles equipped with the Sentry Key Immobilizer System (SKIS) are replaced at the same time, perform the following steps in order:

1. Program the new PCM or ECM.
2. Program the new SKREEM (also sometimes referred to as the Wireless Control Module or WCM).
3. Replace all ignition keys and program them into the new SKREEM/WCM.

PROGRAMMING THE SKREEM

The SKIS Secret Key is an ID code that is unique to each SKREEM/WCM. This code is programmed and stored in the SKREEM/WCM, the PCM/ECM, and each ignition key transponder chip. When the PCM or SKREEM/WCM is replaced, it is necessary to program the Secret Key into the new module using a diagnostic scan tool. Follow the programming steps outlined in the diagnostic scan tool for “PCM Replaced” or “WCM Replaced” under “Miscellaneous Functions” for the “WCM/Wireless Control Module” menu item as appropriate.

NOTE: If the PCM/ECM and the SKREEM/WCM are replaced at the same time, all vehicle ignition keys will need to be replaced and new keys programmed into the new SKREEM/WCM.

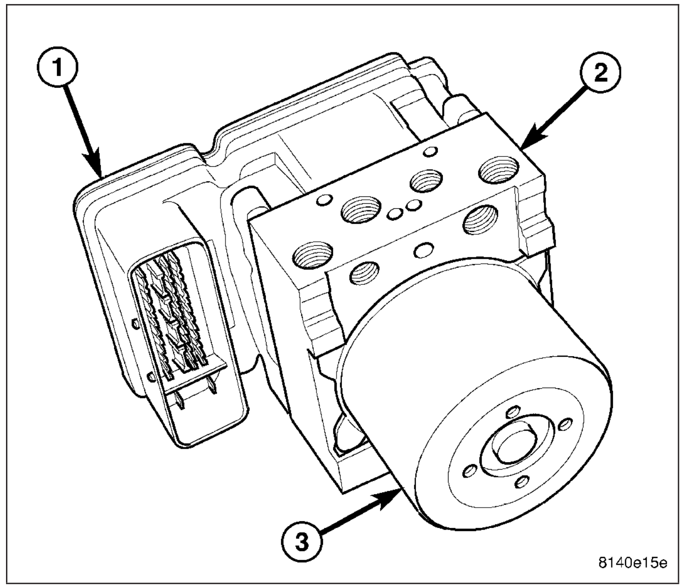
NOTE: Programming the PCM/ECM or SKREEM is done using a diagnostic scan tool and a PIN to enter secure access mode. If eight attempts are made to enter secure access mode using an incorrect PIN, secure access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. (Ensure all accessories are turned OFF. Also monitor the battery state and connect a battery charger if necessary).

PROGRAMMING IGNITION KEYS TO THE SKREEM

Each ignition key transponder also has a unique ID code that is assigned at the time the key is manufactured. When a key is programmed into the SKREEM/WCM, the transponder ID code is learned by the module and the transponder acquires the unique Secret Key ID code from the SKREEM/WCM. To program ignition keys into the SKREEM/WCM, follow the programming steps outlined in the diagnostic scan tool for **PROGRAM IGNITION KEYS OR KEY FOBS** under **MISCELLANEOUS FUNCTIONS** for the **WCM/WIRELESS CONTROL MODULE** menu item.

NOTE: A maximum of eight keys can be learned to each SKREEM. Once a key is learned to a SKREEM, that key has acquired the Secret Key for that SKREEM and cannot be transferred to any other SKREEM or vehicle.

If ignition key programming is unsuccessful, the scan tool will display one of the following error messages:



- **Programming Not Attempted** - The scan tool attempts to read the programmed key status and there are no keys programmed into SKREEM memory.
- **Programming Key Failed (Possible Used Key From Wrong Vehicle)** - SKREEM is unable to program an ignition key transponder due to one of the following:
  - The ignition key transponder is faulty.
  - The ignition key transponder is or has been already programmed to another vehicle.
- **8 Keys Already Learned, Programming Not Done** - The SKREEM transponder ID memory is full.
- **Learned Key In Ignition** - The ID for the ignition key transponder currently in the ignition lock cylinder is already programmed into SKREEM memory.

MODULE-ANTILOCK BRAKE

DESCRIPTION

The Antilock Brake Module (ABM) is a microprocessor-based device which monitors the antilock brake system (ABS) during normal braking and controls it when the vehicle is in an ABS stop or when in a traction control situation. The ABM utilizes a 47-way electrical connector on the vehicle wiring harness. The power source for the ABM is through the ignition switch in the RUN or ON position.

The ABM (1) is mounted to the HCU (2) as part of the Integrated Control Unit (ICU). The ICU is located in the engine compartment on the inboard side of the right body frame rail behind the strut tower. For information on the ICU, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - DESCRIPTION).

OPERATION

The primary functions of the Antilock Brake Module (ABM) are to:

- Monitor the Antilock Brake System (ABS) and Electronic Stability Program (ESP) for proper operation.
- Detect wheel locking or wheel slipping tendencies by monitoring the speed of all four wheels of the vehicle.
- Control fluid modulation to the wheel brakes while the system is in ABS or traction control mode.
- Modulates fluid pressure to the wheel brakes to control vehicle yaw rate in ESP mode.
- Store diagnostic information.
- Provide communication to the scan tool while in diagnostic mode.
- Illuminate the amber ABS indicator in the instrument cluster.
- Illuminate the yellow ESP/BAS indicator in the instrument cluster (if equipped).

The ABM constantly monitors the ABS and ESP (if equipped) for proper operation. If the ABM detects a fault, it will turn on the amber ABS and yellow ESP/BAS indicators and disable the ABS or ESP if so equipped. The normal base braking system will remain operational at that time.

The ABM continuously monitors the speed of each wheel through the signals generated by the wheel speed sensors to determine if any wheel is beginning to lock. When a wheel locking tendency is detected, the ABM commands the ABM solenoid coils to actuate. The coils then open and close the valves in the HCU that modulate brake fluid pressure in some or all of the hydraulic circuits. The ABM continues to control pressure in individual hydraulic circuits until a locking tendency is no longer present.

REMOVAL

Due to packaging and limited space it is necessary to remove and disassemble the Integrated Control Unit (ICU) to service the Antilock Brake Module (ABM) on this vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - REMOVAL)

INSTALLATION

Due to packaging and limited space it is necessary to install the Antilock Brake Module (ABM) on the Hydraulic Control Unit (HCU), then install the Integrated Control Unit (ICU) on the vehicle as an assembly. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - ASSEMBLY)

COMMUNICATION

DESCRIPTION

The primary on-board communication network between microprocessor-based electronic control modules in this vehicle is the Controller Area Network (CAN) data bus system. A data bus network minimizes redundant wiring connections; and, at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be connected to only one module (also referred to as a node). Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data. Each node ignores the messages on the bus that it cannot use.

The CAN bus is a two-wire multiplex system. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. The CAN bus is used for communication between most vehicle nodes. However, in addition to the CAN bus network, certain nodes may also be equipped with a Local Interface Network (LIN) data bus. The LIN data bus is a single wire low-speed system used to provide direct communication between a master module and certain switch or sensor inputs.

There are actually three separate CAN bus systems used in the vehicle. They are designated: the CAN-B, the CAN-C and the Diagnostic CAN-C. The CAN-B and CAN-C systems provide on-board communication between all nodes in the vehicle. The CAN-C is the faster of the two systems providing near real-time communication (500 Kbps), but is less fault tolerant than the CAN-B system. The CAN-C is used exclusively for communications between critical powertrain and chassis nodes. The slower (83.3 Kbps), but more fault tolerant CAN-B system is used for communications between body and interior nodes. The CAN-B fault tolerance comes from its ability to revert to a single wire communication mode if there is a fault in the bus wiring.

The added speed of the CAN data bus is many times faster than previous data bus systems. This added speed facilitates the addition of more electronic control modules or nodes and the incorporation of many new electrical and electronic features in the vehicle. The Diagnostic CAN-C bus is also capable of 500 Kbps communication, and is sometimes informally referred to as the CAN-D system to differentiate it from the other high speed CAN-C bus. The Diagnostic CAN-C is used exclusively for the transmission of diagnostic information between the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) and a diagnostic scan tool connected to the industry-standard 16-way Data Link Connector (DLC) located beneath the instrument panel on the driver side of the vehicle.

The TIPM is located in the engine compartment near the battery. The central CAN gateway or hub module integral to the TIPM is connected to all three CAN buses. This gateway physically and electrically isolates the CAN buses from each other and coordinates the bi-directional transfer of messages between them.

OPERATION

The Controller Area Network (CAN) data bus allows all electronic modules or nodes connected to the bus to share information with each other. Regardless of whether a message originates from a module on the low speed CAN-B bus or on the high speed CAN-C or CAN-D bus, the message structure and layout is similar, which allows the Totally Integrated Power Module/Central GateWay (TIPM or TIPMCGW) to process and transfer messages between the CAN buses. The TIPM also stores a Diagnostic Trouble Code (DTC) for certain bus network faults.

All modules (also referred to as nodes) transmit and receive messages over one of these buses. Data exchange between nodes is achieved by serial transmission of encoded data messages. Each node can both send and receive serial data simultaneously. Bus messages are carried over the data bus in the form of Variable Pulse Width Modulated (VPWM) signals which, when the high and low voltage pulses are strung together, form a message. Each node uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time.

The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) is the Local Interface Network (LIN) master module in this vehicle and it gathers information from the compass module, the instrument panel switch bank, the Steering Control Module (SCM), and the Heated Seat Module (HSM) through the LIN data bus. There is also LIN data bus communication between the individual Tire Pressure Monitor (TPM) transponders and the Sentry Key REmote Entry Module (SKREEM) (also known as the Wireless Control Module/WCM). Both the EMIC and the SKREEM either act directly upon the information received through the LIN data bus or relay the information to other nodes in the vehicle using electronic messages placed on the CAN-B bus.

The voltage network used to transmit messages requires biasing and termination. Each module on the CAN bus network provides its own biasing and termination. Each node terminates the bus through a terminating resistor and a terminating capacitor. There are two types of nodes on the bus. The dominant node terminates the bus through a 1 KW resistor and a 3300 pF capacitor, typically resulting in about a 3300 ohm termination resistance. However, this

resistance value may vary somewhat by application. The TIPM (or TIPMCGW) is the only dominant node in this network. A non-dominant (or recessive) node terminates the bus through an 11 KW resistor and a 330 pF capacitor, typically resulting in about a 10800 ohm termination resistance.

The communication protocol being used for the CAN data bus is a non-proprietary, open standard adopted from the Bosch CAN Specification 2.0b. The CAN-C is the faster of the two primary buses in the CAN bus system, providing near real-time communication (500 Kbps).

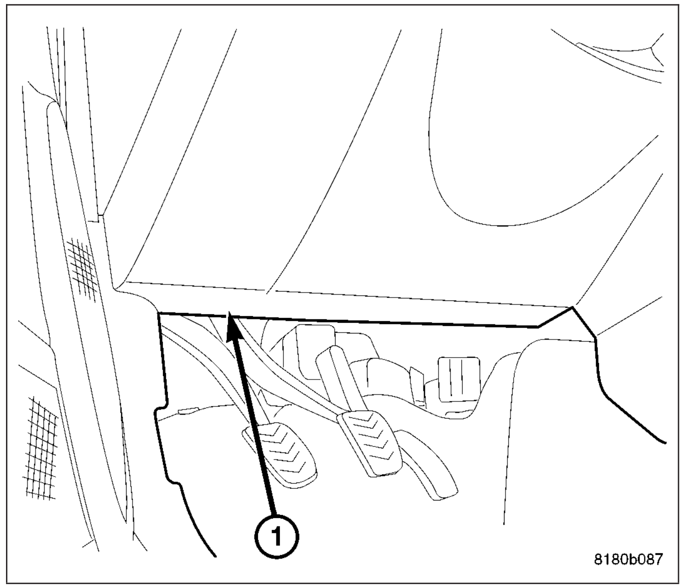
The CAN bus nodes are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (–) wire. Refer to the CAN Bus Voltages table.

CAN Bus Voltages (Normal Operation)								
CAN-C Bus Circuits	**Sleep**	**Recessive (Bus Idle)**	**Dominant (Bus Active)**	**CAN-L Short to Ground**	**CAN-H Short to Ground**	**CAN-L Short to Battery**	**CAN-H Short to Battery**	**CAN-H Short to CAN-L**
CAN-L (–)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
CAN-B Bus Circuits	**Key-Off (Bus Asleep)**		**Key-On (Bus Active)**	**CAN-L Short to Ground**	**CAN-H Short to Ground**	**CAN-L Short to Battery**	**CAN-H Short to Battery**	**CAN-H Short to CAN-L**
CAN-L (–)	10.99 V		4.65 - 4.98 V	0 V	4.5 - 4.7 V	Battery Voltage	4.5 - 4.7 V	0.3 - 0.7 V
CAN-H (+)	0.0 V		0.39 - 0.46 V	0.3 - 0.7 V	0 V	0.3 - 0.7 V	Battery Voltage	0.3 - 0.7 V
Notes								
All measurements taken between node ground and CAN terminal with a standard DVOM. DVOM will display average network voltage. Total resistance of CAN-C network can also be measured (60 ohms). Cannot measure total resistance of CAN-B network.								

In order to minimize the potential effects of Ignition-Off Draw (IOD), the CAN-B network employs a sleep strategy. However, a network sleep strategy should not be confused with the sleep strategy of the individual nodes on that network, as they may differ. For example: The CAN-C bus network is awake only when the ignition switch is in the ON or START positions; however, the TIPM, which is on the CAN-C bus, may still be awake with the ignition switch in the ACCESSORY or UNLOCK positions. The integrated circuitry of an individual node may be capable of processing certain sensor inputs and outputs without the need to utilize network resources.

The CAN-B bus network remains active until all nodes on that network are ready for sleep. This is determined by the network using tokens in a manner similar to polling. When the last node that is active on the network is ready for sleep, and it has already received a token indicating that all other nodes on the bus are ready for sleep, it broadcasts a **bus sleep acknowledgment** message that causes the network to sleep. Once the CAN-B bus network is asleep, any node on the bus can awaken it by transmitting a message on the network. The TIPM will keep either the CAN-B or the CAN-C bus awake for a timed interval after it receives a diagnostic message for that bus over the Diagnostic CAN-C bus.

In the CAN system, available options are configured into the TIPM at the assembly plant, but additional options can be added in the field using the diagnostic scan tool. The configuration settings are stored in non-volatile memory. The TIPM also has two 64-bit registers, which track each of the **as-built** and **currently responding** nodes on the CAN-B and CAN-C buses. The TIPM stores a Diagnostic Trouble Code (DTC) in one of two caches for any detected



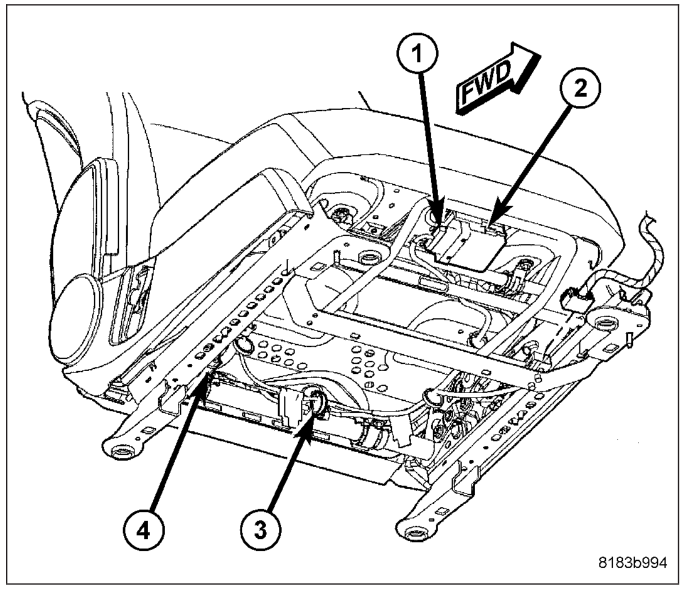
active or stored faults in the order in which they occur. One cache stores powertrain (P-Code), chassis (C-Code) and body (B-Code) DTCs, while the second cache is dedicated to storing network (U-Code) DTCs.

If there are intermittent or active faults in the CAN network, a diagnostic scan tool connected to the Diagnostic CAN-C bus through the 16-way Data Link Connector (DLC) may only be able to communicate with the TIPM. To aid in CAN network diagnosis, the TIPM will provide CAN-B and CAN-C network status information to the scan tool using certain diagnostic signals. In addition, the transceiver in each node on the CAN-C bus will identify a **bus off hardware failure**, while the transceiver in each node on the CAN-B bus will identify a **general bus hardware failure**. The transceivers for some CAN-B nodes will also identify certain failures for both CAN-B bus signal wires.

DATA LINK CONNECTOR

DESCRIPTION

The Data Link Connector (DLC) (1) is a 16-way molded plastic connector that is part of the instrument panel wire harness. This connector is located at the lower edge of the instrument panel, outboard of the steering column. The connector insulator is retained by integral snap features within a rectangular cutout in a mounting bracket integral to the lower instrument panel and inboard of the inside hood release on the inner cowl side trim.



OPERATION

The Data Link Connector (DLC) is an industry-standard 16-way connector that permits the connection of a diagnostic scan tool to the Controller Area Network (CAN) data bus for interfacing with, configuring, and retrieving Diagnostic Trouble Code (DTC) data from the electronic modules that reside on the data bus network of the vehicle.

HEATED SEAT MODULE

DESCRIPTION

The heated seat module (2) is located under the left front seat. It has a single electrical connector (1) and a push pin style retainer that secures it to the seat pan. The module can be accessed from under the front left seat with the seat in the full back position.

The heated seat module is a microprocessor designed to use the Local Interface Network (LIN) data bus messages from the instrument cluster also known as the Cabin Compartment Node (CCN). The CCN receives inputs from the heated seat switches and in turn signals the heated seat module to operate the heated seat elements for both front seats.

OPERATION

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded to the body at all times through the electrical connector. Inputs to the module include Local Interface Network (LIN) data bus messages and standard hardwired 12 volt power and ground. In response to the LIN inputs the heated seat module will control the battery current to the appropriate heated seat elements.

When a heated seat switch LIN data bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38°C (100.4°F), and the High heat set point is about 42°C (107.6°F).

In addition to operating the heated seat elements, the heated seat module sends LED illumination messages to the CNN via the LIN data bus. The CNN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

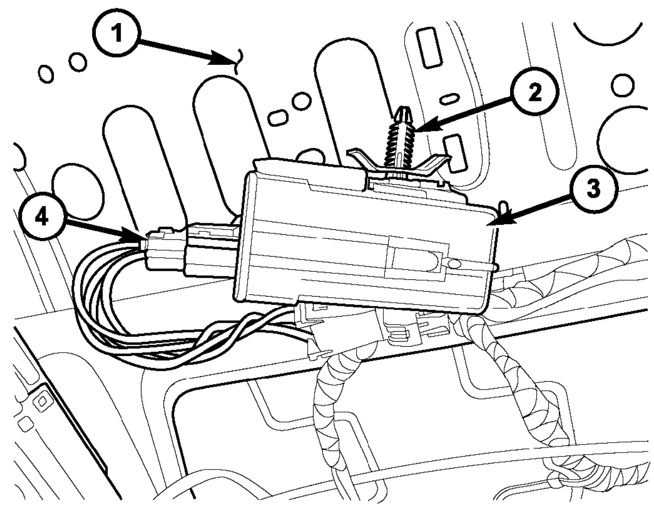
If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate diagnostic trouble code (DTC).

DIAGNOSIS AND TESTING

HEATED SEAT MODULE

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.



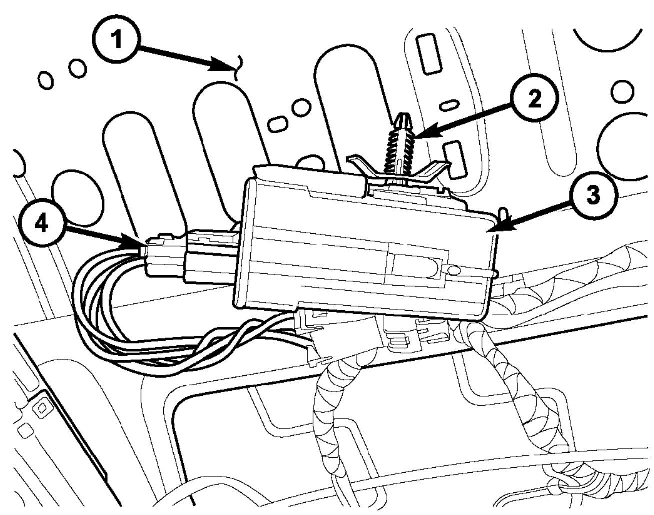
NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Position the right front seat to the full rearward position.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the wire harness connector (4) from the heated seat module (3).
4. Unsnap the heated seat module retaining tab (2) from the seat pan (1).
5. Remove the heated seat module (3) from the vehicle.



816ba78c

INSTALLATION

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Install the heated seat module (3) into the vehicle.
2. Position the retaining tab (2) with the mounting hole in the seat pan (1). Firmly apply even pressure to the module (3) until the mounting tab is fully seated.
3. Connect the wire harness connector (4) to the heated seat module (3).
4. Connect the battery negative cable.
5. Check for proper heated seat system operation.

816ba78c

MODULE-POWERTRAIN CONTROL

DESCRIPTION

PCM GROUND

Ground is provided through multiple pins of the PCM connector. Depending on the vehicle there may be as many as two different ground pins. There are power grounds and sensor grounds.

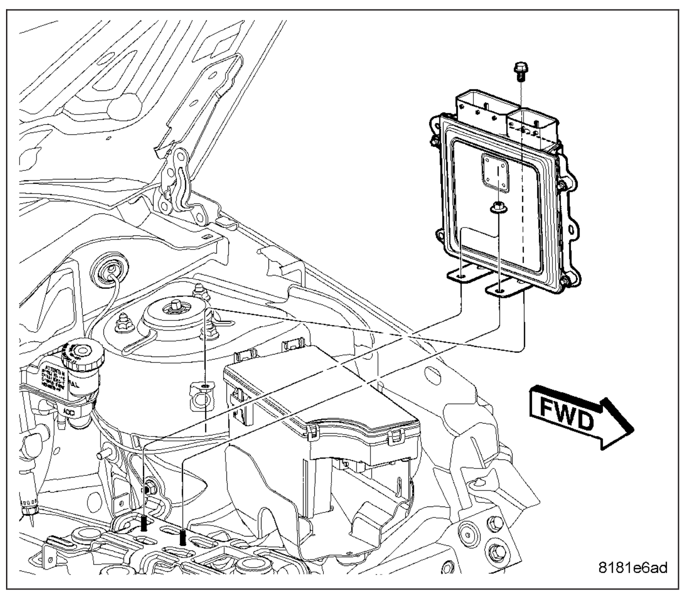
The power grounds are used to control the ground side relays, solenoids, ignition coil or injectors. The signal ground is used for any input that uses sensor return for ground, and the ground side of any internal processing component.

The PCM case is shielded to prevent RFI and EMI. The PCM case is grounded and must be firmly attached to a good, clean body ground.

Internally all grounds are connected together, however there is noise suppression on the sensor ground. For EMI and RFI protection the housing and cover are also grounded separately from the ground pins.

SENSOR RETURN - PCM INPUT

The sensor return circuit provides a low electrical noise ground reference for all of the systems sensors. The sensor return circuit connects to internal ground circuits within the Powertrain Control Module (PCM).



IGNITION SENSE - PCM INPUT

The ignition sense input informs the Powertrain Control Module (PCM) that the ignition switch is in the crank or run position.

OPERATION

POWERTRAIN CONTROL MODULE

The PCM receives input signals from various switches and sensors that are referred to as PCM Inputs. Based on these inputs, the PCM adjusts various engine and vehicle operations through devices that are referred to as PCM Outputs.

NOTE: PCM Inputs:

- Air Conditioning Controls
- Battery Voltage
- Brake Switch
- Camshaft Position Sensor
- Clutch Upstop Switch
- Clutch Interlock
- Crankshaft Position Sensor

- Engine Coolant Temperature Sensor
- Fuel Level Sensor (Bus message)
- Ignition Switch
- Intake Air Temperature Sensor
- Knock Sensor
- Evaporative System Integrity Monitor
- Manifold Absolute Pressure (MAP) Sensor
- Oil Pressure Switch
- Oxygen Sensors
- Power Steering Pressure Switch
- Speed Control Switches
- Vehicle Speed Sensor (MTX-equipped models)

NOTE: PCM Outputs:

- Air Conditioning Clutch Relay
- Charging Indicator Lamp (Bus Message)
- Proportional Purge Solenoid
- Fuel Injectors
- Generator Field
- Ignition Coils
- Malfunction Indicator (Check Engine) Lamp (Bus Message)
- Manifold Flow Valve
- Oxygen Sensors Heater Controls
- Variable Valve Timing
- Vehicle Speed (Manual Transmission)

Based on inputs it receives, the PCM adjusts fuel injector pulse width, idle speed, ignition spark advance, ignition coil dwell and EVAP canister purge operation. The PCM also determines the appropriate transmission shift schedule and shift points, depending on the present operating conditions and driver demand. The PCM regulates the cooling fan, air conditioning and speed control systems. The PCM changes generator charge rate by adjusting the generator field. The PCM also performs diagnostics.

The PCM adjusts injector pulse width (air-fuel ratio) based on the following inputs.

- Battery voltage
- Coolant temperature
- Exhaust gas content (oxygen sensor)
- Engine speed (crankshaft position sensor)
- Intake air temperature
- Manifold absolute pressure
- Throttle position

The PCM adjusts ignition timing based on the following inputs.

- Coolant temperature
- Engine speed (crankshaft position sensor)
- Knock sensor
- Manifold absolute pressure
- Throttle position
- Transmission gear selection (park/neutral switch)
- Intake air temperature

The PCM also adjusts engine idle speed through the idle air control motor based on the following inputs.

- Air conditioning sense
- Battery voltage
- Brake switch

- Coolant temperature
- Engine speed (crankshaft position sensor)
- Engine run time
- Manifold absolute pressure
- Power steering pressure switch
- Throttle position
- Transmission gear selection (park/neutral switch)
- Vehicle distance (speed)

The camshaft position sensor and crankshaft position sensor signals are sent to the PCM. If the PCM does not receive the signal within approximately 1 second of engine cranking, it deactivates the fuel pump. When these are deactivated, power is shut off to the fuel injectors, ignition coils, oxygen sensor heating elements and fuel pump.

The PCM contains a voltage converter that changes battery voltage to a regulated 5 volts direct current to power the camshaft position sensor, crankshaft position sensor, manifold absolute pressure sensor, throttle position sensor, A/C pressure switch, A/C pressure transducer, and vehicle speed sensor.

5 VOLT SUPPLY - PCM OUTPUT

The PCM supplies 5 volts to the following sensors:

- A/C pressure transducer
- Ambient Temperature sensor
- Battery temperature
- Camshaft Position Sensor (NGC)
- Crankshaft Position Sensor (NGC)
- Engine coolant temperature sensor
- Inlet Air Temperature Sensor
- Knock sensor
- Linear EGR solenoid (if equipped)
- Manifold absolute pressure sensor
- Oil Pressure Switch
- Throttle position sensor

STANDARD PROCEDURE

OBTAINING DIAGNOSTIC TROUBLE CODES

BULB CHECK

Key on: Bulb illuminated until vehicle starts, as long as all once per trip (readiness) monitors completed. If monitors have **not** been completed, then: Key on: bulb check for about 5 to 8 seconds, lamp then flashes if once per trip (readiness) monitors have **not** been completed until vehicle is started, then MIL is extinguished.

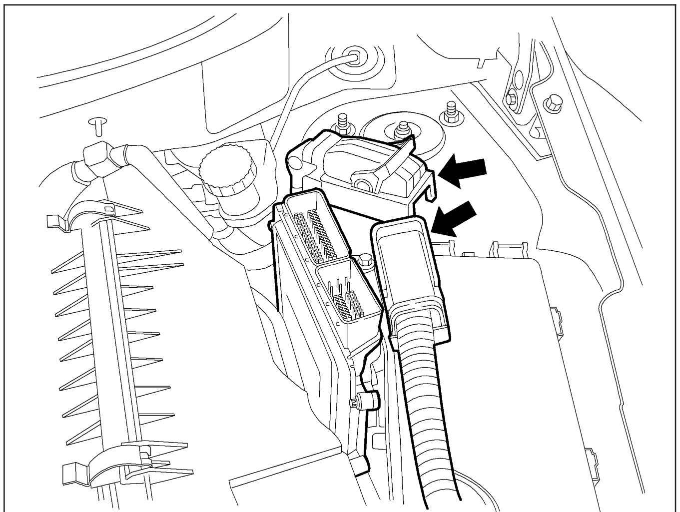
OBTAINING DTC’S USING SCAN TOOL

1. Connect the scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.
2. Turn the ignition switch on and access the “Read Fault” screen.
3. Record all the DTC’s and “freeze frame” information shown on the scan tool.
4. To erase DTC’s, use the “Erase Trouble Code” data screen on the scan tool. **Do not erase any DTC’s until problems have been investigated and repairs have been performed.**

PINION FACTOR SETTING

NOTE: This procedure must be performed if the PCM has been replaced with a NEW or replacement unit. Failure to perform this procedure will result in an inoperative or improperly calibrated speedometer.

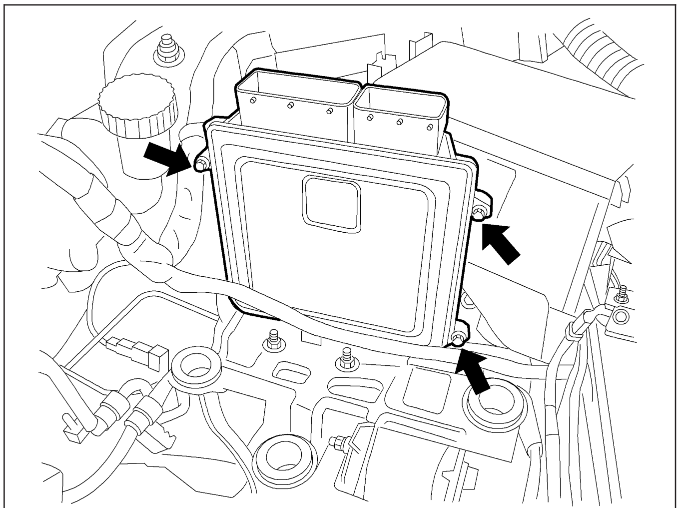
The vehicle speed readings for the speedometer are taken from the output speed sensor. The PCM must be calibrated to the different combinations of equipment (final drive and tires) available. Pinion Factor allows the technician to set the Powertrain Control Module initial setting so that the speedometer readings will be correct. To properly read and/or reset the Pinion Factor, it is necessary to use a scan tool.



1. Plug the scan tool into the diagnostic connector located under the instrument panel.
2. Select the Transmission menu.
3. Select the Miscellaneous menu.
4. Select Pinion Factor. Then follow the instructions on the scan tool screen.

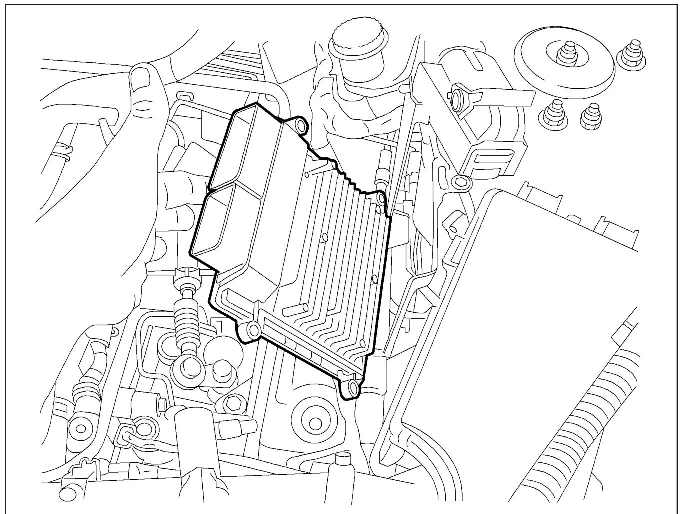
REMOVAL

USE THE SCAN TOOL TO REPROGRAM THE NEW POWERTRAIN CONTROL MODULE (PCM) WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.



To avoid possible voltage spike damage to PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

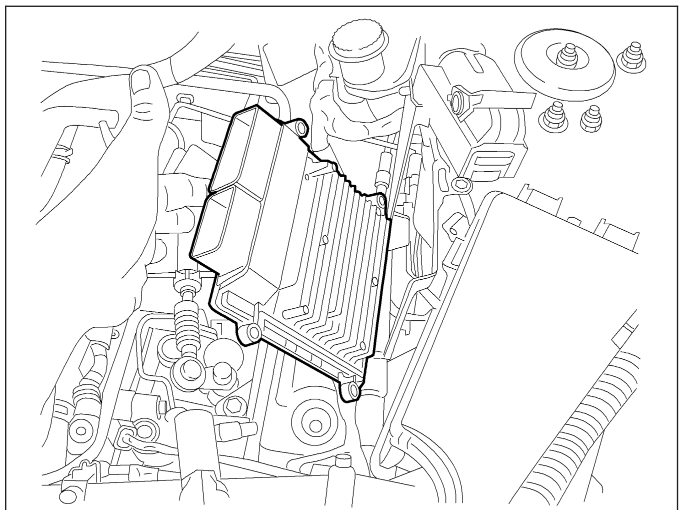
1. Disconnect negative battery cable.
2. Unlock and disconnect the electrical connectors from PCM.



8181e69a

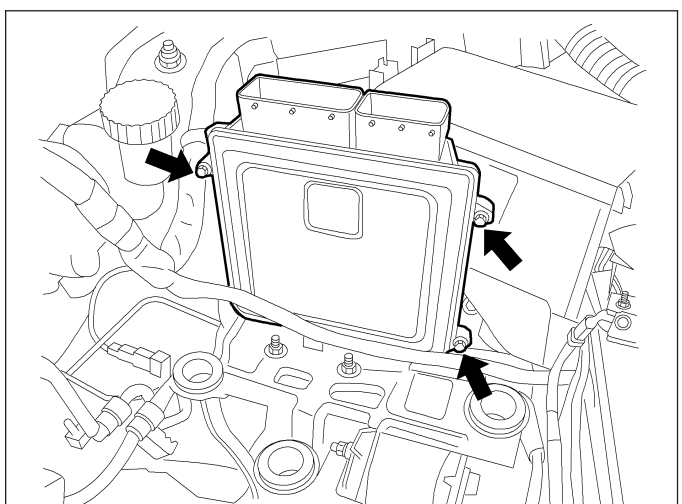
3. Remove the air cleaner box.
4. Remove the three mounting bolts.

8181e69e



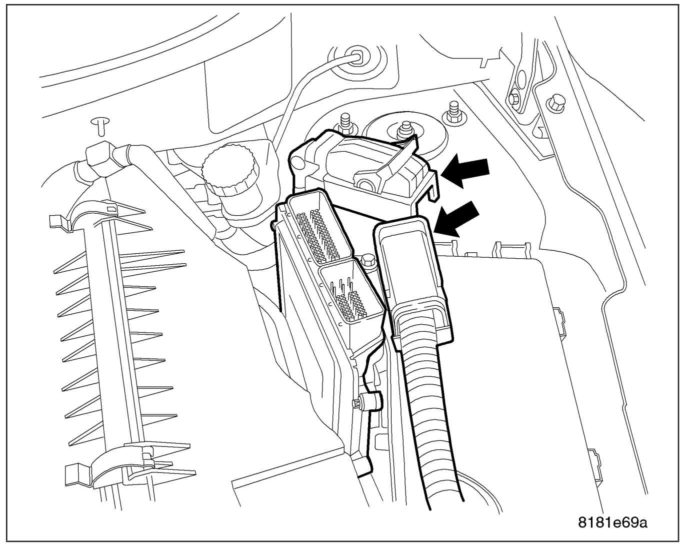
5. Tip module out and remove from bracket.

8181e6a6



INSTALLATION

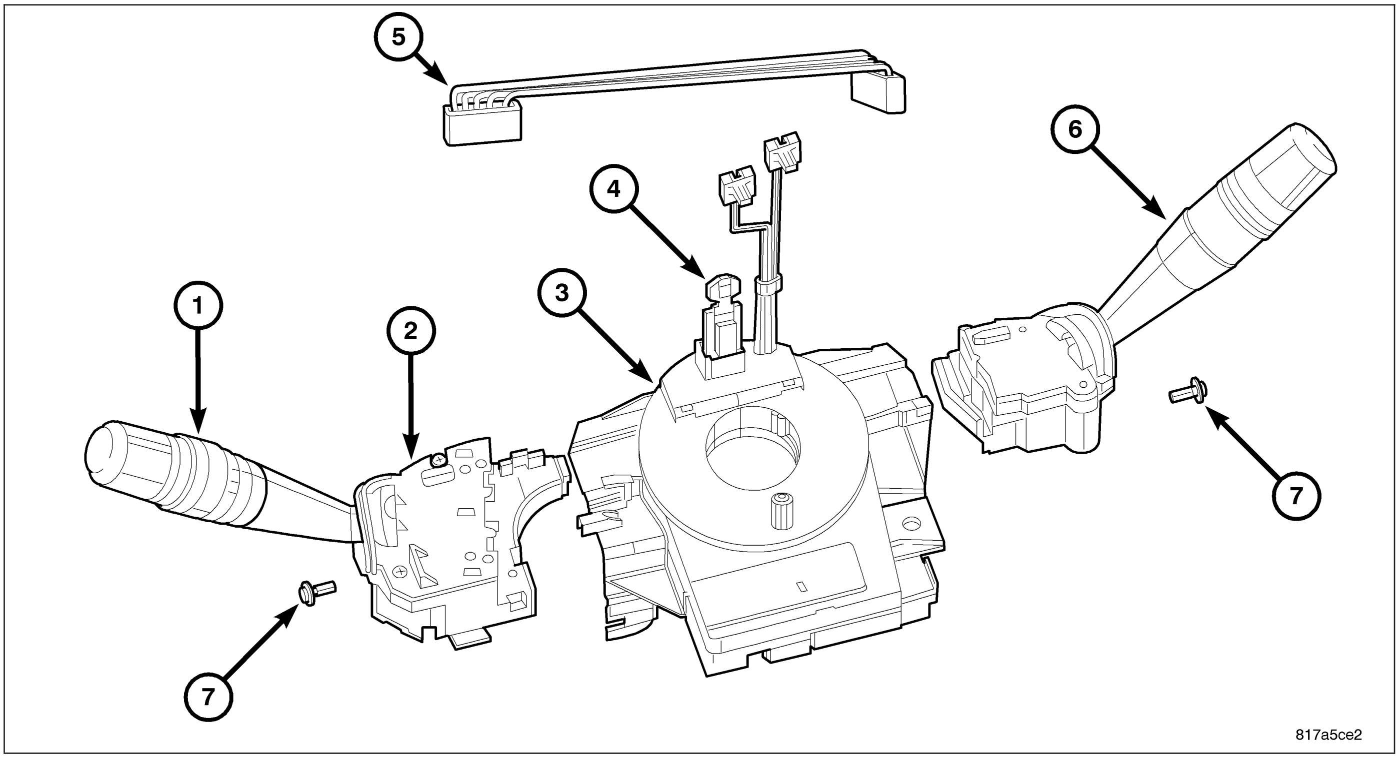
USE THE SCAN TOOL TO REPROGRAM THE NEW POWERTRAIN CONTROL MODULE (PCM) WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.



1. Tip module into bracket.

8181e6a6

2. Install three mounting bolts and tighten to 9 N·m (80 in. lbs.) torque.



8181e69e

3. Check pins in electrical connectors for damage. Repair as necessary.
4. Connect electrical connectors and lock.
5. Install air cleaner box.
6. Connect negative battery cable.
7. Use the scan tool to reprogram new PCM with vehicles original Identification Number (VIN) and original vehicle mileage.

MODULE-STEERING CONTROL

DESCRIPTION

This vehicle is equipped with a Steering Column Control Module (SCCM) The SCCM is secured near the top of the steering column below the steering wheel and is completely concealed beneath the steering column shrouds. It is installed as a modular unit that supports the left (lighting) multi-function switch (1) and right (wiper) multi-function switch (6). The controls for each of these switches extend through appropriate clearance holes provided in the steering column shrouds.

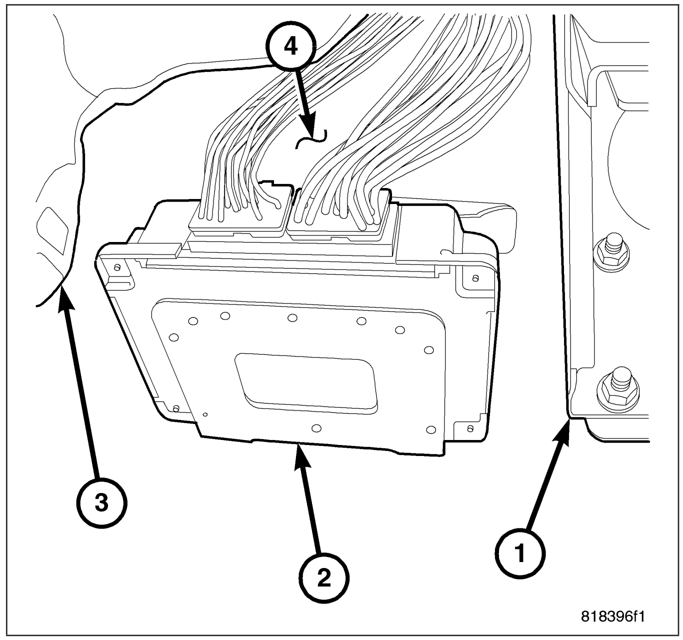
The microprocessor-based Steering Control Module (SCM) (2) utilizes integrated circuitry and information carried on the Controller Area Network (CAN) data bus along with several hard wired analog and multiplexed inputs to monitor both the right and left multi-function switches. The SCCM uses a Local Interconnect Network (LIN) data bus for exterior lighting and wiper functions. The LIN data is sent to the Cab Compartment Node (CCN) and the CCN then sends it out on the CAN data bus (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION - CAN BUS). The SCCM is available for service replacement as a unit or each individual component:

- Clockspring (with integral Steering Angle Sensor if equipped)
- Left Multi-Function Switch
- Right Multi-Function Switch

OPERATION

The Steering Control Module (SCM) communicates over the Local Interconnect Network (LIN) data bus with other electronic modules in the vehicle and/or a diagnostic scan tool. The horn switch circuits pass through the clockspring to the Cab Compartment Node (CCN) and the CCN sends a CAN message to the Totally Integrated Power Module (TIPM) to control the horn. The CCN stores Diagnostic Trouble Codes (DTC's) for the SCM. The right (wiper) multi-function switch has several inputs to the CCN.

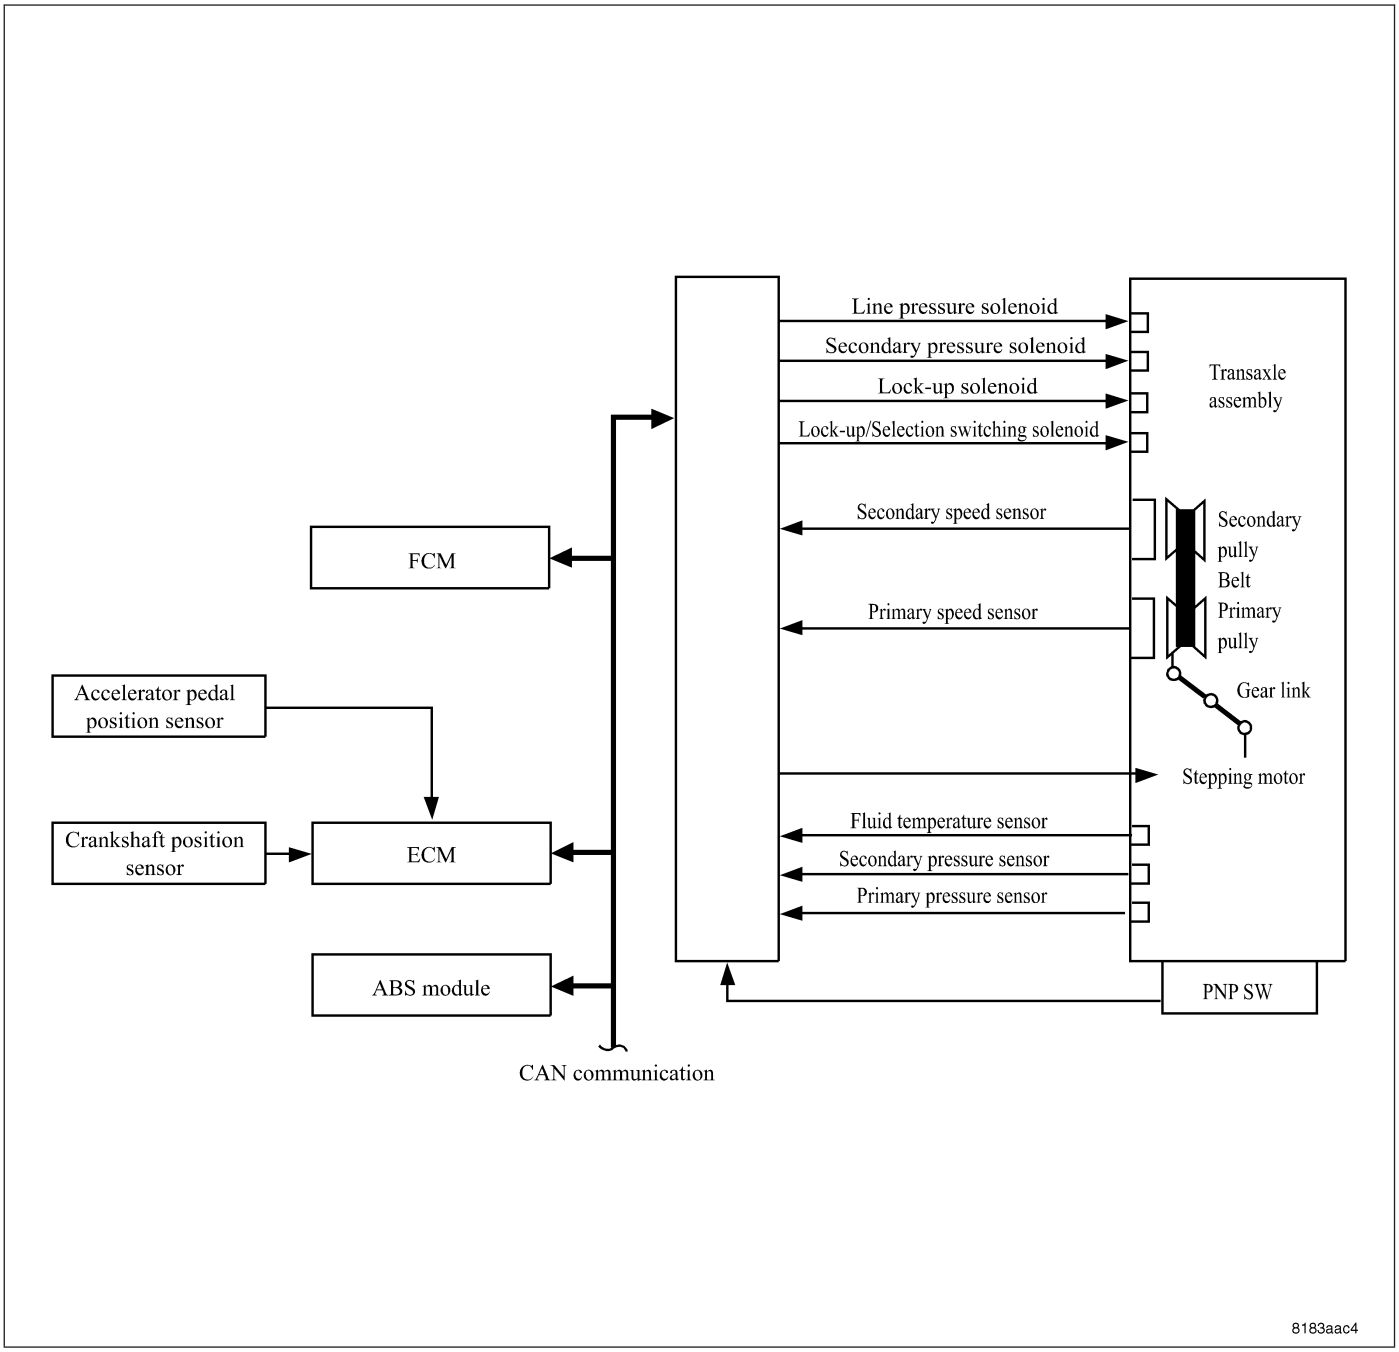
The SCM is connected to a fused B(+) circuit and receives a path to ground at all times. These connections allow it to remain functional regardless of the ignition switch position. The driver airbag squib circuits of the clockspring, the horn, and the speed control switch circuits pass through the SCM, but the SCM does not monitor, and has no control outputs related to these circuits. Any other input to the SCM that would cause a vehicle system to function but does not require that the ignition switch be in the On position, such as turning on the lights or sounding the horn, prompts the SCM to wake up and transmit on the CAN data bus.



The most reliable, efficient, and accurate means to diagnose the SCM, the CAN data bus, the hard wired inputs or the electronic communication related to SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

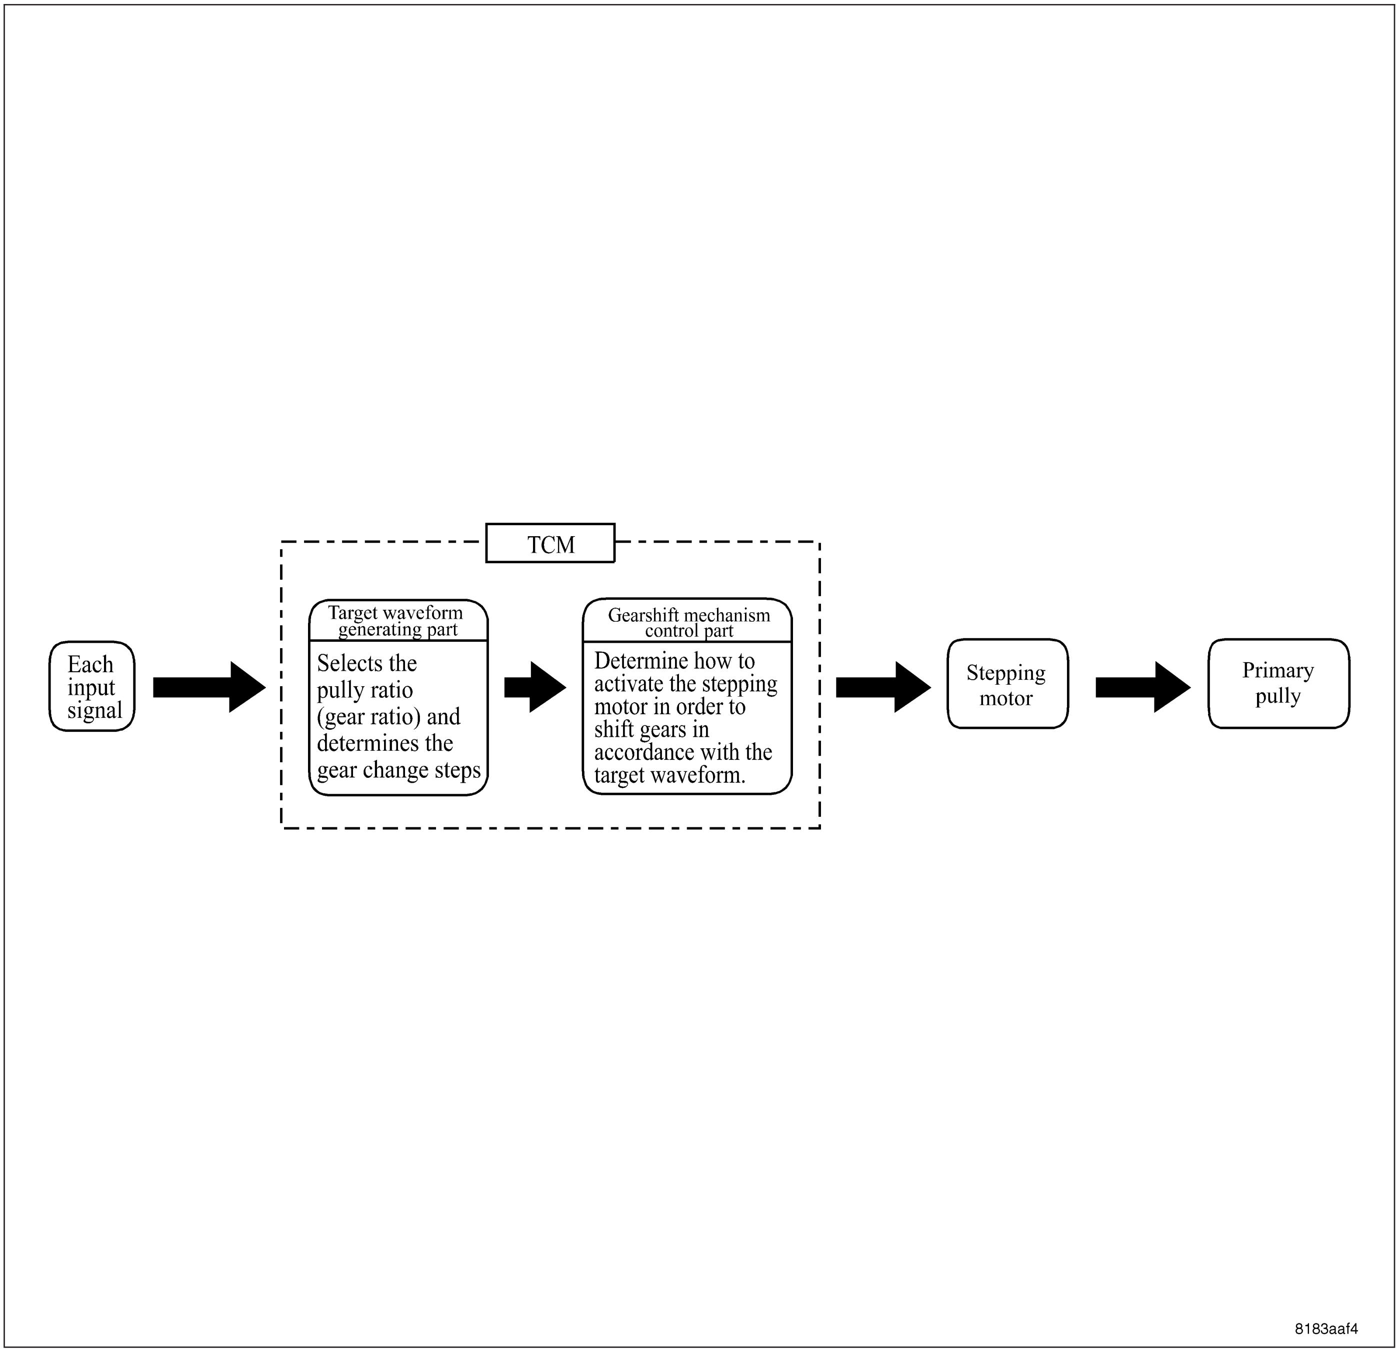
The integral SCM is not available for separate service replacement. If found inoperative or defective, the entire left (lighting) multi-function switch must be replaced (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LEFT MULTI-FUNCTION SWITCH - REMOVAL).

MODULE-TRANSMISSION CONTROL



DESCRIPTION

The transmission control module (TCM) is inside the car, behind the instrument panel where the clutch pedal would be located. New controllers are shipped with generic software but need to be initialized for the vehicle into which it is installed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)



OPERATION

Shift Control

In order to select the gear ratio which can obtain the driving force in accordance with driver's intention and the vehicle condition, TCM monitors the driving conditions, such as the vehicle speed and the throttle position and selects the optimum gear ratio, and determines the gear change steps to the gear ratio. Then it sends the command to the stepping motor, and controls the flow-in/flow-out of line pressure to/from the primary pulley to determine the position of the moving-pulley and control the gear ratio.

Selection of the gear ratio is set for every position separately.

“Drive” Position

Shifting is available over all the ranges of gear ratios from the lowest to the highest.

When using the Manual Mode (Vehicles with the manual mode)

When the manual mode switch is turned ON, the fixed changing gear line is set. By moving the switch to + side or – side, shift change is like a M/T and selects from a range of 6 pre-programmed gear ranges.

By limiting the shift to the area nearest the low side of the gear ratio, a larger driving force and engine brake are secured.

Downhill Engine Brake Control

When a downhill condition is detected while the accelerator pedal is released, the engine brake will be increased by downshifting so as to limit acceleration of the vehicle. Also, if uphill is detected, acceleration performance is improved by limiting the shift area on the highest side of the gear ratio.

Acceleration Control

According to vehicle speed and a increase of accelerator pedal angle, driver's request for acceleration as well as driving conditions are measured. At the time of starting or acceleration while moving, this function improves in acceleration feeling by making the engine speed proportionate to the vehicle speed. Even at the time of slower acceleration, a shift map which can gain a larger driving force is chosen for compatibility of mileage with drivability.

Line Pressure and Secondary Pressure Control

Control of line pressure and secondary pressure with a high degree of accuracy has reduced friction and improved fuel economy.

Normal Fluid Pressure Control

The line pressure and the secondary pressure are optimized depending on driving conditions, on the basis of the throttle position, the engine speed, the primary pulley (input) revolution speed, the secondary pulley (output) revolution speed, the stop lamp SW signal, the PNP switch signal, the lock-up signal, the voltage, the target gear ratio, the fluid temperature, and the fluid pressure.

Secondary Pressure Feedback Control

When controlling the normal fluid pressure or the fluid pressure at the time of selection, the secondary pressure can be set more accurately by using the fluid pressure sensor to detect the secondary pressure and performing the feedback control.

Lock-up Control

The lock-up applied gear range has been expanded by locking up the torque converter at a lower vehicle speed than conventional A/T models.

Selection Control

When selecting between N (P) and D(R) position, the optimum operating pressure is set on the basis of the throttle position, the engine speed, and the secondary pulley (output) revolution speed to lessen the select shock.

CAN Communication

Real-time communications (signal exchanges) are maintained among the control units such as the CVT, C/U, ECM, combination meter etc. Each unit is controlled optimally depending on vehicle driving conditions while sharing information and in cooperating with the other control units.

In CAN (Controller Area Network) communication, control units are connected with two communication lines (CAN-H line, CAN-L line) allowing a high rate of information to be transmitted by fewer wirings. Each control unit transmits/receives data but selectively reads required data only.

Inputs and Outputs

Item		Shift Control	Line Pressure Control	Selection Control	Lock-up Control	CAN Communication Control	Fail-safe Function (Note 1)
Input	Engine speed signal		X	X	X	X	X
	Accelerator pedal position signal	X	X	X	X	X	X
	Closed throttle position signal	X			X	X	
	Stop lamp SW signal	X	X		X	X	X
	Primary pressure sensor		X				
	Secondary pressure sensor		X	X			X
	Fluid temperature sensor	X	X	X	X		X
	Primary speed sensor	X	X		X		X
	Secondary speed sensor	X	X	x	X		X
	PNP switch	X	X	X	X		X
Output	Line pressure solenoid value		X	x			X
	Secondary pressure solenoid value		X	X			X
	Lock-up solenoid value			X	X		X
	Lock-up/ Selection switching solenoid value			X	X		X
	Stepping motor	X					X

Engine/CVT Integration Control (CAN Communication Control)

In order to improve gearshift feeling and to perform controls such as prevention of engine slowdown, engine power control signals are intercommunicated between the engine ECM and the TCM, and real-time cooperative controls depending on vehicle driving conditions are performed.

TCM sends information such as fast slowdown signals, lock-up signals, torque down request signals to ECM, while receiving information such as torque down permission/prohibition signals, lock-up permission/prohibition signals, throttle position from ECM.

Fail-safe Function

If an unexpected signal is sent from any sensor, switch, solenoid etc., this function controls the CVT to make driving as smooth as possible.

Secondary Speed Sensor

The shift pattern is changed in accordance with throttle position when an unexpected signal is sent from the output speed sensor (secondary speed sensor) to the TCM. The manual mode position or the sports mode position is inhibited, and the transaxle is put in “D”.

Primary Speed Sensor

The shift pattern is changed in accordance with throttle position and secondary speed (vehicle speed) when an unexpected signal is sent from the primary speed sensor to the TCM. The manual mode function or the sports mode function is inhibited, and the transaxle is put in “D”.

PNP Switch

If an unexpected signal is sent from the PNP switch to the TCM, the transaxle is put in “D”.

Fluid Temperature Sensor

If an unexpected signal is sent from the fluid temperature sensor to the TCM, the gear ratio obtained immediately before receiving the unexpected signal is maintained and the gear ratio is controlled to keep engine speed under 5,000 rpm (approximately), depending on driving conditions.

Secondary Pressure Sensor

If an unexpected signal is sent from the secondary pressure sensor to the TCM, the secondary pressure feedback control is stopped and the offset value obtained immediately before the non-standard condition occurs is used to control line pressure.

Line Pressure Solenoid

If an unexpected condition of the solenoid is detected by the TCM, the line pressure solenoid is turned OFF to achieve the maximum fluid pressure.

Secondary Pressure Solenoid

If an unexpected condition of the secondary solenoid is detected by the TCM, the secondary pressure solenoid is turned OFF to achieve the maximum fluid pressure.

Lock-up solenoid

If an unexpected condition of the lock-up solenoid is detected by the TCM, the lock-up solenoid is turned OFF to cancel the lock-up.

Stepping Motor

If an unexpected condition of the stepping motor is detected by the TCM, the stepping motor coil phases “A” through “D” are all turned OFF to hold the gear ratio used immediately before the unexpected condition occurred.

Lock-up/Selection Switching Solenoid

If an unexpected condition of the solenoid is detected by the TCM, the lock-up/selection switching solenoid is turned OFF to cancel the lock-up.

Backup Power Supply

Transaxle assembly is protected by limiting the engine torque when the memory back-up power supply for controlling from the battery is not supplied to the TCM. Normal status is restored when turning the ignition switch OFF to ON after power is normally supplied

TCM

- 1. Shift control
- 2. Line pressure control
- 3. Selection control
- 4. Lock-up control
- 5. Engine/CVT integration control [CAN communication control]
- 6. Self-diagnosis function
- 7. Fail-safe function

Primary Speed Sensor, Secondary Speed Sensor

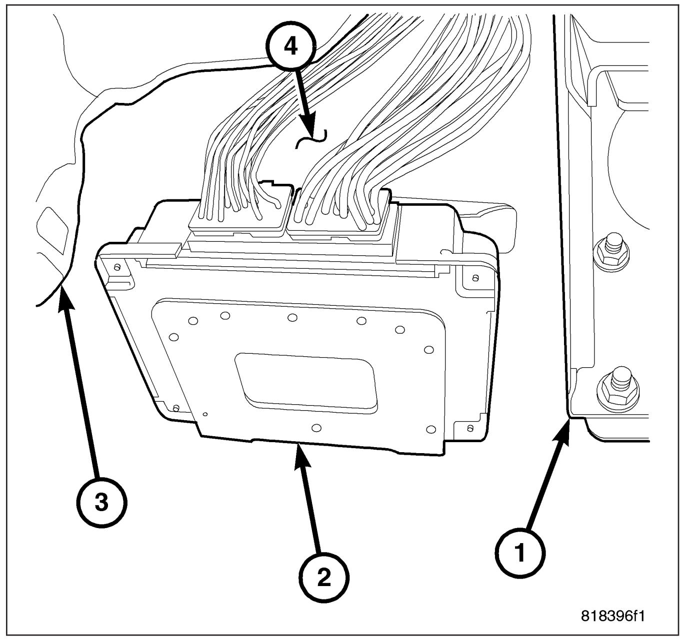
Primary Speed Sensor It is installed near the CVT fluid cooler in the transaxle case. It sends rotating speed of the primary pulley (input shaft) to the TCM as a pulse signal.

Secondary Speed Sensor It is installed near the output gear part in the transaxle case. It sends rotating speed of the secondary pulley (output shaft) to the TCM as a pulse signal. TCM converts the pulse signal to vehicle speed.

STANDARD PROCEDURE - TRANSMISSION CONTROL MODULE INITIALIZATION

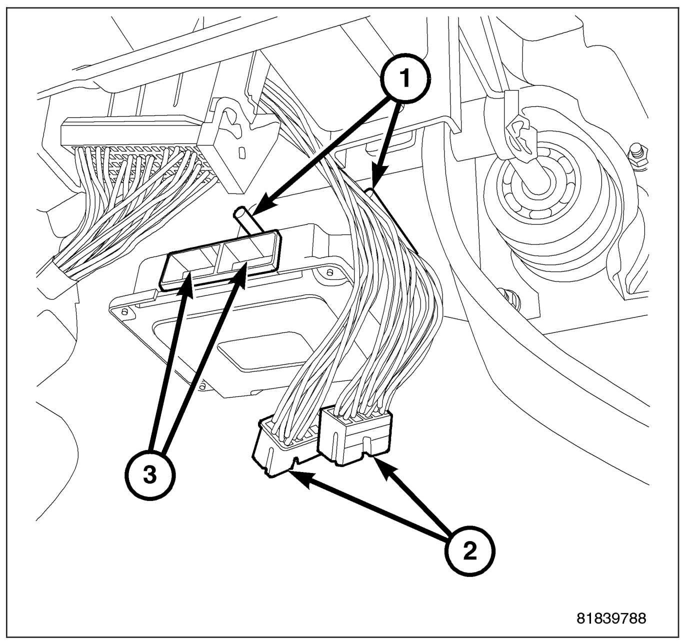
INITIAL LEARN (BRAND-NEW MODULE, MEMORY ALREADY CLEAR

) Battery must be connected. If TIPM is to be configured, do this, then Turn ignition key to OFF/LOCKED briefly, then back to RUN. Shifter must be in PARK or NEUTRAL, engine not running.



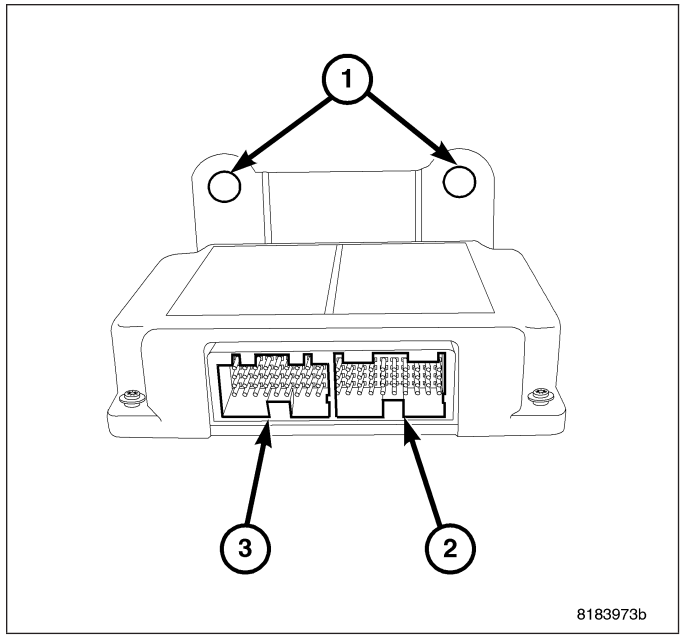
1. Turn Ignition key to RUN for 4 seconds to allow reading of new values.
2. Clear fault codes.
3. Turn ignition key to OFF/LOCKED for 2 seconds to allow storing new values in EEROM.
4. Turn ignition key to RUN.
5. At least 7 seconds, Read fault codes.

RELEARN, AFTER REPLACING A TRANSAXLE



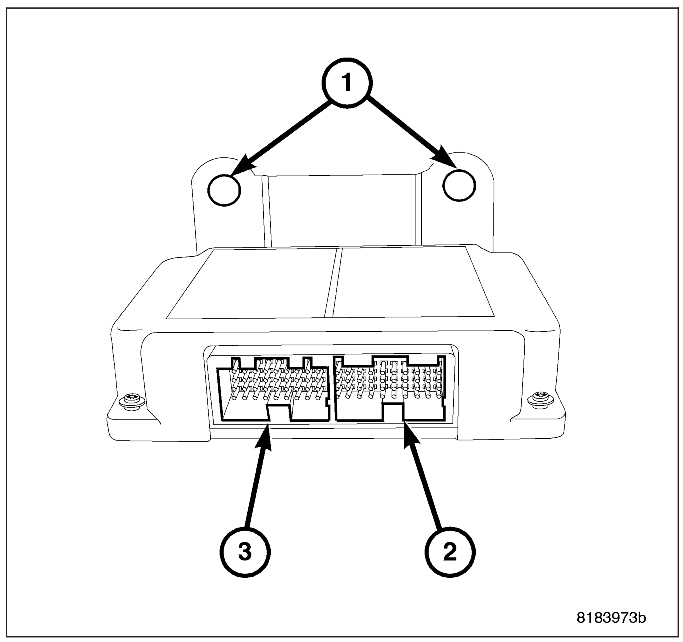
1. Clear learning memory using the scan tool.
2. Turn ignition key to OFF/LOCKED for 2 seconds to allow clearing of values in EEROM.
3. Turn Ignition key to RUN for 4 seconds to allow reading of new values.
4. Clear fault codes.
5. Turn ignition key to OFF/LOCKED for 2 seconds to allow storing new values in EEROM.
6. Turn ignition key to RUN.
7. At least 7 seconds later, Read fault codes.

REMOVAL

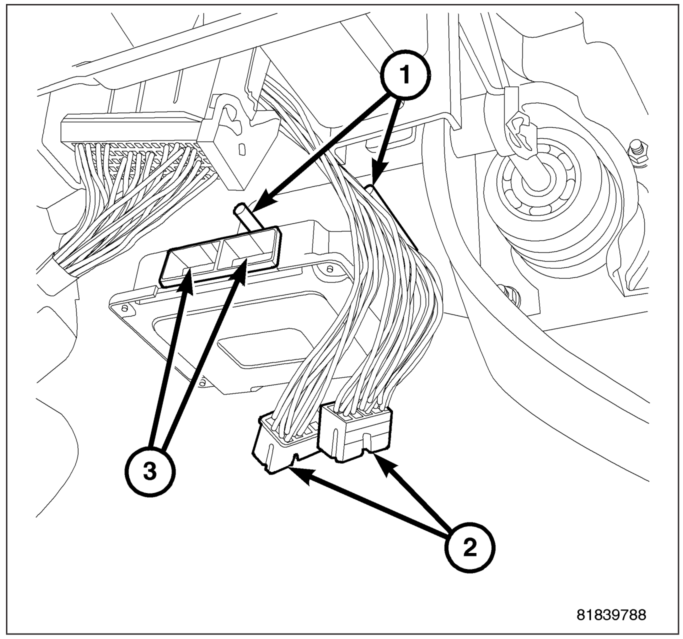


1. The TCM (2) is located between the brake pedal bracket (1) and the left kick panel (3).

2. Unplug the two electrical connectors (2) at the TCM.
3. Remove the two nuts (1) that hold the TCM to the bulkhead.



4. Remove the TCM.



INSTALLATION

1. Install TCM mounting bracket holes (1) over the two studs on the bulkhead.

2. Install the two nuts to mounting studs (1) on the bulkhead and torque to 15 N·m (130 in. lbs.).
3. Plug in electrical connectors (2) to TCM (3).

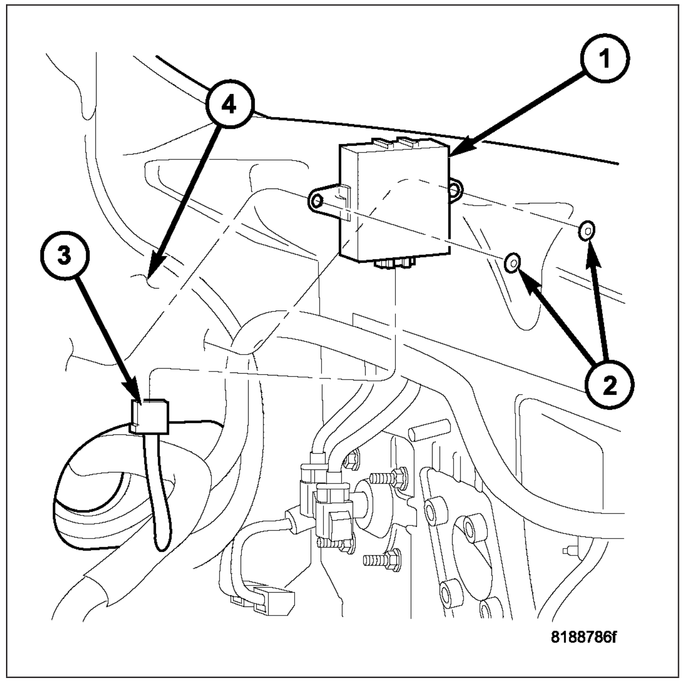
NOTE: If a new TCM is installed a learn procedure must be performed.

MODULE - FINAL DRIVE CONTROL

DESCRIPTION

The ECC is controlled by it's own controller that is located in the left kick panel area. It gets signals over the CAN bus from the ABS Wheel speed sensors and TPS signal.

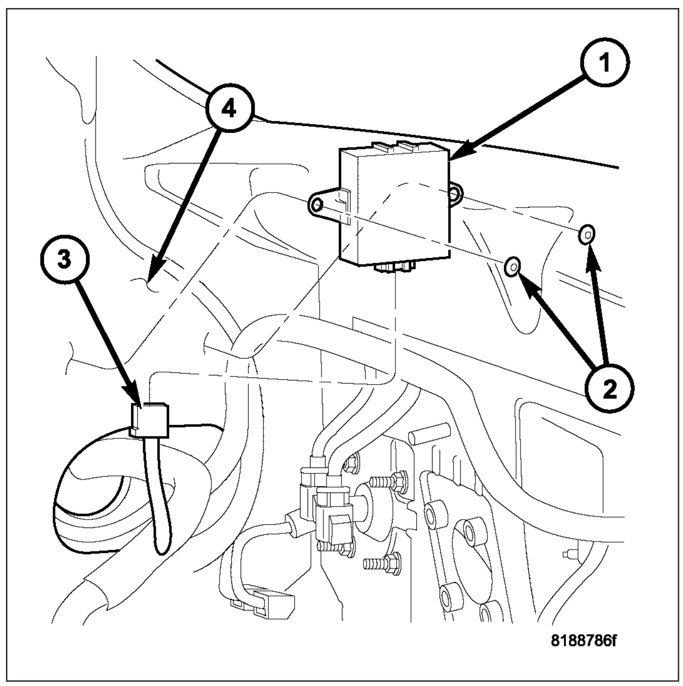
OPERATION



The all-wheel-drive system requires no driver input or control. Under most driving conditions, it is passive and power is transmitted to the front wheels alone. Unlike all-wheel drive systems that rely on pumps or viscous fluids to transfer torque, this system requires no front-to-rear slippage for activation. This allows the system to transfer torque solely in response to accelerator pedal position. If the driver is asking for a lot of power, the system immediately starts clamping the electronically controlled coupling (ECC), transferring a high percentage of power to the rear wheels. This avoids front wheel slippage, as power to propel the car is transmitted through all four tires. This mode of operation is called open-loop operation in that there is no feedback to affect the torque transfer.

A second, closed loop, operating mode uses feedback from the wheel-speed sensors to determine the appropriate torque transfer. When the front wheels slip, the allwheel- drive electronic control module tells the ECC to start clamping, sending power to the rear wheels. Attempting the same aggressive launch described above with the front wheels on ice and the rear wheels on dry pavement, the ECC sends even more torque to the rear wheels to minimize slippage and launch the vehicle. Both modes are always active with the closed loop mode layered on top of open loop mode to increase torque to the rear wheels when needed to maintain traction in extreme cases.

Power to the rear wheels is modulated under the following conditions: • Slipping on ice while backing up will send a lot of power to the rear axle • Loss of traction while traveling at freeway speeds, for example hydroplaning on a puddle of water, will send very little power to the rear wheels because the controller knows at those speeds a lot of power is not needed at the rear wheels A third condition, which is independent of the others, uses wheel speed differences to determine when the vehicle is turning in a tight circle. This condition, which is indicated by a large discrepancy in side-to-side wheel speeds, causes the electronic control module to reduce torque to the rear wheels to prevent binding in the driveline. The electronic control module is always checking for this condition as well. A fourth condition that is unique to the Caliber system is to influence vehicle dynamics. Other manufacturers limit AWD to aiding traction or providing off-road capability. They concentrate on launching the vehicle or going off road at speeds up to about 25 mph (40 km/hr). Above that speed range, they use it to limit wheel slip for traction. On this system, additional ECM calibration controls torque to the rear wheels for improved handling in the 25-65 mph (40-105 km/hr) range. In this speed range, the system increases torque to the rear wheels during cornering with the throttle open to make the car turn more easily – make the handling more neutral. This is more readily accomplished with an electronically controlled system, than with viscous-coupling or gerotor systems that require some degree of front-to-rear slip to transfer torque to the rear wheels. Above 70 mph (113 km/hr), the control strategy provides minimal torque to the rear wheels under normal driving conditions to aid fuel economy. The ECC system is easier to calibrate, more flexible and more precise than viscouscoupling, Torsen®, or gerotor system, but less costly. It is also less costly than the systems used in luxury cars from other manufacturers while providing similar functionality. The electronic control module also interfaces with the ESP and traction control systems. The interface allows the ESP system to use the ECC to help gain control of the vehicle. For this purpose, torque transmitted to the rear wheels by the ECC can be reduced. The Caliber AWD system is not traction control. It only works on situations where front-to-rear traction varies, for instance, front wheels on ice, rear wheels on dry pavement or climbing steep grades. AWD does not aid side-to-side traction. ESP does that through brake intervention on this system.



REMOVAL

1. Remove the left front kick panel (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL).
2. Remove module retaining bolts (2).
3. Remove electrical connector (3).
4. Remove ECC module (1).

INSTALLATION

1. Plug ECC module in (3).
2. Move into place, install bolts (2) and torque to 11 N·m (97 in. lbs.).
3. Install the left front kick panel (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION).

ENGINE SYSTEMS

TABLE OF CONTENTS

BATTERY SYSTEM

TABLE OF CONTENTS

BATTERY SYSTEM

DESCRIPTION

This vehicle is equipped with a single 12-volt battery. All of the components of the battery system are located within the engine compartment of the vehicle. The battery system for this vehicle contains the following components:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the positive and negative charged battery terminal posts to the vehicle electrical system.
- **Battery Holddown** - The battery holddown hardware secures the battery in the battery tray.
- **Battery Thermal Guard** - The battery thermal guard insulates the battery to protect it from engine compartment temperature extremes.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery holddown hardware.

For battery system maintenance schedules, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). For the proper jump starting procedures, (Refer to LUBRICATION & MAINTENANCE/JUMP STARTING - STANDARD PROCEDURE).

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING

BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for the proper charging system on-board diagnostic test procedures.

MICRO 420 BATTERY TESTER (GASOLINE ENGINES)

The Micro 420 automotive battery tester is designed to help diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) which includes the directions for using the Micro 420 battery tester.

OTC ONE STEP BATTERY ANALYZER AND CHARGER (DIESEL ENGINES)

The OTC One Step Battery Analyzer and Charger is designed to help diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - IGNITION-OFF DRAW TEST) for the appropriate test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is inoperative.	2. Determine if the charging system is performing to specifications. (Refer to 8 - ELECTRICAL/ CHARGING - DIAGNOSIS AND TESTING) for the appropriate charging system diagnosis and testing procedures. Repair the inoperative charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the appropriate battery tester. Charge the inoperative battery, as required.
	4. The battery terminal connections are loose or corroded.	4. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - DIAGNOSIS AND TESTING) for the appropriate battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper battery size and rating. Replace an incorrect battery, as required.
	6. The battery is inoperative.	6. Test the battery using the appropriate battery tester. Replace the inoperative battery, as required.
	7. The starting system is inoperative.	7. Determine if the starting system is performing to specifications. (Refer to 8 - ELECTRICAL/ STARTING - DIAGNOSIS AND TESTING) for the appropriate starting system diagnosis and testing procedures. Repair the inoperative starting system, as required.
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	1. The battery has an incorrect size or rating for this vehicle.	1. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper battery size and rating. Replace an incorrect battery, as required.
	2. The battery terminal connections are loose or corroded.	2. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - DIAGNOSIS AND TESTING) for the appropriate battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	3. The electrical system ignition-off draw is excessive.	3. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - IGNITION-OFF DRAW TEST) for the appropriate test procedures. Repair the excessive ignition-off draw, as required.
	4. The battery is inoperative.	4. Test the battery using the appropriate battery tester. Replace the inoperative battery, as required.
	5. The starting system is inoperative.	5. Determine if the starting system is performing to specifications. (Refer to 8 - ELECTRICAL/ STARTING - DIAGNOSIS AND TESTING) for the appropriate starting system diagnosis and testing procedures. Repair the inoperative starting system, as required.
	6. The charging system is inoperative.	6. Determine if the charging system is performing to specifications. (Refer to 8 - ELECTRICAL/ CHARGING - DIAGNOSIS AND TESTING) for the appropriate charging system diagnosis and testing procedures. Repair the inoperative charging system, as required.
	7. Electrical loads exceed the output of the charging system.	7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads.
	8. Slow driving or prolonged idling with high-amperage draw loads in use.	8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is inoperative.	1. Test the battery using the appropriate battery tester. Replace the inoperative battery, as required.

STANDARD PROCEDURE

BATTERY RECONNECTION

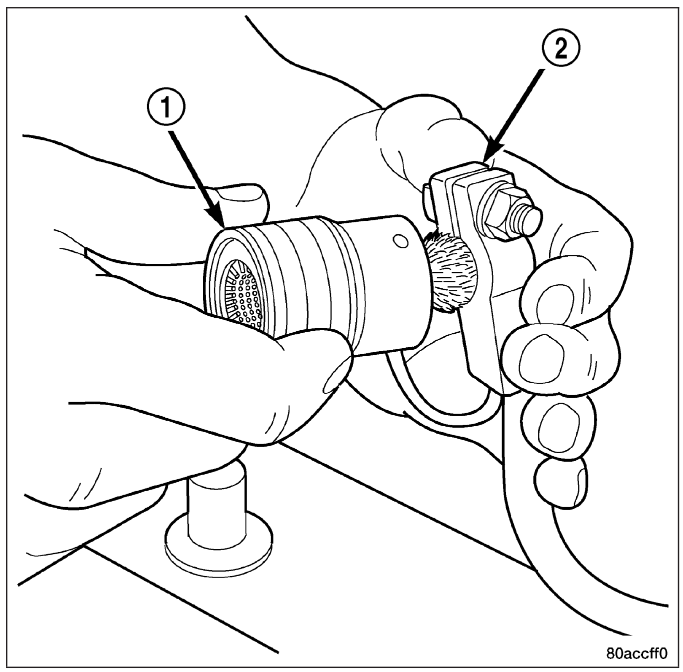
NOTE: This reconnection procedure is to be performed anytime the battery has been disconnected.

1. Connect the battery negative cable to the battery post and tighten the clamp nut.
2. Install the rear compartment floor trim panel.

CAUTION: Once the battery has been connected, review and perform the following information as applica-ble.

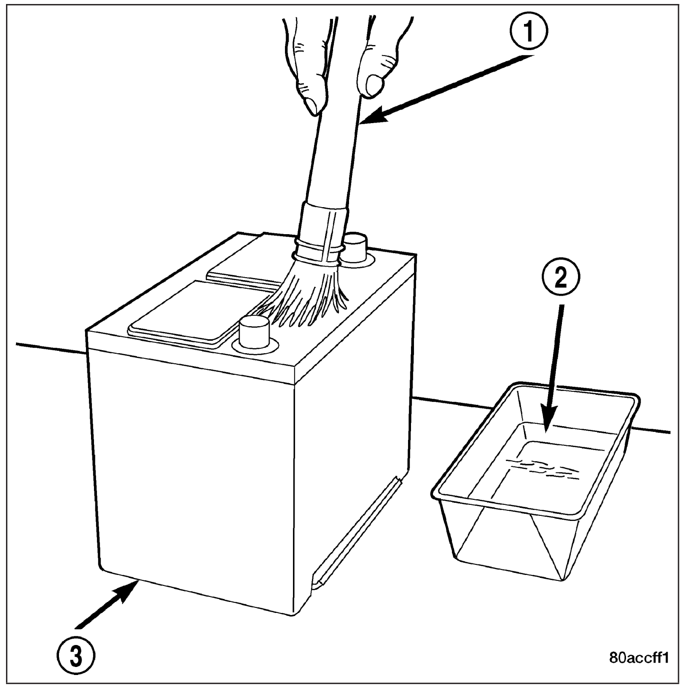
ELECTRONIC STABILITY PROGRAM (ESP)

If the vehicle is equipped with ESP, once the battery is reconnected, the Steering Angle Sensor (SAS) in the clock-spring needs to be calibrated. The SAS requires calibration anytime the battery or an ABS (ESP) component has been disconnected for any length of time. **If the SAS is not calibrated following battery reconnection, the ESP/ BAS indicator lamp is illuminated following five ignition cycles indicating the need for calibration.**

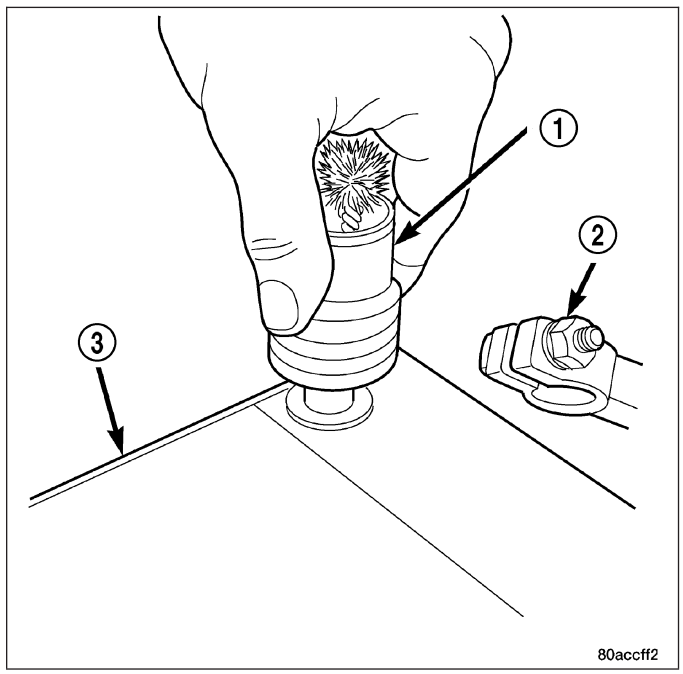


To calibrate, perform the following:

1. Start the engine.
2. Center the steering wheel.
3. Turn the steering wheel all the way to the left until the internal stop in the steering gear is met, then turn the wheel all the way to the right until the opposite internal stop in the steering gear is met.
4. Center the steering wheel.
5. Stop the engine.



CLEANING



The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the Owner's Manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Clean the battery cable terminal clamps of all corrosion. Remove any corrosion using a wire brush or a post and terminal cleaning tool, and a sodium bicarbonate (baking soda) and warm water cleaning solution.

2. Clean the battery tray and battery holddown hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.
3. If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.
4. Clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film.
5. Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner, and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner’s manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
2. Inspect the battery tray and battery holddown hardware for damage. Replace any damaged parts.
3. Slide the thermal guard off of the battery case (if equipped). Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
4. Inspect the battery thermal guard for tears, cracks, deformation or other damage (if equipped). Replace any battery thermal guard that has been damaged.

5. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. Refer to Standard Procedures for detailed instructions.

SPECIFICATIONS

BATTERY

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

NOTE: Vehicles equipped with a diesel engine utilize a unique battery. The specifications for this battery may differ from the standards shown here. Refer to the battery manufacturer for detailed specifications.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.
- **Load Test Amperage** - The Load Test Amperage rating specifies the current (in amperes) that a battery should be tested at with the battery load test equipment. This value should always be 50 percent of the CCA. For example: if the CCA for this battery is 700 amps, the Load Test Amperage is 50 percent of that or 350 amps.

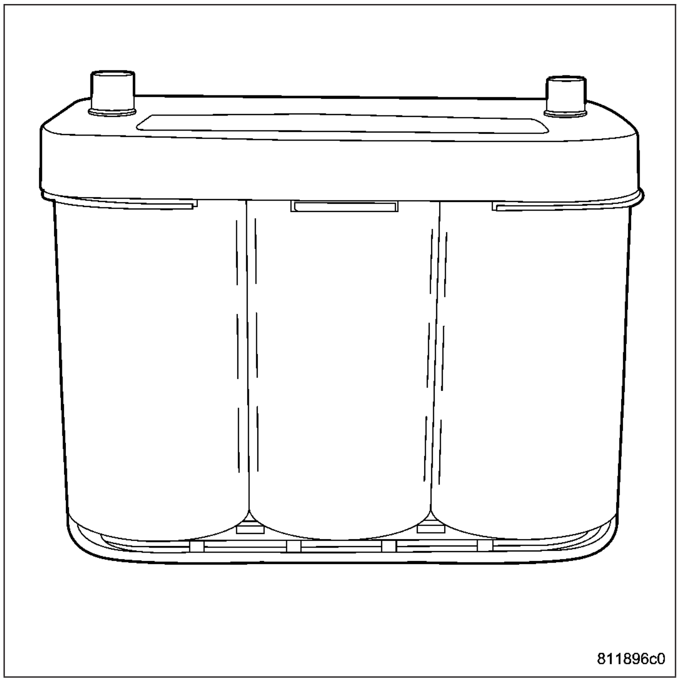
BATTERY

DESCRIPTION

There are two different batteries available for this vehicle. Vehicles equipped with a diesel engine utilize a spiral cell battery with recombination technology. This is a maintenance-free battery that is capable of delivering more power than a conventional battery. This additional power is required by a diesel engine during cold cranking. Vehicles equipped with a gasoline engine utilize a conventional battery. Refer to the following information for detailed differences and descriptions of these two batteries.



SPIRAL CELL BATTERY - DIESEL ENGINE

WARNING: Never exceed 14.4 volts when charging a spiral cell battery. Personal injury and/or battery damage may result.

By tightly winding layers of spiral grids and acid-permeated vitreous separators into cells, the battery has more power and service life than conventional batteries of the same size. The spiral cell battery is completely, permanently sealed. Through gas recombination, hydrogen and oxygen within the battery are captured during normal charging and reunited to form the water within the electrolyte, eliminating the need to add distilled water. Therefore, these batteries have non-removable battery vent caps.

The acid inside a spiral cell battery is bound within the vitreous separators, ending the threat of acid leaks. This feature allows the battery to be installed in any position anywhere in the vehicle.

Spiral cell technology is the process by which the cells holding the active material in the battery are wound tightly in coils instead of hanging flat, like conventional batteries. This design has a lower internal resistance and also increases the active material surface area.

Due to the maintanance-free design, distilled water cannot be added to this battery. Therefore, if more than 14.4 volts are used during the spiral cell battery charging process, water vapor can be exhausted through the pressure-sensitive battery vents and lost for good. This can permanently damage the spiral cell battery.

CONVENTIONAL BATTERY - GASOLINE ENGINE

Low-maintenance conventional batteries are used on vehicles equipped with a gasoline engine, these batteries have non-removable battery cell caps. Under normal service, the composition of this battery reduces gassing and water loss at normal charge rates.

Conventional batteries are made up of six individual cells that are connected in series. Each cell contains positive charged cell groups made of lead oxide, and negatively charged cell groups made of sponge lead. The cells are submerged in a sulfuric acid and water solution called electrolyte.

The battery is used to store electrical energy potential in a chemical form. When an electrical load is applied to the battery terminals, an electrochemical reaction occurs within the battery. This reaction causes the battery to discharge electrical current.

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery is equipped with removable cell caps, add distilled water whenever the electrolyte level is below the top of the plates. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING

BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) for the proper battery cleaning procedures. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery inspection procedures. Refer to Standard Procedures for the proper battery charging procedures.

MICRO 420 BATTERY TESTER (GASOLINE ENGINES)

The Micro 420 automotive battery tester is designed to help diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro 420 battery tester.

OTC ONE STEP BATTERY ANALYZER AND CHARGER (DIESEL ENGINES)

The OTC One Step Battery Analyzer and Charger is designed to help diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle.

WARNING: If the battery shows signs of freezing, leaking or loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

WARNING: Never exceed 14.4 volts when charging a spiral cell battery. Personal injury and/or battery damage may result.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be tested to determine its cranking capacity. A battery that is fully-charged, but fails the OTC One Step Battery Analyzer and Charger or other load test, is faulty and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

STANDARD PROCEDURE

SPIRAL CELL BATTERY CHARGING

WARNING: Never exceed 14.4 volts when charging a spiral cell battery. Personal injury and/or battery damage may result.

Vehicles equipped with a diesel engine utilize a unique spiral cell battery. This battery has a maximum charging voltage that must not be exceeded in order to restore the battery to its full potential, failure to use the following spiral cell battery charging procedure could result in damage to the battery or personal injury.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- OTC One Step Battery Analyzer and Charger special tool number OT-3641 or equivalent tester indicates battery is OK.
- Open-circuit voltage of the battery is 12.65 volts or above.
- Battery passes Load Test multiple times.

WARNING: If the battery shows signs of freezing, leaking, loose posts or low electrolyte level, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

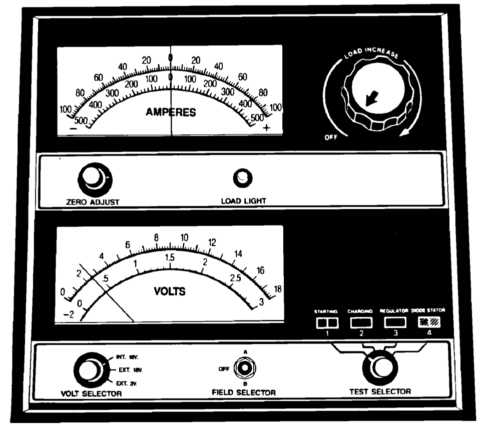
WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Charge the battery directly at the battery terminals. Do not exceed 14.4 volts while charging a battery.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.6 volts or greater, perform a load test to determine the battery cranking capacity. If the battery passes a load test, return the battery to service. If the battery fails a load test, it is faulty and must be replaced.



Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) for the proper battery system cleaning procedures. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY – SPIRAL CELL BATTERY

WARNING: Never exceed 14.4 volts when charging a spiral cell battery. Personal injury and/or battery damage may result.

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. Refer to Battery Removal and Installation for access instructions. If the reading is below ten volts, the battery charging current will be low. It could take several hours before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the OTC One Step Battery Analyzer and Charger special tool number OT-3641 or equivalent.

898A-12

NOTE: Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

SPIRAL-PLATE BATTERY CHARGE RATE TABLE

Voltage	Minutes
14.4 volts maximum	up to 10 minutes
13.0 to 14 volts	up to 20 minutes
12.9 volts or less	up to 30 minutes

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies eight amperes will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

SPIRAL-PLATE BATTERY CHARGING TIME TABLE

Charging Amperage	5 Amps	8 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)	
12.25 to 12.49	6 hours	3 hours
12.00 to 12.24	10 hours	5 hours
10.00 to 11.99	14 hours	7 hours
Below 10.00	18 hours	9 hours

STANDARD PROCEDURE - CONVENTIONAL BATTERY CHARGING

CAUTION: Vehicles equipped with a diesel engine utilize a unique spiral cell battery. This battery has a maximum charging voltage that must be used in order to restore the battery to its full potential, failure to use the spiral cell battery charging procedure could result in damage to the battery or personal injury. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - SPIRAL CELL BATTERY CHARGING) for the appropriate procedure.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 battery tester indicates battery is OK.
- Open-circuit voltage of the battery is 12.65 volts or above.
- Battery passes Load Test multiple times.

WARNING: If the battery shows signs of freezing, leaking, loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

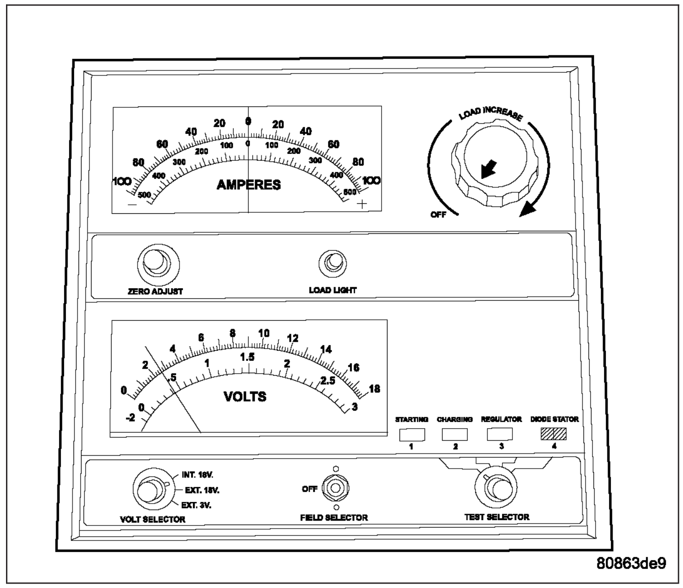
WARNING: If the battery is equipped with removable cell caps, be certain that each of the cell caps is in place and tight before the battery is returned to service. Personal injury and/or vehicle damage may result from loose or missing cell caps.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to an open-circuit voltage reading of 12.4 volts or greater, retest the battery with the Micro 420 tester or perform a load test to determine the battery cranking capacity. (Refer to 8 - ELECTRICAL/



BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) for the proper battery test procedures. If the battery passes a load test, return the battery to service. If the battery fails a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) for the proper battery system cleaning procedures. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED CONVENTIONAL BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CONVENTIONAL BATTERY CHARGE RATE TABLE

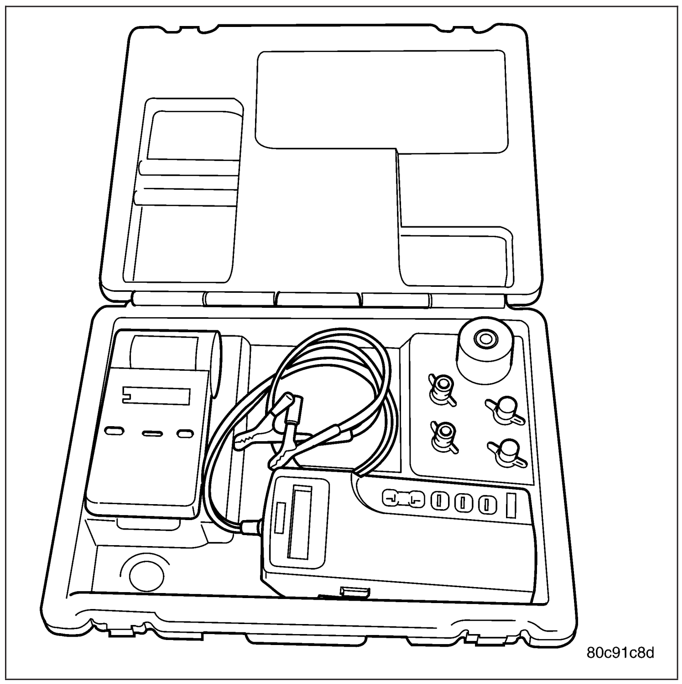
Voltage	Minutes
16.0 volts maximum	up to 10 min.
14.0 to 15.9 volts	up to 20 min.
13.9 volts or less	up to 30 min.

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Conventional Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.



CONVENTIONAL BATTERY CHARGING TIME TABLE

Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

USING MICRO 420 BATTERY TESTER (GASOLINE ENGINES)

NOTE: The Micro 420 Battery Tester should only be used to test vehicles equipped with gasoline engines. If the vehicle being tested has a diesel engine the OTC One Step Battery Analyzer and Charger special tool number OT-3641 or equivalent should be used to test the battery.

Always use the Micro 420 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: Always wear appropriate eye protection and use extreme caution when working with batteries.

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition.
3. Connect the tester to the battery, the red clamp to the positive (+) terminal and the black clamp to the negative (–) terminal.

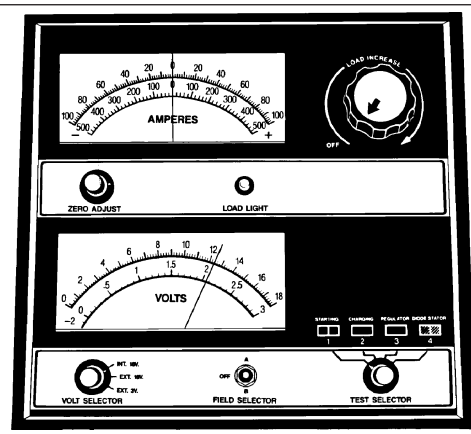
NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

4. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
5. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the BATTERY TEST RESULTS TABLE.

CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.

6. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE & RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system



NOTE: The SERVICE CODE is required on every warranty claim submitted for battery replacement.

STANDARD PROCEDURE - OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery.

Before proceeding with this test, completely charge the battery, refer to the appropriate battery charging procedure.

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.
3. Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage.

898A-7

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity.

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Totally Integrated Power Module (TIPM). This will reduce battery discharging.

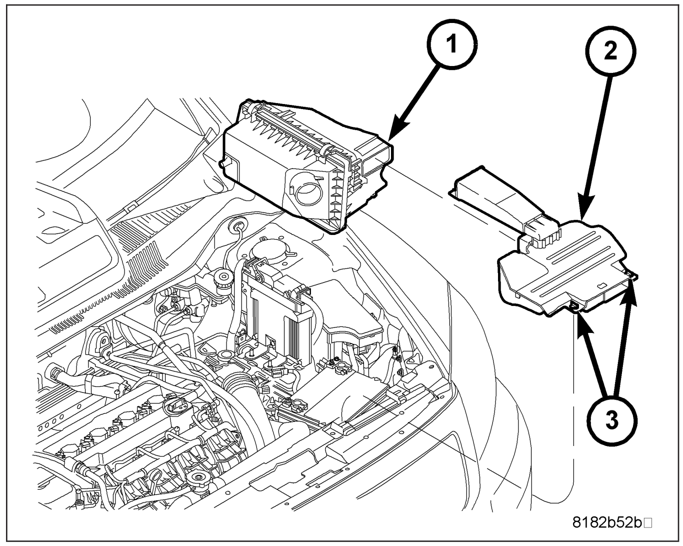
Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.
- Faulty or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes.
2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
3. Disconnect the battery negative cable.
4. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.
5. After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Totally Integrated Power Module (TIPM), one at a time until the amperage reading becomes very low, or nonexistent. **Refer to the appropriate wiring information for complete TIPM fuse, circuit breaker, and circuit identification.** This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.

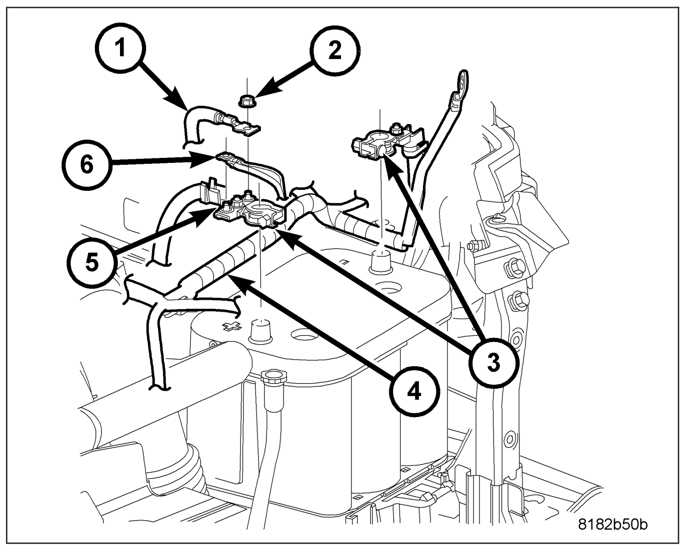


6. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

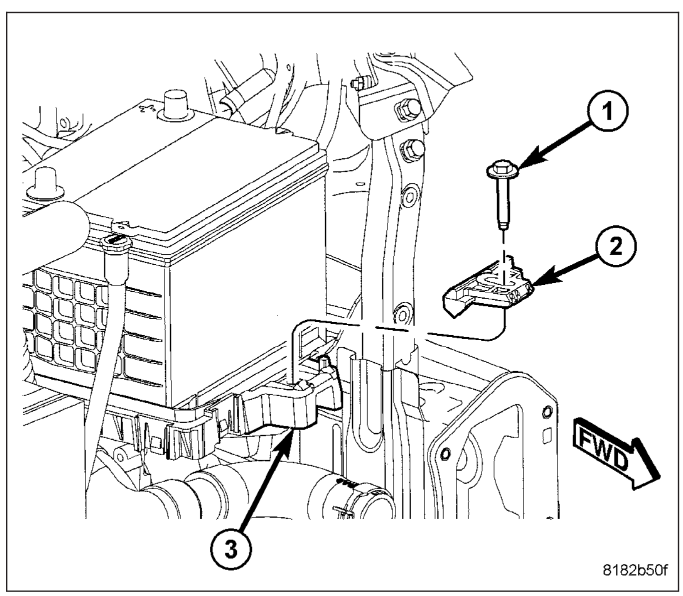
REMOVAL

WARNING:
To protect the hands from battery acid, a suitable pair of heavy duty rubber gloves should be worn when removing or servicing a battery. Safety glasses also should be worn.

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.



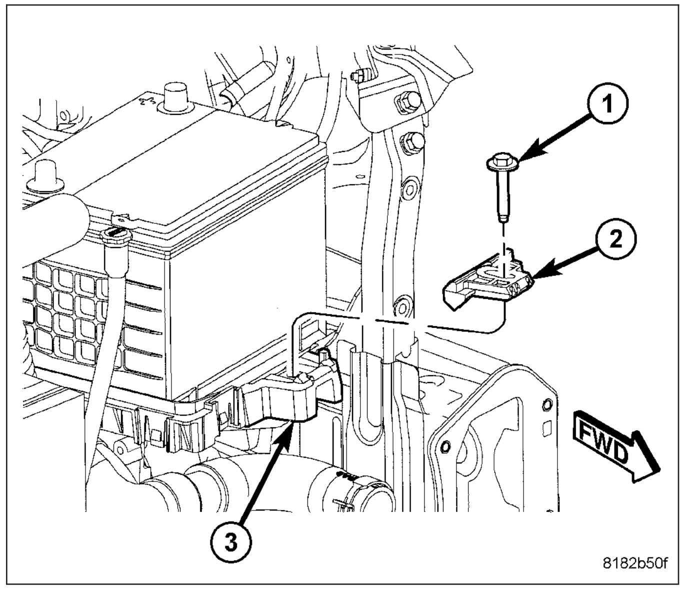
1. Rotate the two retaining clips (3) and remove the air cleaner fresh air duct (2).



WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Diesel battery shown, gasoline battery similar.

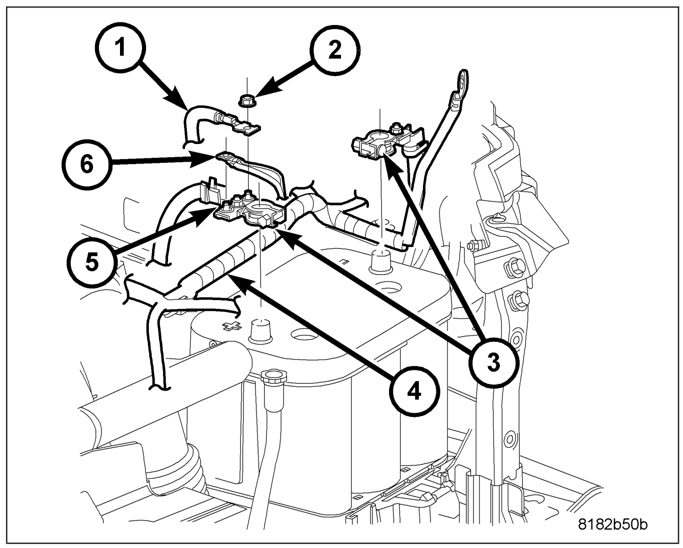
2. Disconnect and isolate the battery negative cable then the positive cable (3).



3. Loosen bolt (1) and retainer (2) that holds the battery down to the tray (3).
4. Lift battery out of battery tray and remove from vehicle.
5. Remove thermal guard (if equipped) from battery.

INSTALLATION

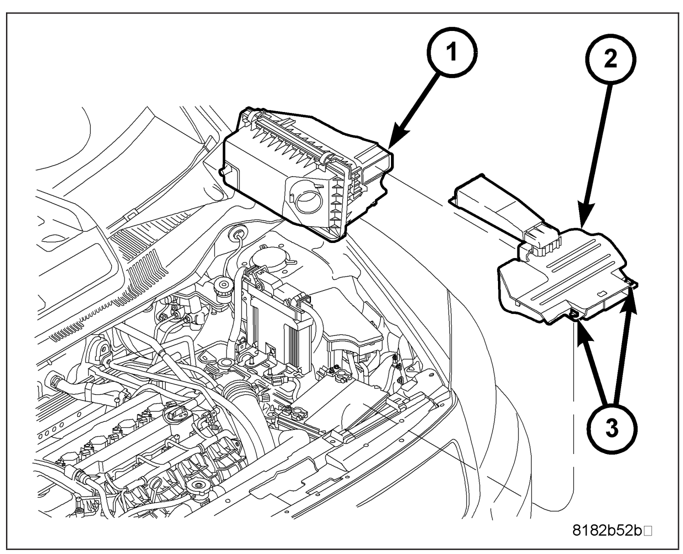
WARNING:
To protect the hands from battery acid, a suitable pair of heavy duty rubber gloves should be worn when removing or servicing a battery. Safety glasses also should be worn.



WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

NOTE: When replacing battery, the thermal guard MUST be transferred to the new battery (if equipped).

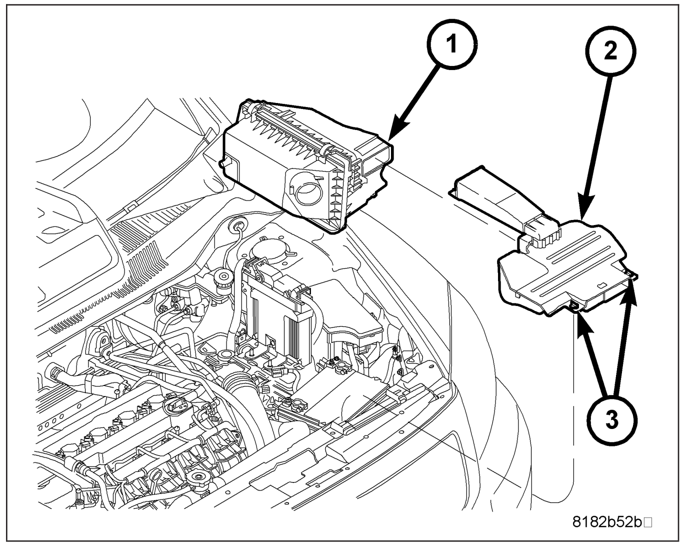
1. Install battery in vehicle making sure that the thermal guard (if equipped) is present and battery is properly positioned on battery tray (3).
2. Install the battery hold down retainer (2) and bolt (1) making sure that it is properly positioned on battery. Torque the hold down bolt to 7 N·m (62 in. lbs.)



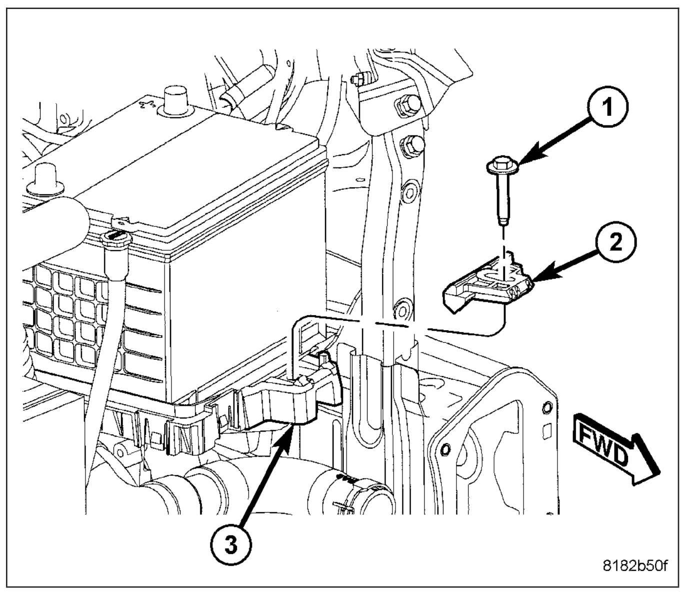
WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Diesel battery shown, gasoline battery similar.

3. Connect the battery positive cable then the negative cable (3).
4. Torque the cable clamp nuts to 5 N·m (45 in. lbs.).



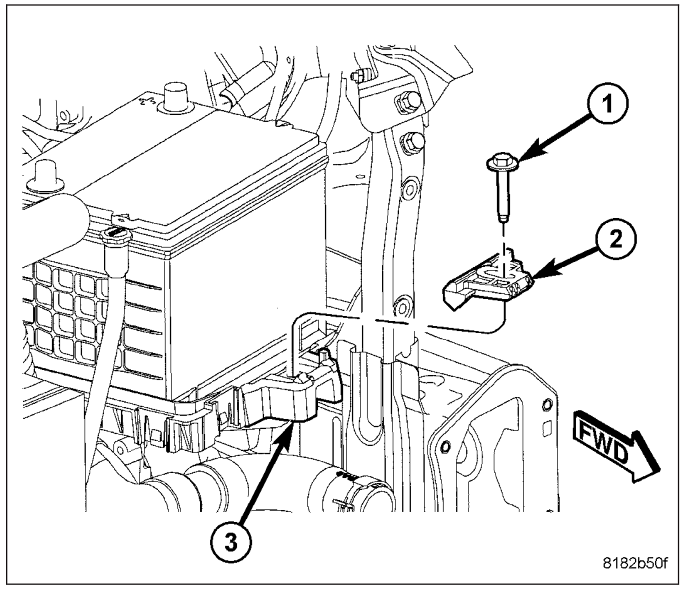
5. Install the air cleaner fresh air duct (2) and secure in place by rotating the two retaining clips (3).
6. Verify proper vehicle operation.



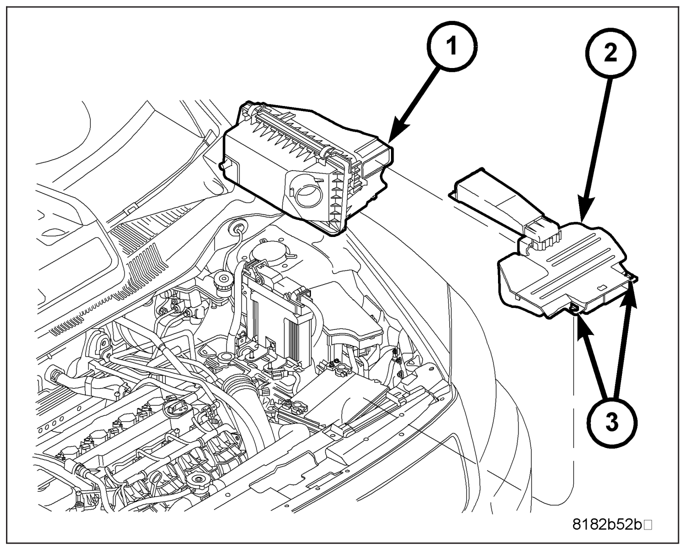
BATTERY HOLDDOWN

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Rotate the two retaining clips (3) and remove the air cleaner fresh air duct (2).



3. Remove the battery hold down retaining bolt (1).
4. Remove the battery hold down (2) from the vehicle.



INSTALLATION

1. Install the battery hold down (2) into the vehicle.
2. Install the battery hold down retaining bolt (1). Tighten the bolt to 7 N·m (62 in. lbs.).

3. Install the air cleaner fresh air duct (2) and secure in place by rotating the two retaining clips (3).
4. Connect the battery negative cable.

BATTERY CABLES

DESCRIPTION

The battery cables are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a clamping type female battery terminal made of stamped sheet metal that is die cast onto one end of the battery cable wire. A pinch-bolt and nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then soldered. The battery positive cable wires feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a smaller female battery terminal clamp.

Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some vehicles.

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

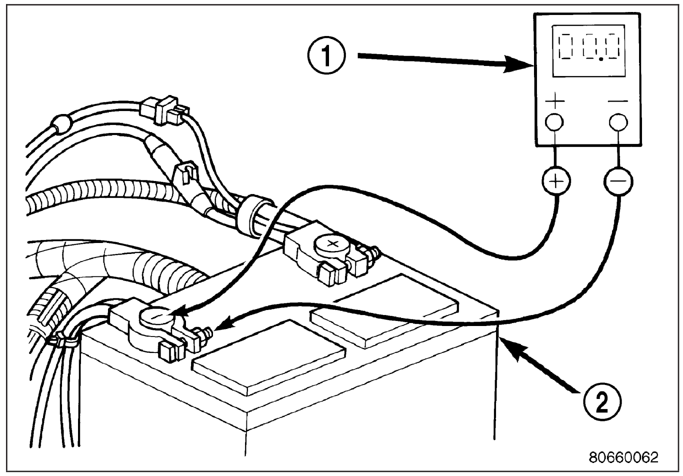
One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the Totally Integrated Power Module (TIPM), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp has one wire as an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a ground connection, typically on the engine cylinder block.

DIAGNOSIS AND TESTING

BATTERY CABLES

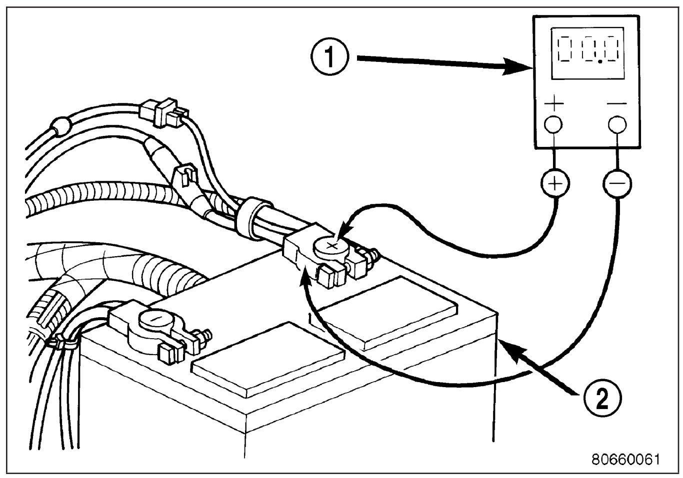
A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.



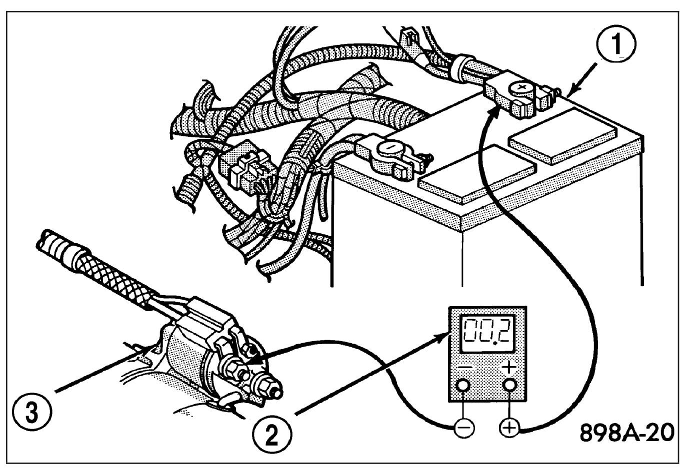
VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

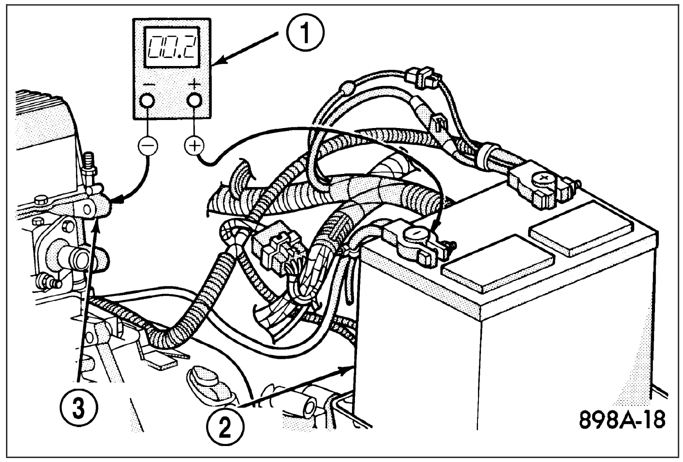


- The battery is fully-charged and load tested. Refer to Standard Procedures for the proper battery charging and load test procedures.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.

- To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay is located in the Totally Integrated Power Module (TIPM), in the engine compartment. See the fuse and relay layout label affixed to the underside of the TIPM cover for ASD relay identification and location.

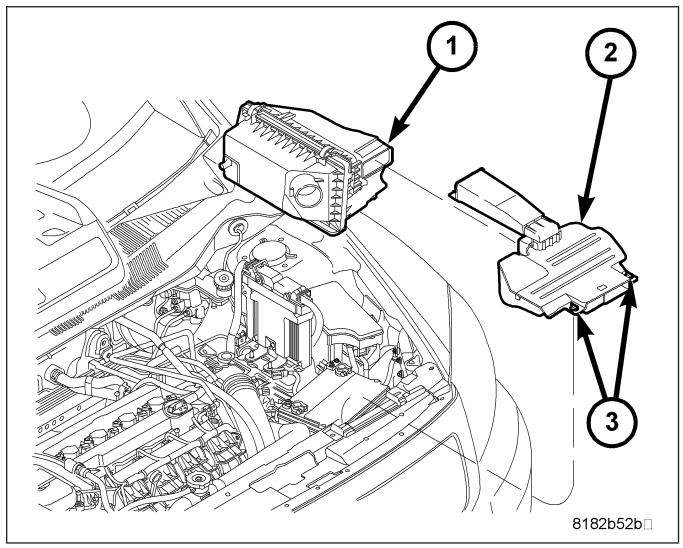


1. Connect the positive lead of the voltmeter (1) to the battery (2) negative terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.



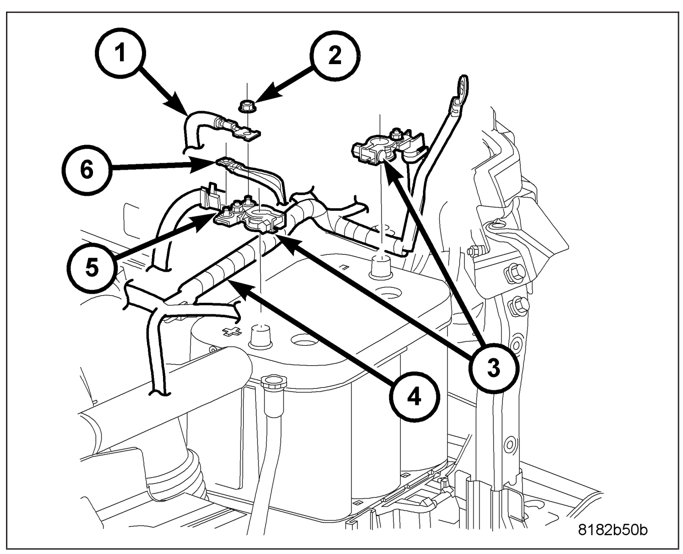
2. Connect the positive lead of the voltmeter (1) to the battery (2) positive terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) positive cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

3. Connect the voltmeter (2) to measure between the battery positive cable terminal clamp (1) and the starter solenoid B(+) terminal stud (3). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.

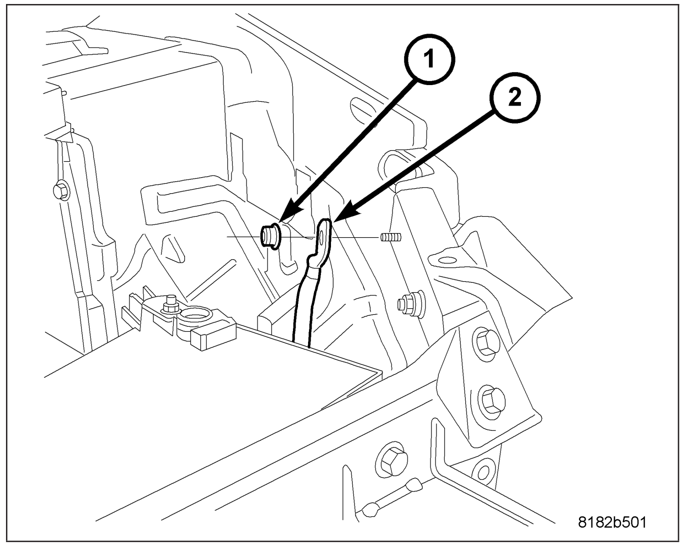


4. Connect the voltmeter (1) to measure between the battery (2) negative cable terminal clamp and a good clean ground on the engine block (3). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.

REMOVAL

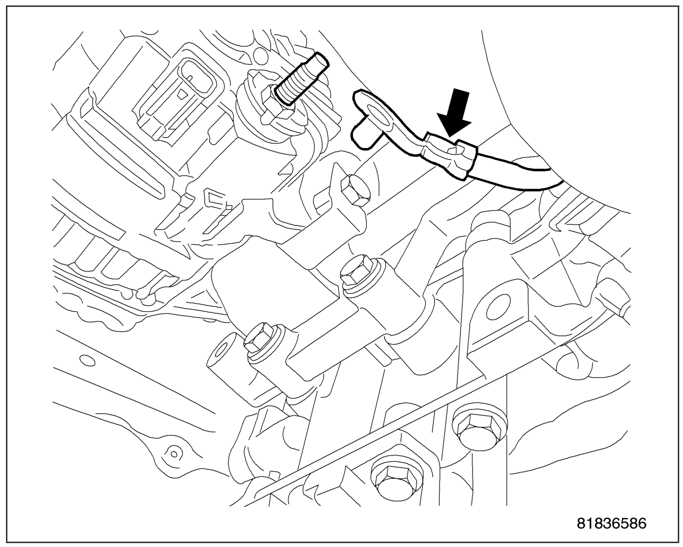


1. Disconnect and isolate the battery negative cable.
2. Rotate the two retaining clips (3) and remove the air cleaner fresh air duct (2).



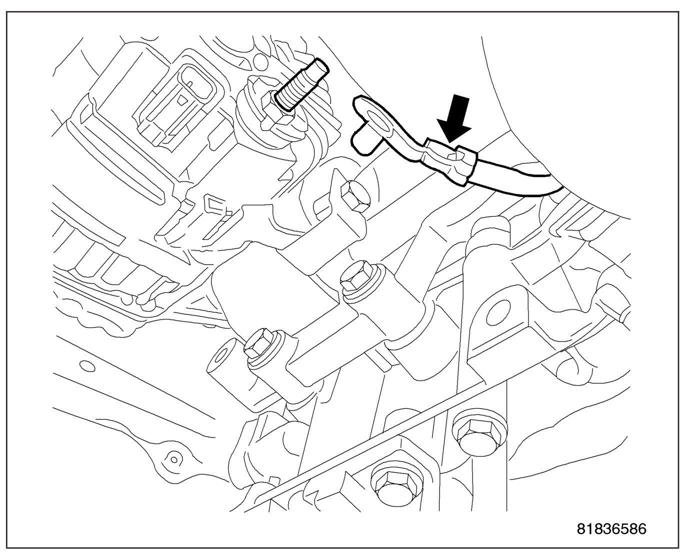
WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Diesel battery shown, gasoline battery similar.

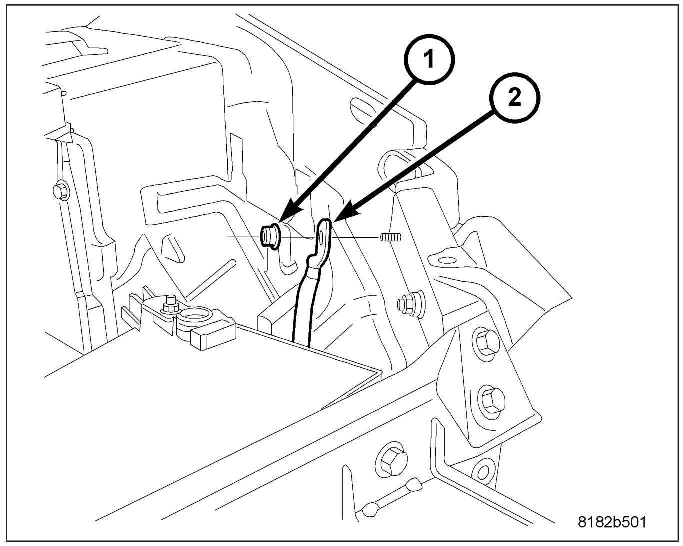


3. Remove the nut (2) securing the Totally Integrated Power Module (TIPM) cable (1) to the battery clamp stud (5).
4. Disconnect and isolate the battery negative cable then the positive cable (3).

5. Remove the nut (1) securing the negative cable (2) to the body ground stud.

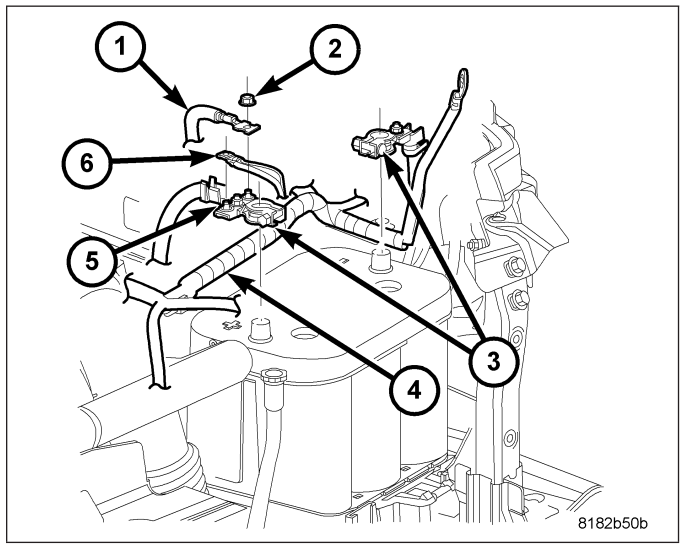


6. Remove the battery cable from the B+ terminal of the generator.
7. Remove the battery cable from the B+ terminal of the starter motor.
8. One at a time, trace the battery cable retaining pushpins, fasteners and routing clips until the cables are free from the vehicle.
9. Remove the battery cables from the engine compartment.

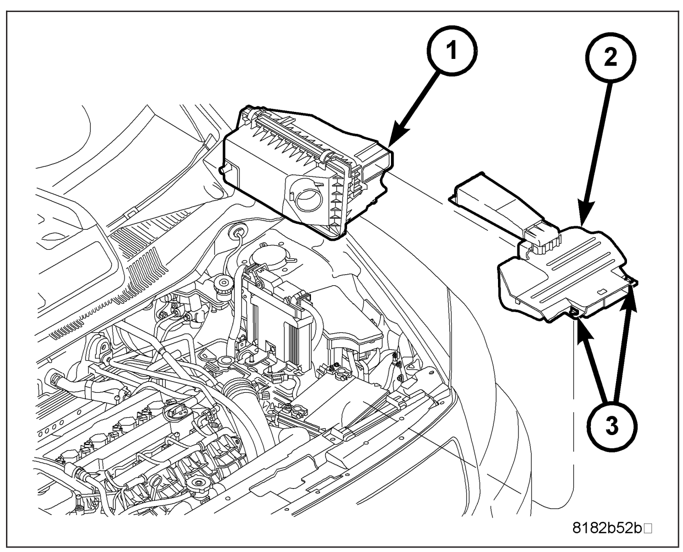


INSTALLATION

1. Position the battery cables in the engine compartment.
2. One at a time, install the battery cable retaining pushpins, fasteners and routing clips until the cables are installed exactly where they were in the vehicle.
3. Connect the battery cable to the B+ terminal of the starter motor. Torque the cable nut to 13 N·m (115 in. lbs.).
4. Connect the battery cable to the B+ terminal of the generator. Torque the cable nut to 14 N·m (125 in. lbs.).

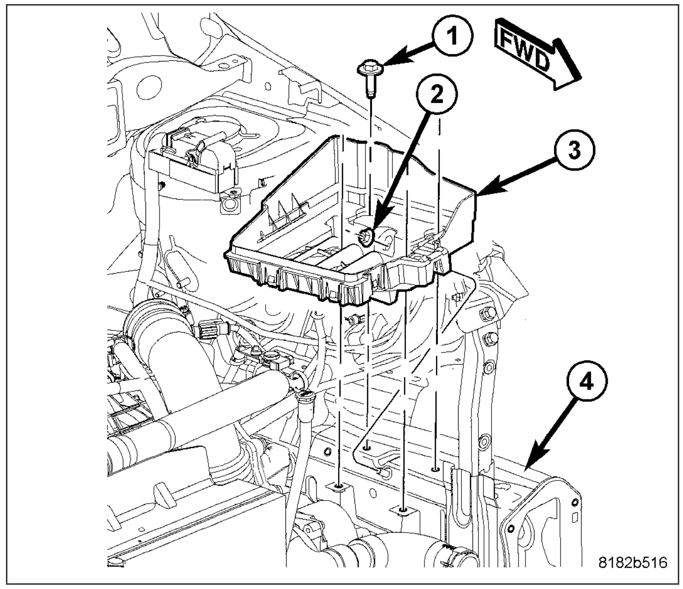


5. Install the nut (1) securing the negative cable (2) to the body ground stud. Torque the cable nut to 12 N·m (9 ft. lbs.).



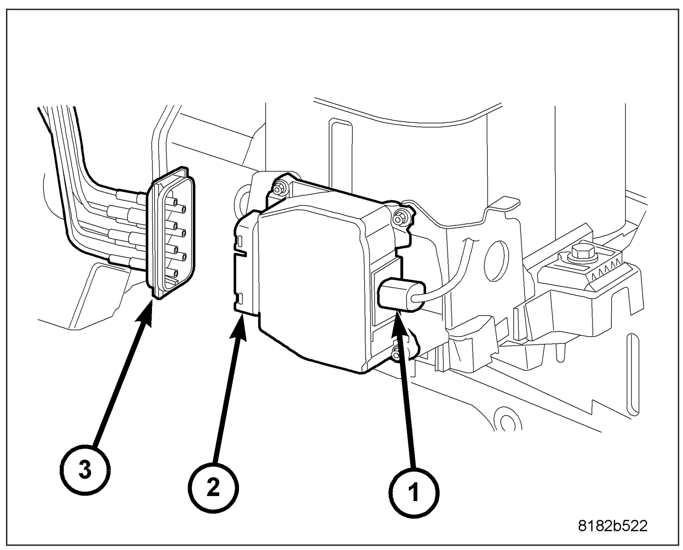
WARNING: The battery negative and positive cable polarity are different from the gasoline engine equipped vehicles to the diesel engine equipped vehicles. Please note the location of the positive and negative cables prior to service of the battery or related components.

NOTE: Diesel battery shown, gasoline battery similar.



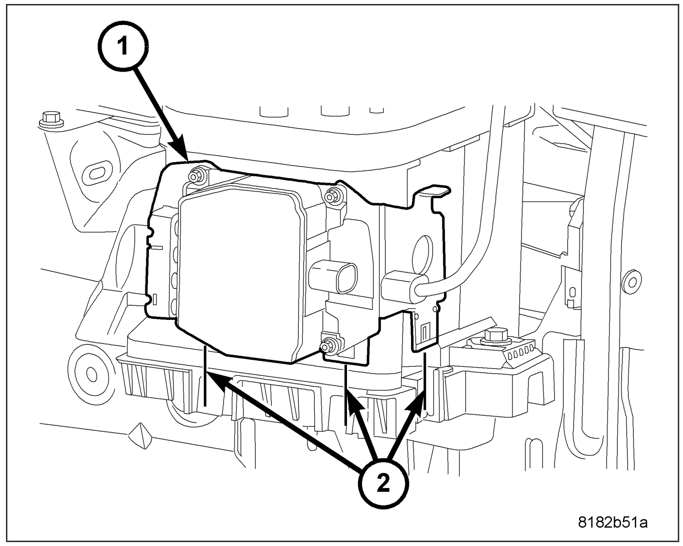
6. Connect the battery positive cable then the negative cable (3).
7. Torque the cable clamp nuts to 5 N·m (45 in. lbs.).
8. Install the nut (2) securing the Totally Integrated Power Module (TIPM) cable (1) to the battery clamp stud (5).
9. Install the air cleaner fresh air duct (2) and secure in place by rotating the two retaining clips (3).

BATTERY TRAY

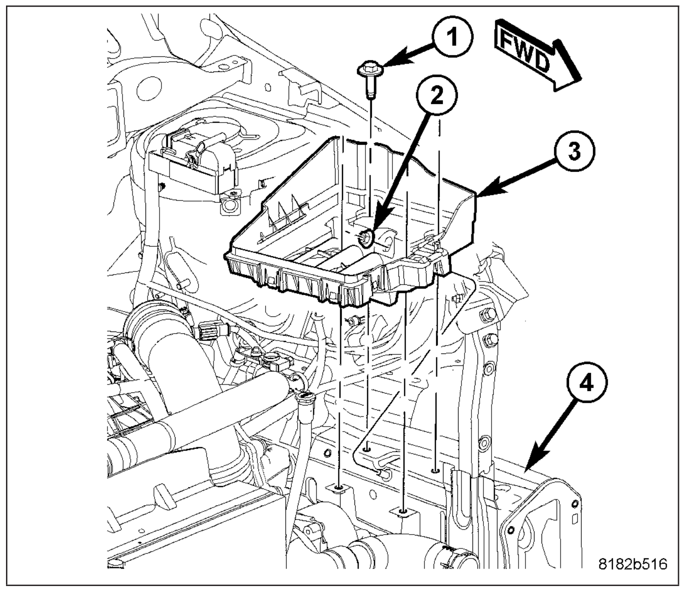


DESCRIPTION

The battery is placed and secured in a plastic battery tray (3). The battery tray is located in the left front side of the vehicle and is secured in place by one nut (2) and four bolts (1).

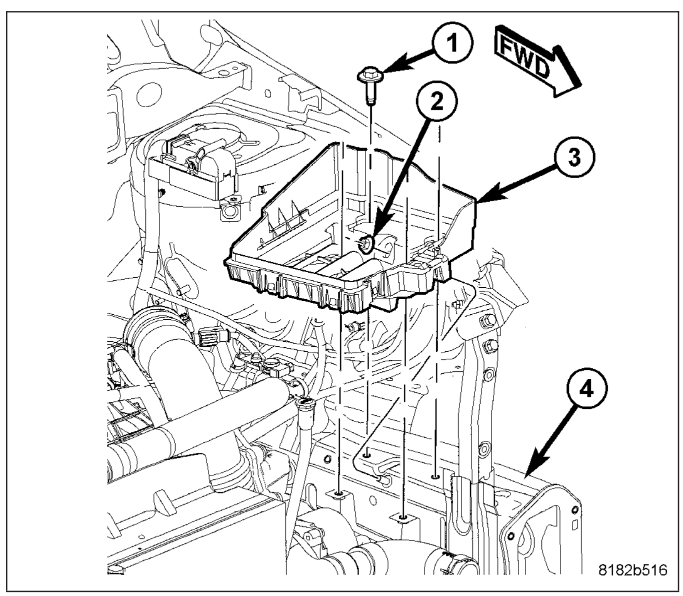


REMOVAL

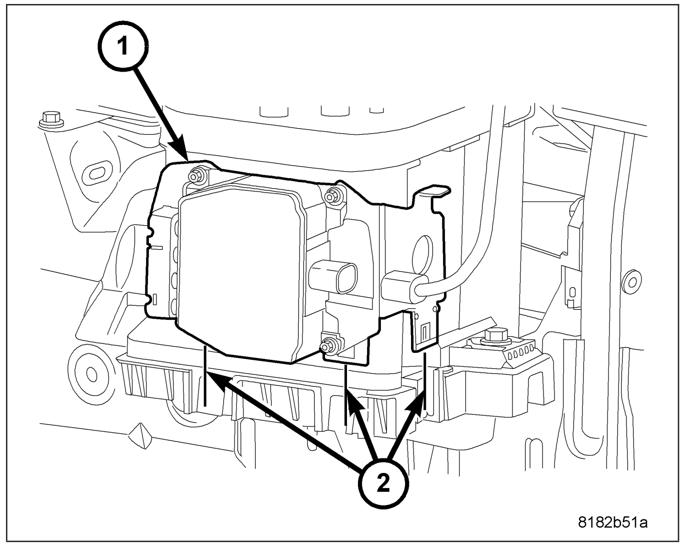


1. Disconnect and isolate the battery negative cable.
2. On diesel engine equipped vehicles disconnect the vacuum connector (3) and electrical connector (1) from the diesel vacuum valve (2).

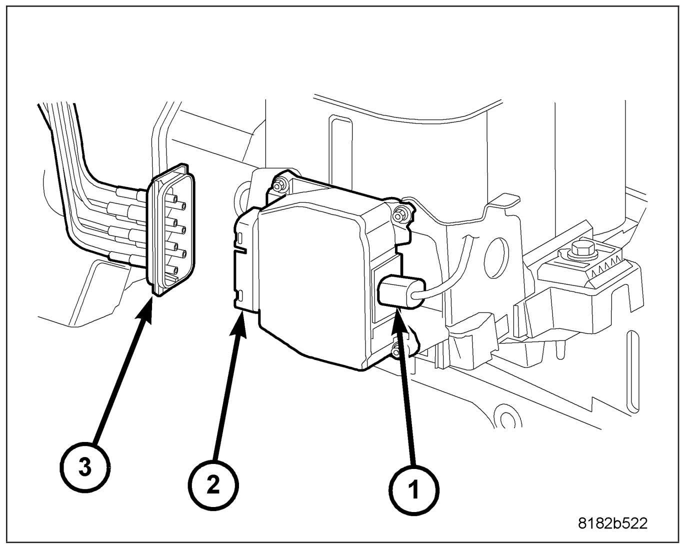
3. On diesel engine equipped vehicles lift the diesel vacuum valve bracket (1) up disengaging the mounting tabs from the receptacles (2) in the battery tray.



4. Remove the battery (Refer to 8 - ELECTRICAL/ BATTERY SYSTEM/BATTERY - REMOVAL).
5. Remove the four bolts (1) and one nut (2) securing the battery tray (3) to the left frame rail (4).
6. Lift the battery tray out of the engine compartment and remove from the vehicle.

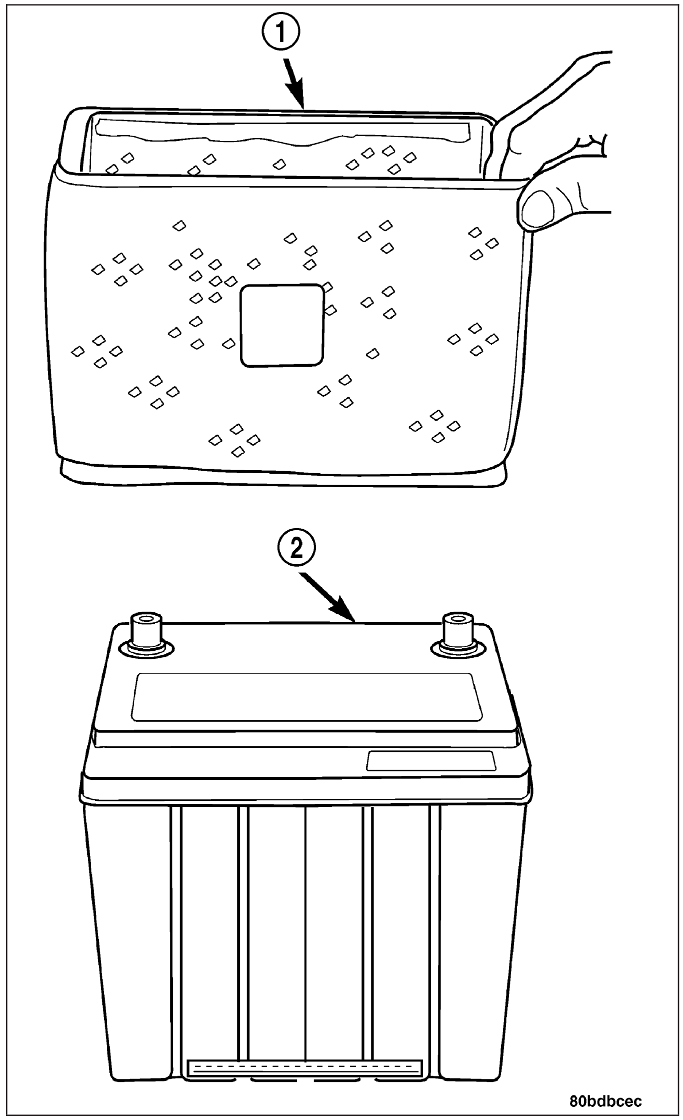


INSTALLATION



1. Place the battery tray (3) into the engine compartment over the left frame rail (4).
2. Install the one nut (2) and four bolts (1) securing the battery tray (3) to the frame rail (4).
3. Tighten the nut to 10.5 N·m (93 in. lbs.).
4. Tighten the bolts to 1.5 N·m (93 in. lbs.).
5. Install the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

6. On diesel engine equipped vehicles install the diesel vacuum valve. Push the bracket (1) down until the mounting tabs are completely seated into the receptacles (2) in the battery tray.



7. On diesel engine equipped vehicles connect the vacuum connector (3) and electrical connector (1) to the diesel vacuum valve (2).
8. Connect the battery negative cable.

THERMAL GUARD

DESCRIPTION

On gasoline engine equipped vehicles, a flexible thermal guard wraps around the battery case (2) to enclose the sides of the battery. The thermal guard (1) consists of a plastic cloth outer skin with a polyester based insulator fiber.

REMOVAL

WARNING:
To protect the hands from battery acid, a suitable pair of heavy duty rubber gloves, not the household type, should be worn when removing or servicing a battery. Safety glasses also should be worn.

1. Disconnect and isolate the battery negative cable.
2. Remove the battery, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).
3. Carefully lift the thermal guard off over the battery taking care not to tear it.
4. Remove the thermal guard from battery.

INSTALLATION

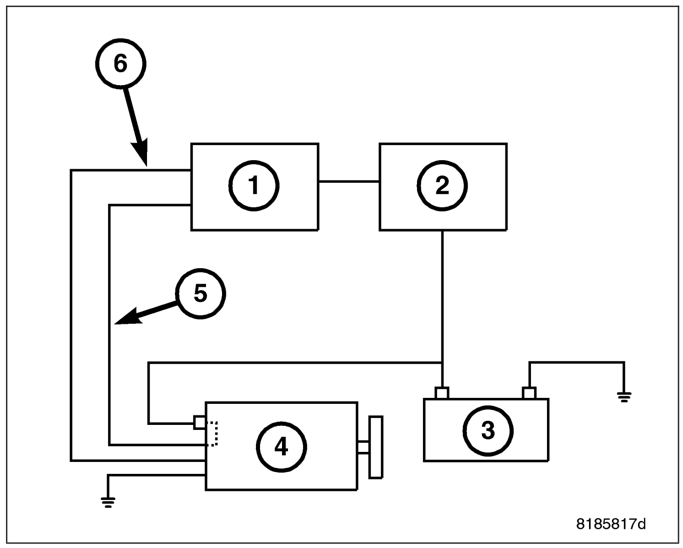
NOTE: When replacing battery, the thermal guard MUST be transferred to the new battery.

1. Slip the battery thermal guard over the battery being careful not to tear it.
2. Install the battery into the vehicle, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).
3. Connect the battery negative cable.

CHARGING

TABLE OF CONTENTS

CHARGING



DESCRIPTION - CHARGING SYSTEM

The charging system consists of:

- Generator
- Decoupler Pulley (If equipped)
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch (refer to the Ignition System section for information)
- Battery (refer to the Battery section for information)
- Inlet Air Temperature
- Voltmeter (refer to the Instrument Cluster section for information if equipped)
- Wiring harness and connections (refer to the Wiring section for information)
- Accessory drive belt (refer to the Cooling section for more information)

OPERATION - CHARGING SYSTEM

The charging system is turned on and off with the ignition switch. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator. The alternator is internally grounded. The generator regulates the field using Pin 1 of the field connector (High side driver).

The generator is driven by the engine through a serpentine belt and pulley or decoupler pulley arrangement.

The PCM receives a voltage input from the alternator and also a battery voltage input from the TIPM, it then compares the voltages and if there is a difference it send a signal to the alternator EVR circuit to increase or decrease output. It uses a pulse width modulation (PWM) to send signals to the alternator circuitry to control the amount of output from the alternator. The amount of DC current produced by the generator is controlled by the EVR (electronic voltage regulator) circuitry contained within the alternator.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (electronic voltage regulator) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage,** engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as reminder to check the three gauges. The lamp is located on the instrument panel. Refer to the Instrument Cluster section for additional information.

Voltage is monitored at B+ stud to insure the cable is connected. If cable is loose PCM will shut down generator field. Because of this new feature, pin 2 of the field connector is internally connected to the B+.

DIAGNOSIS AND TESTING

ON-BOARD DIAGNOSTIC SYSTEM

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 40 good trip if the problem does not occur again.

DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the scan tool. Refer to the appropriate Powertrain Diagnostic Procedures manual for information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

ERASING DIAGNOSTIC TROUBLE CODES

The scan tool must be used to erase a DTC.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE)
- loose generator belt.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Diagnostic manual for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to the Battery section (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING) for procedures.
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in the fuseblock for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications (Refer to 8 - ELECTRICAL/CHARGING - SPECIFICATIONS).
5. Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications (Refer to 7 - COOLING/ACCESSORY DRIVE - SPECIFICATIONS).
6. Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.
7. Inspect automatic belt tensioner (if equipped). Refer to the Cooling System for more information.
8. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

SPECIFICATIONS

GENERATOR RATINGS

TYPE	RATED SAE AMPS	ENGINES	MINIMUM TEST AMPS
MELCO	120 AMPS	1.8/2.0/2.4L	

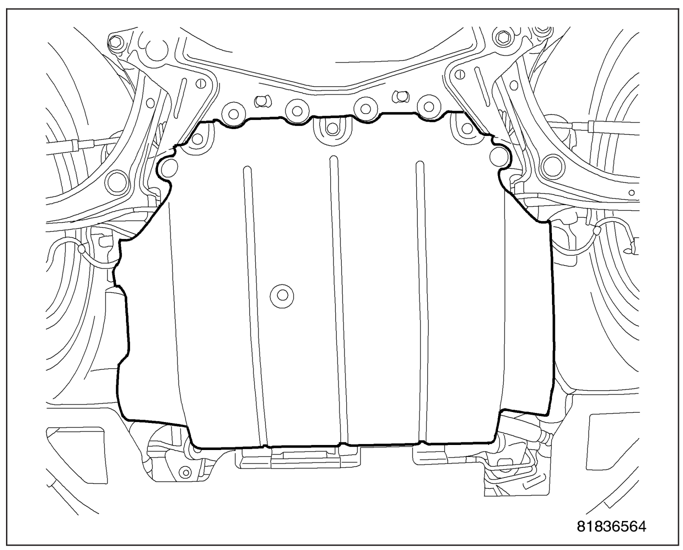
GENERATOR

DESCRIPTION

The generator is belt-driven by the engine. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced. The generator produces DC voltage.

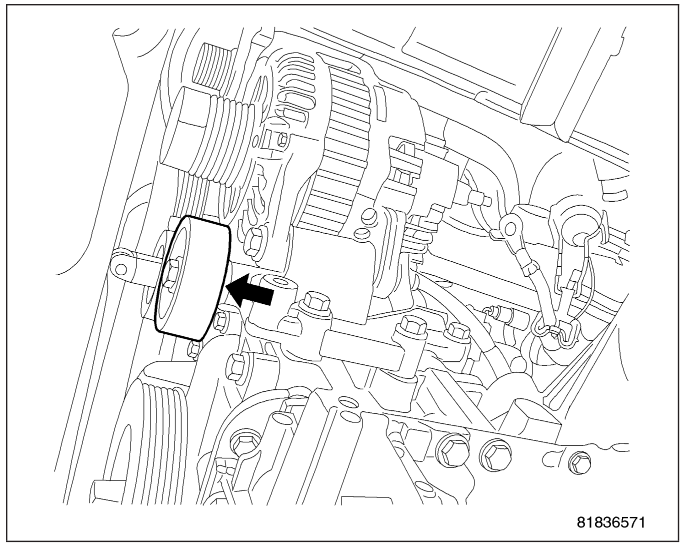
OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil.



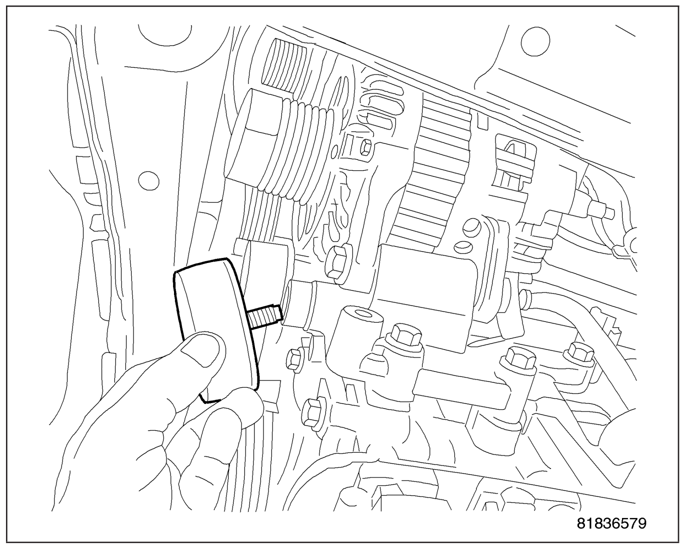
The Y type stator winding connections deliver the induced AC current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicles electrical system through the generator, battery, and ground terminals.

Noise emitting from the generator may be caused by:

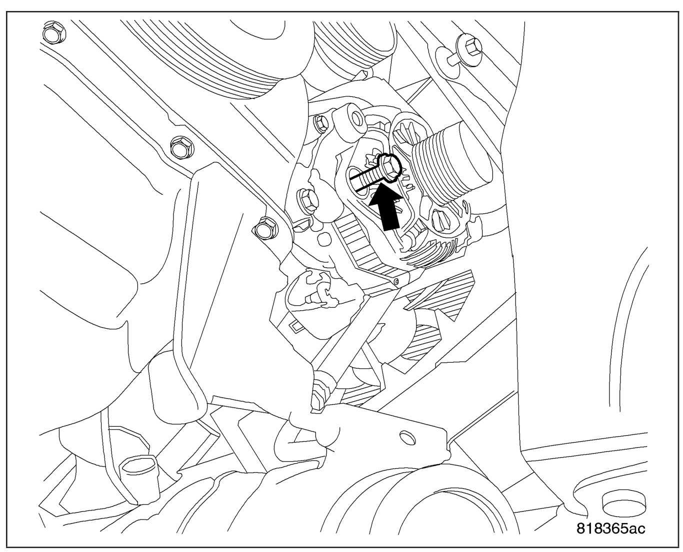


- Worn, loose or defective bearings
- Loose or defective drive pulley
- Incorrect, worn, damaged or misadjusted drive belt
- Loose mounting bolts
- Misaligned drive pulley
- Defective stator or diode
- Damaged internal fins

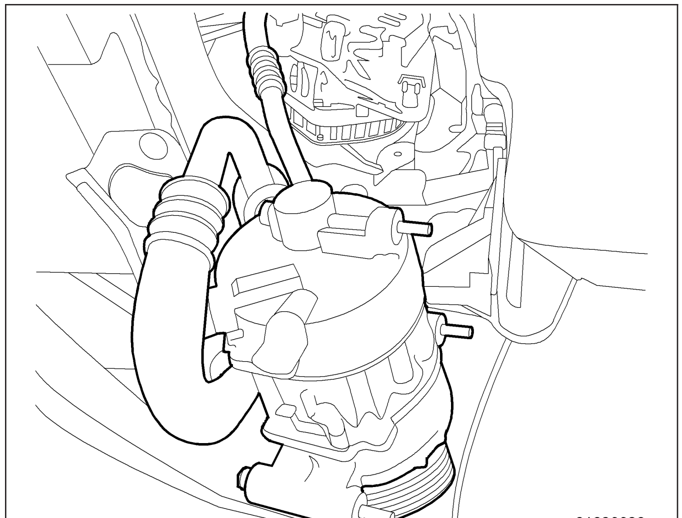
REMOVAL



1. Disconnect the negative battery cable.
2. Raise and support vehicle.
3. Remove the right front wheel.
4. Remove the underbody air dam.

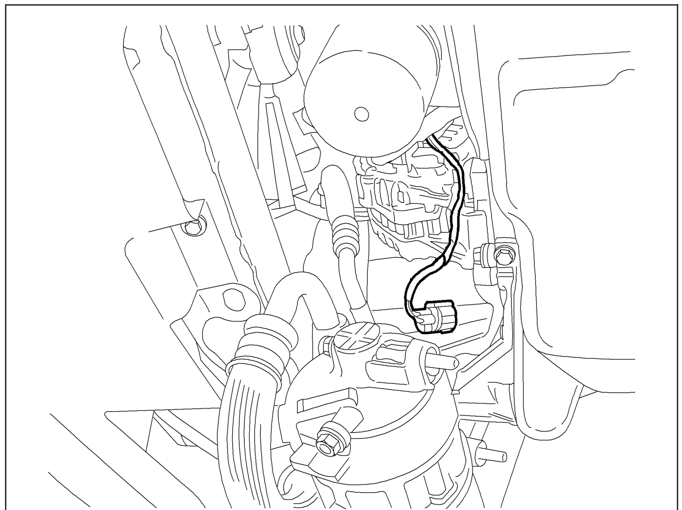


5. Remove the accessory drive splash shield.

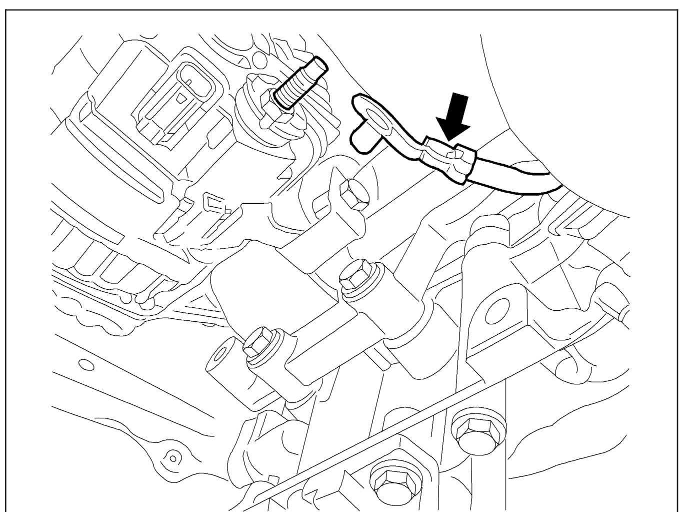


6. Remove the accessory drive idler pulley

7. Loosen the lower mounting bolt.

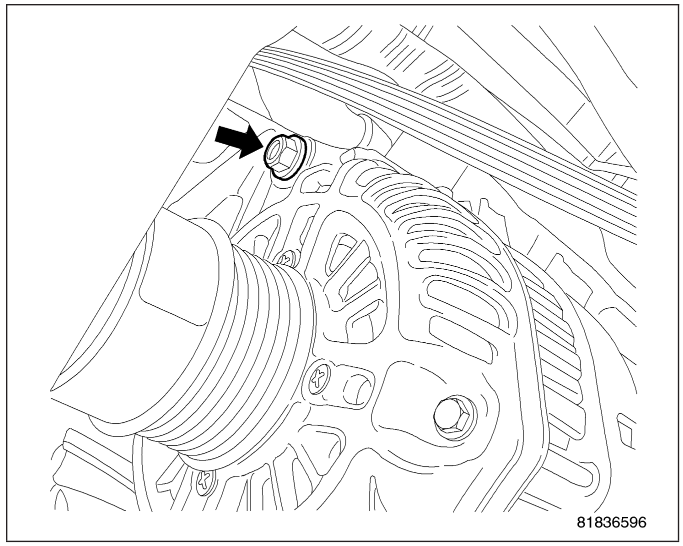


8. Loosen the A/C compressor and relocate, pull down and to outboard side of vehicle to make room to remove generator.



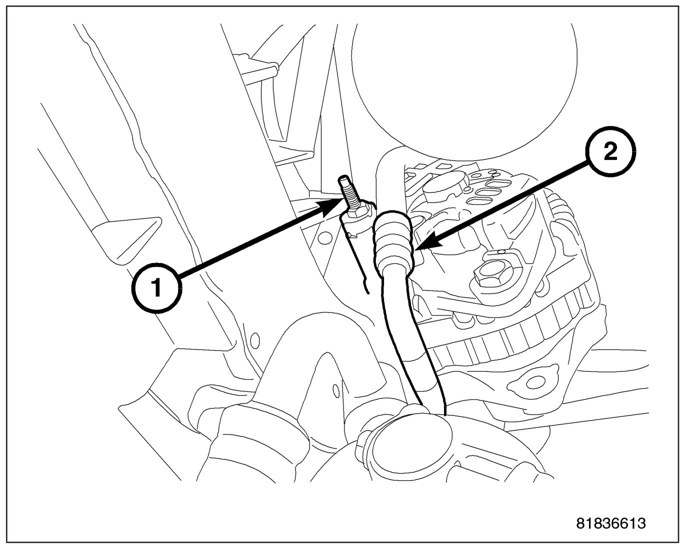
81836632

9. Unplug field circuit from generator.

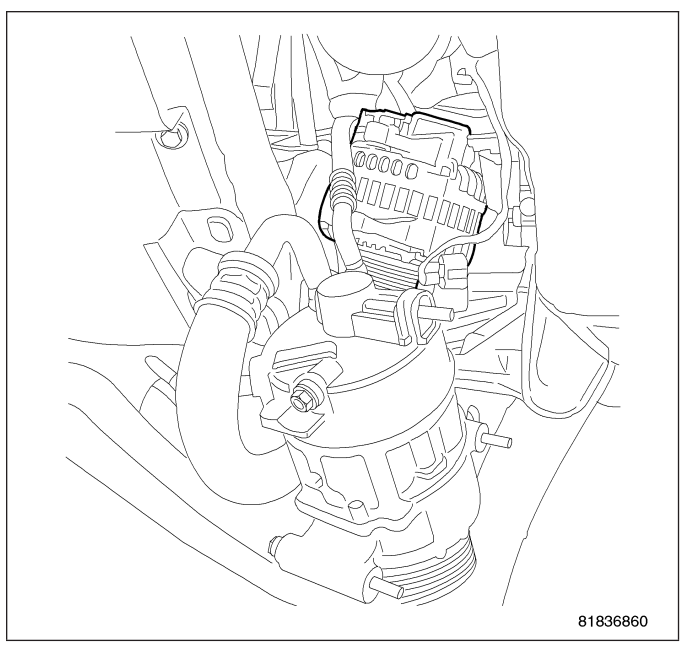


81836591

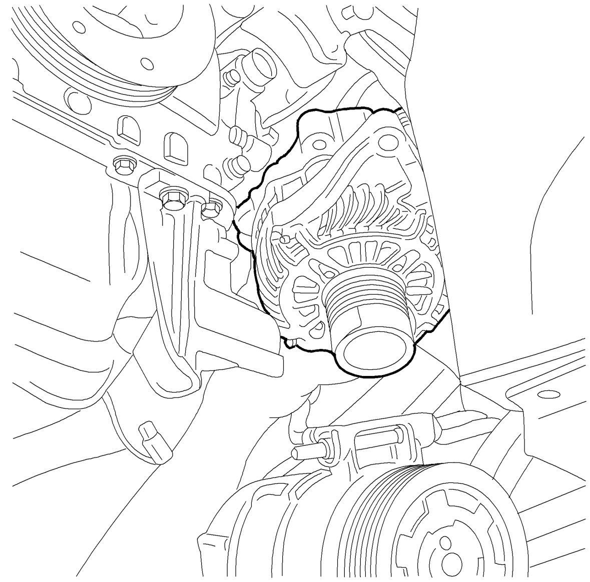
10. Remove the B+ terminal nut and wire.



81836586

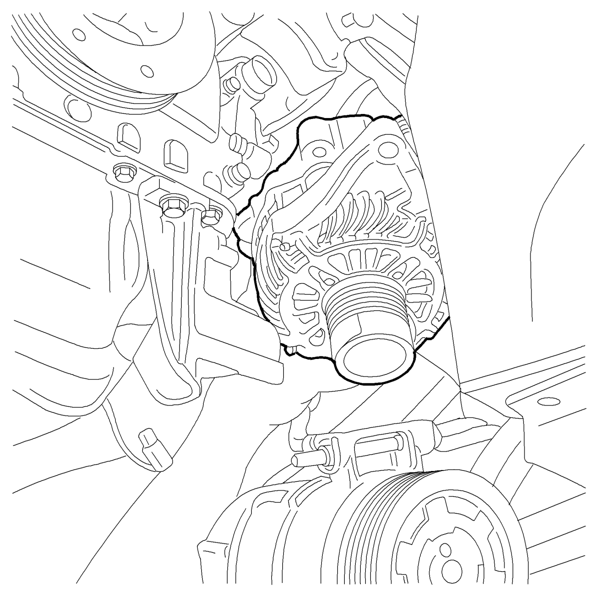


11. Remove the upper mounting bolt.
12. Remove the generator lower mounting bolt.



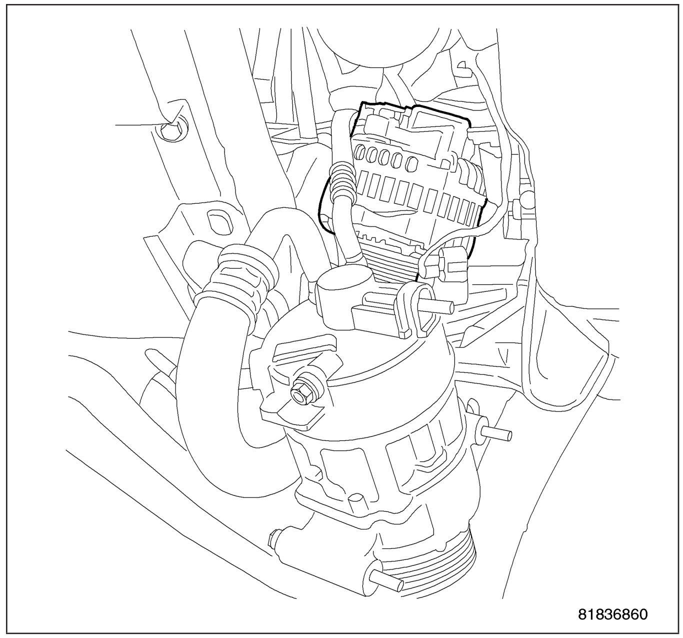
13. Relocate the battery stud (1) to the other side of the A/C line (2) for removal of the generator.

14. Rotate generator pulley down.



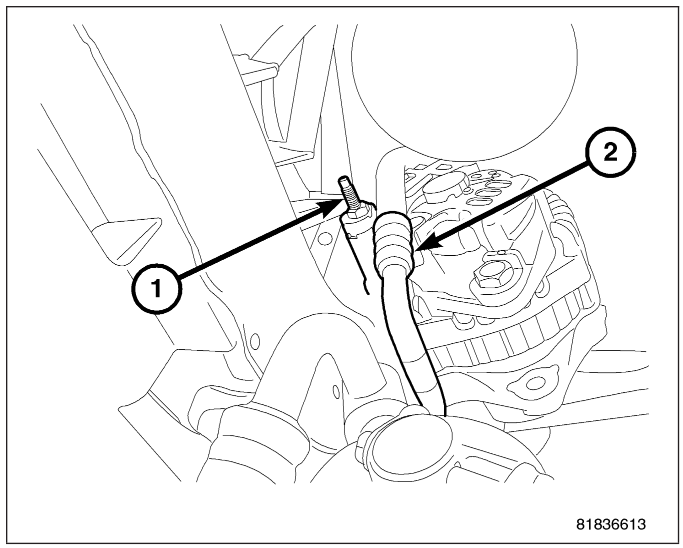
15. Slide generator down and out of vehicle.

8183686e

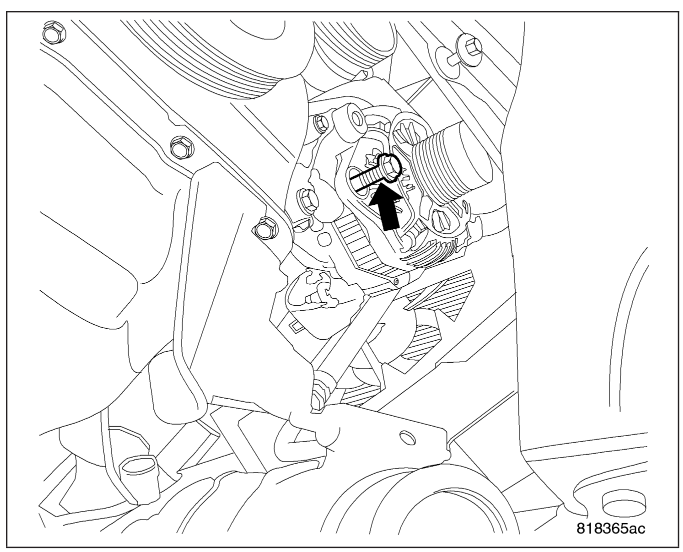


INSTALLATION

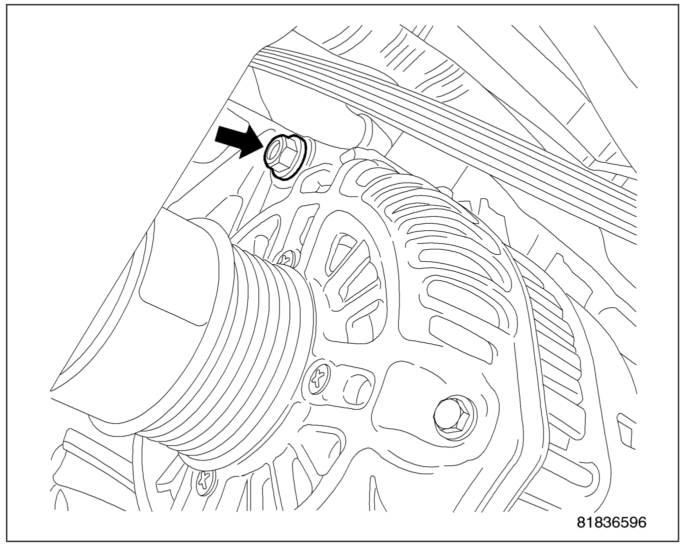
1. Move A/C compressor to the side to install generator.



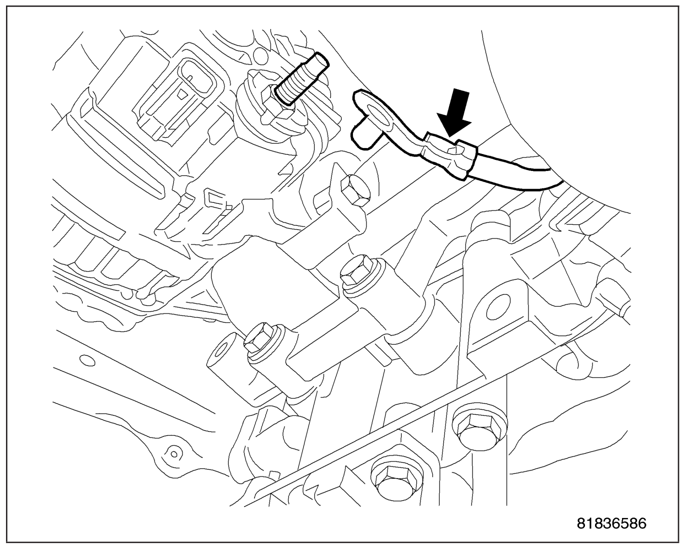
8183686e



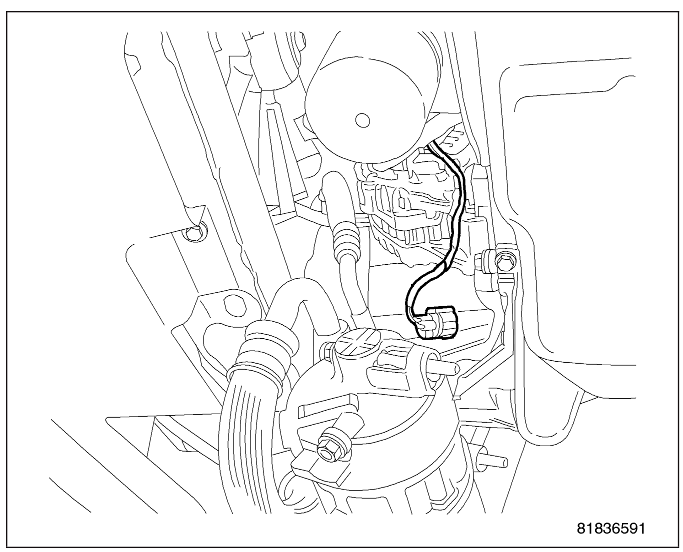
2. Rotate generator and set in place.



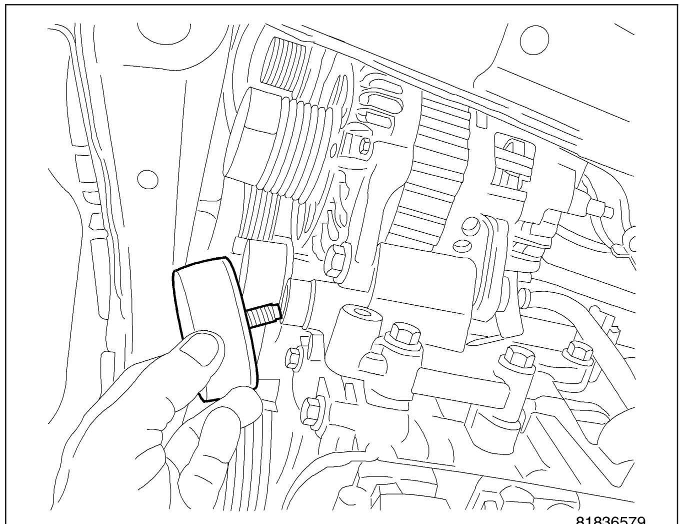
Make sure battery terminal (1) is in front of A/C line (2).



3. Loose install lower mounting bolt.

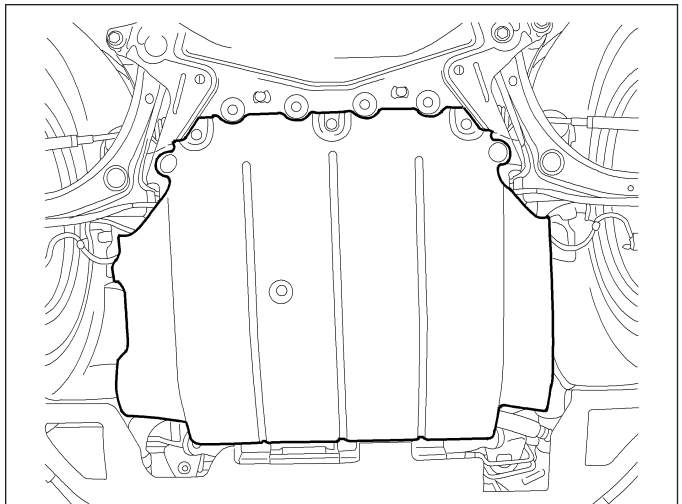


4. Loose install upper mounting bolt.
5. Tighten bolts to 61 N·m (45 ft. lbs.).



6. Install the B+ terminal nut and wire and tighten to 11.3 N·m (100 ins. lbs.).

7. Plug in the field circuit to the generator.



8. Install idler pulley and tighten bolt.
9. Install the accessory drive belt.
10. Install splash shield.

81836579

11. Install lower air dam.
12. Lower vehicle.
13. Connect the negative battery cable.

81836564

STARTING

TABLE OF CONTENTS

STARTING

DESCRIPTION

The starting system consists of:

- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

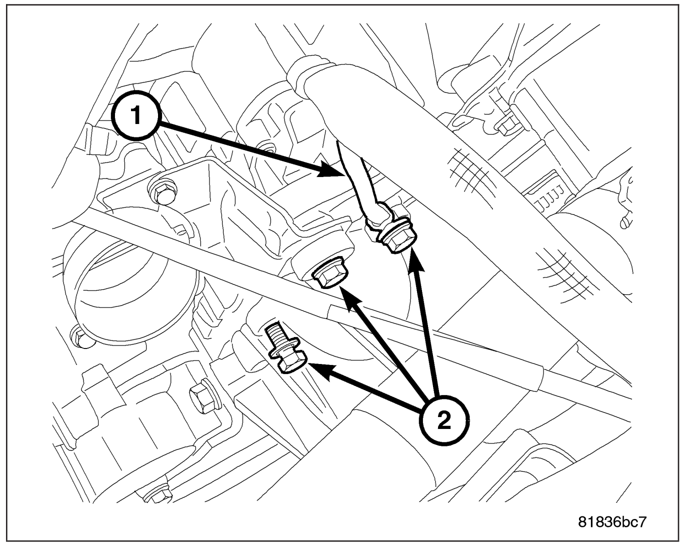
The diagnostic procedures used in each of these groups include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

OPERATION

These components form two separate circuits. A high amperage circuit that feeds the starter motor up to 300+ amps, and a control circuit that operates on less than 20 amps.

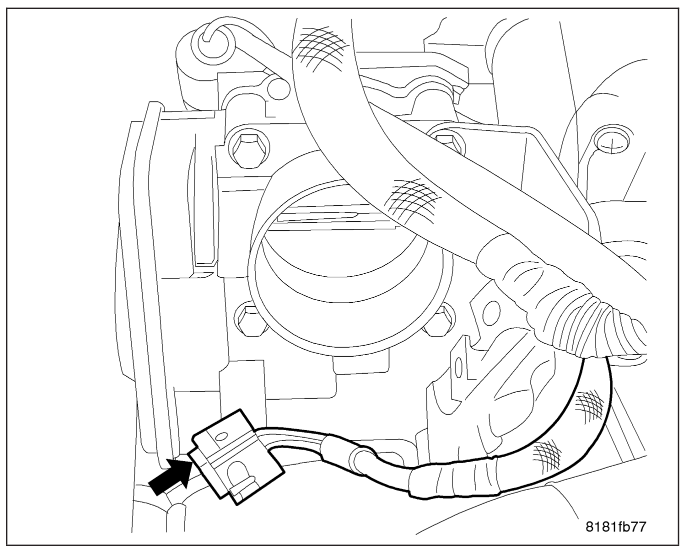
The PCM controls a double start over-ride safety that does not allow the starter to be engaged if the engine is already running.

SPECIFICATIONS



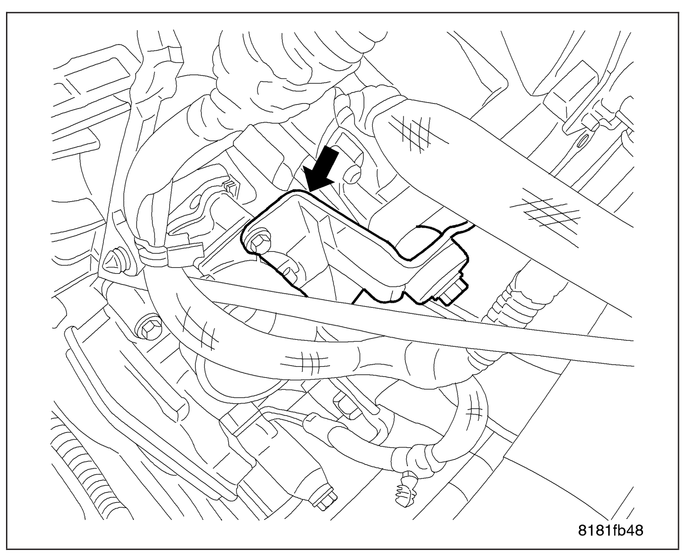
TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Starter Mounting Bolts	54	40	-
Starter Solenoid Battery Nut	10	-	90
Power Steering Lines	61	45	-

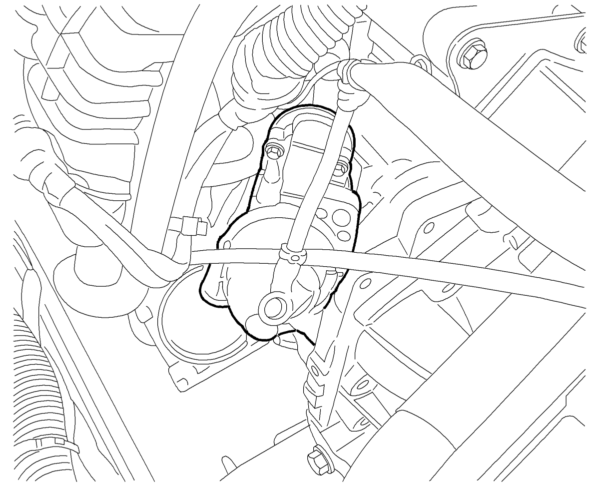


STARTER MOTOR

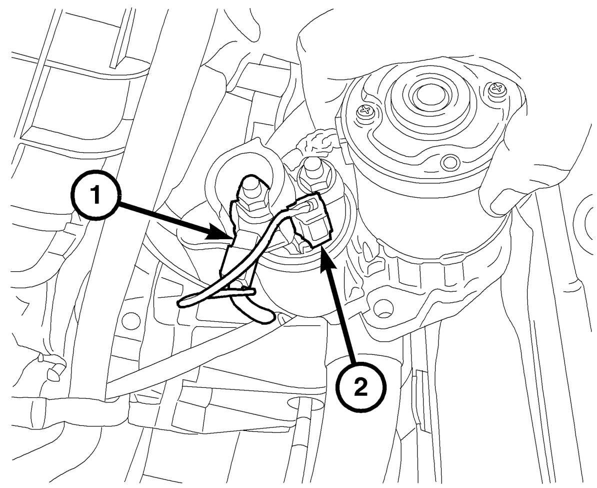
REMOVAL



1. Open hood.
2. Remove air cleaner box and air tube.
3. Disconnect and isolate the battery negative cable
4. Remove starter motor mounting bolt.



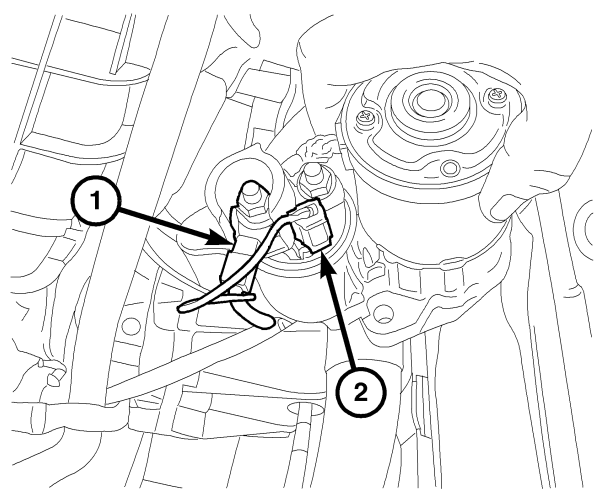
5. Disconnect the electrical connector at throttle body.



6. Remove Throttle body bolts and remove throttle body.

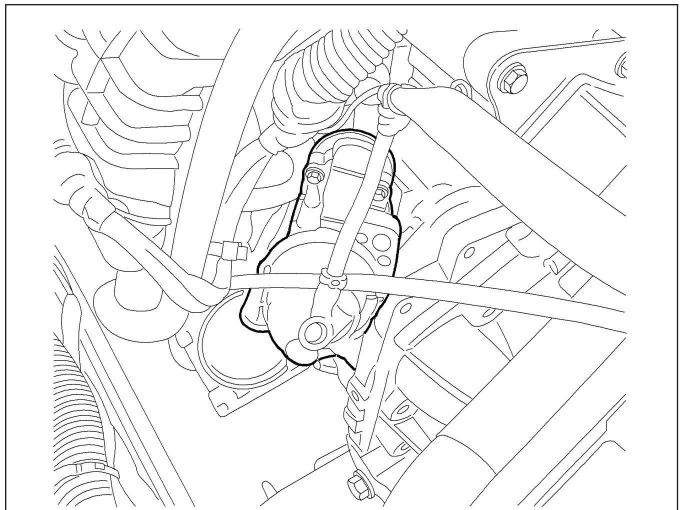
7. Push starter under intake manifold.
8. Tip starter nose toward cooling module.
9. Pull starter up and out.

81836ba1



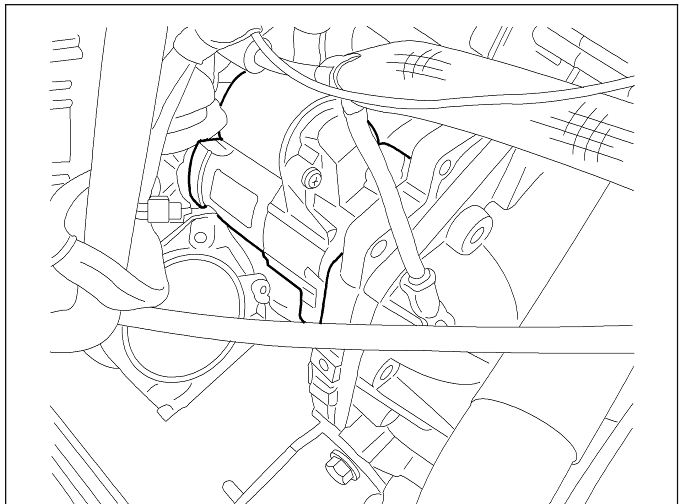
10. Disconnect starter motor wiring.
11. Remove starter motor from vehicle.

81836b94



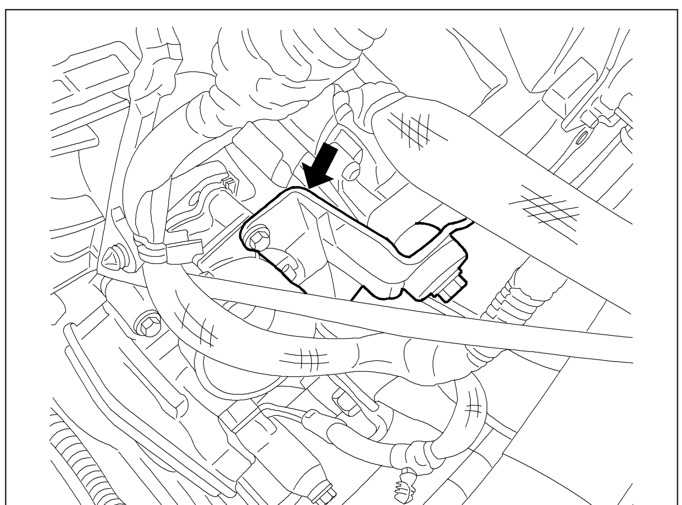
INSTALLATION

1. Connect starter motor wiring. Torque battery cable nut to 10 N·m (90 in. lbs.).



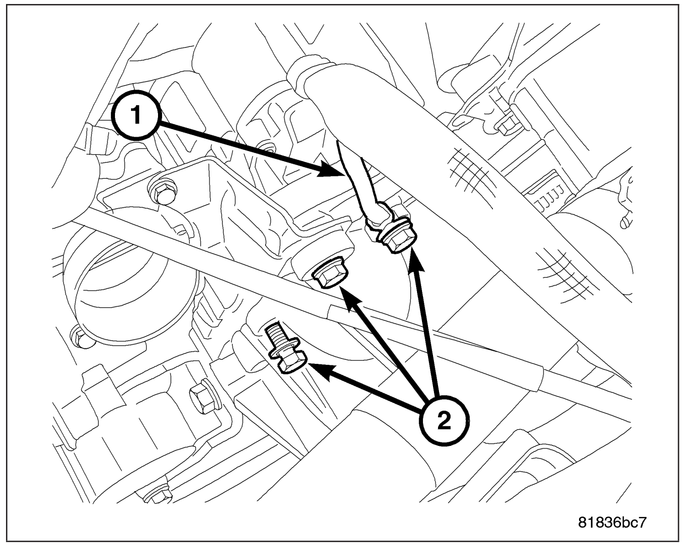
81836b94

2. Reinstall starter motor into vehicle lower engine compartment.



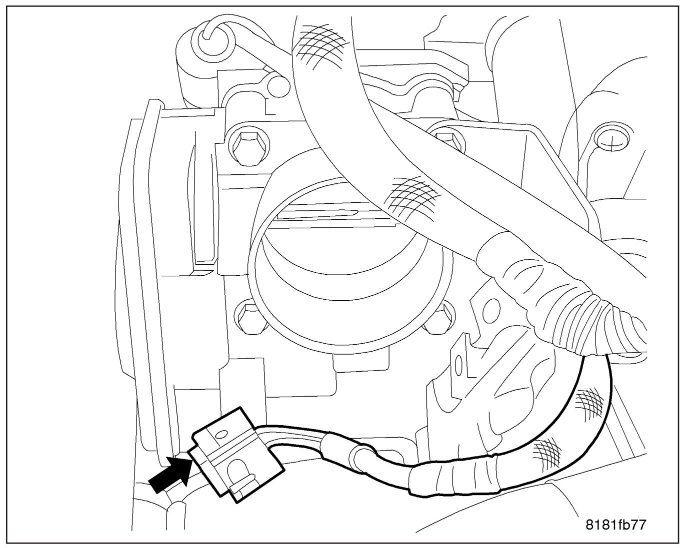
81836ba1

3. Loose install starter into position.



81836bb7

4. Install throttle body
5. Install throttle body bracket.



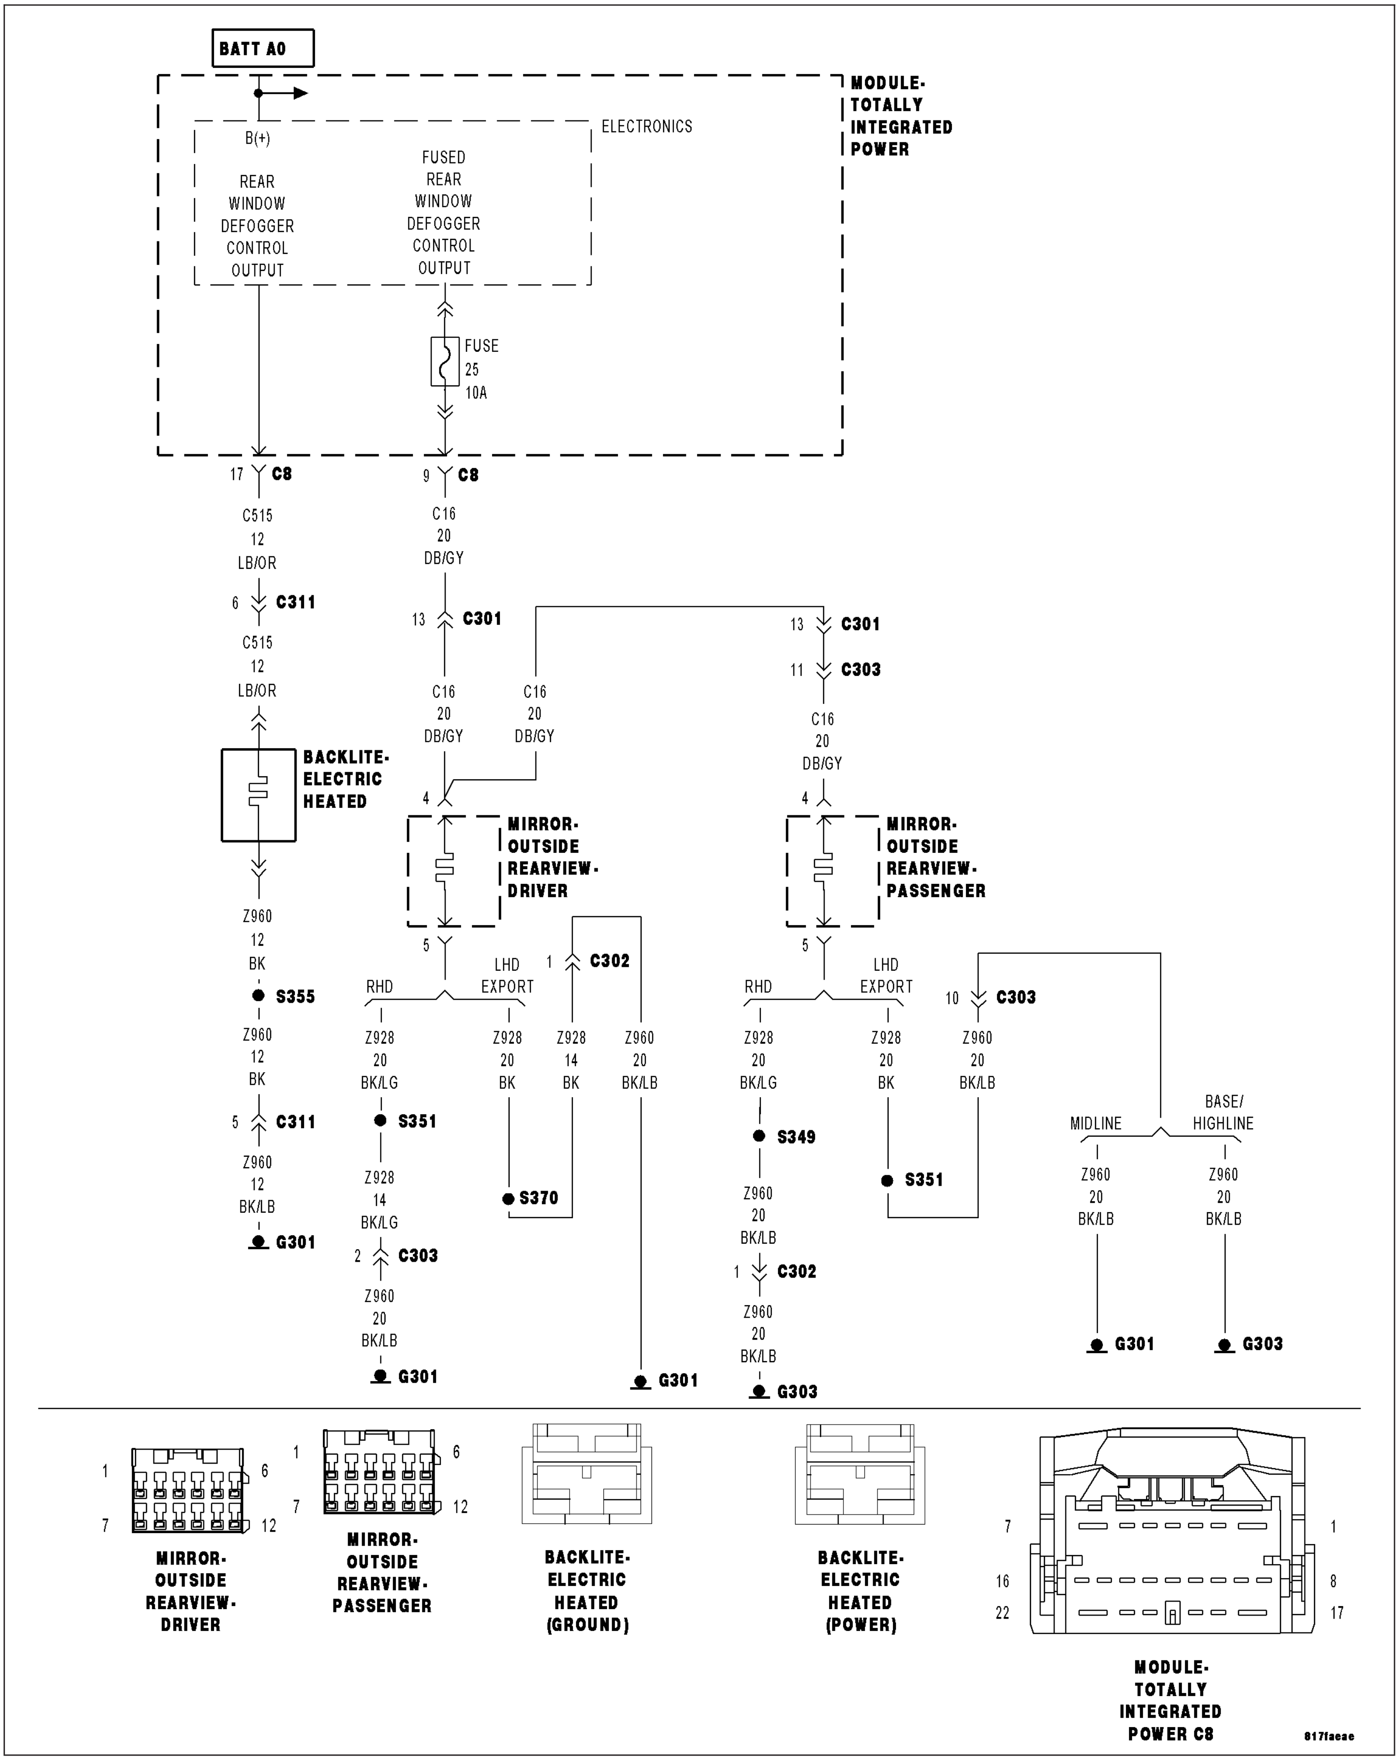
8181fb48

6. Install starter motor mounting bolts and torque to 54 N·m (40 ft. lbs.).

7. Connect throttle body electrical connector.
8. Install air cleaner box and inlet tube.
9. Lower vehicle.
10. Connect battery negative cable.

HEATED SYSTEMS

TABLE OF CONTENTS



HEATED GLASS - ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

HEATED GLASS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B106B–REAR DEFROST CONTROL CIRCUIT LOW (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  A shorted low condition on the (C515) Rear Defogger Control Output or (C16) Fused Rear Defogger Control Output circuit.

Possible Causes
(C515) REAR WINDOW DEFOGGER CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
(C16) FUSED REAR WINDOW DEFOGGER CONTROL OUTPUT CIRCUIT PARTIAL SHORT TO GROUND (IF EQUIPPED WITH HEATED MIRRORS)
HEATED MIRRORS (IF EQUIPPED)
TIPM

Diagnostic Test

1. VERIFY DTC B106B–REAR DEFROST CONTROL CIRCUIT LOW IS ACTIVE

Ensure the Rear Defogger is switched off.

With the scan tool, erase TIPM DTCs.

Operate the Rear Defogger Switch several times.

With the scan tool, read TIPM DTCs.

Does the scan tool display active DTC B106B-REAR DEFROST CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. INSPECT (C515) REAR WINDOW DEFOGGER CONTROL OUTPUT CIRCUIT AT REAR WINDOW GRID

Inspect (C515) Rear Window Defogger Control Output wiring at rear window grid. If necessary remove trim around rear window.

Check for a chafed, pierced or pinched wire. Also look for a metal object that may cause a short to ground condition at the grid.

Were there any problems found?

Yes >> Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

3. VEHICLE EQUIPPED WITH HEATED MIRRORS

Is this vehicle equipped with heated mirrors?

Yes >> Go To 4

No >> Go To 6

4. DISCONNECT MIRROR AND RE-CHECK DTC

NOTE: For this step disconnect each outside rearview mirror one at a time and re–check DTC's.

With the scan tool, erase TIPM DTCs.

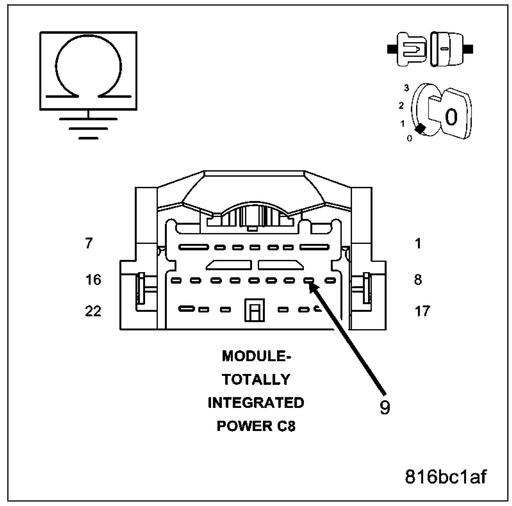
Operate the Rear Defogger Switch several times.

With the scan tool, read TIPM DTCs.

Does the scan tool display active DTC B106B-REAR DEFROST CONTROL CIRCUIT LOW?

Yes >> Go To 5

No >> Inspect mirror pigtail wiring, if the wiring is OK replace mirror as necessary. Perform the BODY VERIFICATION TEST – VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



5. (C16) FUSED REAR WINDOW DEFOGGER CONTROL OUTPUT CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Both outside review mirrors should be disconnected at this time.

Disconnect the TIPM C8 harness connector.

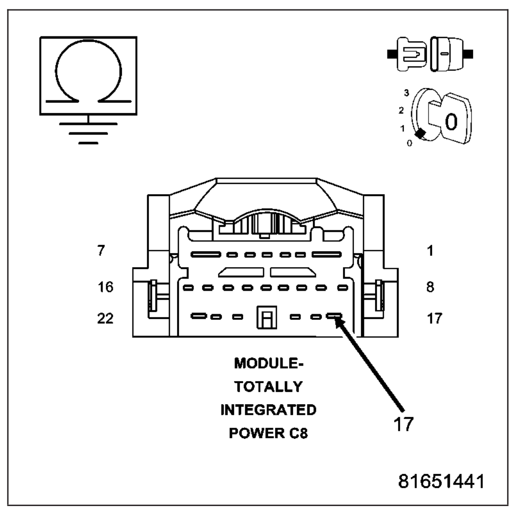
Measure the resistance between ground and the (C16) Fused Rear Window Defogger Control Output circuit at the TIPM C8 harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (C16) Fused Rear Window Defogger Control Output circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 6



6. (C515) REAR WINDOW DEFOGGER CONTROL OUTPUT CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Electric Heated Backlite (Power) 1-way connector.

Disconnect the TIPM C8 harness connector.

Measure the resistance between ground and the (C515) Rear Window Defogger Control Output circuit at the TIPM C8 harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (C515) Rear Window Defogger Control Output circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 7

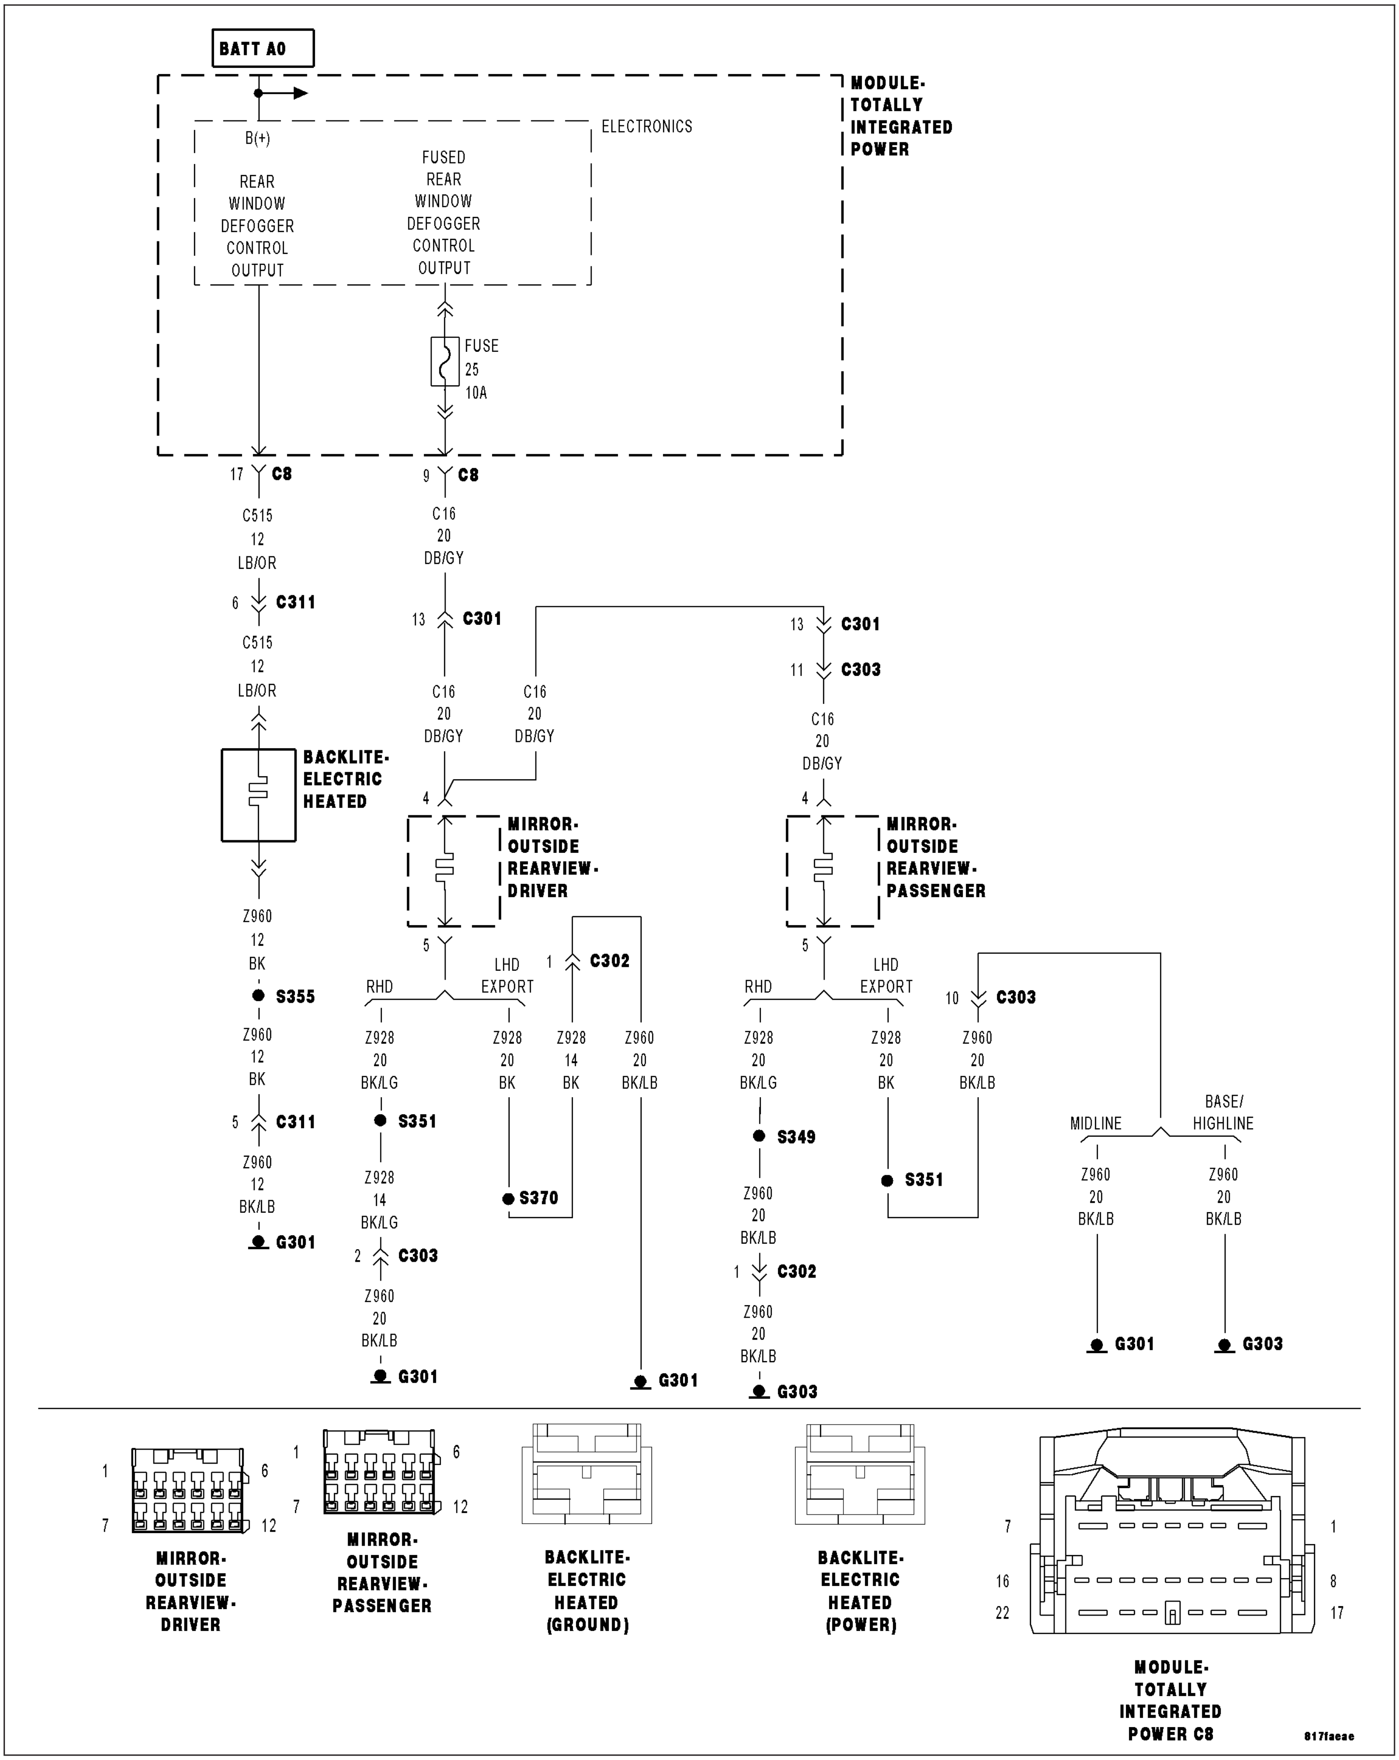
7. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?



Yes >> Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B106C–REAR DEFROST CONTROL CIRCUIT HIGH (TIPM)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  A shorted high condition in the (C515) Rear Defogger Control Output circuit or (C16) Fused Rear Defogger Control Output circuit.

Possible Causes
(C515) REAR DEFOGGER CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE
EXCESSIVE RESISTANCE IN THE DEFOGGER GRID OR (Z908) GROUND CIRCUIT FOR THE GRID
(C16) FUSED REAR DEFOGGER CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE (IF EQUIPPED WITH HEATED MIRRORS)
(Z928)/(Z960) GROUND CIRCUIT (IF EQUIPPED WITH HEATED MIRRORS)
HEATED MIRRORS (IF EQUIPPED)
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC B106C – REAR DEFROST CONTROL CIRCUIT HIGH IN THE TIPM

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Rear Defogger Switch several times.

With the scan tool, read DTC's.

Does the scan tool display active DTC B106C– REAR DEFROST CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECKING THE WINDOW GRID AND (Z908) GROUND CIRCUIT

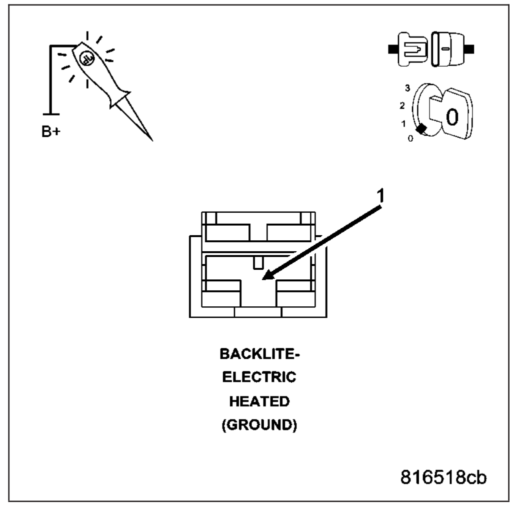
Turn the ignition off.

Disconnect the Electric Heated Backlite (Power) 1-way connector.

Using a 12-volt test light connected to 12-volts, probe the power terminal at the grid.

Does the test light illuminate? Compare with a known good vehicle, if necessary.

Yes >> Go To 4



No >> Go To 3

3. (Z908) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Electric Heated Backlite (Ground) 1-way connector.

Using a 12-volt test light connected to 12-volts, probe the (Z908) ground circuit at the 1-way connector.

Does the test light illuminate brightly?

Yes >> Repair the open or excessive resistance in the Rear Window Defogger Grid.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the open or excessive resistance in the (Z908) Ground circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. VEHICLE EQUIPPED WITH HEATED MIRRORS

Is vehicle equipped with heated mirrors?

Yes >> Go To 5

No >> Go To 7

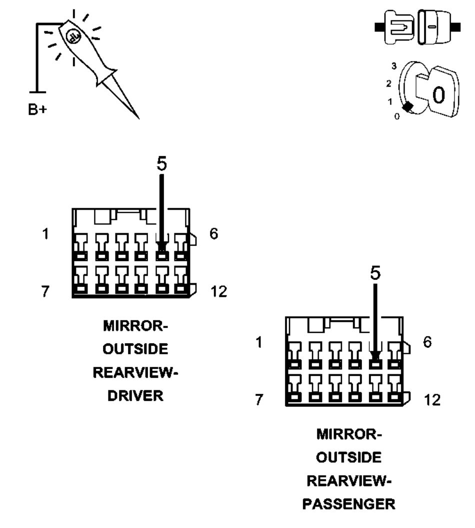
5. DISCONNECT MIRROR AND RE–CHECK DTC

NOTE: For this step disconnect each outside rearview mirror one at a time and re–check DTC's.

With the scan tool, erase TIPM DTCs.

Operate the Rear Defogger Switch several times.

With the scan tool, read TIPM DTCs.



Does the scan tool display active DTC B106C-REAR DEFROST CONTROL CIRCUIT HIGH?

Yes >> Go To 7

No >> Go To 6

6. MIRROR GROUND CIRCUIT

Using a 12-volt test light connected to 12-volts, probe the (Z928) or (Z960) ground circuit at the mirror connector.

817fc101

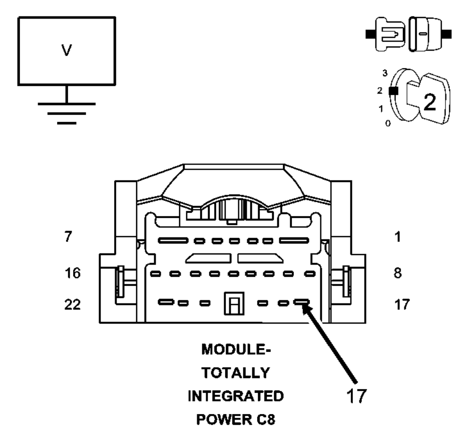
Does the test light illuminate brightly?

Yes >> Inspect mirror pigtail wiring and repair or replace mirror as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the excessive resistance in the (Z928) or (Z960) Ground circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



7. (C515) REAR WINDOW DEFOGGER CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off.

Disconnect the TIPM C8 harness connector.

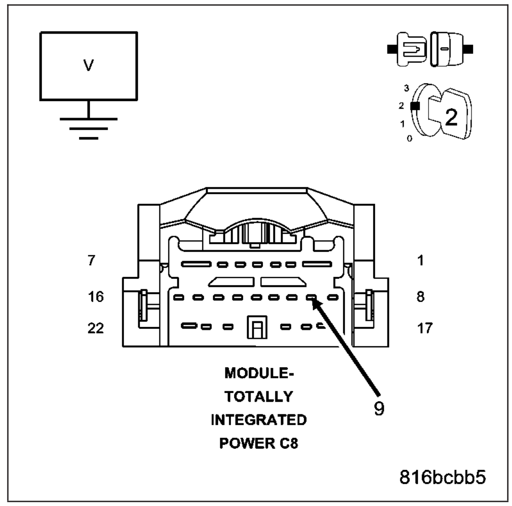
Ignition on, engine not running.

Measure the voltage between (C515) Rear Window Defogger Control Output circuit and ground at the TIPM C8 harness connector.

81653c10

Is there any voltage present?

Yes >> Repair the short to battery voltage in the (C515) Rear Window Defogger Control Output circuit.



Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 8

8. (C16) FUSED REAR WINDOW DEFOGGER CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE

Ignition on, engine not running.

Measure the voltage between (C16) Fused Rear Window Defogger Control Output circuit and ground at the TIPM C8 harness connector.

Is there any voltage present?

Yes >> Repair the short to battery voltage in the (C16) Fused Rear Window Defogger Control Output circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 9

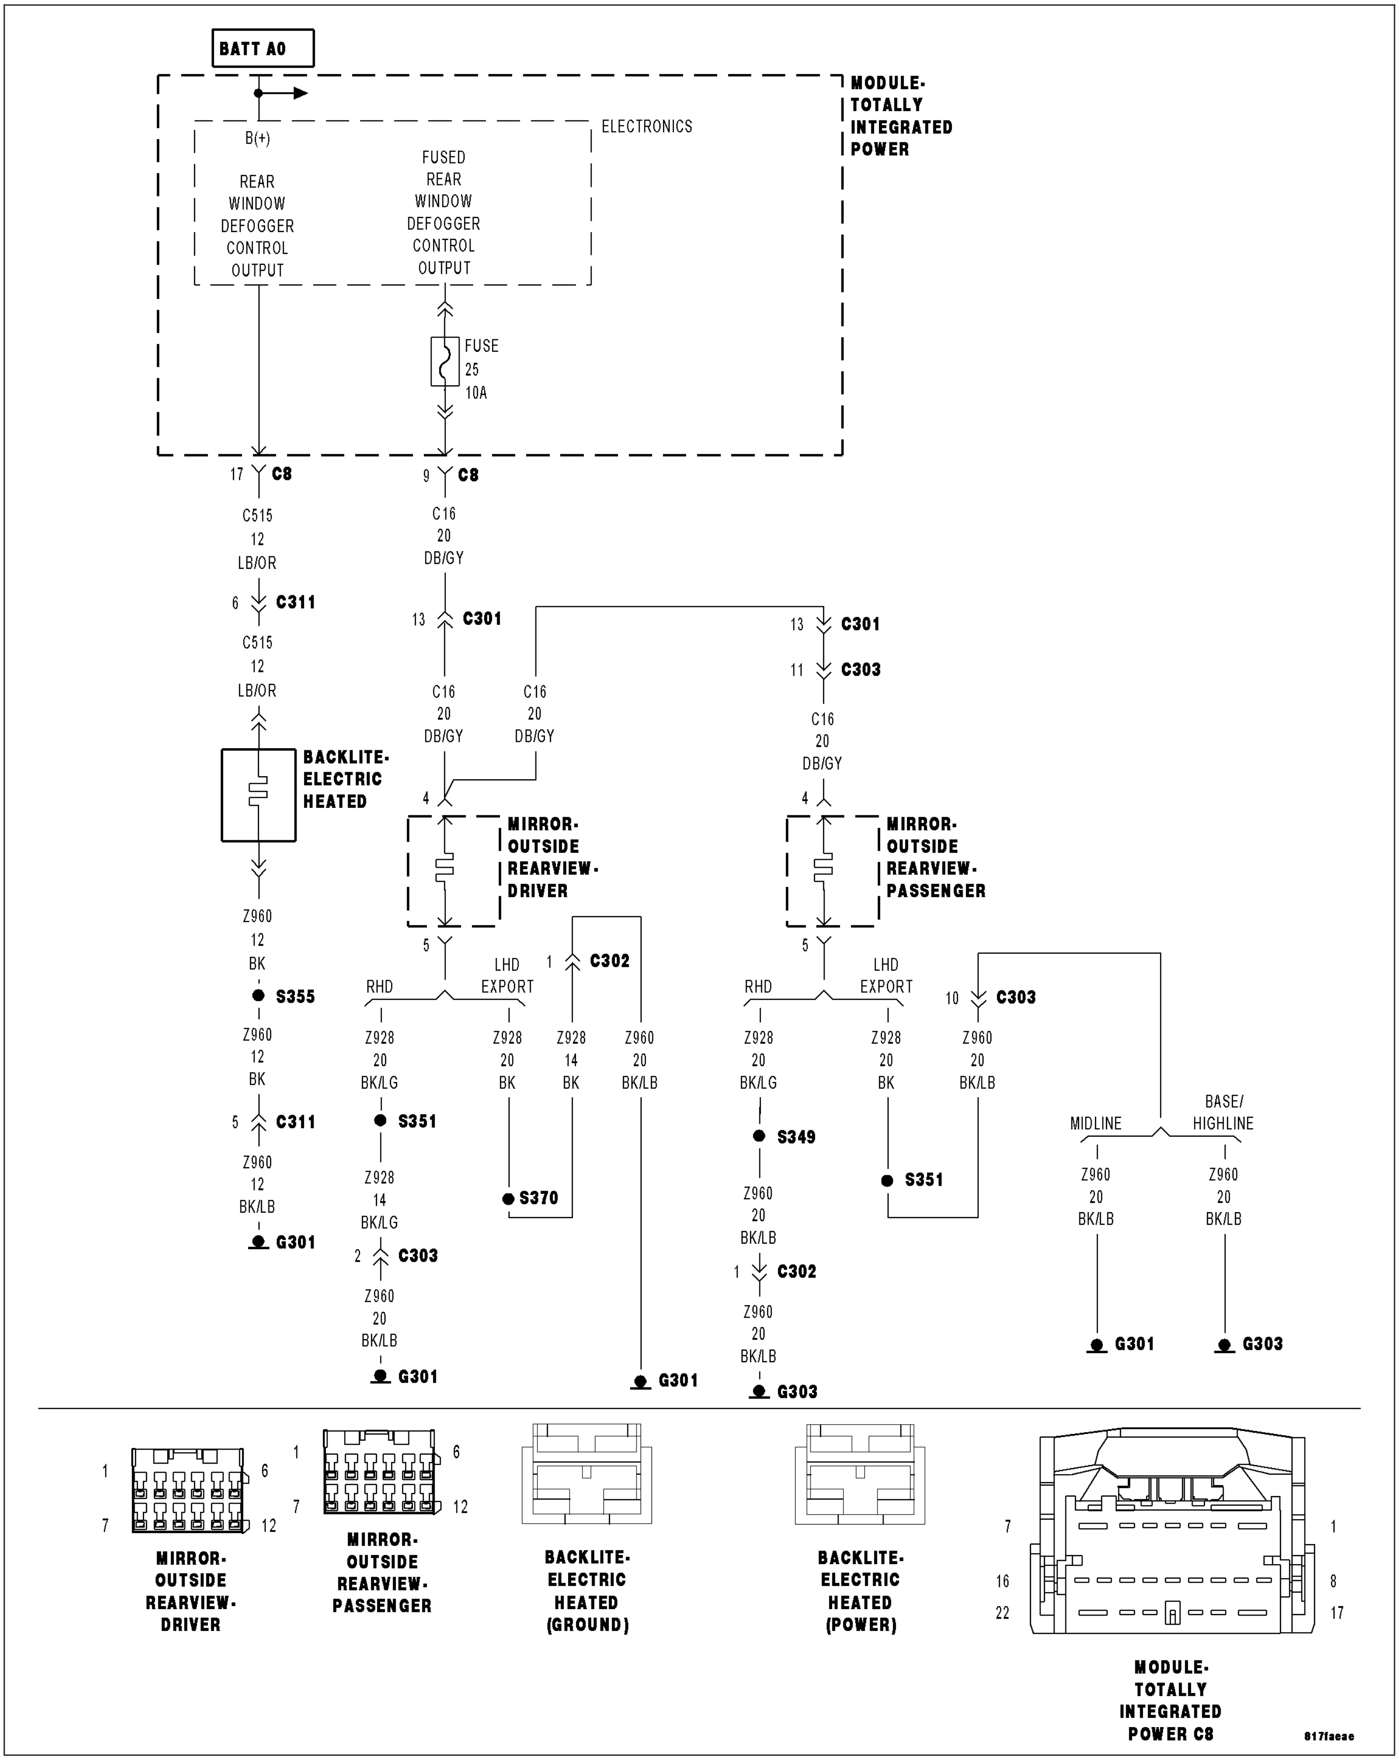
9. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?



Yes >> Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B106D–REAR DEFROST CONTROL CIRCUIT OPEN (TIPM)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  An open condition on the (C515) Rear Defogger Control Output circuit.

Possible Causes
TERMINAL DAMAGE OR CORROSION
(C515) REAR DEFOGGER CONTROL OUTPUT CIRCUIT OPEN
DEFOGGER GRID OR (Z908) GROUND CIRCUIT FOR THE GRID OPEN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC B106D–REAR DEFROST CONTROL CIRCUIT OPEN

Turn the ignition on.

With the scan tool, record and erase DTC's.

Operate the Rear Defogger Switch several times.

With the scan tool, read DTC's.

Does the scan tool display active DTC B106D–REAR DEFROST CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. VISUAL AND PHYSICAL CONNECTOR AND TERMINAL INSPECTION

Turn the ignition off.

Inspect the following connector terminal condition. Check for signs of corrosion build up or damage that would compromise the terminal to controller pin connector.

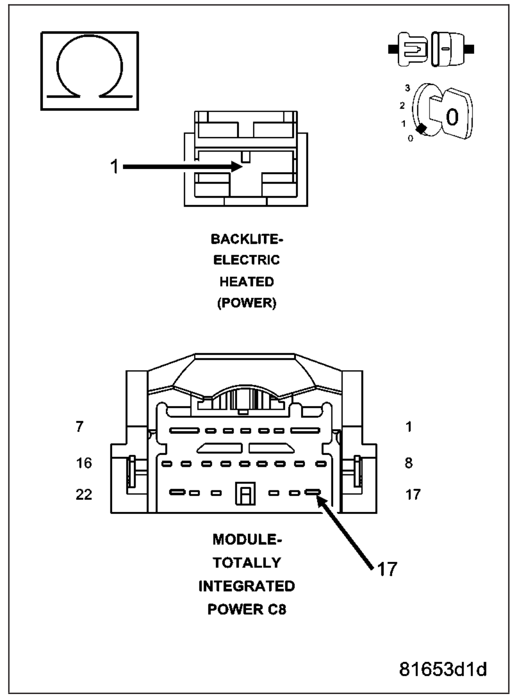
NOTE: Make sure that all in-line connectors are inspected for corrosion and/or damage.

Disconnect the rear window defogger grid connectors.

Disconnect the C8 TIPM harness connector.

Visually inspect the wiring harness. Look for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?



Yes >> Repair or replace as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 3

3. (C515) REAR DEFOGGER CONTROL OUTPUT CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (C515) Rear Defogger Control Output circuit at the between the C8 TIPM harness connector and the 1-way connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (C515) Rear Defogger Control Output circuit for an open.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

4. CHECKING THE WINDOW GRID AND (Z908) GROUND CIRCUIT

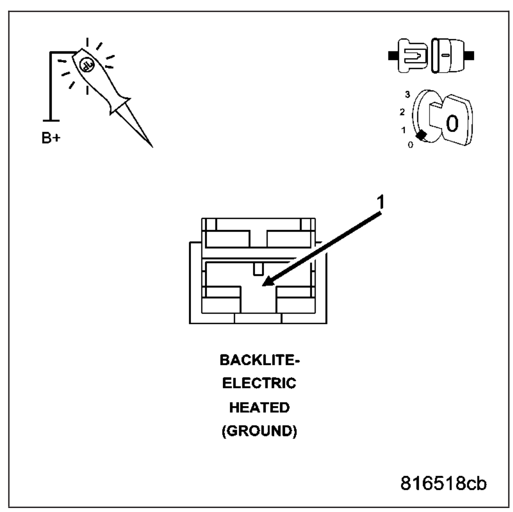
Turn the ignition off.

Disconnect the Electric Heated Backlite (Power) 1-way connector.

Using a 12-volt test light connected to 12-volts, probe the power terminal at the grid.

Does the test light illuminate?

Yes >> Go To 6



No >> Go To 5

5. (Z908) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Electric Heated Backlite (Ground) 1-way connector.

Using a 12-volt test light connected to 12-volts, probe the (Z908) ground circuit at the 1-way connector.

Does the test light illuminate brightly?

Yes >> Repair the open Rear Window Defogger Grid.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the (Z908) Ground circuit for an open.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes >> Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B10C2 – REAR DEFROST SWITCH STUCK – (CCN)

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The switch input changes when the switch is pushed down. A stored DTC B10C2 indicates that the Electronic Back Light (EBL) mode switch was stuck in a pushed position for more than 10 seconds, but has since returned to its normal state. An active DTC B10C2 indicates that the EBL mode switch is stuck in a pushed position. An active DTC B10C2 will prevent proper EBL mode switch and status indicator function.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the EBL mode switch stays in a pushed position for more than 10 seconds.

Possible Causes
OBJECT HOLDING ELECTRONIC BACK LIGHT (EBL) MODE SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING EBL MODE SWITCH TO GET STUCK IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Go To 2

2. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE EBL MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the EBL mode switch to stay or stick in a pushed position.

Is anything present that would cause the EBL mode switch to stay or stick in a pushed position?

Yes >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECK FOR NORMAL EBL MODE SWITCH AND STATUS INDICATOR FUNCTION

Turn the ignition on.

Press the EBL mode switch on and off several times while observing the EBL status indicator.

Does the EBL status indicator turn on and off?

Yes >> Go To 4

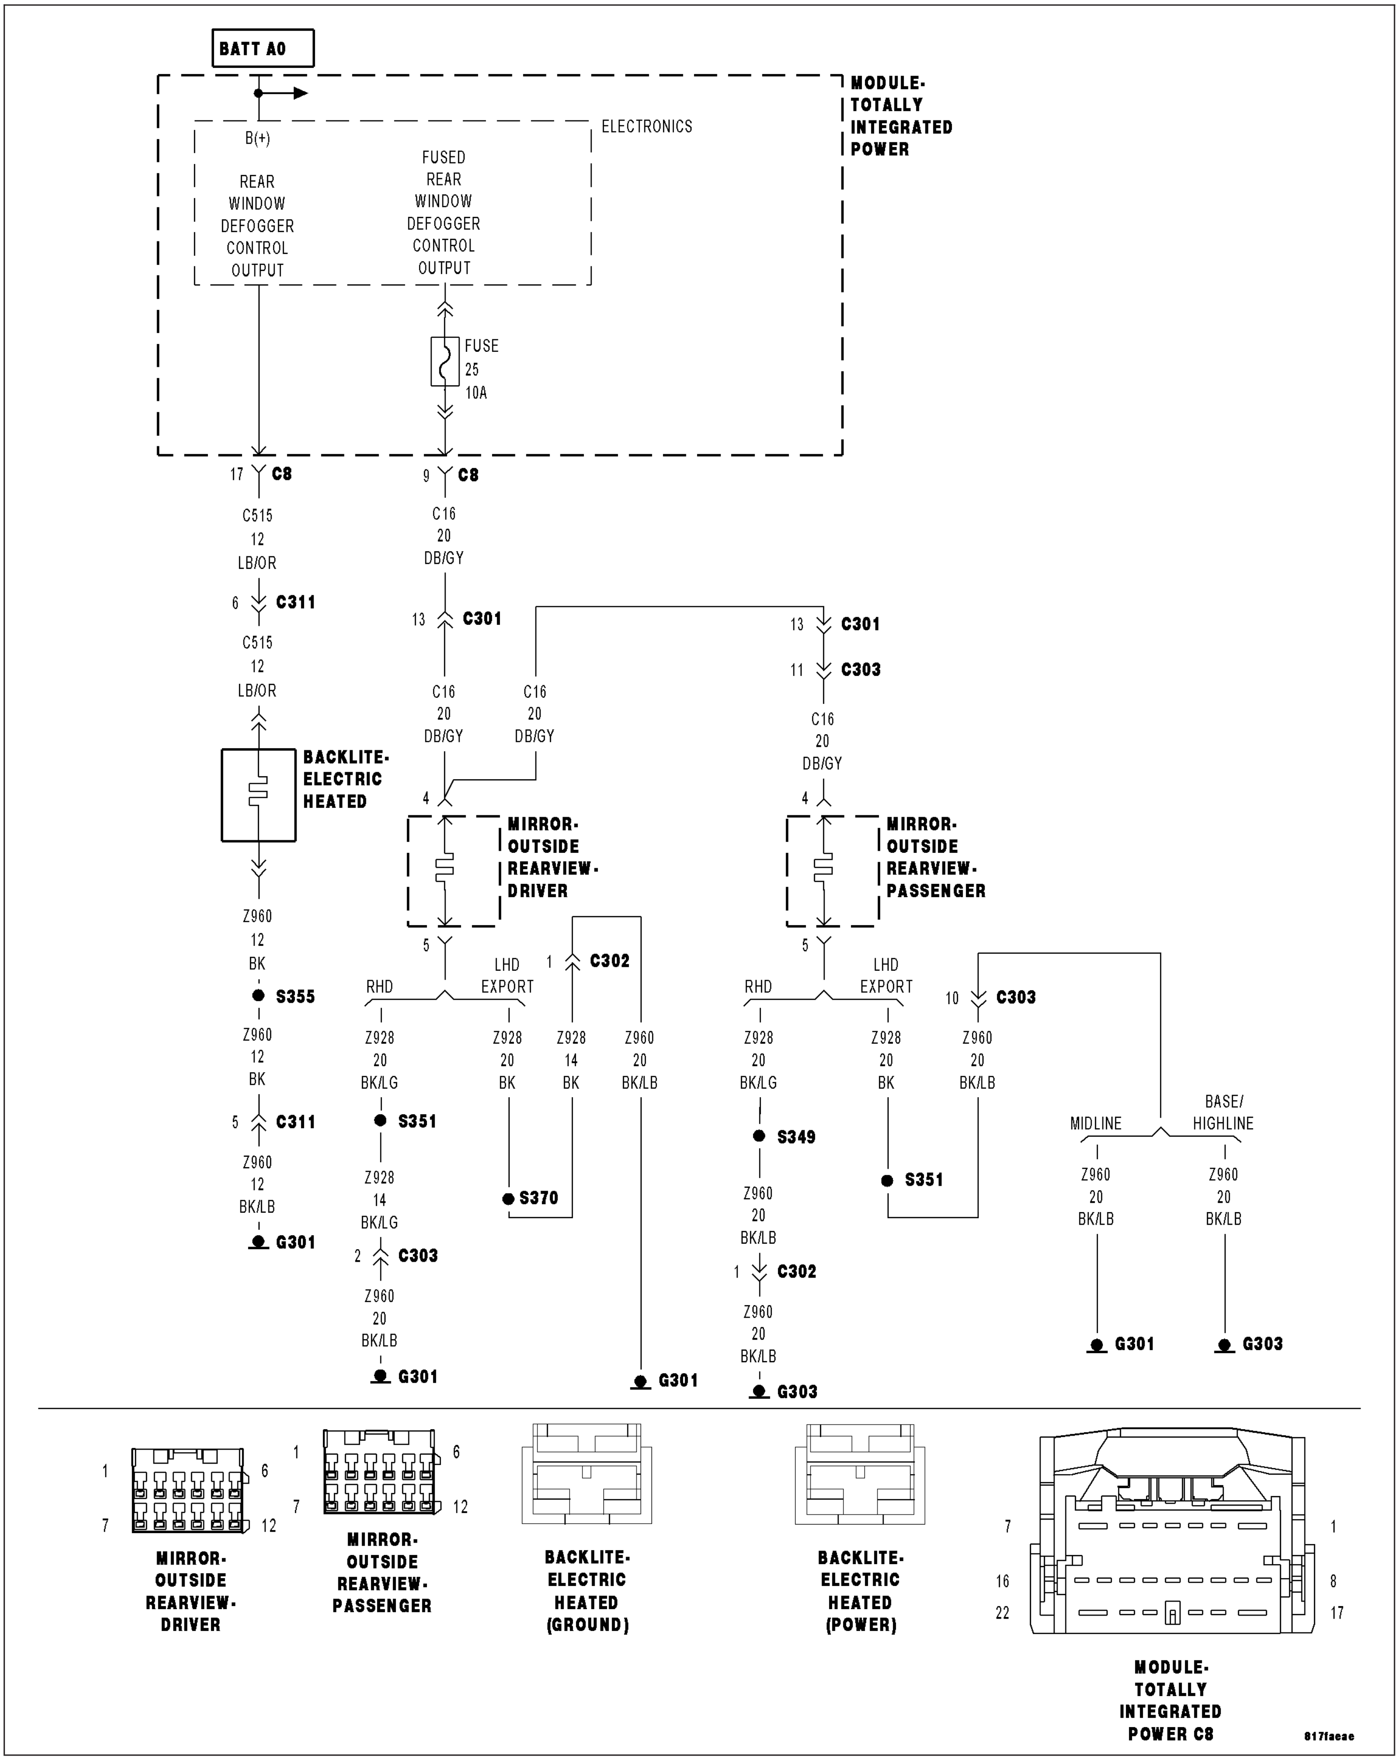
No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

4. VERIFY THAT DTC B10C2 – REAR DEFROST SWITCH STUCK IS STILL ACTIVE

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 1 minute before proceeding.

With the scan tool, read DTCs.



Does the scan tool display active: B10C2 – REAR DEFROST SWITCH STUCK?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

B10ED–REAR DEFROST CONTROL CIRCUIT OVERCURRENT (TIPM)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  An overcurrent condition on the (C515) Rear Defogger Control Output circuit or the (C16) Fused Rear Defogger Control Output circuit.

Possible Causes
TERMINAL DAMAGE OR CORROSION
EXCESSIVE RESISTANCE IN THE DEFOGGER GRID OR (Z908) GROUND CIRCUIT FOR THE GRID
(C515) REAR DEFOGGER CONTROL OUTPUT CIRCUIT HIGH RESISTANCE
(C16) FUSED REAR DEFOGGER CONTROL OUTPUT CIRCUIT HIGH RESISTANCE (IF EQUIPPED WITH HEATED MIRRORS)
(Z928)/(Z960) GROUND CIRCUIT (IF EQUIPPED WITH HEATED MIRRORS)
HEATED MIRRORS (IF EQUIPPED)
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC B10ED–REAR DEFROST CONTROL CIRCUIT OVERCURRENT

Turn the ignition on.

With the scan tool, record and erase DTC’s.

Operate the Rear Defogger Switch several times.

With the scan tool, read DTC’s.

Does the scan tool display active DTC B10ED-REAR DEFROST CONTROL CIRCUIT OVERCURRENT?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. VISUAL AND PHYSICAL CONNECTOR AND TERMINAL INSPECTION

Turn the ignition off.

Inspect the following connector terminal condition. Check for signs of corrosion build up or damage that would compromise the terminal to controller pin connector.

NOTE: Make sure that all in-line connectors are inspected for corrosion and/or damage.

Disconnect the TIPM C8 harness connector.

Visually inspect the wiring harness. Look for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

Yes >> Repair or replace as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

3. VEHICLE EQUIPPED WITH HEATED MIRRORS

Is vehicle equipped with heated mirrors?

Yes >> Go To 4

No >> Go To 7

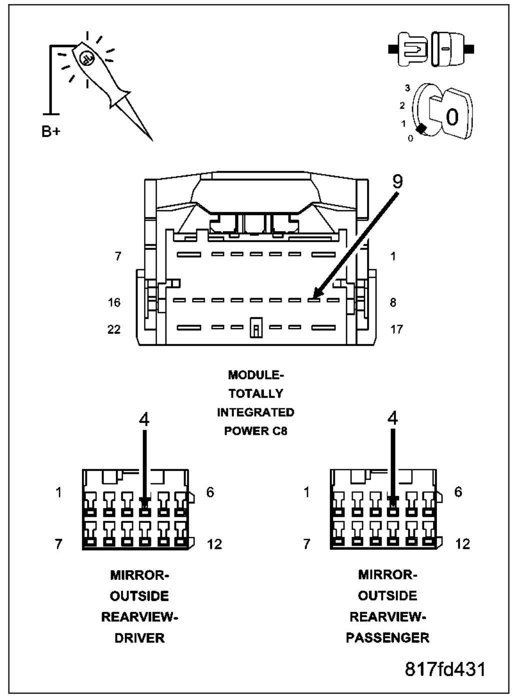
4. (C16) FUSED REAR DEFOGGER CONTROL OUTPUT CIRCUIT HIGH RESISTANCE

Disconnect both mirror connectors.

With a jumper wire, connect one end to the (C16) Fused Rear Defogger Control Output circuit at one mirror connector and the other to a clean chassis ground.

Using a 12-volt test light to battery voltage, probe the (C16) Rear Defogger Control Output circuit in the TIPM C8 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.



NOTE: Repeat this test for each outside mirror.

Does the test light illuminate brightly for each mirror circuit?

Yes >> Go To 5

No >> Repair the excessive resistance in the (C16) Fused Rear Defogger Control Output circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. DISCONNECT ONE MIRROR AND RE–CHECK DTC

NOTE: For this step have only one outside rearview mirror disconnected at a time and re–check DTC's.

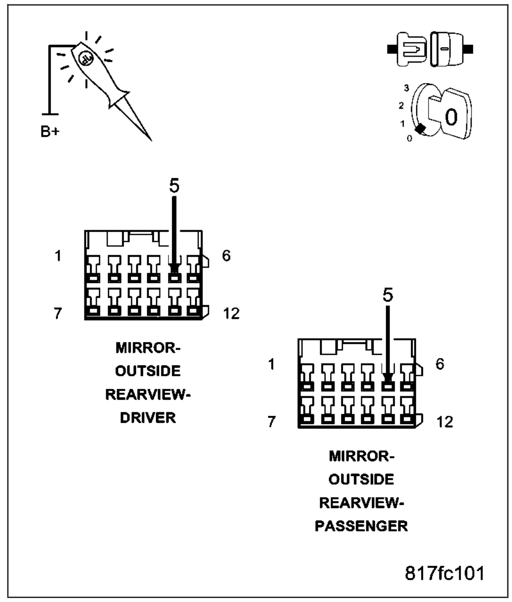
Reconnect the TIPM and one outside rearview mirror.

With the scan tool, erase TIPM DTCs.

Operate the Rear Defogger Switch several times.

With the scan tool, read TIPM DTCs.

Does the scan tool continue to display active DTC B10ED-REAR DEFROST CONTROL CIRCUIT OVER-CURRENT for each mirror?



Yes >> Go To 7

No >> Go To 6

6. (Z928)/(Z960) GROUND CIRCUIT

NOTE: Perform this test on the mirror that caused the code to set.

Using a 12-volt test light connected to 12-volts, probe the (Z928) or (Z960) ground circuit at the mirror connector.

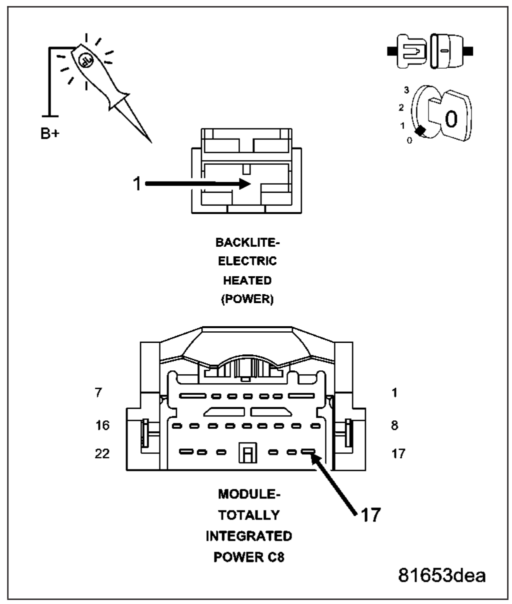
Does the test light illuminate brightly?

Yes >> Inspect mirror pigtail wiring and repair or replace mirror as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the excessive resistance in the (Z928) or (Z960) Ground circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



7. (C515) REAR DEFOGGER CONTROL OUTPUT CIRCUIT HIGH RESISTANCE

Disconnect the TIPM C8 if not disconnected.

Disconnect the Electric Heated Backlite (Power) 1-way connector.

With a jumper wire, connect one end to the (C515) Rear Defogger Control Output circuit at the 1-way connector and the other to a clean chassis ground.

Using a 12-volt test light to battery voltage, probe the (C515) Rear Defogger Control Output circuit in the TIPM C8 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 8

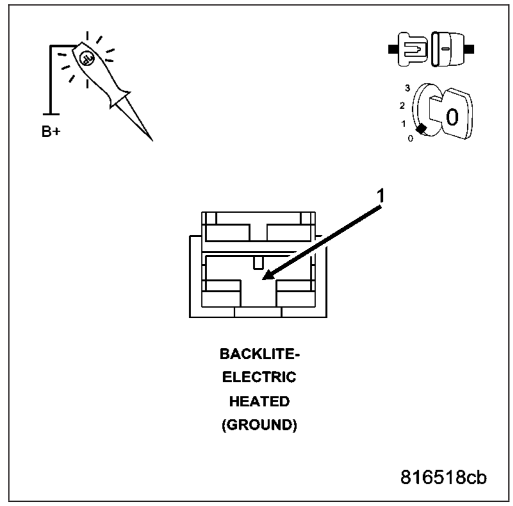
No >> Repair the excessive resistance in the (C515) Rear Defogger Control Output circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

8. CHECKING THE WINDOW GRID AND (Z908) GROUND CIRCUIT

Turn the ignition off.

Disconnect the Electric Heated Backlite (Power) 1-way connector.



Using a 12-volt test light connected to 12-volts, probe the power terminal at the grid.

Does the test light illuminate? Compare with a known good vehicle, if necessary.

Yes >> Go To 10

No >> Go To 9

9. (Z908) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Electric Heated Backlite (Ground) 1-way connector.

Using a 12-volt test light connected to 12-volts, probe the (Z908) ground circuit at the 1-way connector.

Does the test light illuminate brightly?

Yes >> Repair the open or excessive resistance in the Rear Window Defogger Grid.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the open or excessive resistance in the (Z908) Ground circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

10. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes >> Repair as necessary.

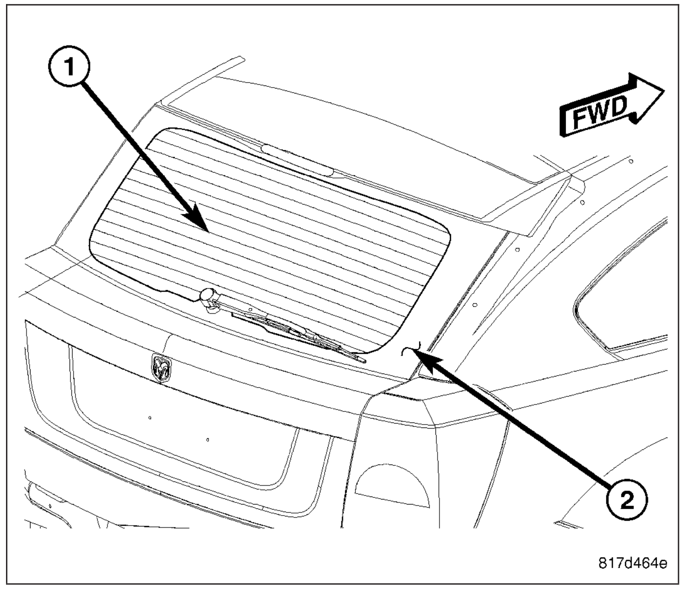
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

HEATED GLASS - SERVICE INFORMATION

TABLE OF CONTENTS

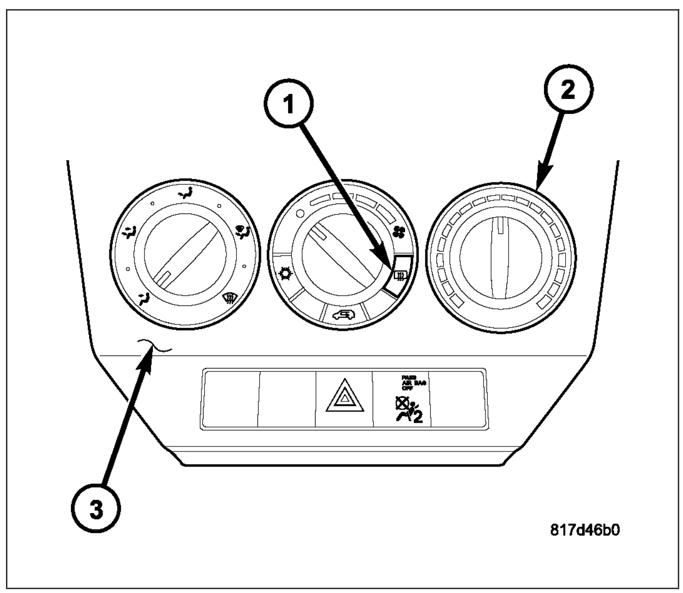


HEATED GLASS - SERVICE INFORMATION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars and a series of grid lines (1) fired onto the inside surface of the rear window (2).



The EBL system is turned on or off by a push-button switch located in the A/C-heater control (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - DESCRIPTION).

OPERATION

The electric backlight (EBL) system is controlled by a momentary push-button switch (1) located on the A/C-heater control (2) in the instrument panel center bezel (3). When the rear window defogger switch is pressed to the On position with the ignition switch in the Run position, the switch sends a request signal to the cabin compartment node (CCN), which sends a message on the CAN-B Bus to the totally integrated power module (TIPM) to energize the internal EBL high side driver. When energized, the EBL high side driver provides battery current to the rear window defogger grid lines and the heated side view mirrors (when equipped). The grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

An amber indicator in the rear window defogger switch will illuminate to indicate when the EBL system is turned on.

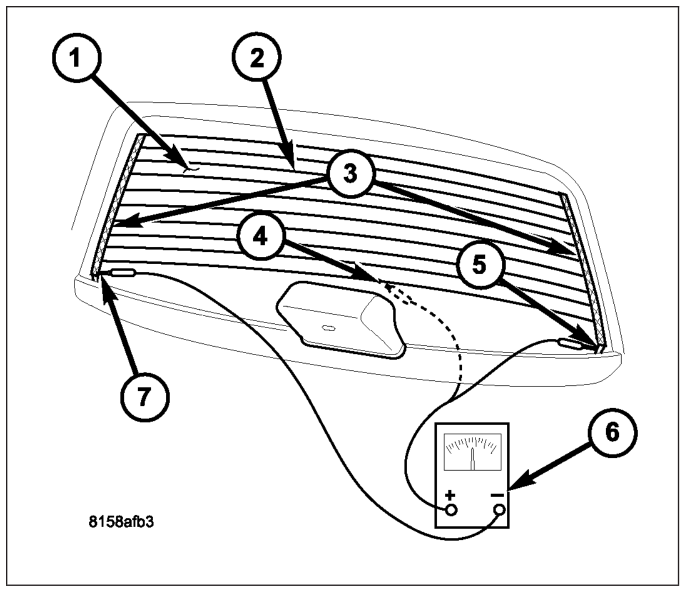
NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.

The EBL system will be automatically turned off after an initial programmed time interval of about 10 minutes as long as the ignition switch is the Run position. After the initial time interval has expired, if the rear window defogger switch is turned on again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than Run or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent (refer to 8 - ELECTRICAL/HEATED GLASS/GRID-REAR WINDOW DEFOGGER - STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR).

The EBL control system is diagnosed using a scan tool (refer to 8G - Heated Glass Electrical Diagnostics for more information).

DIAGNOSIS AND TESTING



ELECTRIC BACKLIGHT (EBL) SYSTEM

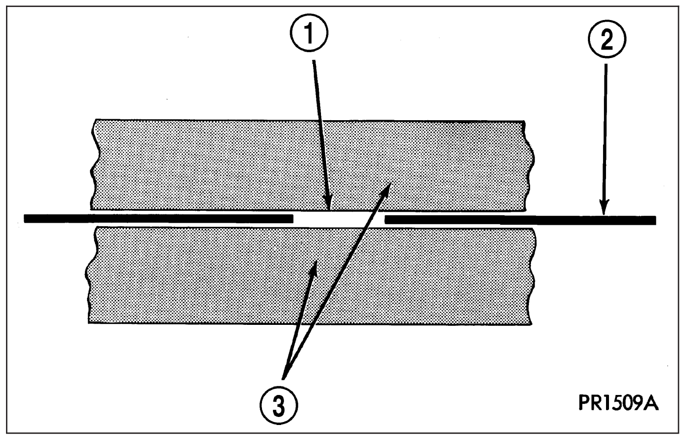
NOTE: Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear window glass and/or the outside rear view mirror heating grids (when equipped).

NOTE: For circuit descriptions and diagrams of the rear window defogger (EBL) and heated mirror systems, refer to 8W - WIRING DIAGRAM INFORMATION.

Operation of the electrical backlight (EBL) system can be confirmed by the following:

NOTE: Typical heated rear window glass shown in illustration.

1. Use a scan tool and check for diagnostic trouble codes (DTCs) related to the rear window defogger switch, cabin compartment node (CCN) and the totally integrated power module (TIPM). If no DTCs are found, go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2.
2. Turn the ignition switch to the Run position. Set the rear window defogger switch in the On position. Rear window defogger operation can be checked by feeling the rear window glass (1), or the heated outside rear view mirror glass when equipped with heated mirrors. A distinct difference in temperature between the grid lines (2) and the adjacent clear glass or the heated mirror glass should be detected within 3 to 4 minutes of operation.
3. If a temperature difference is not detected, use a 12-volt DC voltmeter (6) and contact the rear glass heating grid terminal A (5) with the positive lead, and terminal B (7) with the negative lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
   - Confirm the ignition switch is in the Run position.
   - Confirm the rear window defogger switch is in the On position.
   - Confirm the EBL feed wire is connected to the heating grid positive terminal and that there is continuity between the TIPM and the heating grid.
   - Confirm the EBL ground wire is connected to the heating grid negative terminal and that there is continuity to ground.
   - When diagnosing a heated mirror concern, check the heated mirror circuit fuse located in the TIPM. The fuse must be in the receptacle and all electrical connections must be secure.
4. If broken defogger grid lines or bus bars (3) are suspected, use a 12-volt DC voltmeter and contact terminal B with the negative lead and each rear glass heating grid line at its mid-point C (4) with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s) (refer to 8 - ELECTRICAL/HEATED GLASS/GRID-REAR WINDOW DEFOGGER - STANDARD PROCEDURE).
5. If EBL system operation has been verified but rear window defogger indicator does not illuminate, replace the A/C-heater control (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).



GRID-REAR WINDOW DEFOGGER

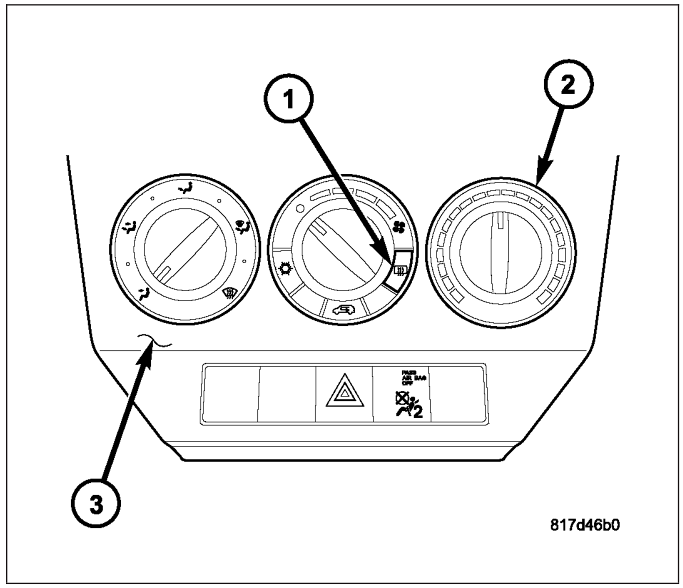
STANDARD PROCEDURE

GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow the warnings could result in possible personal injury or death.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. For grid line repairs, mask the area to be repaired with masking tape or use a template.
5. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
6. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
7. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
8. Carefully remove the masking tape or template.



CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

9. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
10. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
11. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

SWITCH-REAR WINDOW DEFOGGER

DESCRIPTION

The switch for the rear window defogger (EBL) system (1) is located in the A/C-heater control (2) in the instrument panel center bezel (3). When the rear window defogger switch is pressed to the On position a request signal is sent to the cabin compartment node (CCN), which sends a message to the totally integrated power module (TIPM) to operate the EBL system.

When the high side driver in the TIPM is energized, current is directed to the rear defogger grid lines and to the heated side view mirrors (when equipped). The grid lines heat the glass to help clear the surface of fog or frost.

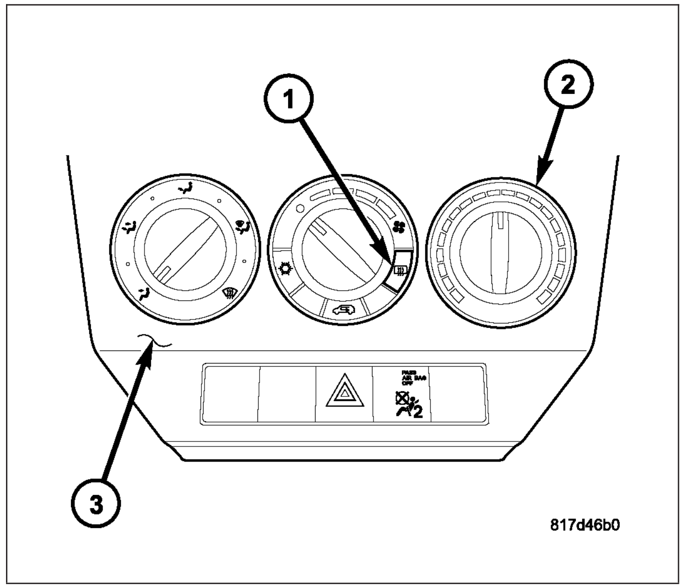
OPERATION

An amber indicator will illuminate when the rear window defogger switch is activated. When activated, the switch sends a request signal to the cabin compartment node (CCN), which sends a message to the totally integrated power module (TIPM) to energize the internal EBL high side driver to provide battery current to the rear window defogger grid lines and, when equipped, to the heated side view mirrors.

NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.

The EBL system will be automatically turned off after an initial programmed time interval of about 10 minutes as long as the ignition switch is the Run position. After the initial time interval has expired, if the rear window defogger switch is turned on again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will automatically shut off if the ignition switch is turned to any position other than Run, or it can be turned off manually by pressing the rear window defogger switch a second time.

The rear window defogger switch is diagnosed using a scan tool (refer to 8G - Heated Glass Electrical Diagnostics for more information).



The rear window defogger switch and the rear window defogger indicator cannot be repaired and, if faulty or damaged, the A/C-heater control must be replaced (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).

HEATED MIRRORS - SERVICE INFORMATION

TABLE OF CONTENTS

HEATED MIRRORS - SERVICE INFORMATION

DESCRIPTION

When equipped, the heated mirror system operates in concert with the rear window defogger (EBL) system and is controlled by the rear window defogger switch (1) located in the A/C-heater control (2) in the instrument panel center bezel (3). An amber indicator lamp in the rear window defogger switch will illuminate to indicate when the heated mirror system is turned on.

The heated mirror system will be automatically turned off after an initial programmed time interval of about 10 minutes as long as the ignition switch is the Run position. After the initial time interval has expired, if the rear window defogger switch is turned on again during the same ignition cycle, the heated mirror system will automatically turn off after about 5 minutes. The heated mirror system will also turn off if the ignition switch is turned to any position other than Run or by manually pressing the rear window defogger switch a second time.

Circuit protection for the heated mirror system is provided by a fuse located in the totally integrated power module (TIPM).

OPERATION

When equipped, the heated mirror system is activated when the rear window defogger (EBL) system is turned on (refer to 8 - ELECTRICAL/HEATED GLASS - OPERATION). When the heated mirror system is activated, an electric heater grid located behind the glass of each of the outside rear view mirror becomes energized and produces heat to help clear the mirror of ice, snow, or fog.

If the outside mirror heating grids are both inoperative, (refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING) in this group. If only one of the outside mirror heating grid is inoperative, (refer to 8 - ELECTRICAL/POWER MIRRORS - DIAGNOSIS AND TESTING).

The heating grid behind each outside mirror glass cannot be repaired and if faulty or damaged the mirror must be replaced (refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - REMOVAL.

DIAGNOSIS AND TESTING

B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on, during the heated seat operation.
- **Set Condition:**
  This code is set immediately after the Heated Seat Module (HSM) detects the control circuit shorted to ground.

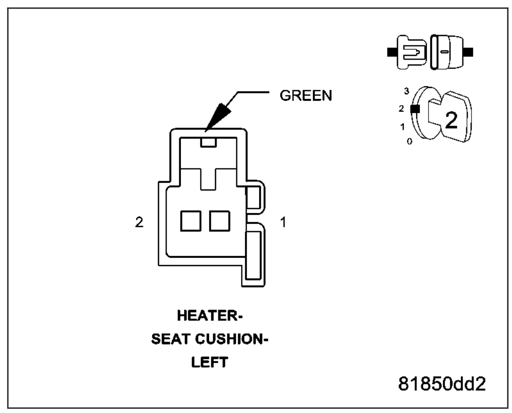
Possible Causes
(P187) LEFT SEAT HEATER B(+) DRIVER SHORTED TO GROUND
SEAT CUSHION HEATER ELEMENT SHORTED
SEAT BACK HEATER ELEMENT SHORTED
HEATED SEAT MODULE

Diagnostic Test

1. VERIFY THAT DTC B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's.
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the DTC B1092 – FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW reset?



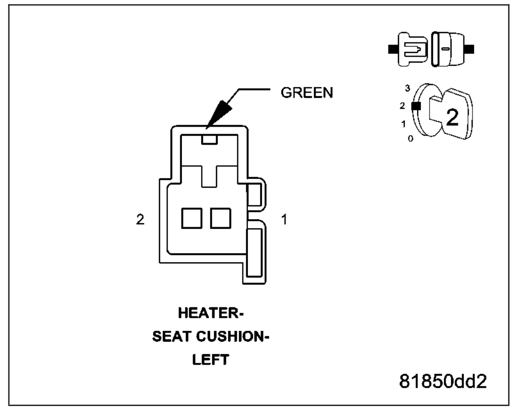
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

2. DISCONNECT LEFT SEAT CUSHION HEATER 2-WAY CONNECTOR AND READ DTC'S

Disconnect the Left Seat Cushion Heater 2–way connector.

NOTE: Check connectors - Clean and repair as necessary.
With the scan tool, erase HSM DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.



Does the scan tool display the same DTC?

Yes >> Go To 5

No >> Go To 3

3. CHECK THE (P187) LEFT SEAT HEATER B(+) DRIVER FOR A SHORT TO GROUND AT THE SEAT

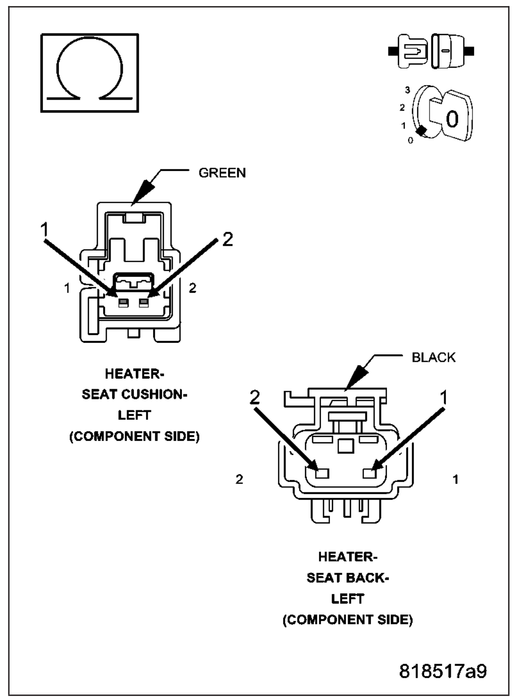
Measure between the (P187) Left Seat Heater B(+) Driver circuit at the Left Seat Heater connector (component side) and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

No >> Go To 4

Yes >> Repair/replace the pigtail/heating element as necessary for a short to ground condition.

Perform BODY VERIFICATION TEST – VER 1 (Refer to BODY VERIFICATION TEST – VER 1).



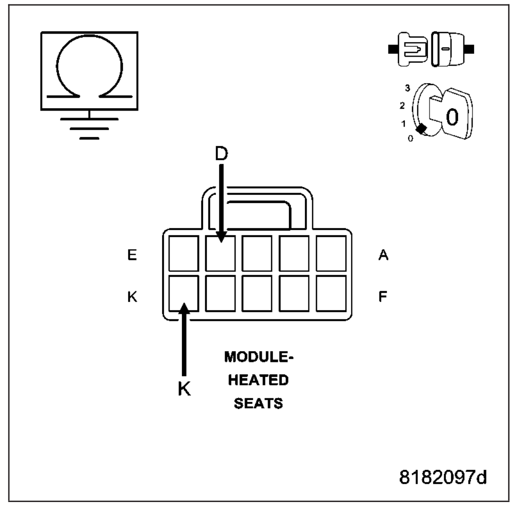
4. CHECK THE LEFT HEATER ELEMENT SEAT CUSHION AND SEAT BACK RESISTANCE

Gain access to the seat cushion and seat back heater connectors.

Check the resistance of each of the heater elements by measuring between the (P187) Left Seat Heater B(+) Driver and the Ground circuit at the seat cushion and seat back heater connectors.

For the seat cushion element, the resistance value is 3 to 5.5 ohms.

For the seat back element, the resistance value is 4 to 6 ohms.



Is the resistance correct for each heater element?

Yes >> Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.

No >> Replace the heater element as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

5. CHECK THE (P187) LEFT SEAT HEATER B(+) DRIVER CIRCUIT FOR A SHORT TO GROUND

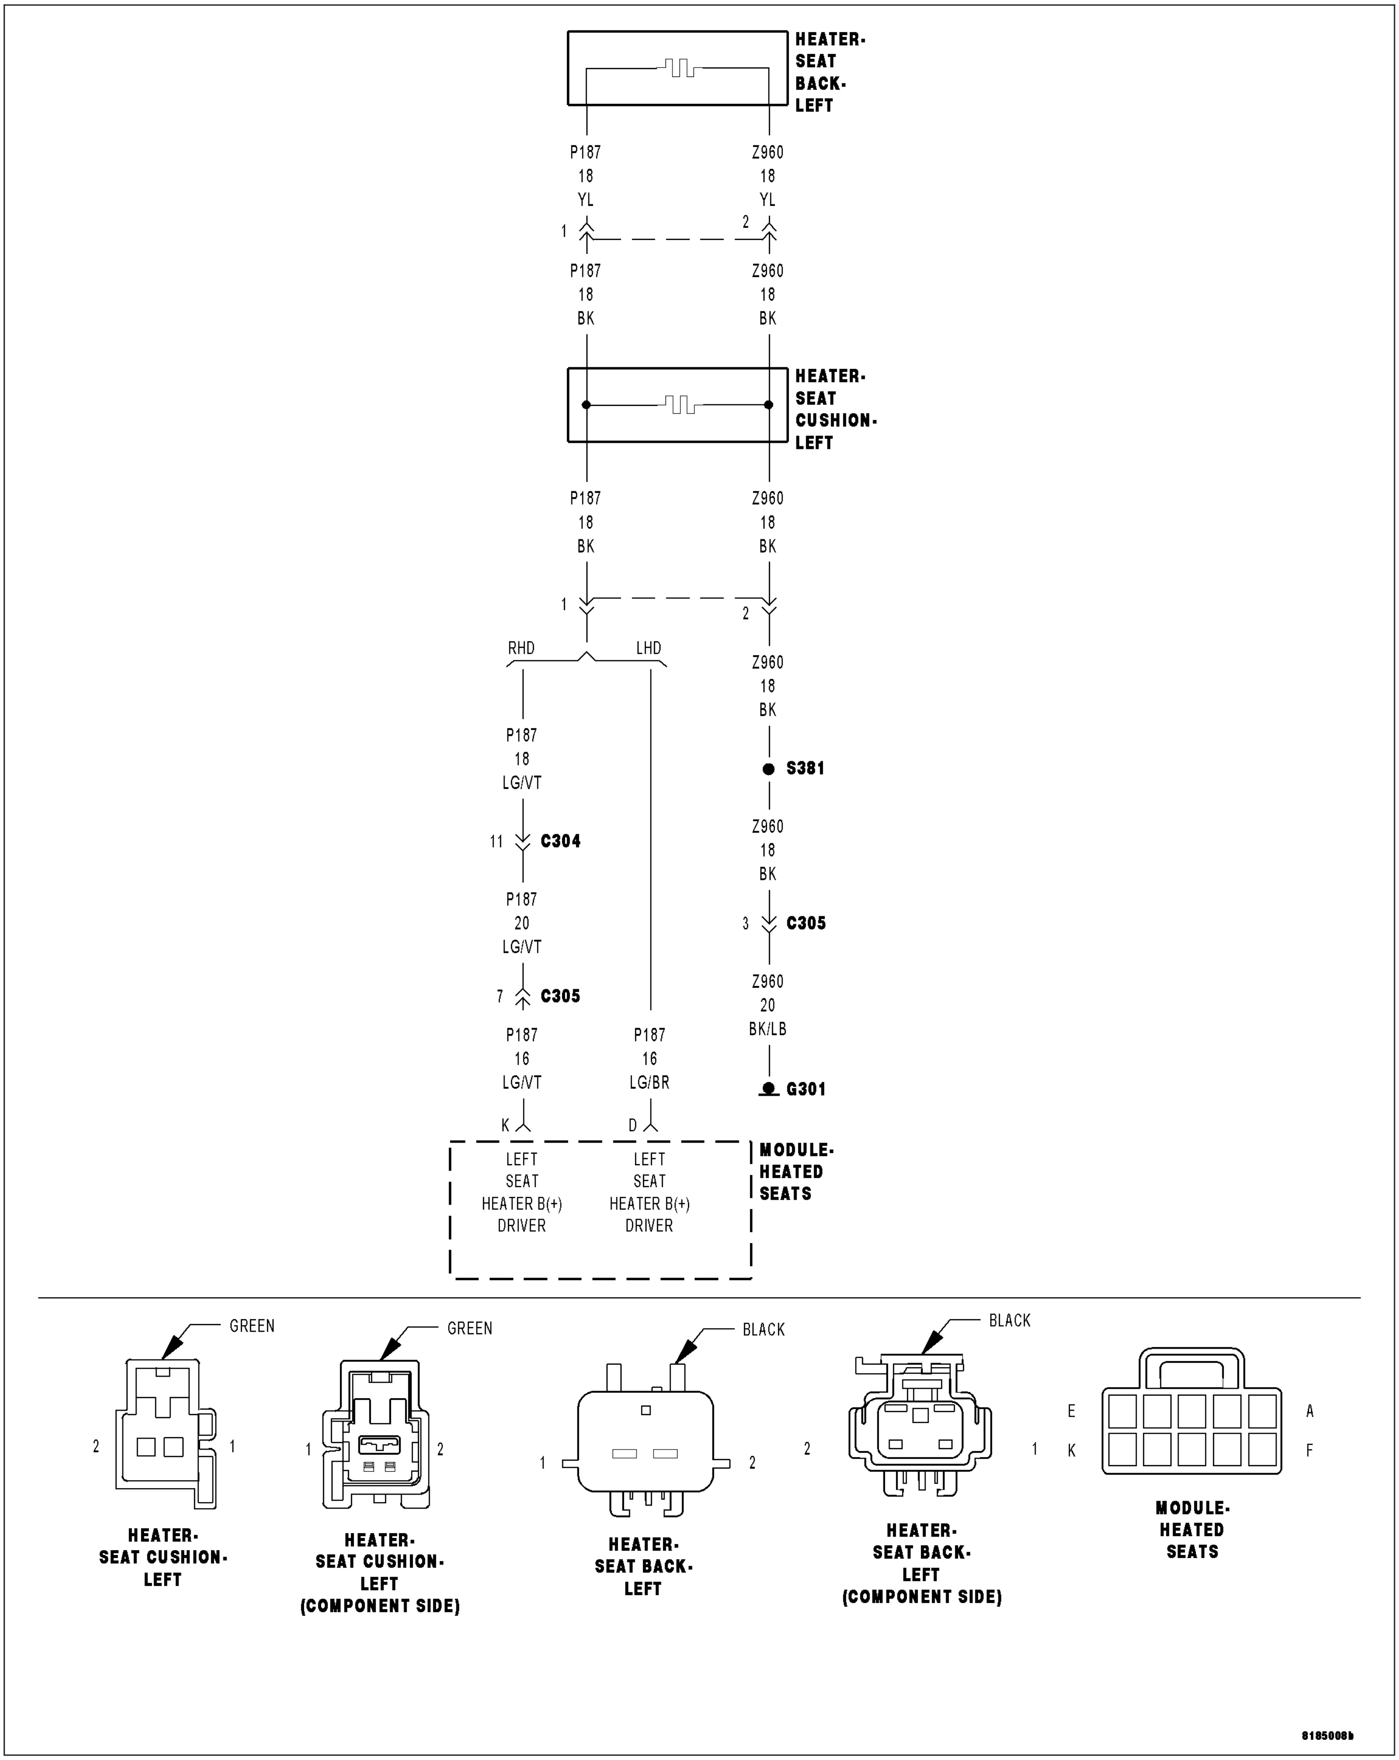
Ensure the Left Seat Cushion Heater 2–way connector is still disconnected.

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the (P187) Left Seat Heater B(+) Driver circuit cavity D for (LHD) or K for (RHD) at the HSM connector to ground.

Is the resistance below 5.0 ohms?



Yes >> Repair the (P187) Left Seat Heater B(+) Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Replace the Heated Seat Module.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on, during the heated seat operation.
- **Set Condition:**
  This code is set immediately after the Heated Seat Module detects an open in the seat heater B(+) driver circuit.

Possible Causes
(P187) LEFT SEAT HEATER B(+) DRIVER WIRE OPEN
(Z960) GROUND WIRE OPEN
SEAT CUSHION HEATER ELEMENT OPEN
SEAT BACK HEATER ELEMENT OPEN
HEATED SEAT MODULE

Diagnostic Test

1. VERIFY THAT DTC B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE

With the scan tool, record and erase DTC's.

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

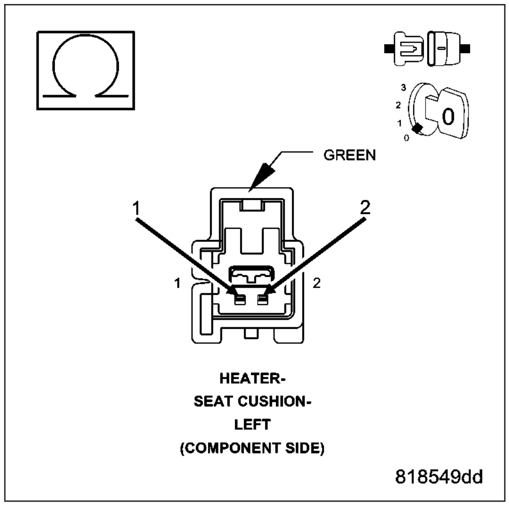
Does the DTC B1094 FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

2. CHECK FOR AN OPEN SEAT HEATER ELEMENT CIRCUIT

Disconnect the Left Seat Cushion Heater 2–way connector.



NOTE: Check connectors - Clean and repair as necessary.

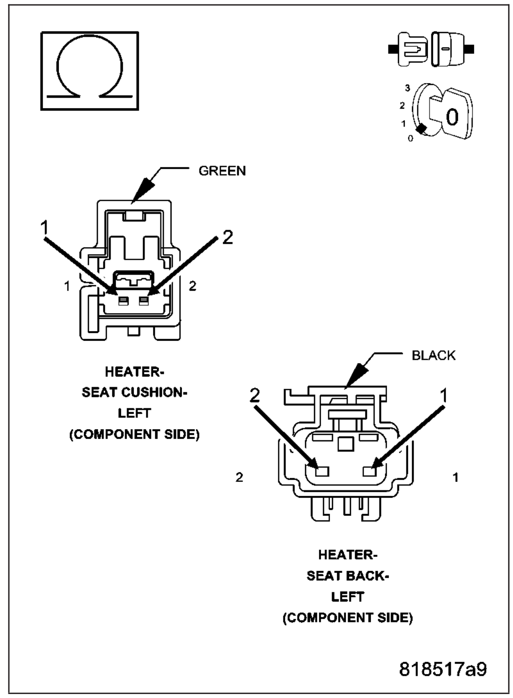
Measure the total resistance of the cushion and seat back heater elements at the Left Seat Cushion 2–way connector (component side).

Is the total resistance 2.5 to 3.5 ohms + or – .5 ohms?

Yes >> Go To 4

No >> Go To 3

3. CHECK THE LEFT SEAT HEATER ELEMENT RESISTANCE



Gain access to and disconnect the seat cushion and seat back heater connectors.

NOTE: Check connectors - Clean and repair as necessary.

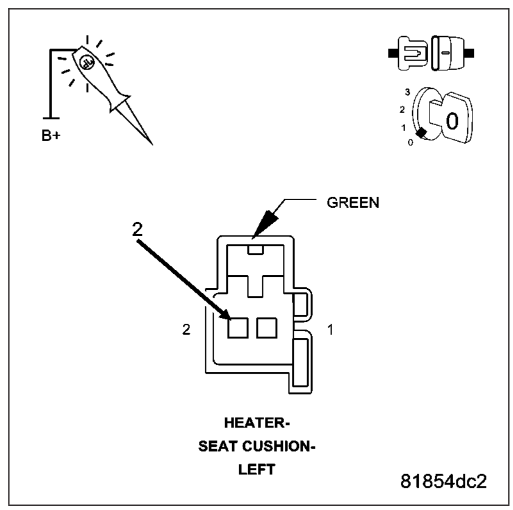
Measure each of the heater elements by measuring between the (P187) Left Seat Heater B(+) Driver and the Ground circuit at the seat cushion and seat back heater connectors.

For the seat cushion element, the resistance value is 3 to 5.5 ohms.

For the seat back element, the resistance value is 4 to 6 ohms.

Is the resistance correct for each heater element?

Yes >> Check for an open in the pigtail harness and repair as necessary.



Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Replace the heater element as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

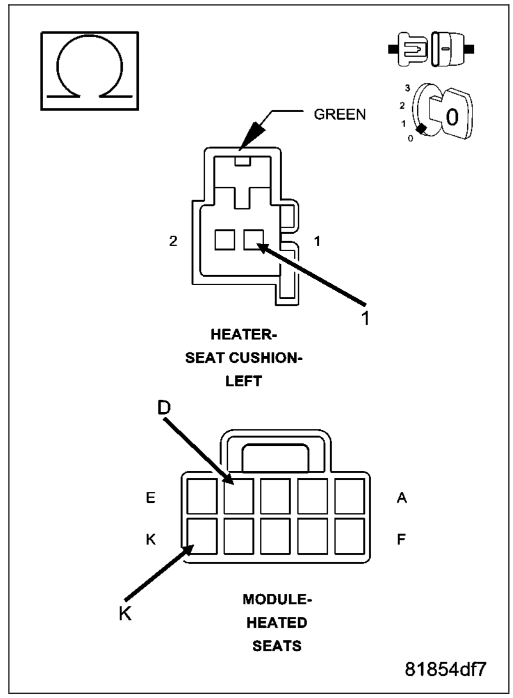
4. CHECK THE LEFT SEAT HEATER GROUND CIRCUIT

Using a 12-volt test light connected to 12-volts, check the (Z960) Ground circuit at the Left Seat Cushion Heater 2–way connector (harness side).

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (Z960) Ground circuit for an open.



Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

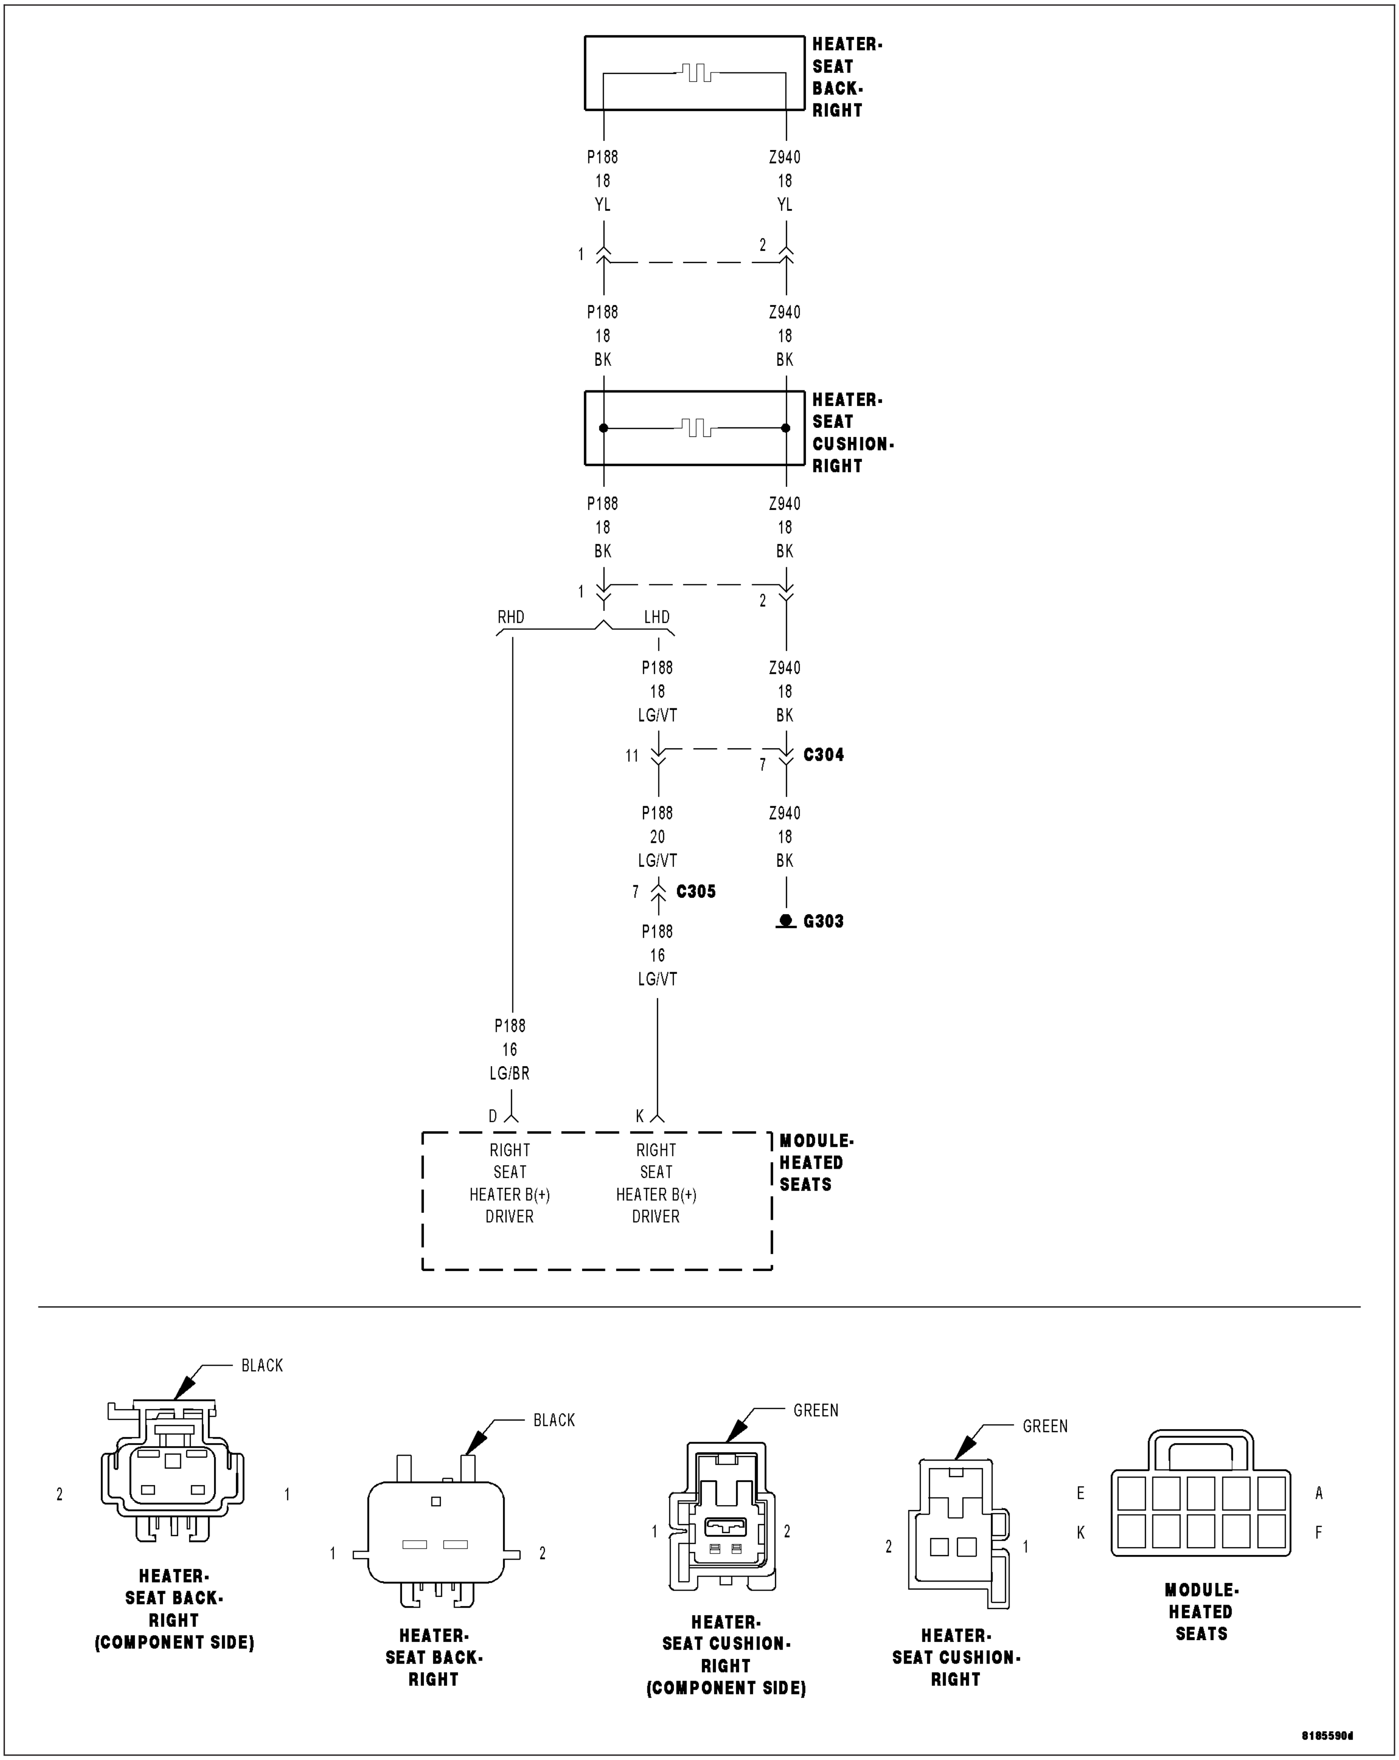
5. CHECK THE (P187) LEFT SEAT HEATER B(+) DRIVER CIRCUIT FOR AN OPEN.

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the (P187) Left Seat Heater B(+) Driver circuit cavity D for (LHD) or K for (RHD) from the HSM connector to the Left Seat Cushion Heater 2–way connector (harness side).

Is the resistance below 5.0 ohms?



Yes >> Replace the Heated Seat Module.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Repair the (P187) Left Seat Heater B(+) Driver circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on, during the heated seat operation.
- **Set Condition:**
  This code is set immediately after the Heated Seat Module detects the control circuit shorted to ground.

Possible Causes
(P188) RIGHT SEAT HEATER B(+) DRIVER SHORTED TO GROUND
SEAT CUSHION HEATER ELEMENT SHORTED
SEAT BACK HEATER ELEMENT SHORTED
HEATED SEAT MODULE

Diagnostic Test

1. VERIFY THAT DTC B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's.

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1096 – FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW reset?

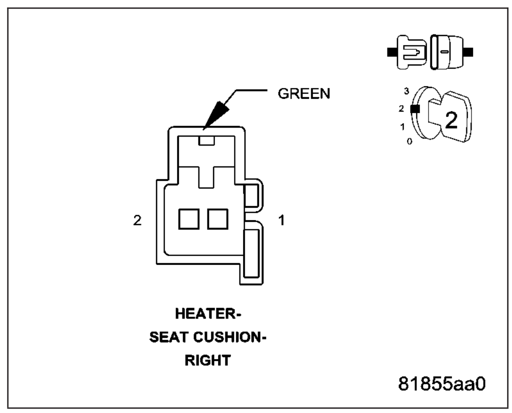
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

2. DISCONNECT RIGHT CUSHION HEATER 2-WAY CONNECTOR AND READ DTC'S

Disconnect the Left Seat Cushion Heater 2–way connector.

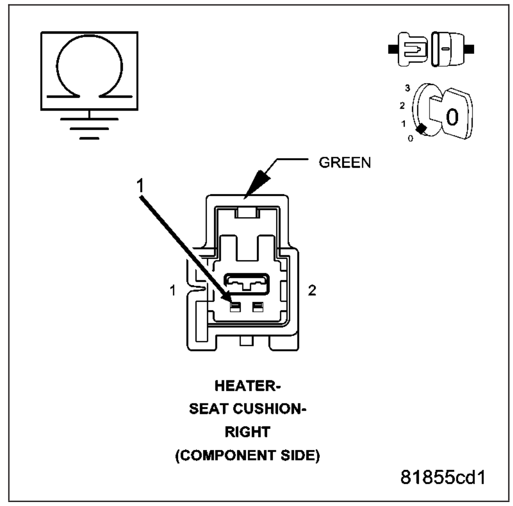
NOTE: Check connectors - Clean and repair as necessary.
With the scan tool, erase HSM DTC's.



Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the scan tool display the same DTC?



Yes >> Go To 5

No >> Go To 3

3. CHECK THE (P188) RIGHT SEAT HEATER B(+) DRIVER FOR A SHORT TO GROUND AT THE SEAT

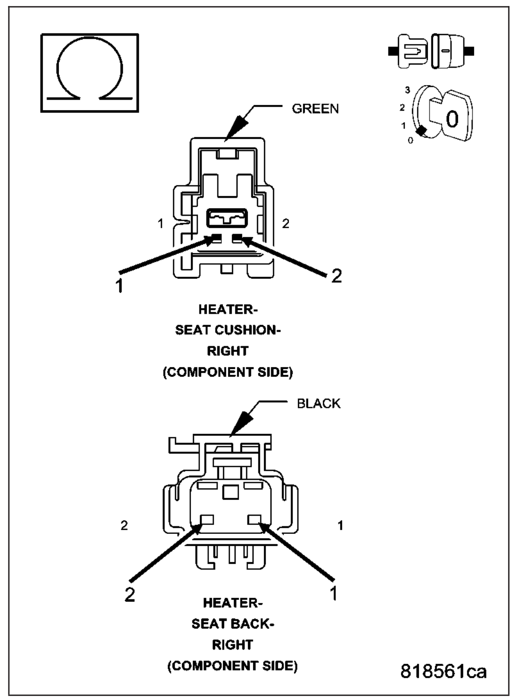
Measure between the (P188) Right Seat Heater B(+) Driver circuit at the Right Seat Heater connector (component side) and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

No >> Go To 4

Yes >> Repair/replace the pigtail/heating element as necessary for a short to ground condition.

Perform BODY VERIFICATION TEST – VER 1 (Refer to BODY VERIFICATION TEST – VER 1).



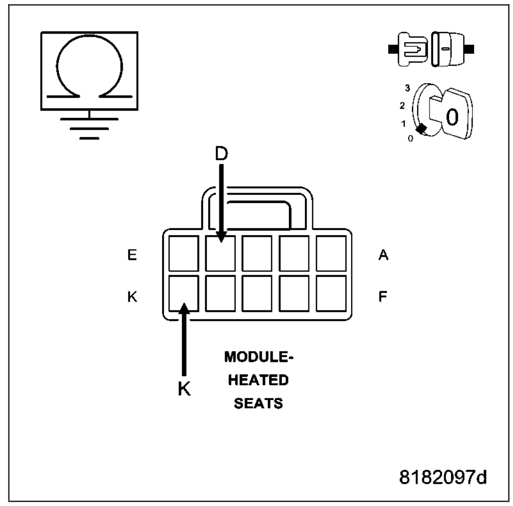
4. CHECK THE RIGHT HEATER ELEMENT SEAT CUSHION AND SEAT BACK RESISTANCE

Gain access to the seat cushion and seat back heater connectors.

Check the resistance of each of the heater elements by measuring between the (P188) Right Seat Heater B(+) Driver and the Ground circuit at the seat cushion and seat back heater connectors.

For the seat cushion element, the resistance value is 3 to 5.5 ohms.

For the seat back element, the resistance value is 4 to 6 ohms.



Is the resistance correct for each heater element?

Yes >> Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.

No >> Replace the heater element as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

5. CHECK THE (P188) RIGHT SEAT HEATER B(+) DRIVER CIRCUIT FOR A SHORT TO GROUND

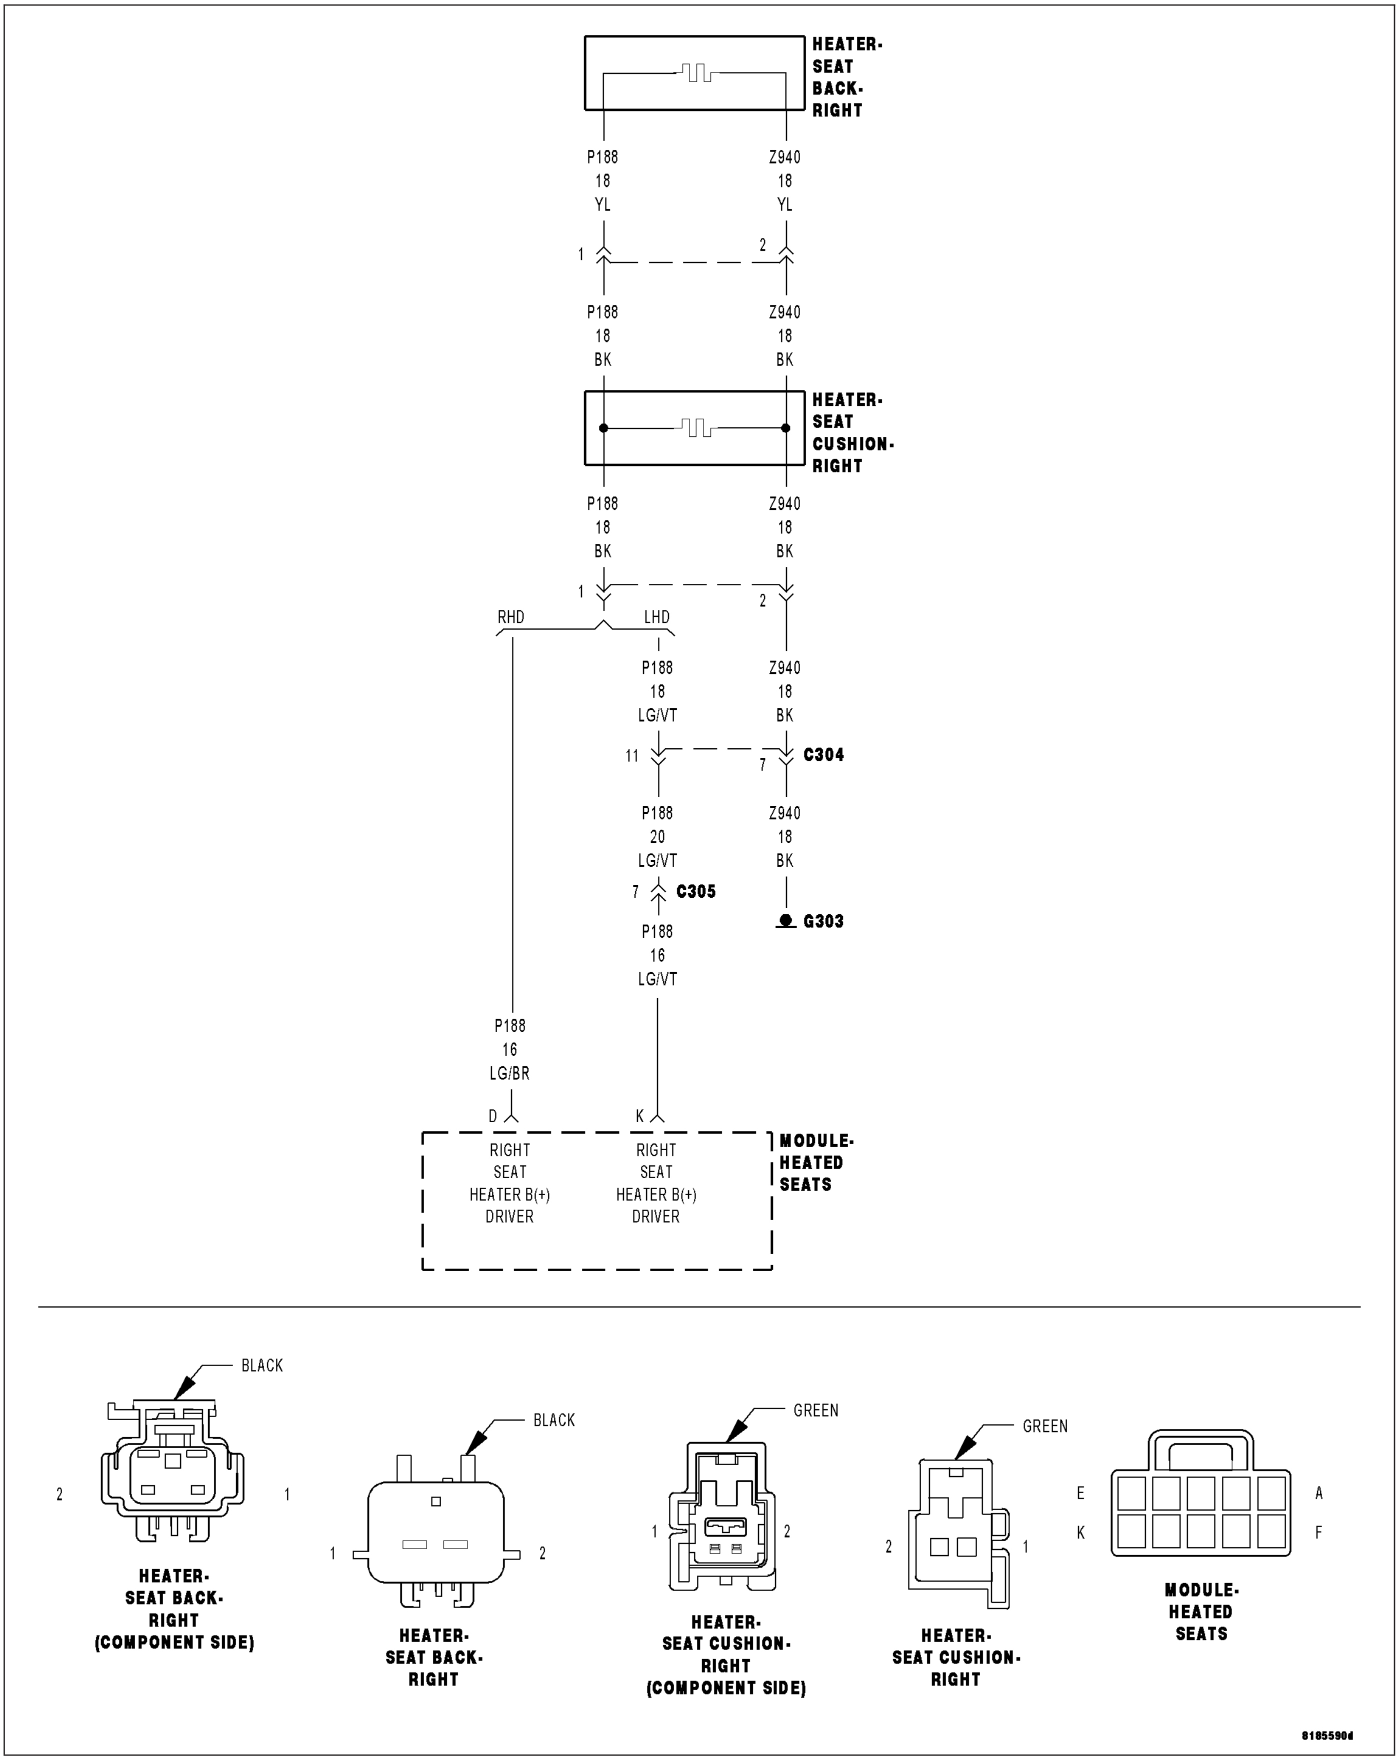
Ensure the Right Seat Cushion Heater 2–way connector is still disconnected.

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the (P188) Right Seat Heater B(+) Driver circuit cavity K for (LHD) or D for (RHD) at the HSM connector to ground.

Is the resistance below 5.0 ohms?



Yes >> Repair the (P188) Right Seat Heater B(+) Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Replace the Heated Seat Module.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on, during the heated seat operation.
- **Set Condition:**
  This code is set immediately after the Heated Seat Module detects an open in the seat heater B(+) driver circuit.

Possible Causes
(P188) RIGHT SEAT HEATER B(+) DRIVER WIRE OPEN
(Z940) GROUND WIRE OPEN
SEAT CUSHION HEATER ELEMENT OPEN
SEAT BACK HEATER ELEMENT OPEN
HEATED SEAT MODULE

Diagnostic Test

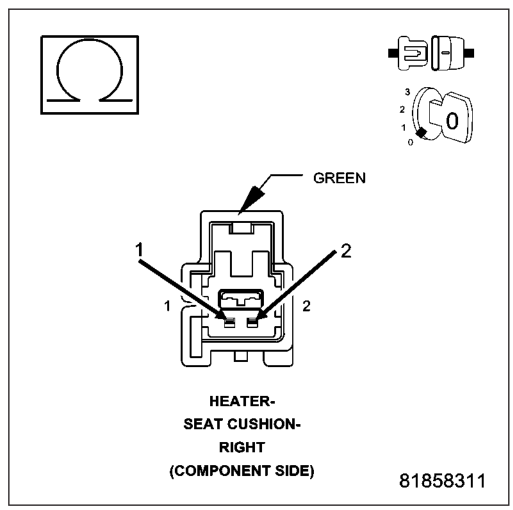
1. VERIFY THAT DTC B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE

With the scan tool, record and erase DTC's.

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1098 FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN reset?



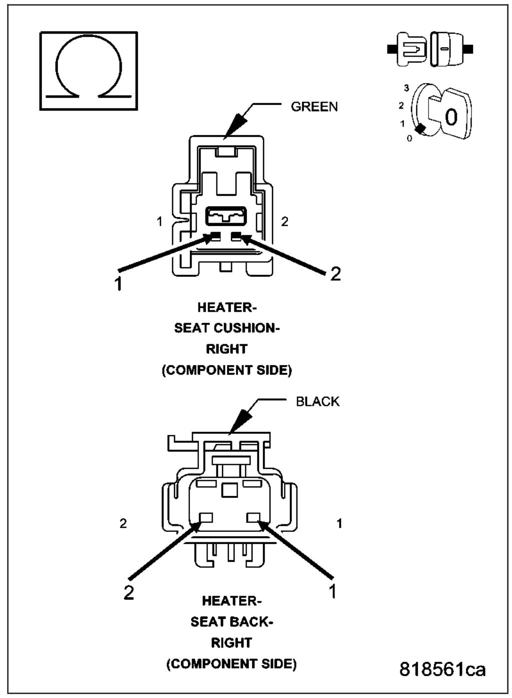
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

2. CHECK FOR AN OPEN SEAT HEATER ELEMENT

Disconnect the Right Seat Cushion Heater 2–way connector.

NOTE: Check connectors - Clean and repair as necessary.
Measure the total resistance of the cushion and seat back heater elements at the Right Seat Cushion 2–way connector (component side).



Is the total resistance 2.5 to 3.5 ohms + or – .5 ohms?

Yes >> Go To 4

No >> Go To 3

3. CHECK THE RIGHT SEAT HEATER ELEMENT RESISTANCE

Gain access to and disconnect the seat cushion and seat back heater connectors.

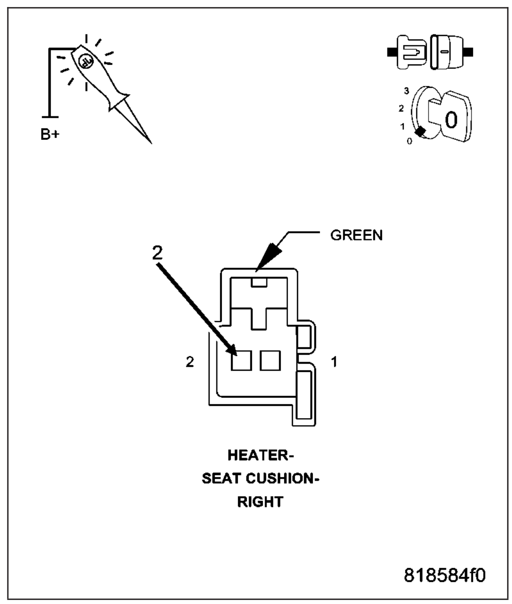
NOTE: Check connectors - Clean and repair as necessary.

Measure each of the heater elements by measuring between the (P188) Right Seat Heater B(+) Driver and the Ground circuit at the seat cushion and seat back heater connectors.

For the seat cushion element, the resistance value is 3 to 5.5 ohms.

For the seat back element, the resistance value is 4 to 6 ohms.

Is the resistance correct for each heater element?



Yes >> Check for an open in the pigtail harness and repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Replace the heater element as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

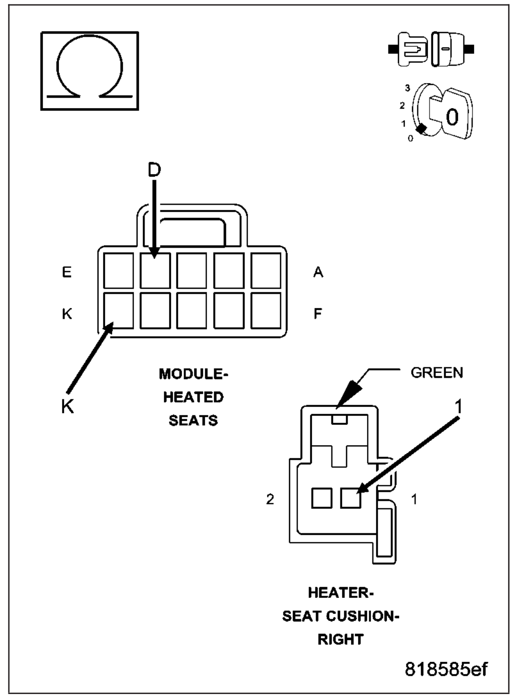
4. CHECK THE SEAT HEATER GROUND CIRCUIT

Using a 12-volt test light connected to 12-volts, check the (Z940) Ground circuit at the Right Seat Cushion Heater 2–way connector (harness side).

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (Z940) Ground circuit for an open.



Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

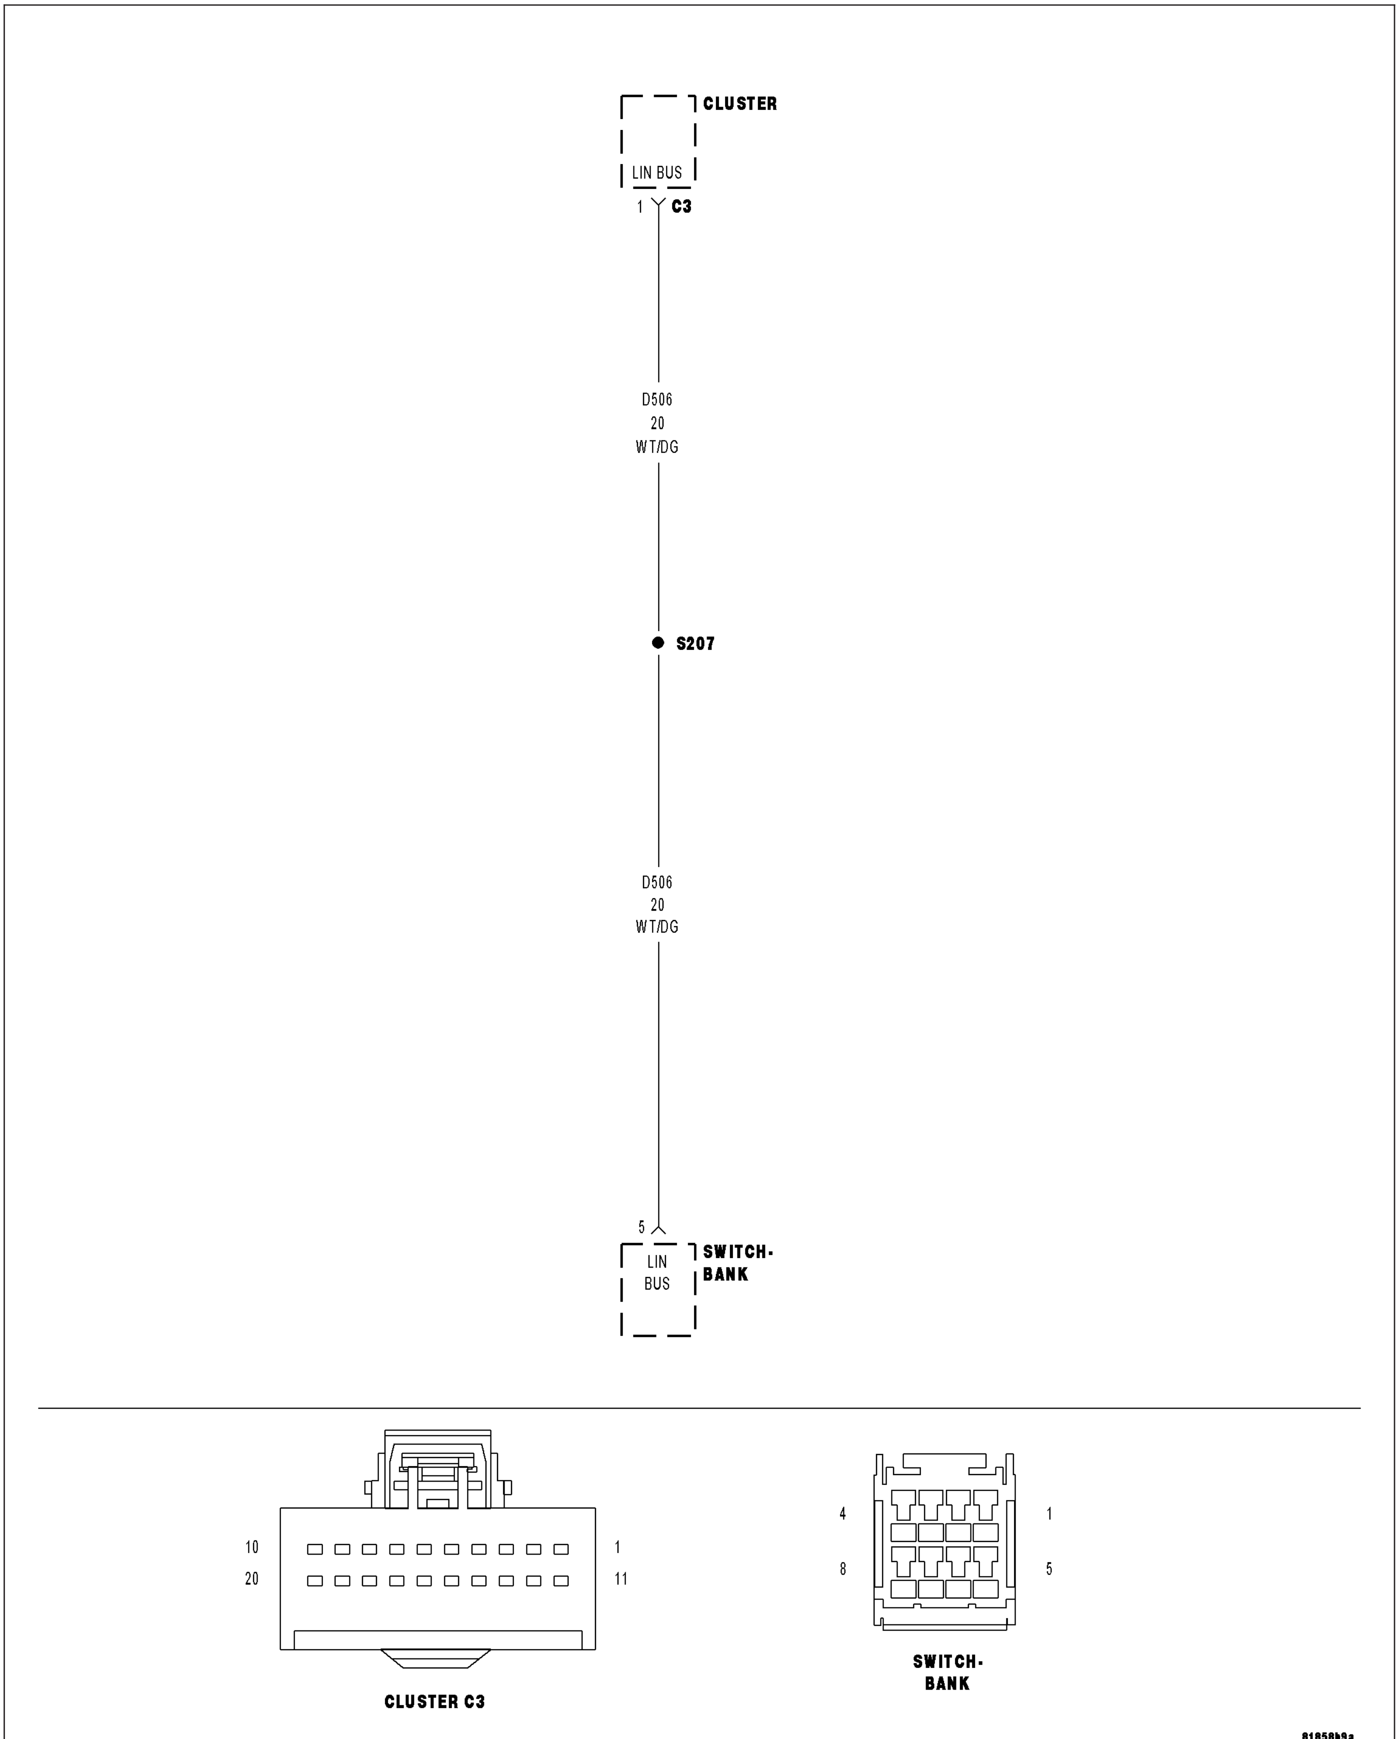
5. CHECK THE (P188) RIGHT SEAT HEATER B(+) DRIVER CIRCUIT FOR AN OPEN.

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the (P188) Right Seat Heater B(+) Driver circuit cavity K for (LHD) or D for (RHD) from the HSM connector to the Right Seat Cushion Heater 2–way connector (harness side).

Is the resistance below 5.0 ohms?



Yes >> Replace the Heated Seat Module.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Repair the (P188) Right Seat Heater B(+) Driver circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B10BB – LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK – CLUSTER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Heated Seat Switch in the Switch Bank is held in the On position for over 10 seconds, this code will set.

Possible Causes
(D506) LIN BUS CIRCUIT PARTIAL SHORT TO GROUND
SWITCH BANK STUCK
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's.

Operate the Heated Seat Switch several times.

Cycle the ignition from on to off.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display B10BB LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK?

Yes >> Go To 2

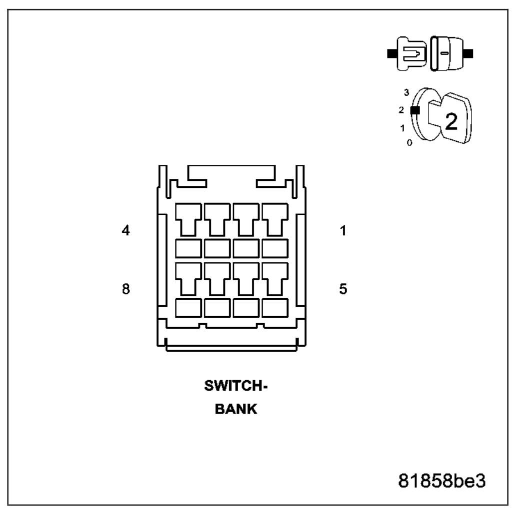
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. SWITCH SHORTED

With the scan tool, erase DTC's.

Disconnect the Switch Bank connector.



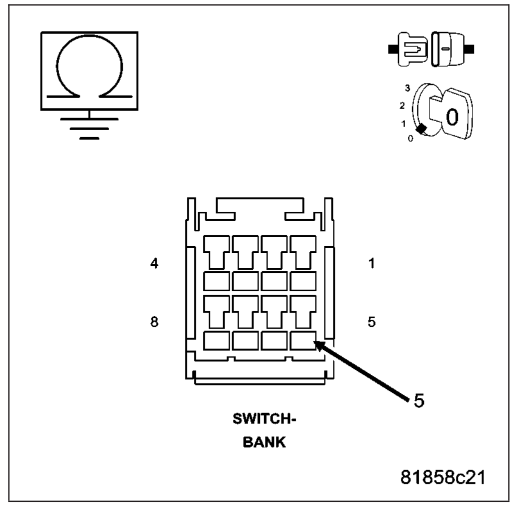
With the scan tool, read DTC's.

Does the scan tool display B10BB – LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK?

No >> Replace the Switch Bank.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

Yes >> Go To 3



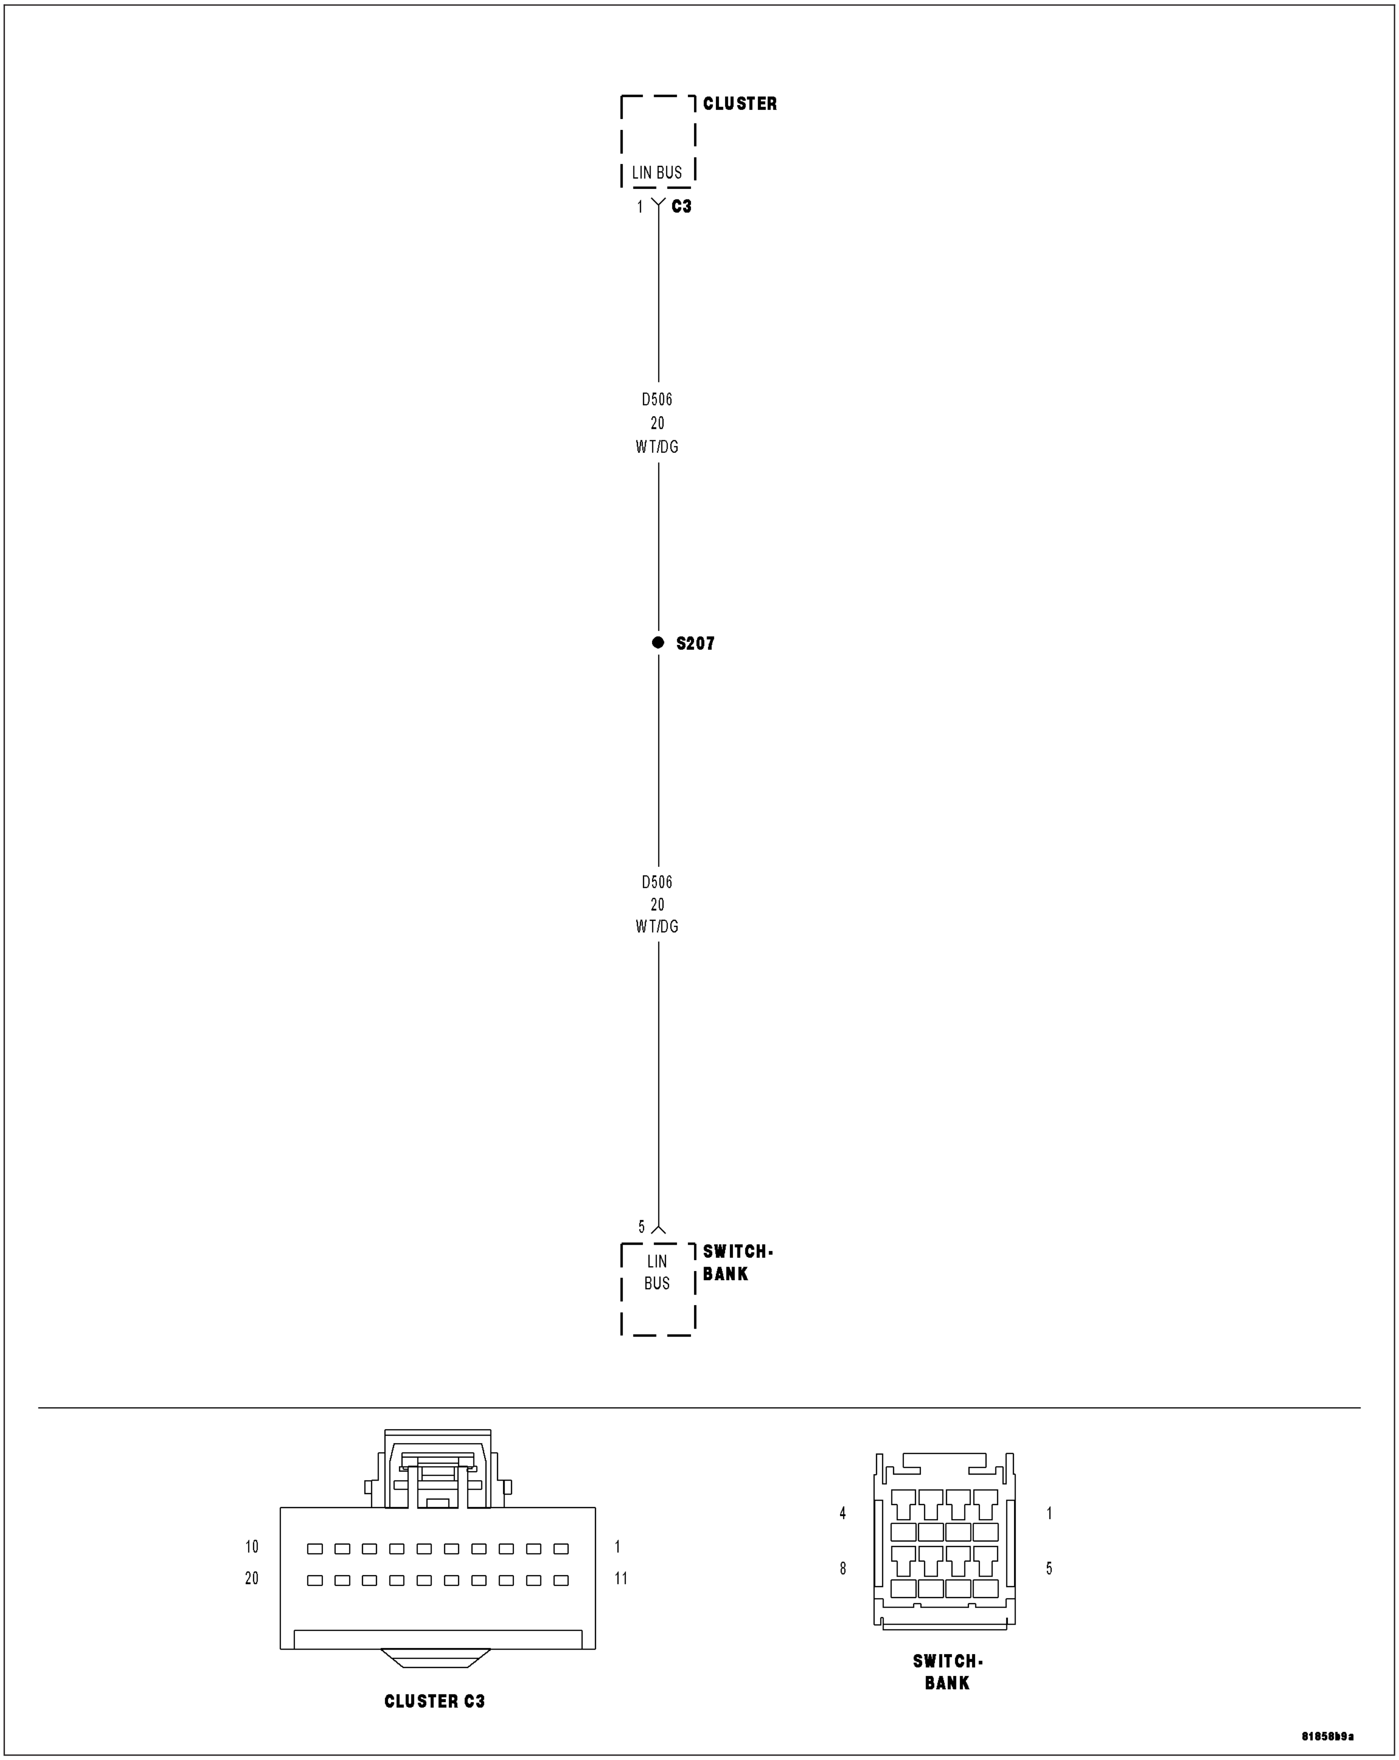
3. (D506) LIN BUS CIRCUIT PARTIAL SHORT TO GROUND

Turn the ignition off.

Disconnect the Cluster C3 connector.

Measure the resistance between ground and the (D506) LIN Bus circuit.

Is the resistance below 10000.0 ohms?



Yes >> Repair the (D506) LIN Bus circuit for a partial short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B10BC – RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK – CLUSTER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Heated Seat Switch in the Switch Bank is held in the On position for over 10 seconds, this code will set.

Possible Causes
(D506) LIN BUS CIRCUIT PARTIAL SHORT TO GROUND
SWITCH BANK STUCK
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC’s.

Operate the Heated Seat Switch several times.

Cycle the ignition from on to off.

Turn the ignition on.

With the scan tool, read DTC’s.

Does the scan tool display B10BC RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK?

Yes >> Go To 2

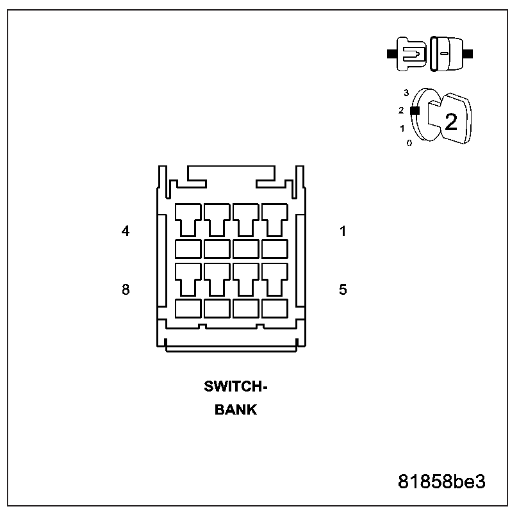
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. SWITCH SHORTED

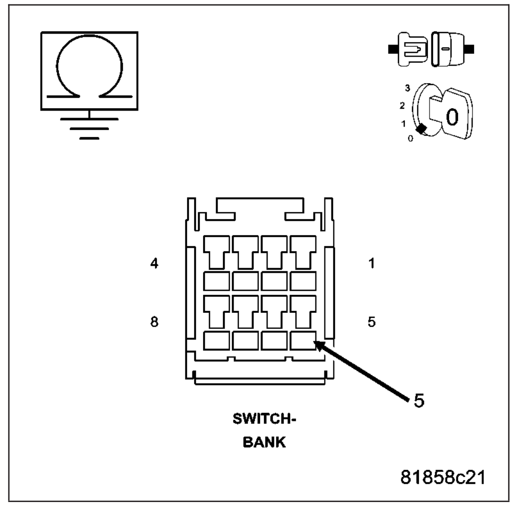
With the scan tool, erase DTC’s.

Disconnect the Switch Bank connector.



With the scan tool, read DTC’s.

Does the scan tool display B10BC – RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK?



No >> Replace the Switch Bank.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

Yes >> Go To 3

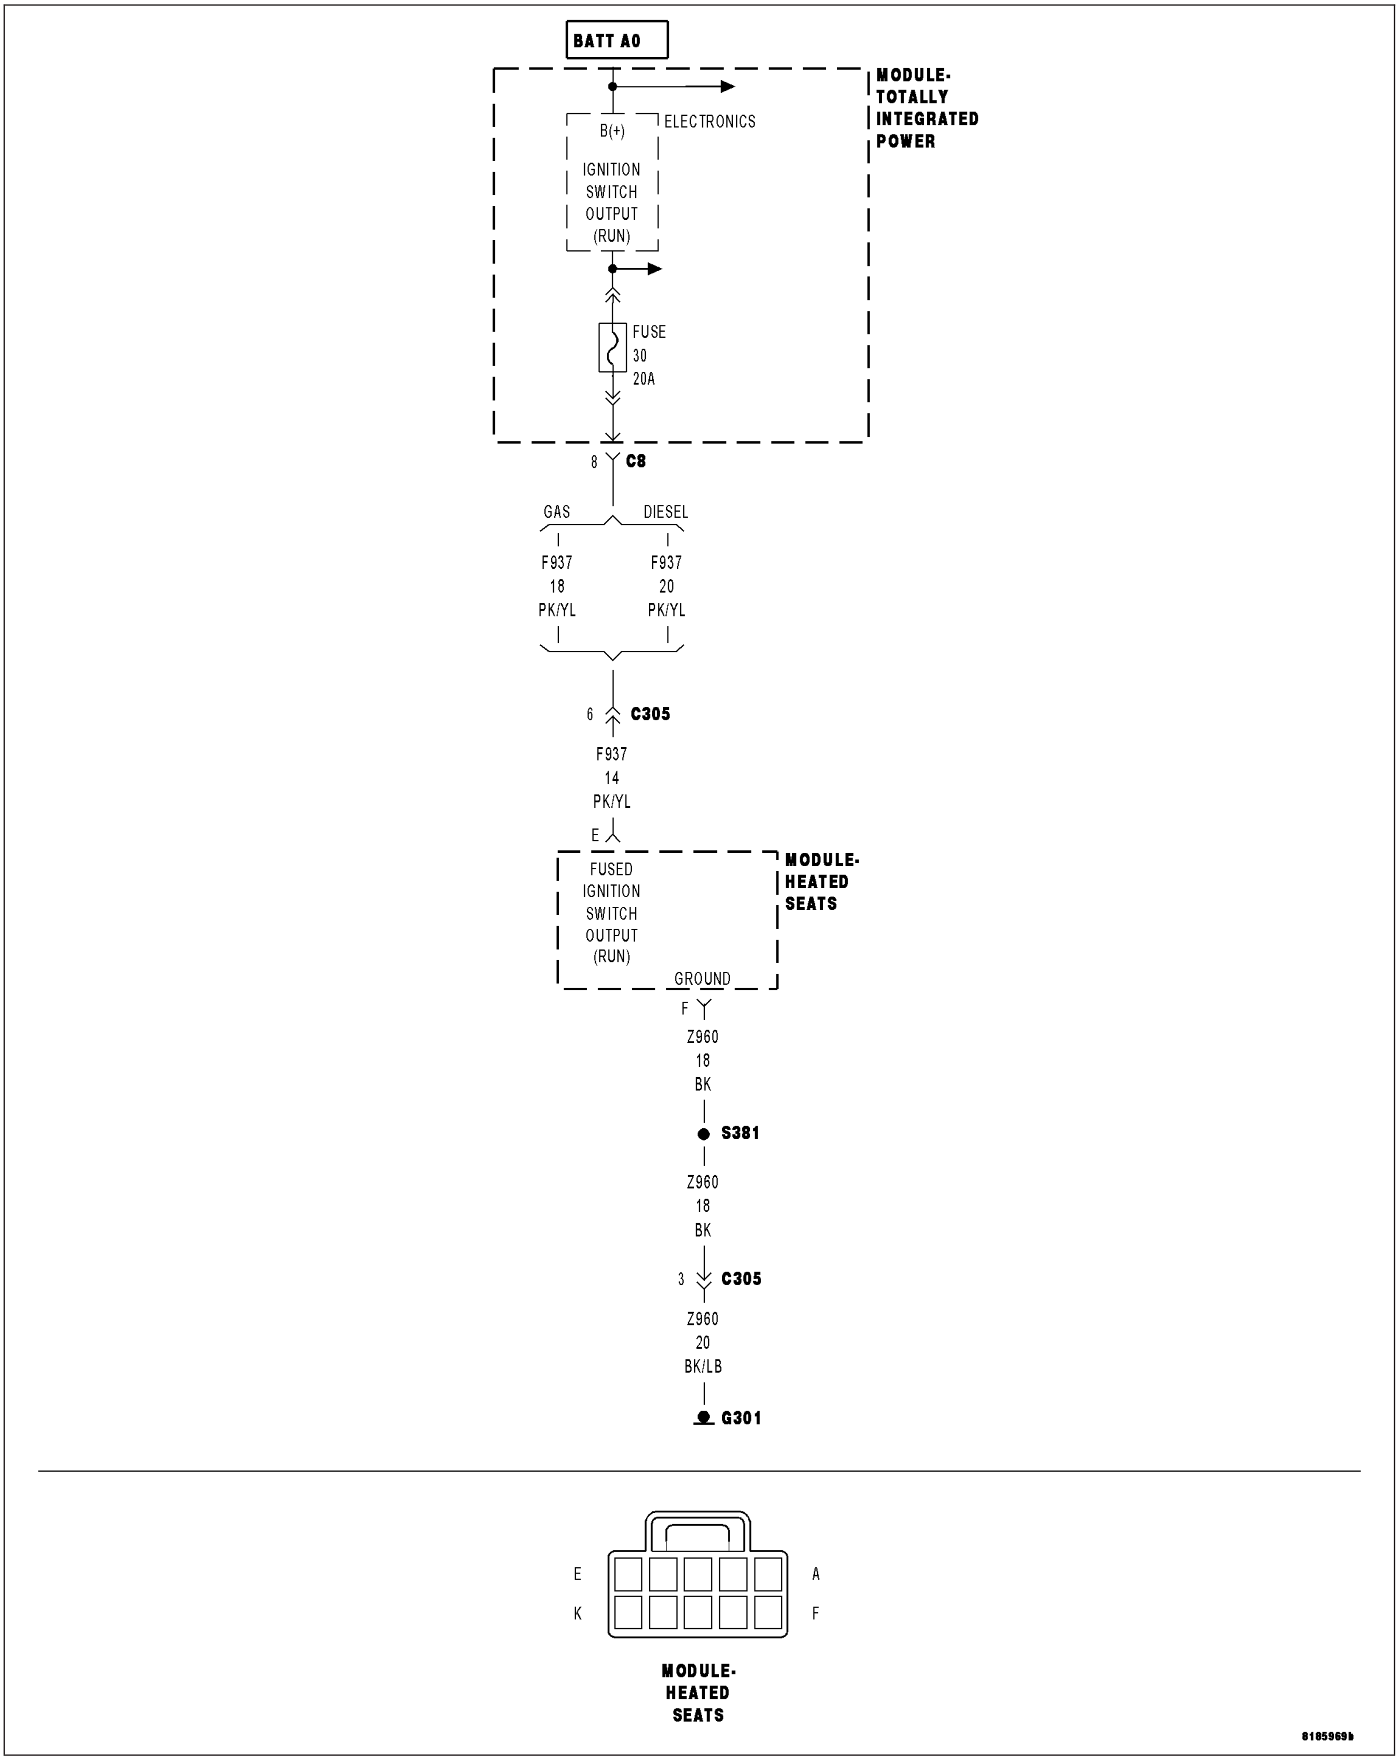
3. (D506) LIN BUS CIRCUIT PARTIAL SHORT TO GROUND

Turn the ignition off.

Disconnect the Cluster C3 connector.

Measure the resistance between ground and the (D506) LIN Bus circuit.

Is the resistance below 10000.0 ohms?



Yes >> Repair the (D506) LIN Bus circuit for a partial short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2181- HEATED SEAT MODULE POWER SUPPLY LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During heated seat operation.
- **Set Condition:**
  This code is set immediately if the Heated Seat Module detects voltage under 10 volts on the (F937) Fused Ignition Switch Output (Run) circuit.

Possible Causes
(F937) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT HIGH RESISTANCE
HEATED SEAT MODULE

Diagnostic Test

1. CHECK PCM FOR CHARGING SYSTEM DTC

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

Yes >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.

No >> Go To 2
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

2. VERIFY THAT DTC B2181 - HEATED SEAT MODULE POWER SUPPLY LOW IS ACTIVE

With the scan tool, record and erase DTC's.

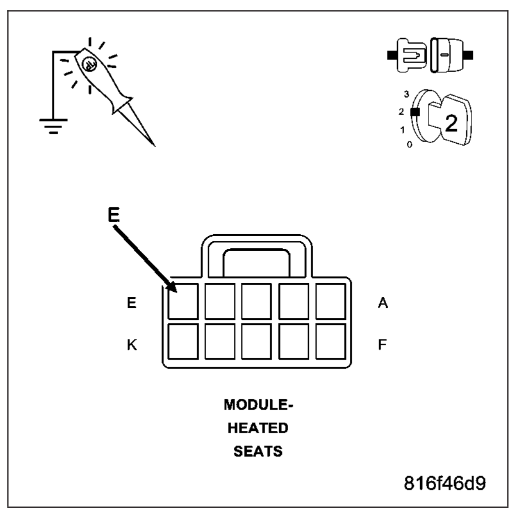
Turn the ignition switch to the Off position then start the engine and operate the heated seats for one minute.

With the scan tool, read DTC's.

Does the DTC B2181 - HEATED SEAT MODULE POWER SUPPLY LOW reset?

Yes >> Go To 3

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST - VER 1).



3. (F937) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT HIGH RESISTANCE

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.
Start the engine and let idle.

Using a 12-volt test light connected to ground, check the (F937) Fused Ignition Switch Output (Run) circuit at the HSM connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Replace the Heated Seat Module in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

No >> Repair the (F937) Fused Ignition Switch Output (Run) circuit as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B2182- HEATED SEAT MODULE POWER SUPPLY HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During heated seat operation.
- **Set Condition:**
  This code is set immediately if the Heated Seat Module detects voltage over 16.0 volts on the (F937) Fused Ignition Switch Output (Run) circuit.

Possible Causes
TROUBLE CODE PRESENT
CHARGING SYSTEM HIGH

Diagnostic Test

1. CHECK PCM FOR CHARGING SYSTEM DTC

With the scan tool, record and erase DTC's.

Cycle the ignition switch from On to Off.

Start the engine.

Run the engine at approximately 1500 RPM for 1 minute.

With the scan tool, read DTCs.

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

Yes >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> The conditions that caused this code to set are not present at this time. Using Service Information, check the charging system.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B221A-HEATED SEAT MODULE INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  This code is set immediately if the Heated Seat Module internal self test fails.

Possible Causes
HEATED SEAT MODULE

Diagnostic Test

1. VERIFY THAT DTC B221A-HEATED SEAT MODULE INTERNAL IS ACTIVE

With the scan tool, record and erase DTC's.

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B221A-HEATED SEAT MODULE INTERNAL reset?

Yes >> Replace the Heated Seat Module.

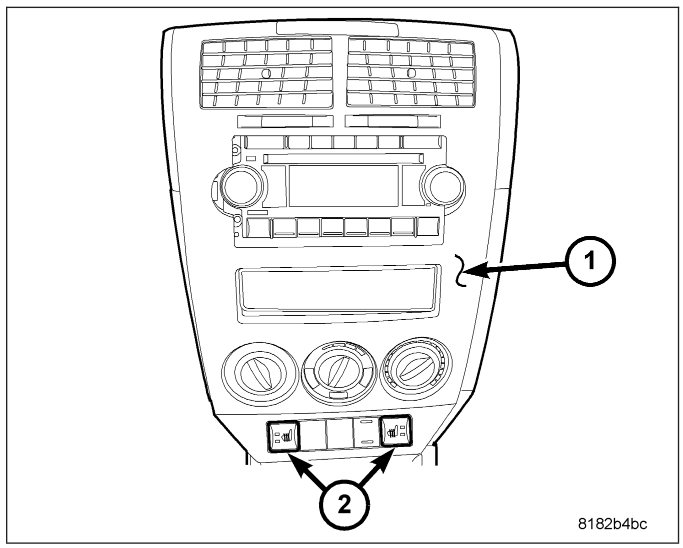
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

HEATED SEATS - SERVICE INFORMATION

TABLE OF CONTENTS



HEATED SEATS - SERVICE INFORMATION

DESCRIPTION

WARNING: The front passenger seat assembly contains critical components that affect the front passenger airbag deployment. Correctly functioning front passenger seat components are critical for the Occupant Classification System (OCS) to properly classify the front passenger and calculate the proper airbag deployment. Unapproved modifications or service procedures to the front passenger seat assembly, its related components, or trim cover may inadvertently change the airbag deployment in case of a frontal crash. This could result in death or serious injury to the front seat passenger if the vehicle is involved in an accident. The following requirements must be strictly adhered to:

- **Do not modify the front passenger seat assembly or components in any way.**
- **Do not modify the front seat center console or center position seat in any way.**
- **Do not use prior or future model year seat trim covers not designated for the specific model being repaired. Always use the correct seat trim cover specified for the vehicle.**
- **Do not replace the seat trim cover with an aftermarket trim cover.**
- **Do not add a secondary trim cover other than those approved by DaimlerChrysler/Mopar.**
- **At no time should any Supplemental Restraint System (SRS) component or SRS related component or fastener be modified or replaced with any part except those which are approved by DaimlerChrysler/Mopar.**

Vehicles with the heated seat option can be visually identified by the two heated seat switches located in the center stack (1) of the instrument panel. The switches are located on the outer edges of the accessory switch bank (2). The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI/LO). The heated seat system for this vehicle includes the following major components, which are described in further detail later in this section:

- **Heated Seat Elements** - Four heated seat elements are used per vehicle. Two heated seat elements are integral to each seat, one in the seat back and the other in the seat cushion.
- **Heated Seat Module** - One heated seat module is used per vehicle. The Heated Seat Module is mounted under the left front seat. This module contains the control logic and software for the front heated seat system. The module communicates on the Local Interface Network (LIN) data bus.
- **Heated Seat Switches** - Two heated seat switches are used per vehicle, one for each heated seat. Both switches are mounted in the instrument panel center stack.
- **Instrument Cluster (CCN)** - A Cab Compartment Node (CCN) is part of the instrument cluster on this vehicle. The CCN utilizes integrated software and information carried on the LIN data bus. The CCN serves as the link between the heated seat switches and the heated seat module.

OPERATION

The heated seat system operates on battery current received through a fuse in the Totally Integrated Power Module (TIPM). Fused ignition switch output (Run) circuits are used, so that the heated seat system will only operate when the ignition switch is in the On position. The heated seat system will turn Off automatically whenever the ignition switch is turned to any position except On.

A Heated Seat Module is used to control the heated seat system. The module responds to heated seat switch messages and ignition switch status inputs by controlling the 12v output to the front seat heating elements through integral solid-state relays.

When either of the heated seat switches are depressed a switch status message is sent to the Cab Compartment Node (CCN) or instrument cluster via the Local Interface Network (LIN) data bus. The CCN then sends a message via the LIN data bus to the heated seat module, signaling the module to energize the heating element for the

selected seat. Amber Light Emitting Diodes (LEDs) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. The heated seat module sends the LED illumination message to the CNN via the LIN data bus. The CNN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The heated seat module energizes an integral solid-state relay, which supplies battery current to the heating elements. When high-temperature heating is selected, the heaters provide a boosted heat level during the first four minutes of operation after heating is activated. The heat output then drops to the normal high-temperature level. If high-level heating is selected, the control system will automatically switch to the low level after two hours of continuous operation. At that time, the number of illuminated LEDs changes from two to one, indicating the change. Operation on the low setting also turns off automatically after two hours.

The module will automatically turn off the heating elements if it detects an OPEN or LOW short in the heating element circuit.

DIAGNOSIS AND TESTING

HEATED SEAT SYSTEM

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

HEATER-CUSHION PAD

DESCRIPTION

Vehicles equipped with the optional heated seat system have two, carbon fiber heated seat elements, located in each front seat. One heating element is used for each seat cushion and another for each seat back.

Each of the heated seat element consists of multiple heating circuits operating in parallel throughout the carbon fiber element. The heated seat elements are captured between the leather trim cover and the seat cushion assembly. If a malfunction occurs in one or more of the individual carbon fiber circuits, the others will continue to provide heat.

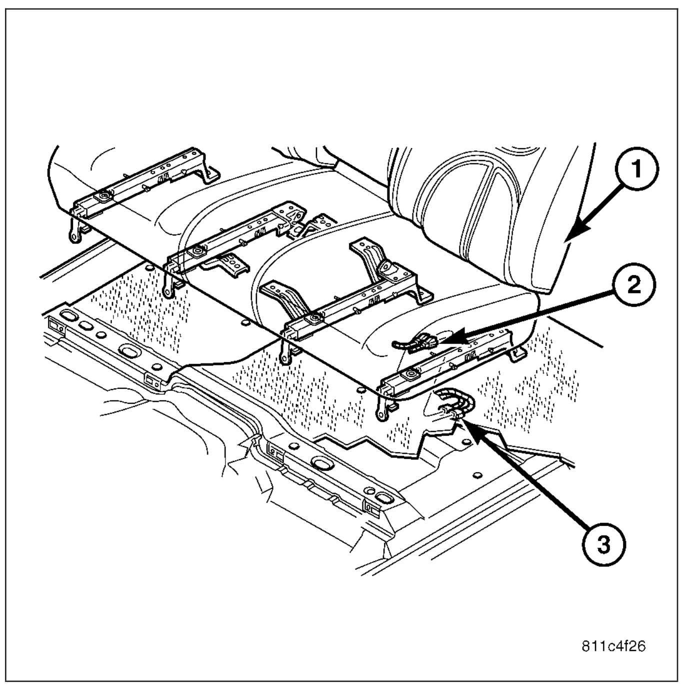
The heated seat elements cannot be repaired. If found to be damaged or inoperative, a new heating element assembly must be installed.

OPERATION

One end of the heated seat element is connected to ground at all times through a splice under the seat. Battery current is directed to the other end of the heated seat element by the heated seat module. The heated seat module will energize the heated seat element when the heated seat switch is depressed in the Low or High position.

As electrical current passes through the heated seat element, the resistance of the wire used in the element disperses some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

DIAGNOSIS AND TESTING

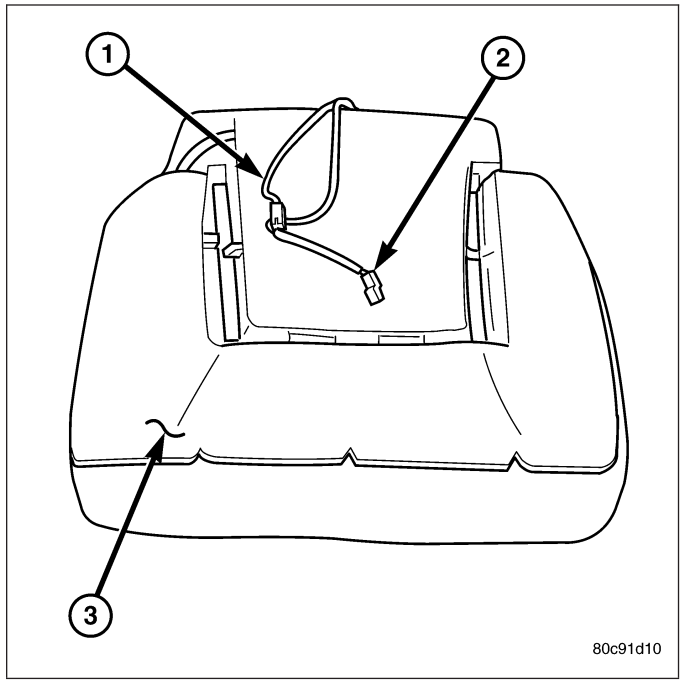


HEATED SEAT ELEMENT

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

The wire harness connectors (2&3) for the heating elements are located under the seat (1).

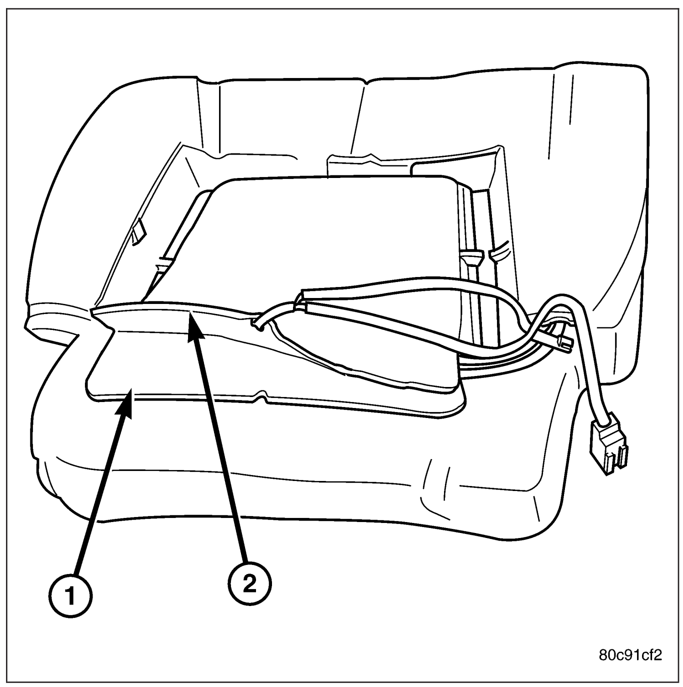
NOTE: When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position. Failure to check the element in various positions could result in an incomplete test.



1. Locate and disconnect the seat electrical connector.
2. Check the resistance between the circuit leading in and out of the suspect heated seat element. The resistance should be between 3.0 - 5.5 ohms for a seat cushion element and 4.0 - 6.0 ohms for a seat back element. If OK, (Refer to 8 - ELECTRICAL/ HEATED SEATS - DIAGNOSIS AND TESTING). If not OK, replace the inoperative heated seat element.

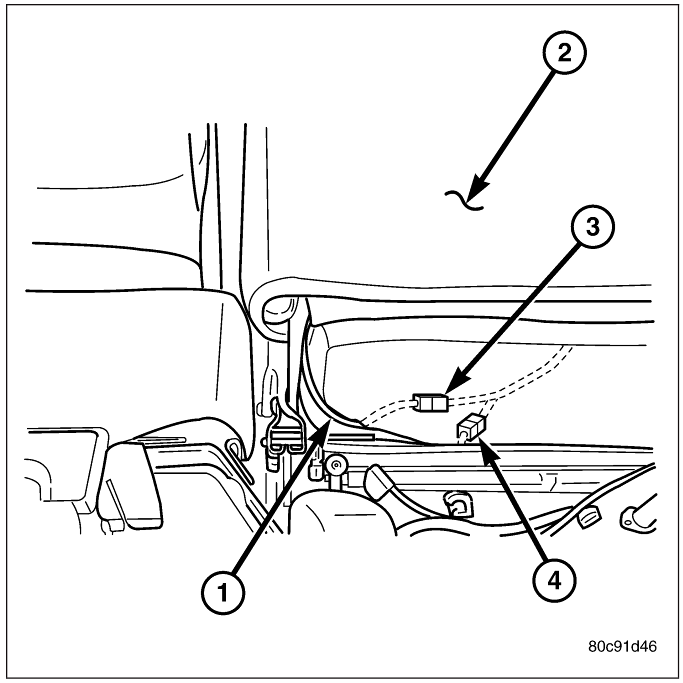
REMOVAL

NOTE: Do not remove the factory installed heating elements (3) from the seat or seat back cushions. The original element is permanently attached and cannot be removed without permanent damage. The replacement heating element is designed to be applied directly on top of the inoperative factory installed heating element.



1. Disconnect and isolate the battery negative cable.
2. Remove the appropriate seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL) or seat back trim cover, (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - REMOVAL).
3. Disconnect the inoperative heated seat cushion or seat back element electrical connectors (2).
4. Locate the wires leading from the inoperative heating element and cut them off flush with the edge of the original heating element.

INSTALLATION

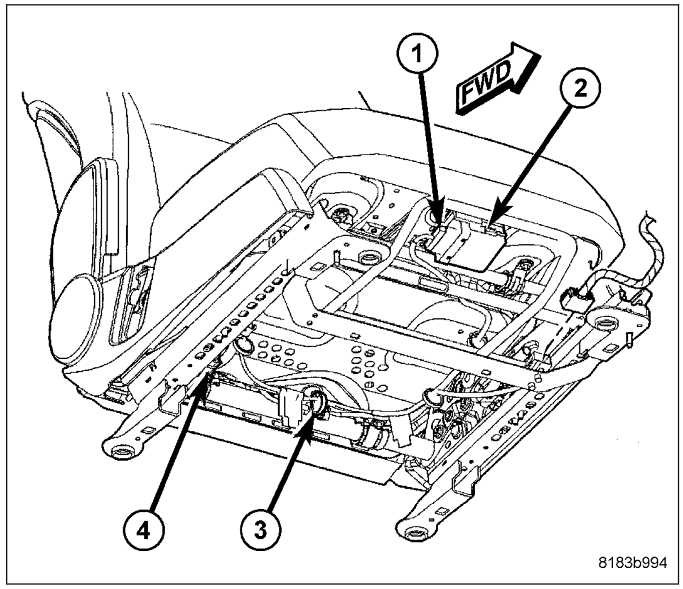


1. Peel off the adhesive backing on the back of the replacement heating element (2) and stick directly on top of the factory installed heating element (1).

CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

2. Connect the new heating element electrical connectors (3&4).
3. Connect the battery negative cable.
4. Verify heated seat system operation.
5. Install the appropriate seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION) or seat back trim cover, (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - INSTALLATION).

NOTE: Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover.



MODULE-HEATED SEATS

DESCRIPTION

The heated seat module (2) is located under the left front seat. It has a single electrical connector (1) and a push pin style retainer that secures it to the seat pan. The module can be accessed from under the front left seat with the seat in the full back position.

The heated seat module is a microprocessor designed to use the Local Interface Network (LIN) data bus messages from the instrument cluster also known as the Cabin Compartment Node (CCN). The CCN receives inputs from the heated seat switches and in turn signals the heated seat module to operate the heated seat elements for both front seats.

OPERATION

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded to the body at all times through the electrical connector. Inputs to the module include Local Interface Network (LIN) data bus messages and standard hardwired 12 volt power and ground. In response to the LIN inputs the heated seat module will control the battery current to the appropriate heated seat elements.

When a heated seat switch LIN data bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38°C (100.4°F), and the High heat set point is about 42°C (107.6°F).

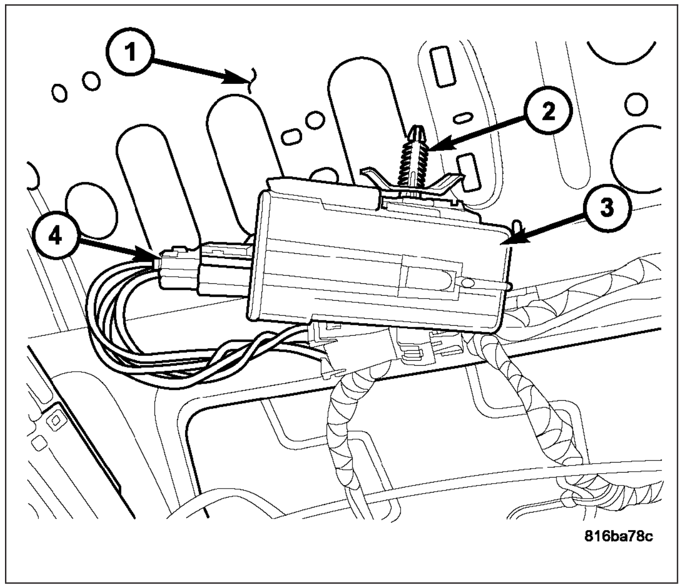
In addition to operating the heated seat elements, the heated seat module sends LED illumination messages to the CNN via the LIN data bus. The CNN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate diagnostic trouble code (DTC).

DIAGNOSIS AND TESTING

HEATED SEAT MODULE

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

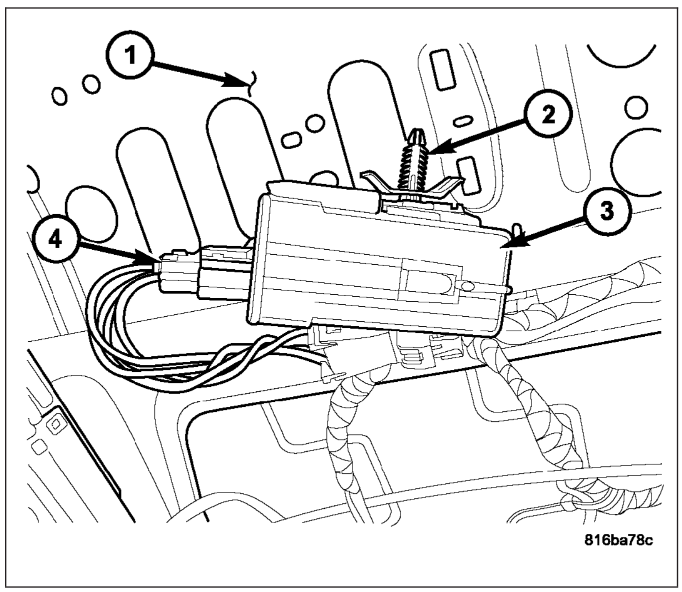


Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

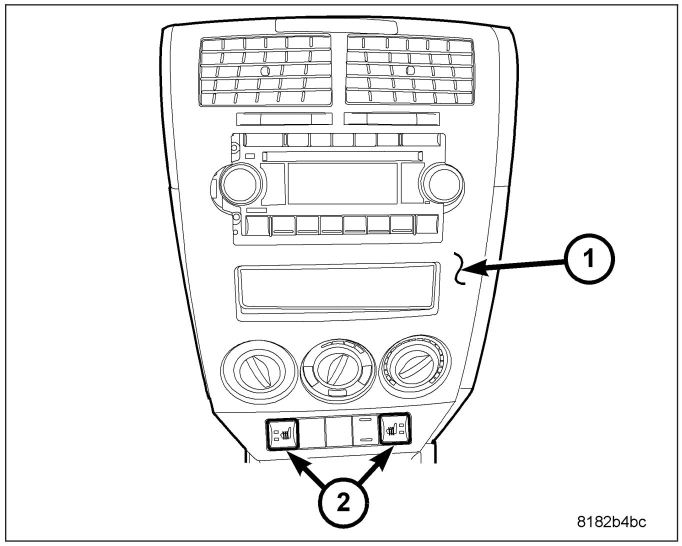
REMOVAL



CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Position the right front seat to the full rearward position.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the wire harness connector (4) from the heated seat module (3).
4. Unsnap the heated seat module retaining tab (2) from the seat pan (1).
5. Remove the heated seat module (3) from the vehicle.

INSTALLATION



CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Install the heated seat module (3) into the vehicle.
2. Position the retaining tab (2) with the mounting hole in the seat pan (1). Firmly apply even pressure to the module (3) until the mounting tab is fully seated.
3. Connect the wire harness connector (4) to the heated seat module (3).
4. Connect the battery negative cable.
5. Check for proper heated seat system operation.

SWITCH-HEATED SEAT

DESCRIPTION

The heated seat switches are located in the center stack (1) of the instrument panel. The switches are located on the outer edges of the accessory switch bank (2). If either of the switches is damaged or inoperative the complete accessory switch bank assembly must be replaced.

When either of the heated seat switches are depressed a switch status message is sent to the Cab Compartment Node (CCN) or instrument cluster via the Local Interface Network (LIN) data bus. The CCN then sends a message via the LIN data bus to the heated seat module, signaling the module to energize the heating element for the selected seat. Amber Light Emitting Diodes (LEDs) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. The heated seat module sends the LED illumination message to the CNN via the LIN data bus. The CNN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The LED indicator lamps in each heated seat switch cannot be repaired. If the LED lamps are inoperative or damaged, or the switch is inoperative or damaged the complete accessory switch bank assembly must be replaced.

OPERATION

The heated seat switches are active any time the Local Interface Network (LIN) data bus is active. Depressing the heated seat switch provides a switch status message to the Cabin Compartment Node (CCN) via the LIN data bus. The CCN is responsible for supplying the LIN data bus message to the heated seat module, signaling the module to power the heated seat element of the selected seat and maintain the temperature setting. If the heated seat switch is depressed to a different position (Low or High) than the currently selected state, the CCN will go through the process again to change the temperature setting.

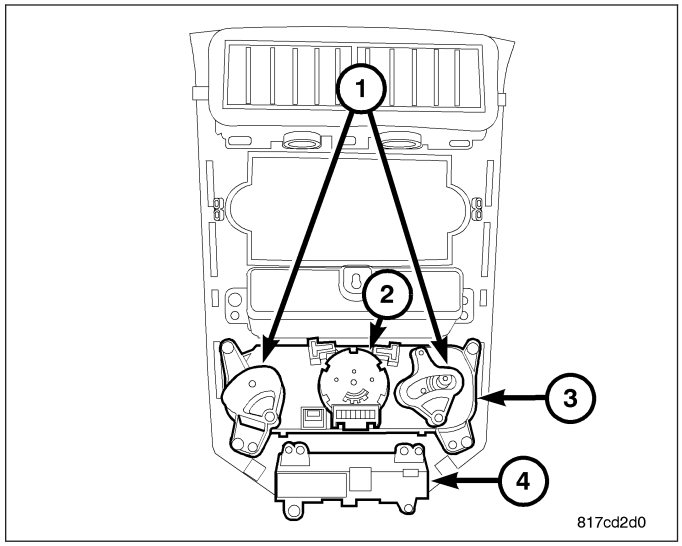
DIAGNOSIS AND TESTING

HEATED SEAT SWITCH

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.0v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

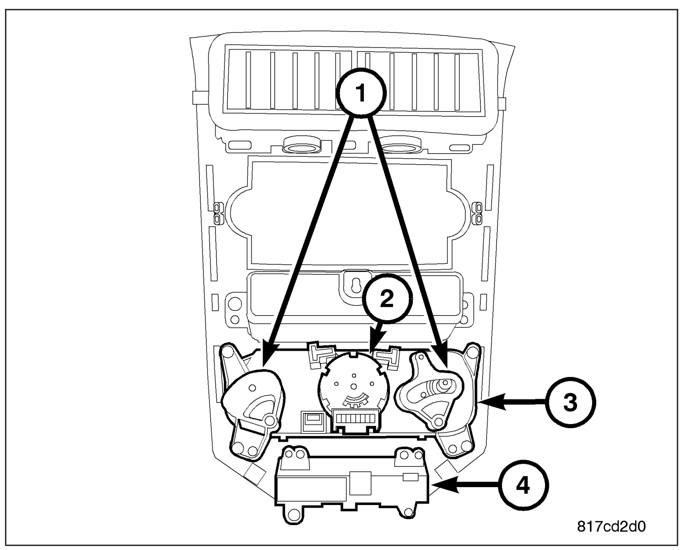


Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The heated seat switches are integral to the accessory switch bezel and cannot be serviced separately.



1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel from the instrument panel and place it on a work bench (Refer to 23 - BODY/ INSTRUMENT PANEL/BEZEL-CENTER - REMOVAL).
3. Remove the screws that secure the accessory switch bank (4) to the back of the center bezel and remove the accessory switch bank.

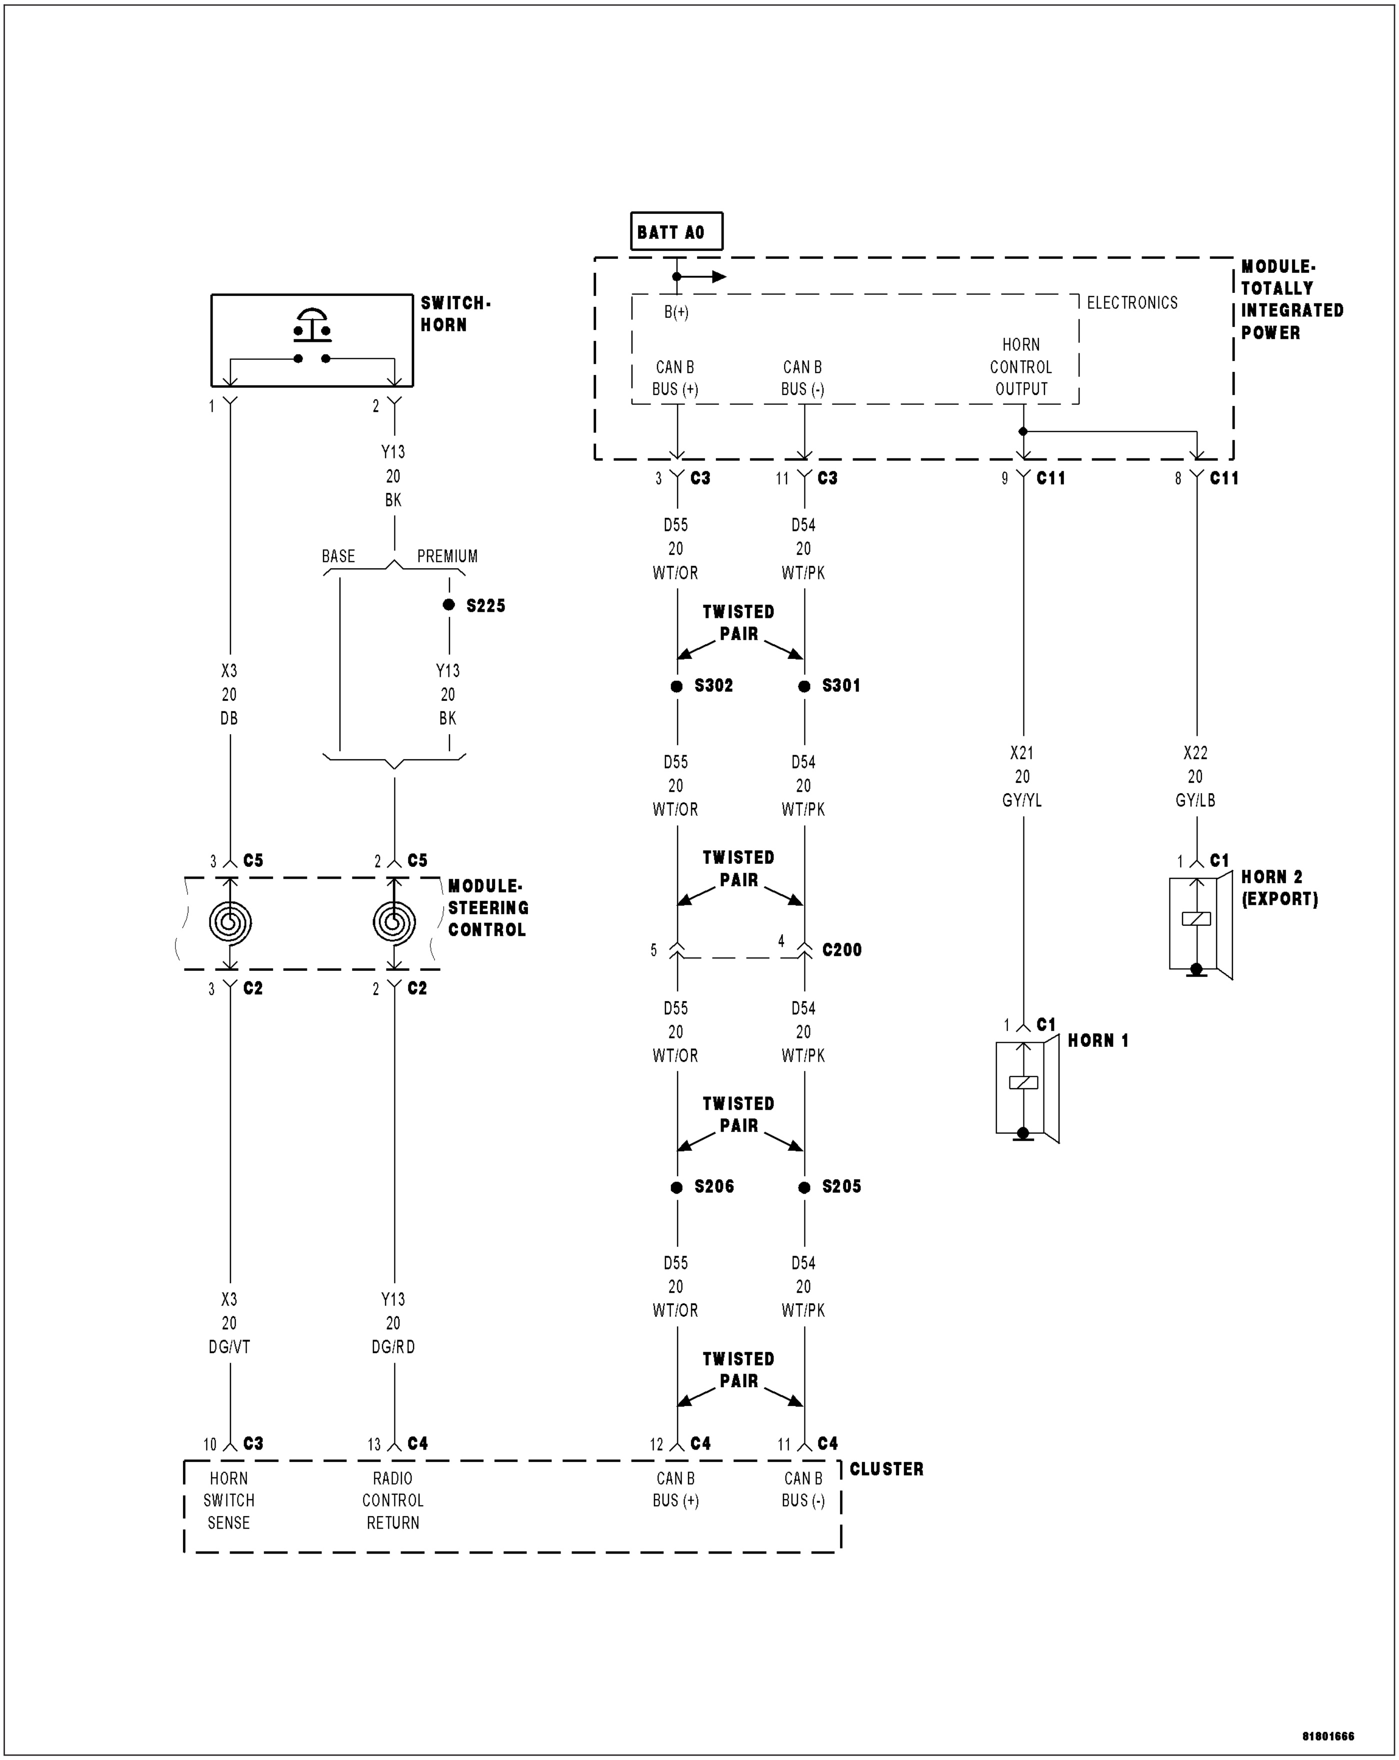
INSTALLATION

NOTE: There are different instrument panel accessory switch banks available based on the option content of the vehicle. Ensure the accessory switch bank being installed matches the vehicle options.

1. Position the accessory switch bank (4) onto the back of the instrument panel center bezel.
2. Install the screws that secure the accessory switch bank to the center bezel. Tighten the screws to 1N·m (8 in. lbs.).
3. Install the center bezel onto the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - INSTALLATION).
4. Reconnect the negative battery cable.
5. Verify heated seat system operation.

HORN

TABLE OF CONTENTS



HORN SYSTEM - ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

HORN SYSTEM - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B2336–HORN CONTROL CIRCUIT LOW (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  A shorted low condition on the (X21)/(X22) Horn Control Output circuit.

Possible Causes
(X21) HORN CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
(X22) HORN CONTROL OUTPUT CIRCUIT SHORTED TO GROUND (EXPORT)
TIPM

Diagnostic Test

1. VERIFY DTC B2336–HORN CONTROL CIRCUIT LOW IS ACTIVE

With the scan tool, erase TIPM DTCs.

Operate the Horn Switch several times.

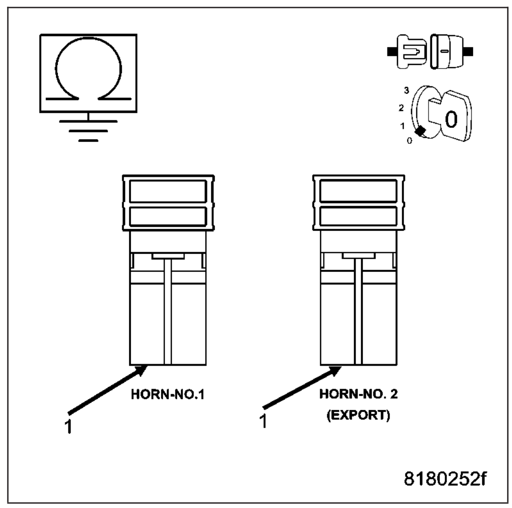
With the scan tool, read TIPM DTCs.

Does the scan tool display active DTC B2336-HORN CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (X21)/(X22) HORN CONTROL OUTPUT CIRCUIT SHORTED TO GROUND

Turn the ignition off

Disconnect the horn connector(s).

Disconnect the C11 TIPM harness connector.

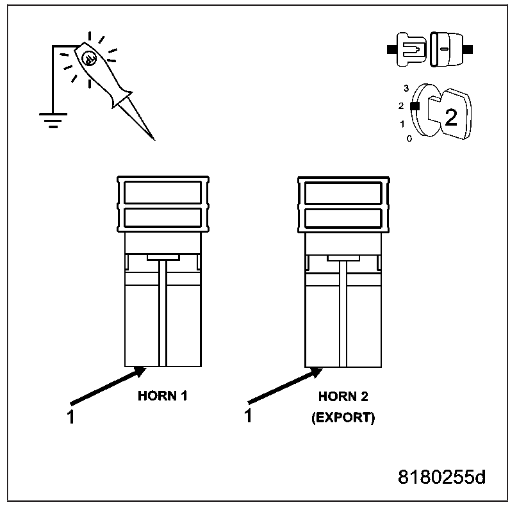
Measure the resistance between ground and the Horn Control Output circuit(s) at the horn connector(s).

Is the resistance below 100 ohms?

Yes >> Repair the (X21)/(X22) Horn Control Output circuit for a short to ground.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3



3. HORN

Connect the C11 TIPM harness connector.

Turn the ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate the Horn.

With a 12-volt test light connected to ground, probe the Horn Control Output circuit at the Horn connector(s).

Does the test light illuminate brightly and flash on and off?

Yes >> Replace the Horn(s) as necessary per Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

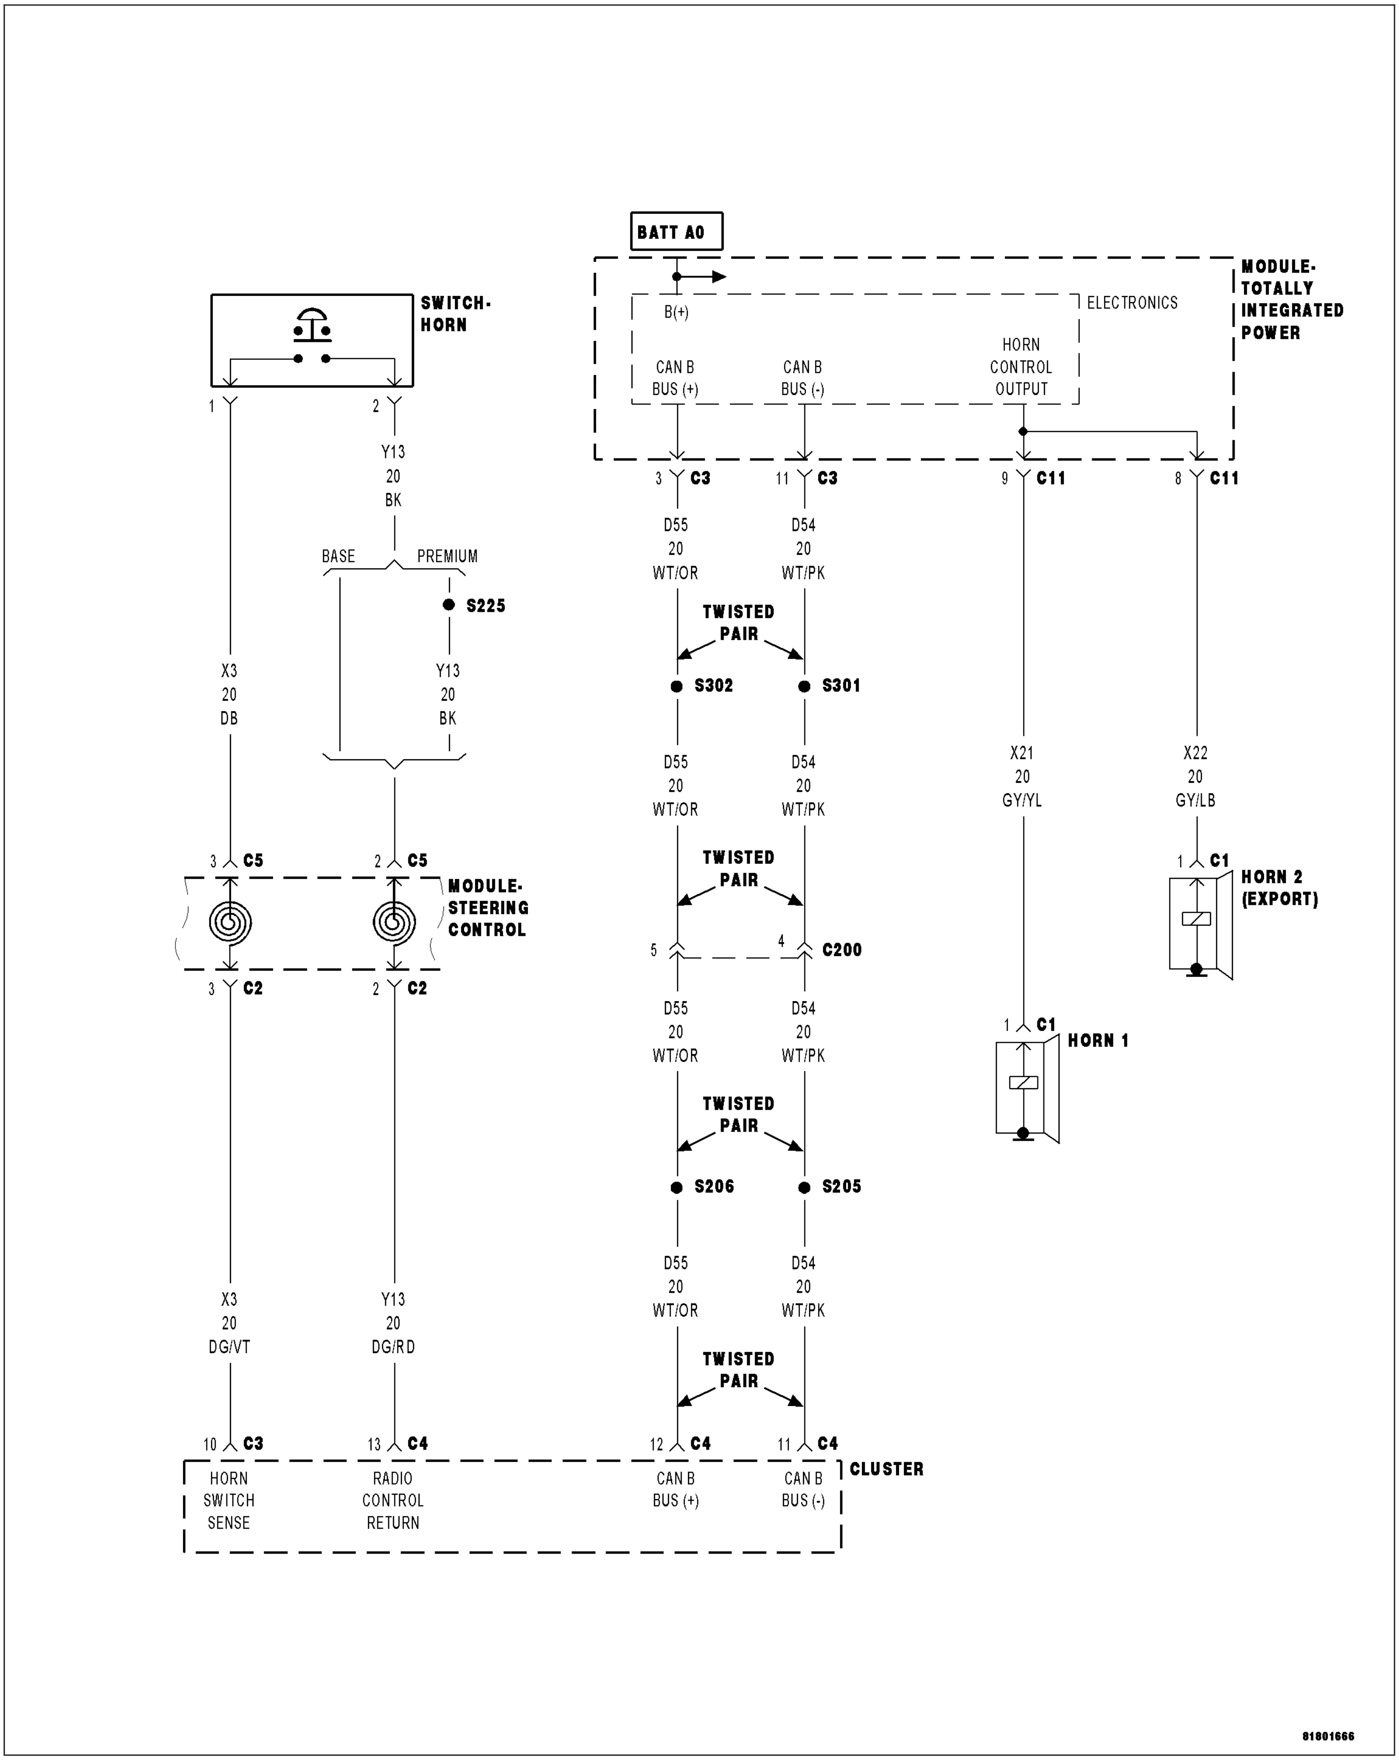
4. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?



Yes >> Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module per Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2337–HORN CONTROL CIRCUIT HIGH (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  A shorted high condition in the (X21)/(X22) Horn Control Output circuit.

Possible Causes
(X21) HORN CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE
(X22) HORN CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE (EXPORT)
EXCESSIVE RESISTANCE IN THE HORN OR CASE GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC B2337 – HORN CONTROL CIRCUIT HIGH IN THE TIPM

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Horn Switch several times.

With the scan tool, read DTC's.

Does the scan tool display active DTC B2337– HORN CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECKING THE HORN(S)

Turn the ignition off.

Disconnect the Horn(s) connector(s).

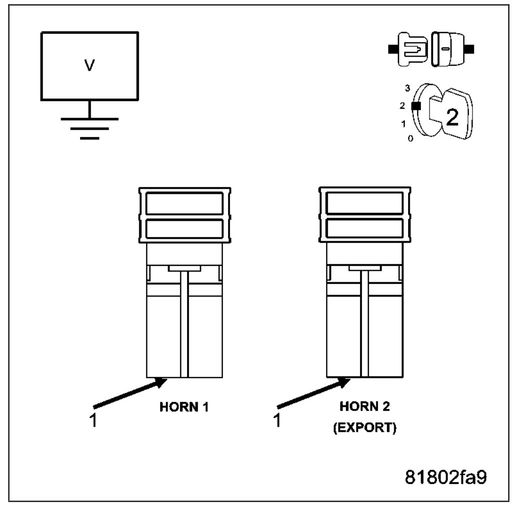
Momentarily jumper 12-volts to the horn(s).

Did the horn(s) operate properly?

Yes >> Go To 4

No >> Go To 3

3. CASE GROUND CIRCUIT OPEN



Using a 12-volt test light connected to 12-volts, check for a good case ground at the horn(s) case.

Does the test light illuminate brightly?

Yes >> Replace the Horn(s) as necessary.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the open or excessive resistance at the horn(s) case ground.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (X21)/(X22) HORN CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off

Disconnect the C11 TIPM harness connector.

Ignition on, engine not running.

Measure the voltage between (X21)/(X22) Horn Control Output circuit(s) and ground at the horn connector(s).

Is there any voltage present?

Yes >> Repair the short to battery voltage in the (X21)/(X22) Horn Control Output circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

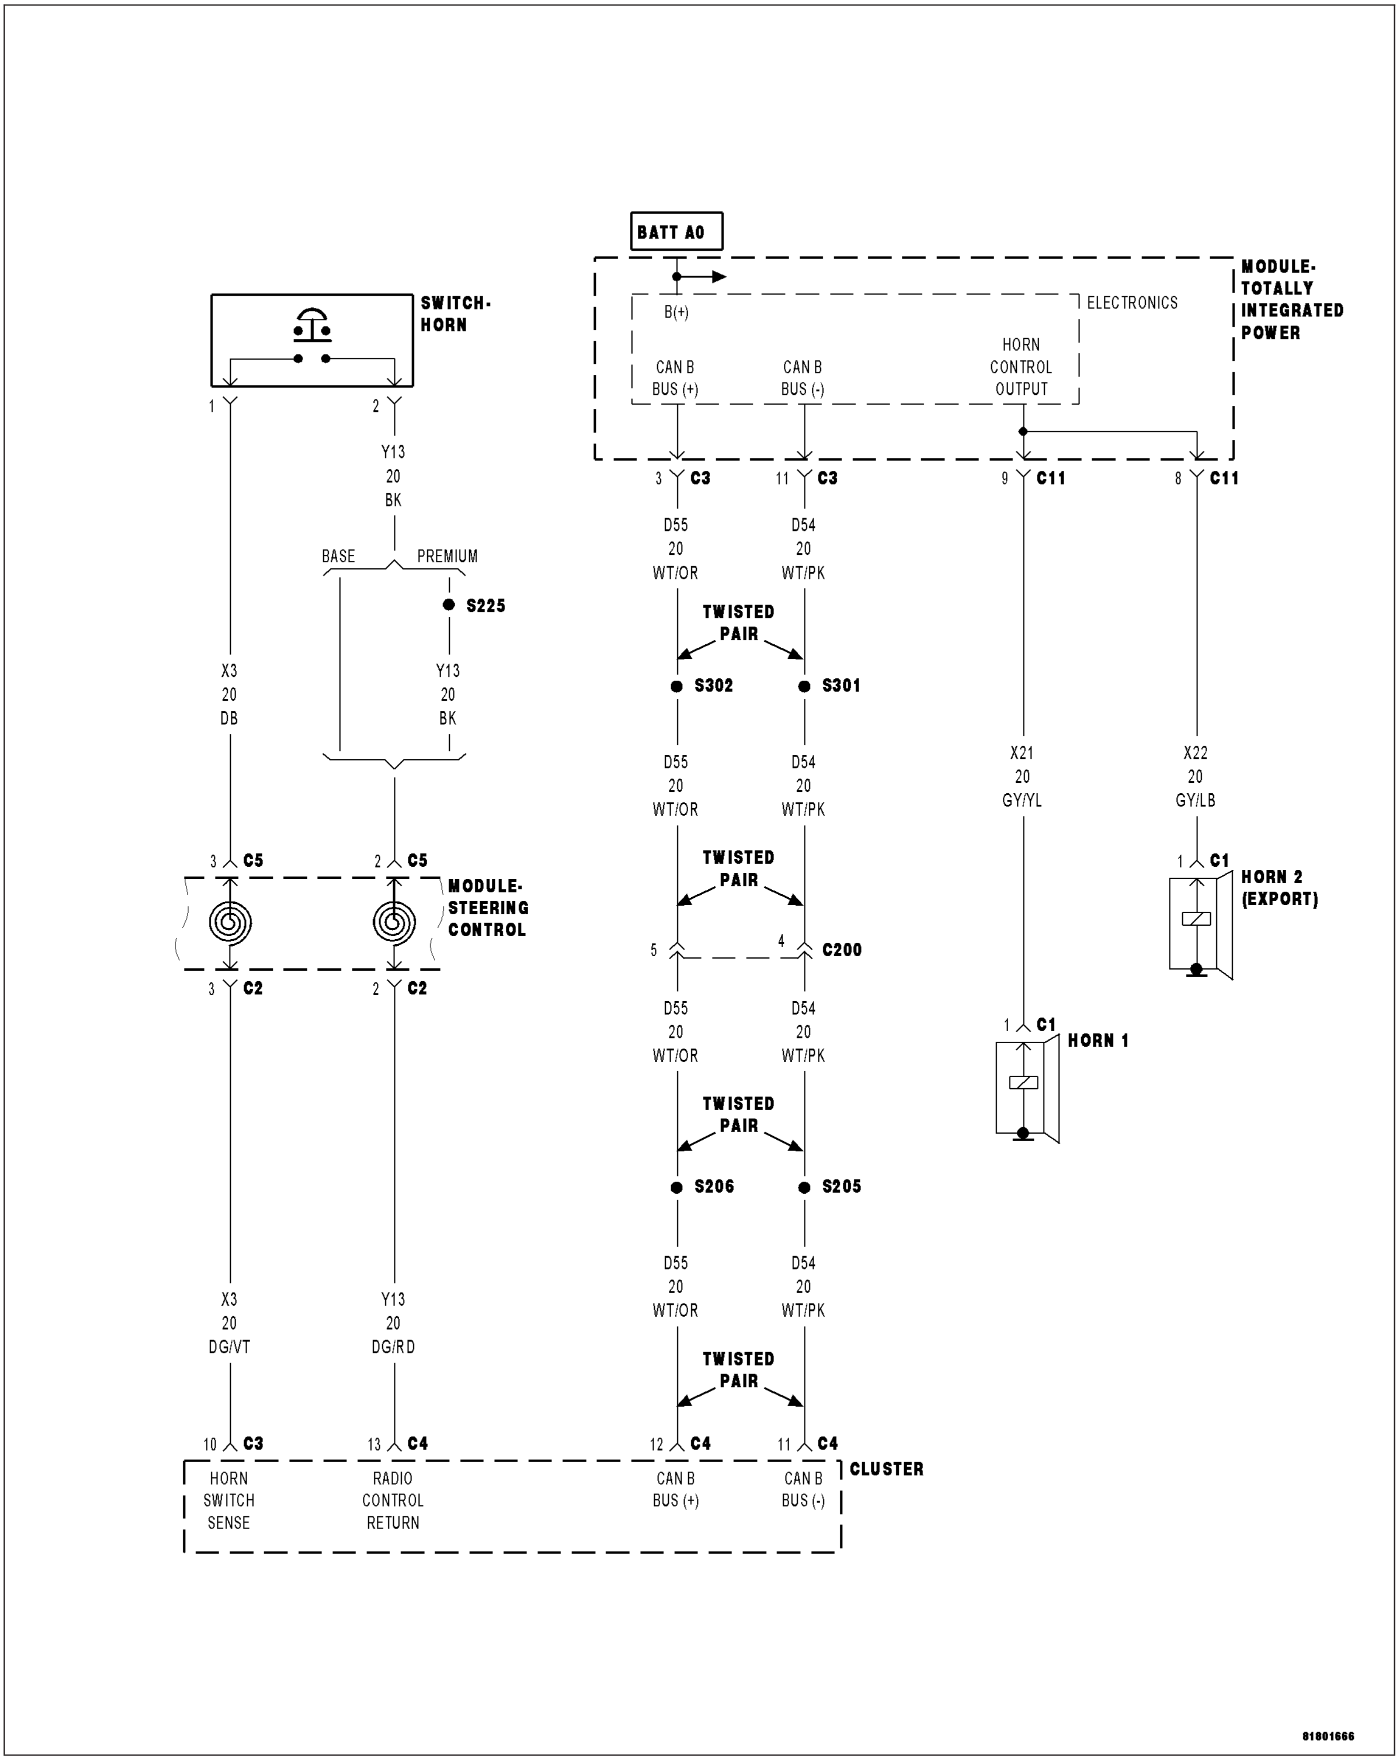
5. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?



Yes >> Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module per Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2338–HORN CONTROL CIRCUIT OPEN (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  An open condition on the (X21)/(X22) Horn Control Output circuit.

Possible Causes
TERMINAL DAMAGE OR CORROSION
(X21) HORN CONTROL OUTPUT CIRCUIT OPEN
(X22) HORN CONTROL OUTPUT CIRCUIT OPEN (EXPORT)
HORN CASE GROUND
HORN
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC B2338–HORN CONTROL CIRCUIT OPEN

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the horn switch several times.

With the scan tool, read DTC's.

Does the scan tool display active DTC B2338–HORN CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. VISUAL AND PHYSICAL CONNECTOR AND TERMINAL INSPECTION

Turn the ignition off.

Inspect the following connector terminal condition. Check for signs of corrosion build up or damage that would compromise the terminal to controller pin connector.

NOTE: Make sure that all in-line connectors are inspected for corrosion and/or damage.

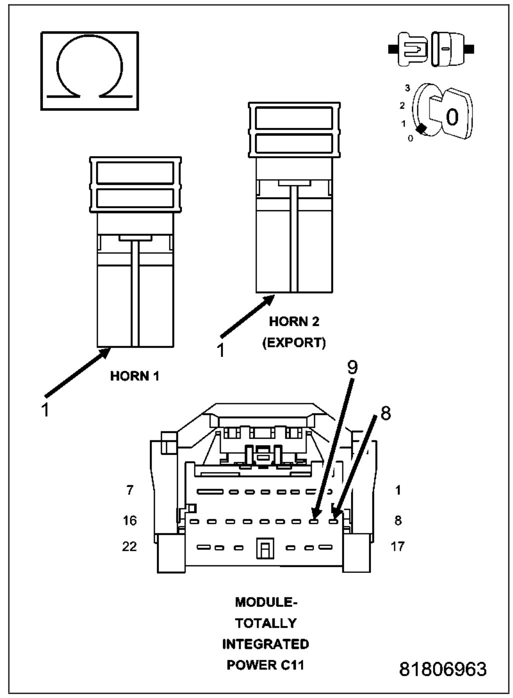
Disconnect the horn connectors.

Disconnect the C11 TIPM harness connector.

Visually inspect the wiring harness. Look for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

Yes >> Repair or replace as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



No >> Go To 3

3. (X21)/(X22) HORN CONTROL OUTPUT CIRCUIT OPEN

NOTE: Cavity 8 at the C11 TIPM harness connector is for export vehicles only.

Turn the ignition off

Measure the resistance of the (X21)/(X22) Horn Control Output circuit between the C11 TIPM harness connector and the Horn connector(s).

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X21)/(X22) Horn Control Output circuit for an open.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

4. CHECKING HORN OPERATION

Turn the ignition off.

Disconnect the horn(s) connector(s) if not disconnected.

Momentarily jumper 12-volts to the horn(s).

Did the horn(s) operate properly?

Yes >> Go To 6

No >> Go To 5

5. CASE GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check for a good case ground at the horn(s) case.

Does the test light illuminate brightly?

Yes >> Replace the Horn(s) as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the open or excessive resistance at the horn(s) case ground.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

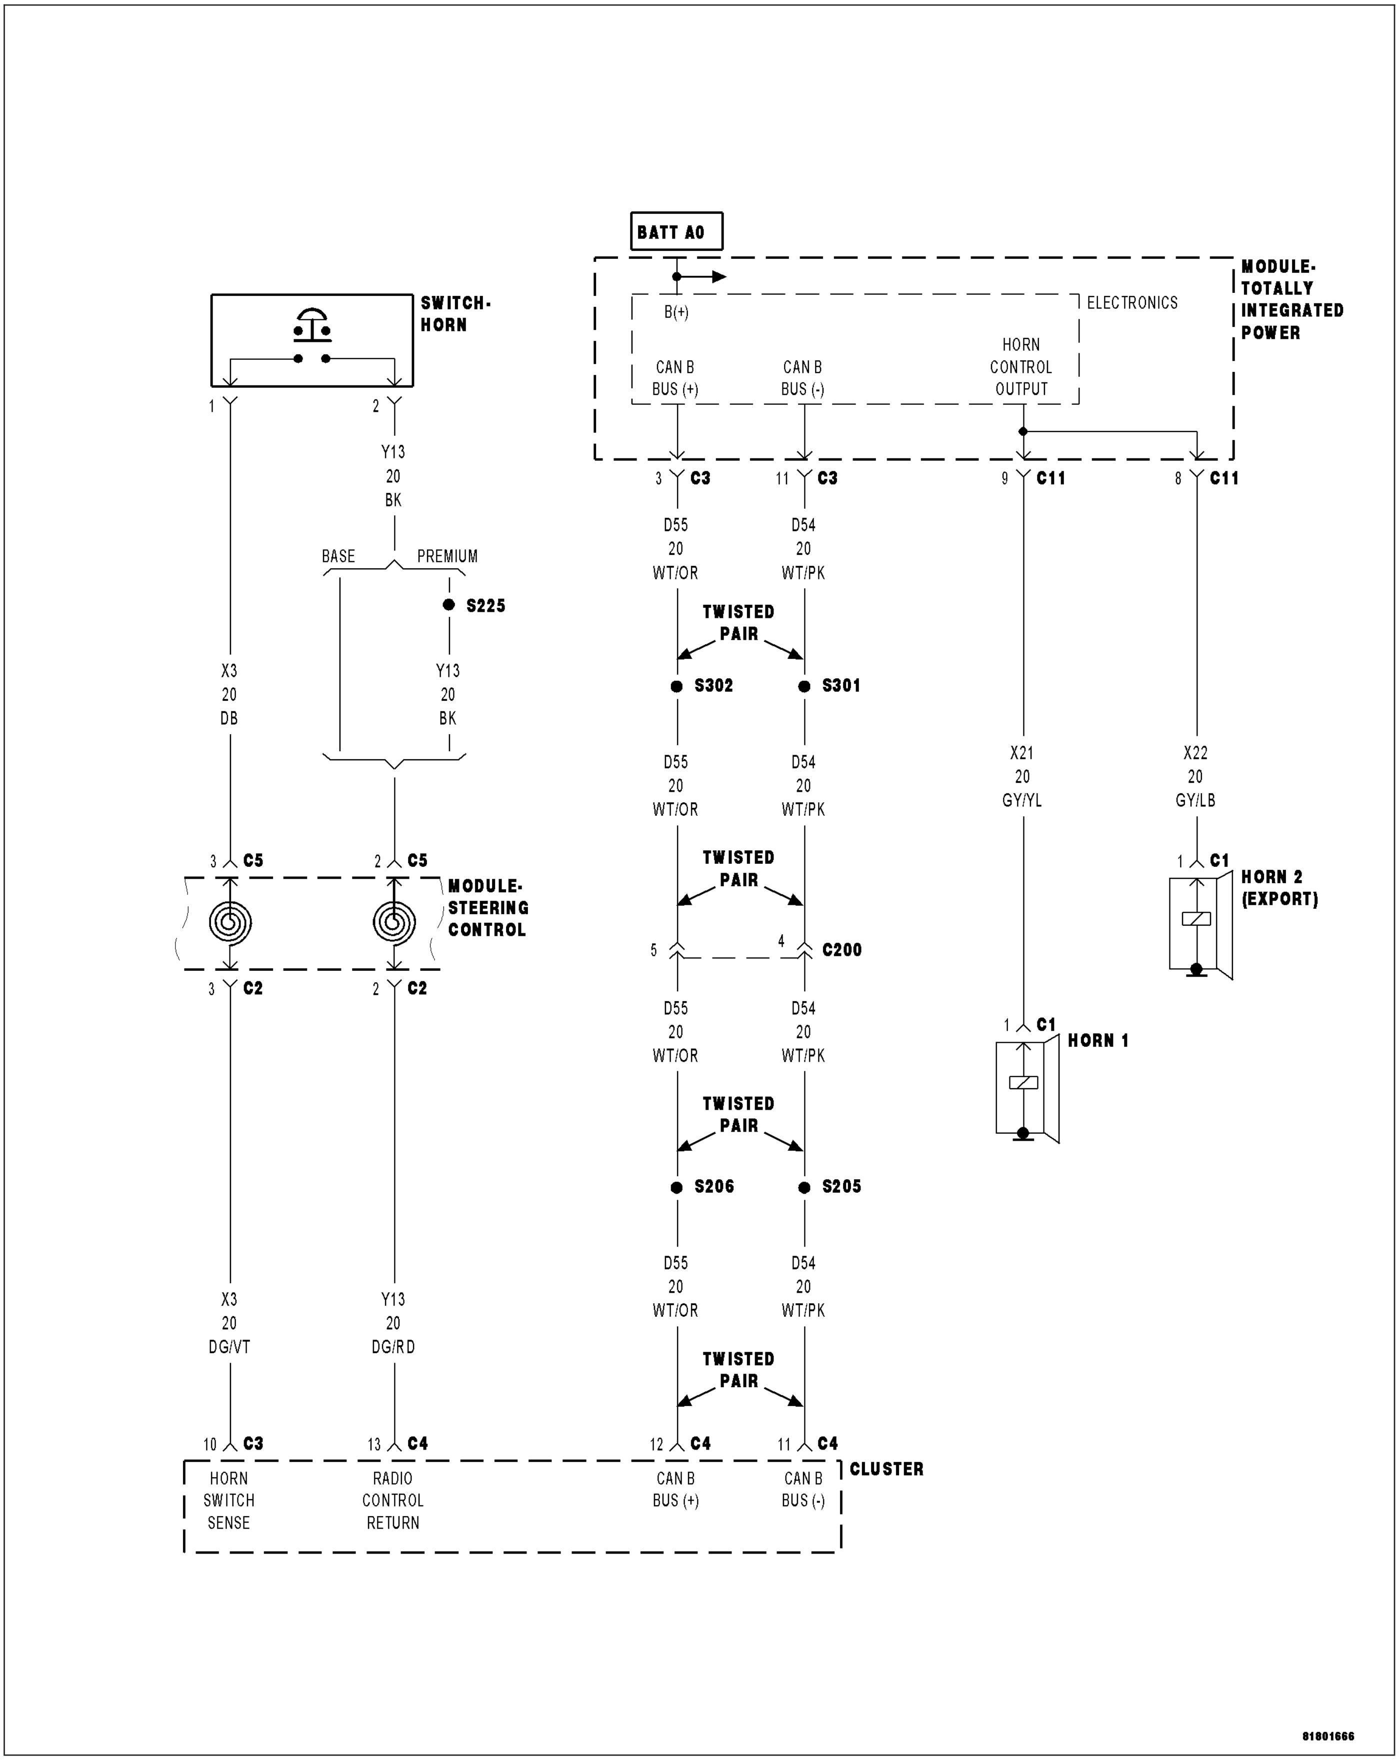
6. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?



Yes >> Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module per Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2339 - HORN SWITCH STUCK – CCN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The Cluster senses that the Horn switch is in the Set position for greater than 50 seconds.

Possible Causes
HORN SWITCH
CLOCKSPRING
(X3) HORN SWITCH SENSE CIRCUIT SHORTED TO GROUND
CLUSTER

Diagnostic Test

1. VERIFY DTC B2339 – HORN SWITCH STUCK IS ACTIVE

With the scan tool, erase CCN DTCs.

Operate the Horn Switch several times.

Wait 1 minute.

With the scan tool, read CCN DTCs.

Does the scan tool display active DTC B2339 - HORN SWITCH STUCK?

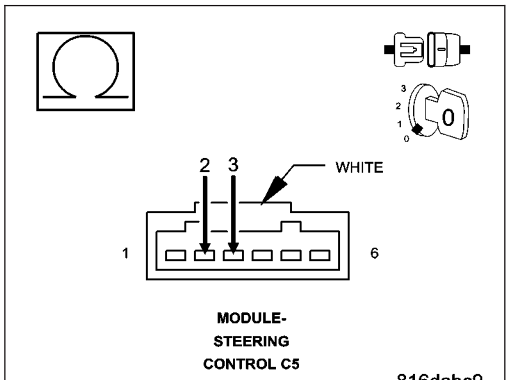
Yes >> Go To 2

No >> Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. HORN SWITCH

WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding.



WARNING: Do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed, and could results in serious or fatal injury.

Remove the Driver Airbag in accordance with the Service information.

Disconnect the Steering Control Module C5 connector.

NOTE: Before proceeding, thoroughly inspect the wiring harness and connectors between the Horn Switch for a short to ground or to any other circuit.

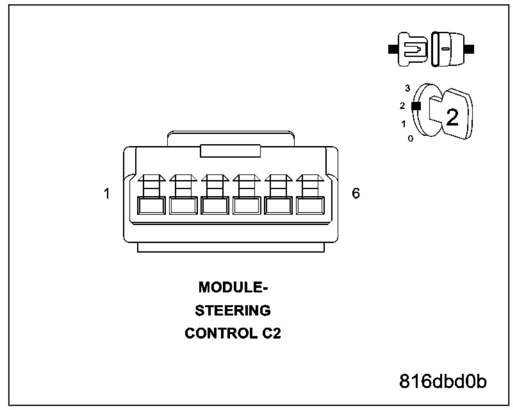
Measure the resistance between the (X3) Horn Switch Sense circuit at the C5 connector to the Radio Control Return.

816dabc9

Is the resistance below 5.0 ohms?

Yes >> Replace the Horn Switch in accordance with the Service Information.

No >> Go to 3



3. CLOCKSPRING

Disconnect the Steering Control Module C2 connector.

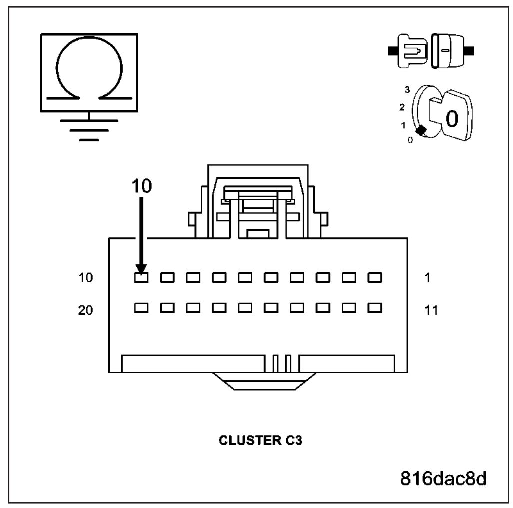
With the scan tool, erase CCN DTCs.

Wait 1 minute.

With the scan tool, read CCN DTCs.

Does the scan tool display active DTC B2339 - HORN SWITCH STUCK?

Yes >> Go To 4



No >> Replace the Steering Control Module in accordance with the Service Information.

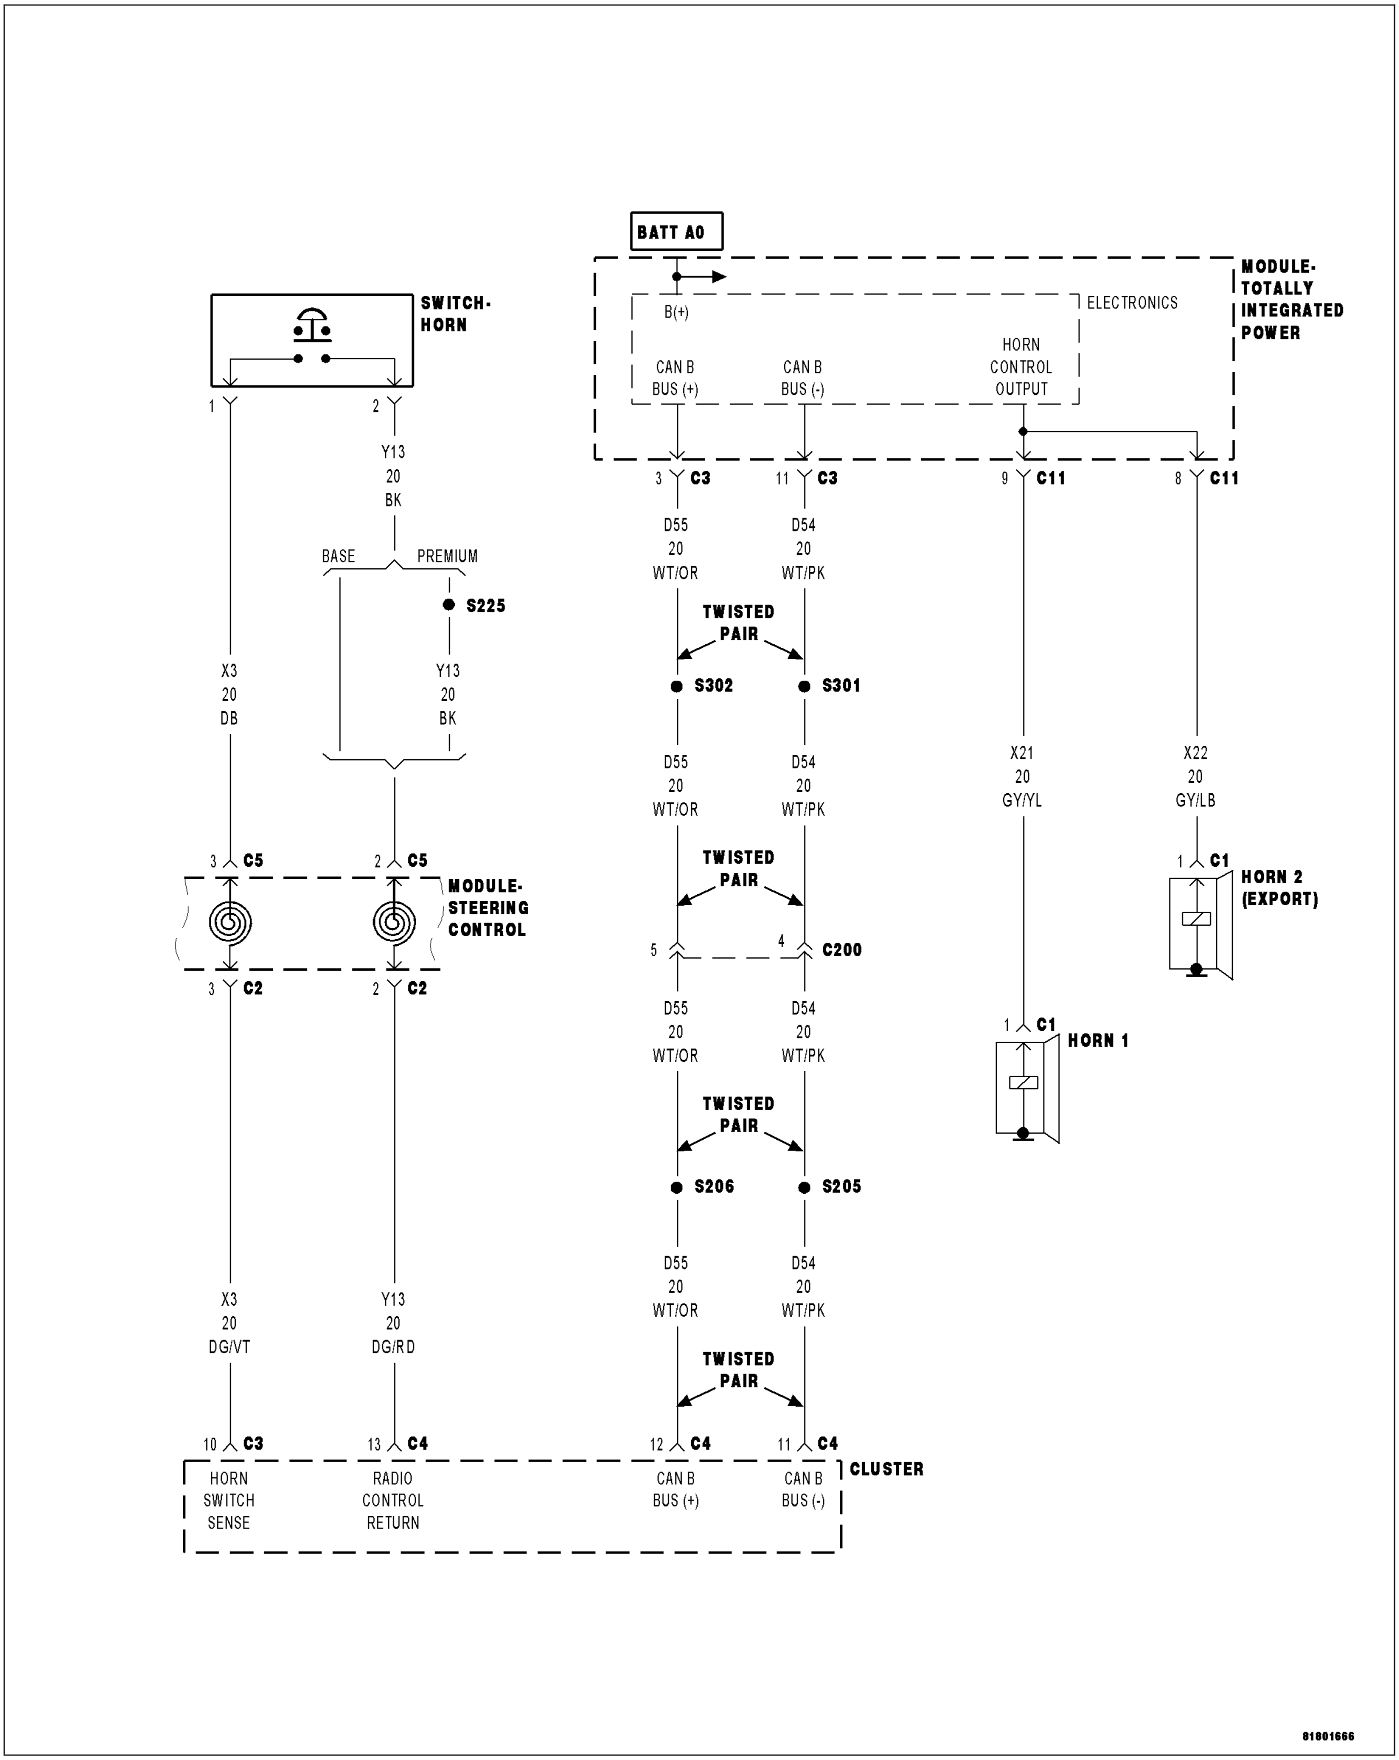
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (X3) HORN SWITCH SIGNAL CIRCUIT SHORT TO GROUND

Disconnect the Cluster C3 connector.

Measure the resistance between ground and the (X3) Horn Switch circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (X3) Horn Switch circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2371–HORN CONTROL CIRCUIT OVERCURRENT (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  An overcurrent condition in the (X21)/(X22) Horn Control Output circuit.

Possible Causes
TERMINAL DAMAGE OR CORROSION
(X21) HORN CONTROL OUTPUT CIRCUIT HIGH RESISTANCE
(X22) HORN CONTROL OUTPUT CIRCUIT HIGH RESISTANCE (EXPORT)
HORN CASE GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC B2371 HORN CONTROL CIRCUIT OVERCURRENT

Turn the ignition on.

With the scan tool, record and erase DTC's.

Operate the Horn Switch several times.

With the scan tool, read DTC's.

Does the scan tool display active DTC B2371-HORN CONTROL CIRCUIT OVERCURRENT?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. VISUAL AND PHYSICAL CONNECTOR AND TERMINAL INSPECTION

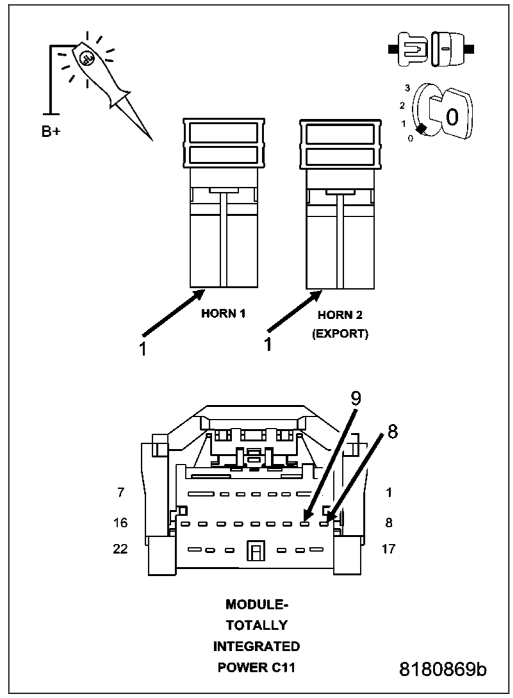
Turn the ignition off.

Inspect the following connector terminal condition. Check for signs of corrosion build up or damage that would compromise the terminal to controller pin connector.

NOTE: Make sure that all in-line connectors are inspected for corrosion and/or damage.

Disconnect the Horn connectors.

Disconnect the C11 TIPM harness connector.



Visually inspect the wiring harness. Look for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

Yes >> Repair or replace as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 3

3. (X21)/(X22) HORN CONTROL OUTPUT CIRCUIT HIGH RESISTANCE

With a jumper wire, connect one end to the (X21) Horn Control Output circuit at the Horn connector and the other to a clean chassis ground.

Using a 12-volt test light to battery voltage, probe the (X21) Control Output circuit in the C11 TIPM harness connector.

NOTE: Cavity 8 at the C11 TIPM harness connector is for export vehicles only.

NOTE: If this is an export vehicle, follow the previous steps for the (X22) Horn Control Circuit also.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the excessive resistance in the Horn Control Output circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

4. CHECKING HORN OPERATION

Turn the ignition off.

Disconnect the horn(s) connector(s) if not disconnected.

Momentarily jumper 12-volts to the horn(s).

Did the horn(s) operate properly?

Yes >> Go To 6

No >> Go To 5

5. CASE GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check for a good case ground at the horn(s) case.

Does the test light illuminate brightly?

Yes >> Replace the Horn(s) as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the open or excessive resistance at the horn(s) case ground.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes >> Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module per Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

HORN SYSTEM - SERVICE INFORMATION

TABLE OF CONTENTS

HORN SYSTEM - SERVICE INFORMATION

DESCRIPTION

A single note (domestic) or dual note (export) electric horn system is installed on this vehicle.

The horn system features electromagnetic horn(s). The horn system includes the following major components:

- **Horn** - The horn(s) are located on the left and right side frame rail.
- **Horn Relay** - The horn relay is located in the Junction Block (JB).
- **Horn Switch** - The horn switch is located under the driver airbag.

OPERATION

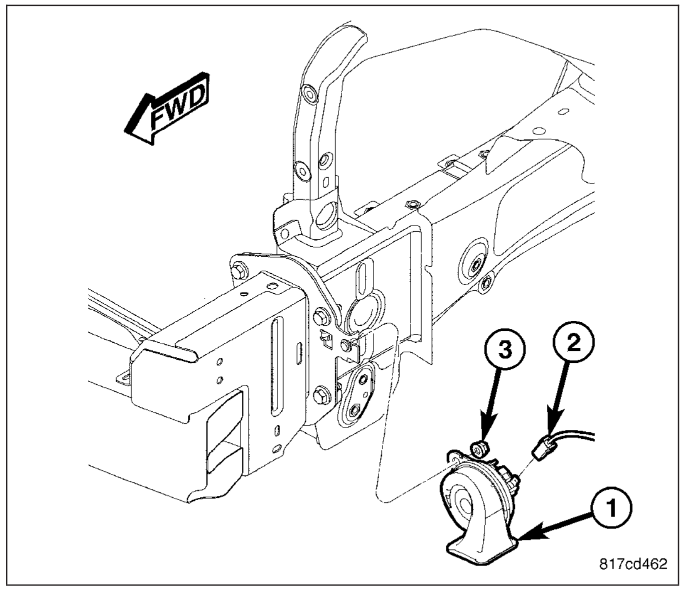
The horn system operates on battery current received through a fuse in the Totally Integrated Power Module (TIPM). The horn system circuit is designed so that the system will remain operational, regardless of the ignition switch position.

DIAGNOSIS AND TESTING - HORN SYSTEM

HORN SYSTEM TEST TABLE

CONDITION	POSSIBLE CAUSE	CORRECTION
HORN SOUNDS CONTINUOUSLY. NOTE: IMMEDIATELY UNPLUG HORN AND RELAY IN THE JUNCTION BLOCK	1. INOPERATIVE HORN RELAY.	1. REPLACE RELAY, IF INOPERATIVE
	2. HORN CONTROL CIRCUIT TO RELAY SHORTED TO GROUND.	2. CHECK TERMINAL 65 IN TIPM FOR CONTINUITY TO GROUND INDICATES: A. WIRING HARNESS SHORTED TO GROUND. B. FIND THE SHORT AND REPAIR AS NECESSARY.
	4. PINCHED HORN SWITCH WIRE UNDER DRIVER AIRBAG MODULE.	4. REPLACE DRIVER AIRBAG.
	5. INOPERATIVE HORN SWITCH	5. REPLACE DRIVER AIRBAG.
HORN SOUNDS INTERMITTENTLY AS THE STEERING WHEEL IS TURNED.	1. HORN RELAY CONTROL CIRCUIT X3 IS SHORTED TO GROUND INSIDE STEERING WHEEL.	1. REMOVE DRIVER AIRBAG AND CHECK FOR RUBBING OR LOOSE WIRE/CONNECTOR, REPAIR AS NECESSARY.
	2. PINCHED HORN SWITCH WIRE UNDER DRIVER AIRBAG.	2. REPLACE DRIVER AIRBAG.
	3. INOPERATIVE HORN SWITCH.	3. REPLACE DRIVER AIRBAG.
HORN DOES NOT SOUND	1. CHECK FUSE 23 IN THE TIPM.	1. REPLACE FUSE IF INOPERATIVE.
	2. NO VOLTAGE AT HORN RELAY TERMINALS 62 & 66 AND FUSE IS OK.	2. NO VOLTAGE, REPAIR TIPM AS NECESSARY.
	3. OPEN CIRCUIT FROM TERMINAL 65 OF THE RELAY TO HORN SWITCH X3 CIRCUIT.	3. REPAIR CIRCUIT AS NECESSARY.

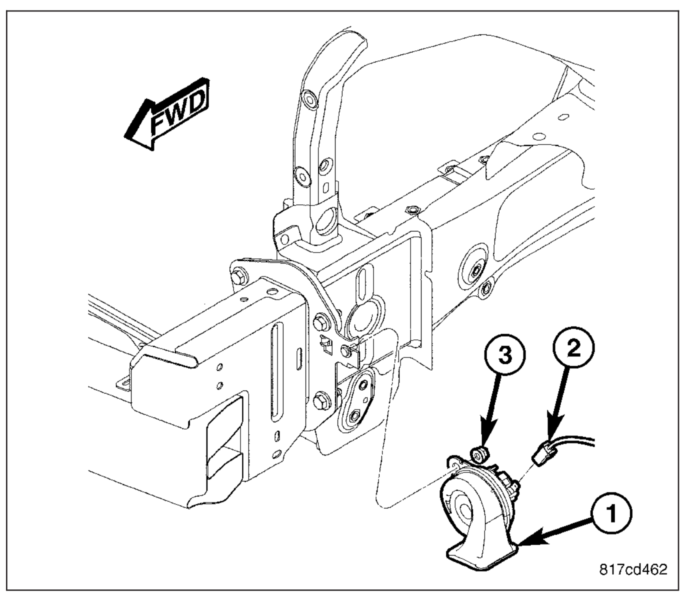
CONDITION	POSSIBLE CAUSE	CORRECTION
	4. INOPERATIVE OR DAMAGED HORN.	4. VOLTAGE AT HORN WHEN HORN SWITCH IS PRESSED, REPLACE HORN.
	5. INOPERATIVE HORN SWITCH	5. REPLACE DRIVER AIRBAG.
FUSE BLOWS WHEN HORN IS BLOWN	1. SHORT CIRCUIT IN HORN OR HORN WIRING	1. REMOVE HORN RELAY, CHECK FOR SHORTED HORN OR HORN WIRING. DISCONNECT HORN WIRE HARNESS TO ISOLATE SHORT AND REPAIR AS NECESSARY.
FUSE BLOWS WITHOUT BLOWING HORN NOTE: FOR WIRING REPAIRS REFER TO GROUP 8W, WIRE DIAGRAMS.	1. SHORT CIRCUIT	1. REMOVE RELAY, INSTALL NEW FUSE, IF FUSE DOES NOT BLOW REPLACE HORN RELAY. IF FUSE BLOWS WITH RELAY REMOVED, CHECK FOR SHORT TO GROUND WITH OHMMETER BETWEEN TERMINALS 62 & 66 AND THE FUSE TERMINAL. REPAIR AS NECESSARY.



HORN

DIAGNOSIS AND TESTING - HORN

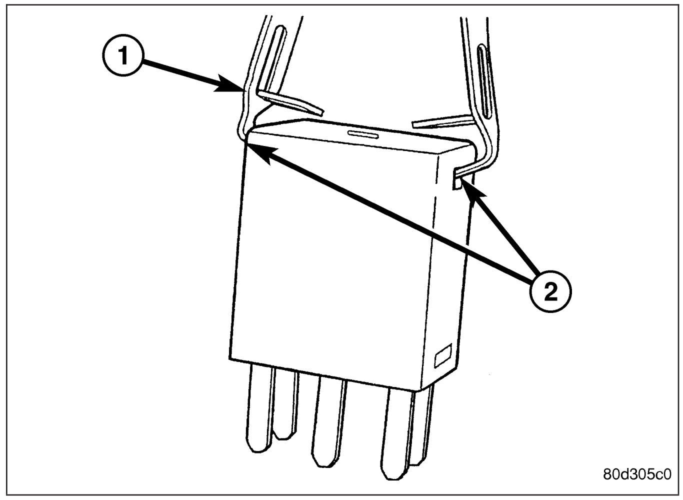
1. Disconnect wire connector at horn.
2. Using a voltmeter, connect one lead to ground terminal and the other lead to the positive wire terminal.
3. Depress the horn switch, battery voltage should be present.
4. If no voltage, (Refer to 8 - ELECTRICAL/HORN - DIAGNOSIS AND TESTING). If voltage is OK, go to Step 5.
5. Using ohmmeter, test ground wire for continuity to ground.
6. If no ground repair as necessary.
7. If wires test OK and horn does not sound, replace horn.



REMOVAL

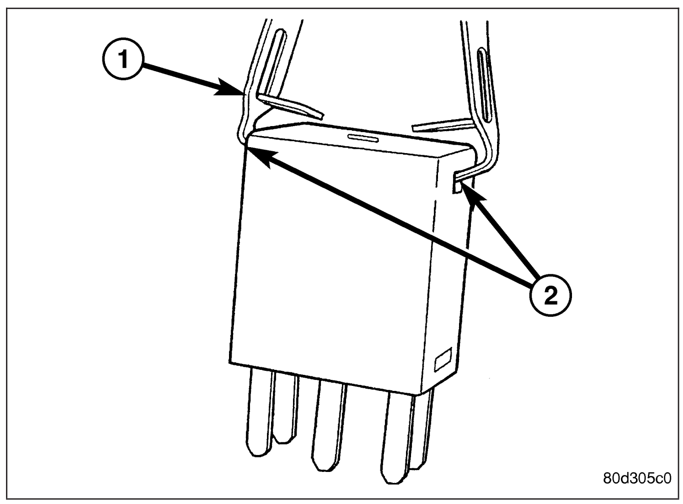
1. Disconnect and isolate the battery negative cable.
2. Remove the left or right front wheelhouse splash shield.
3. Disconnect the harness connector.
4. Remove the fastener securing the horn the vehicle.

INSTALLATION



1. Install the fastener securing the horn to the vehicle.
2. Connect the harness connector.
3. Install the left or right front wheelhouse splash shield.
4. Connect the battery negative cable.

HORN RELAY



REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove cover from Totally Integrated Power Module (TIPM).
3. Using special tool C-4817 (1), grip the relay (2) by the sides and pull upward with an even effort.

INSTALLATION

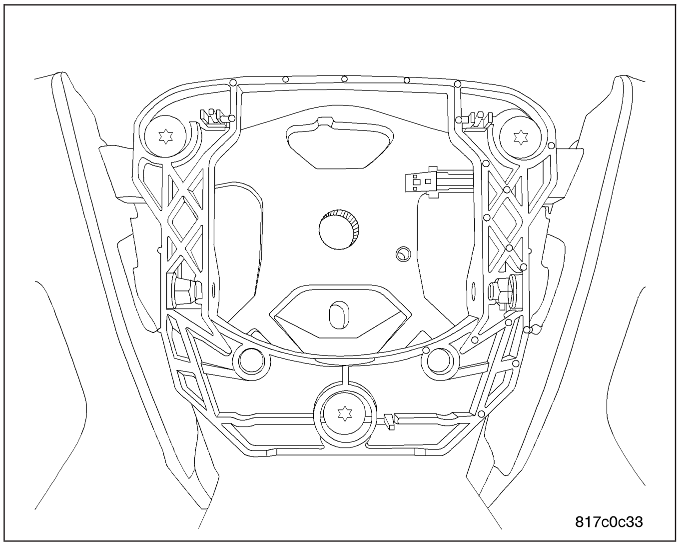
1. Align relay (2) with Totally Integrated Power Module (TIPM) and press into position.
2. Install cover to TIPM.
3. Connect battery negative cable.

HORN SWITCH

DESCRIPTION

WARNING:
On vehicles equipped with an airbag, refer to restraint systems for warnings and cautions before servicing the horn switch.

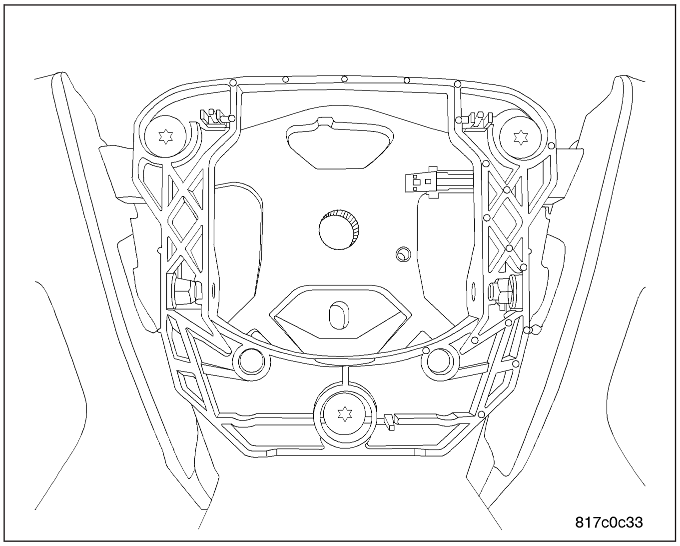
The horn switch is mounted inside the driver airbag. The horn switch has three contacts that are grounded when the driver airbag is depressed.



OPERATION

When the Driver Airbag Cover is pressed, the horn switch makes contact to ground. The ground signal is carried to the horn relay and the horn sounds. The horn switch grounds to the airbag housing.

REMOVAL



WARNING:
On vehicles equipped with an airbag, refer to restraint systems for warnings and cautions before servicing the horn switch.

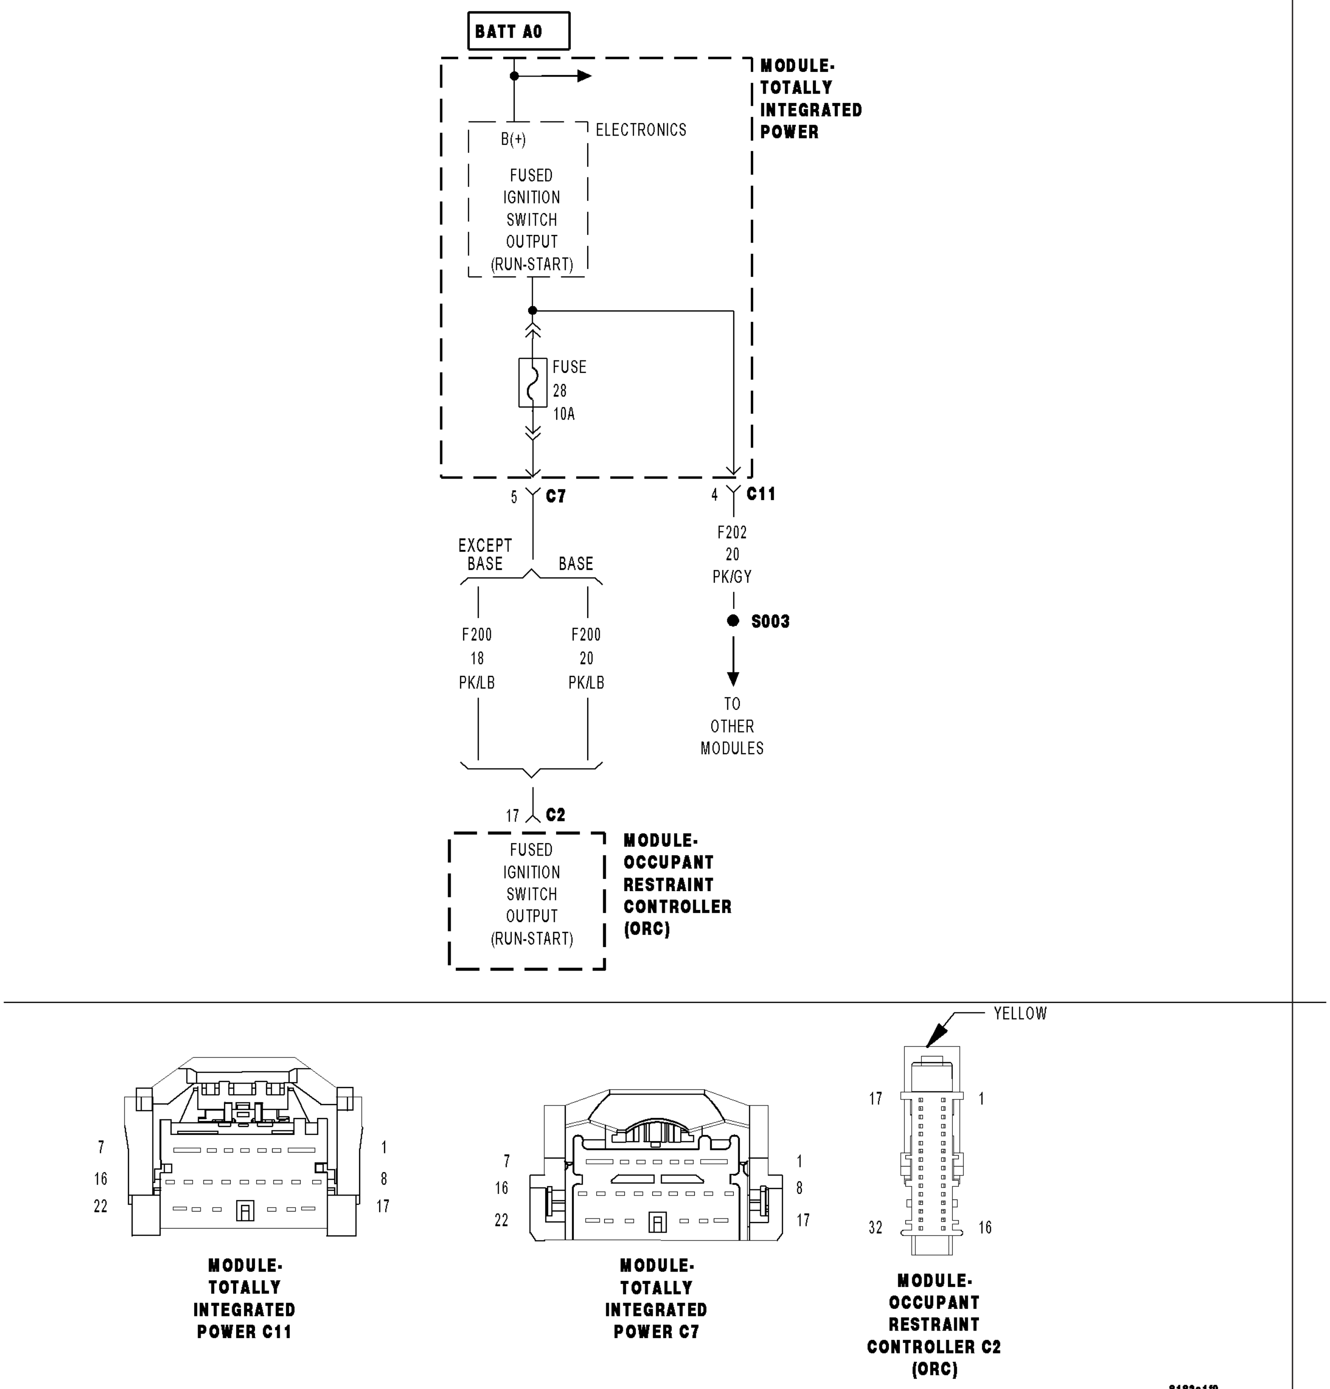
1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
3. Disconnect the connector from the clockspring.
4. Remove the three mounting fasteners.
5. Remove the horn switch.

INSTALLATION

1. Install the horn switch.
2. Install the three mounting fasteners.
3. Connect the electrical connector to the clockspring.
4. Install the driver airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION)
5. Connect the battery negative cable.

IGNITION CONTROL

TABLE OF CONTENTS



IGNITION SYSTEM - ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

IGNITION SYSTEM - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B2104-IGNITION RUN/START CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  (F200) Fused Ignition Switch Output (Run-Start) circuit low.

Possible Causes
(F200) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO GROUND
ORC INTERNAL SHORT
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.

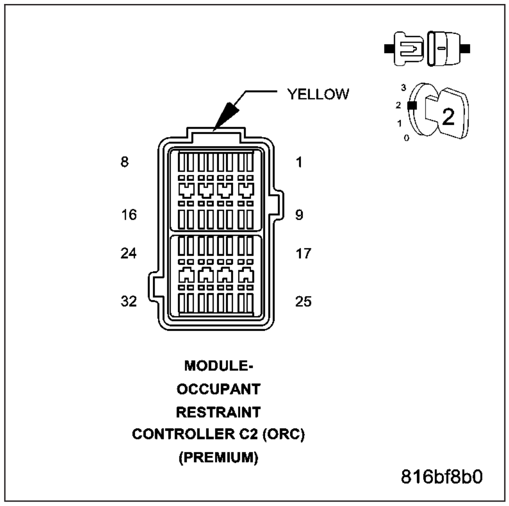
With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. ORC INTERNAL SHORT



WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC C2 harness connector.

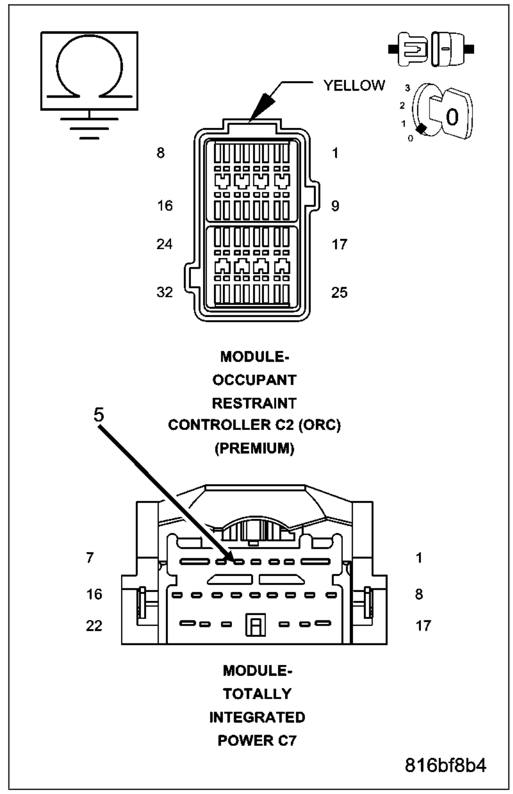
Turn the ignition on.

Reconnect the battery.

With the scan tool, read DTCs.

Does the scan tool display B2104-IGNITION RUN/START CONTROL CIRCUIT LOW?

Yes >> Go To 3



No >> Replace the ORC in accordance with the service information.
Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

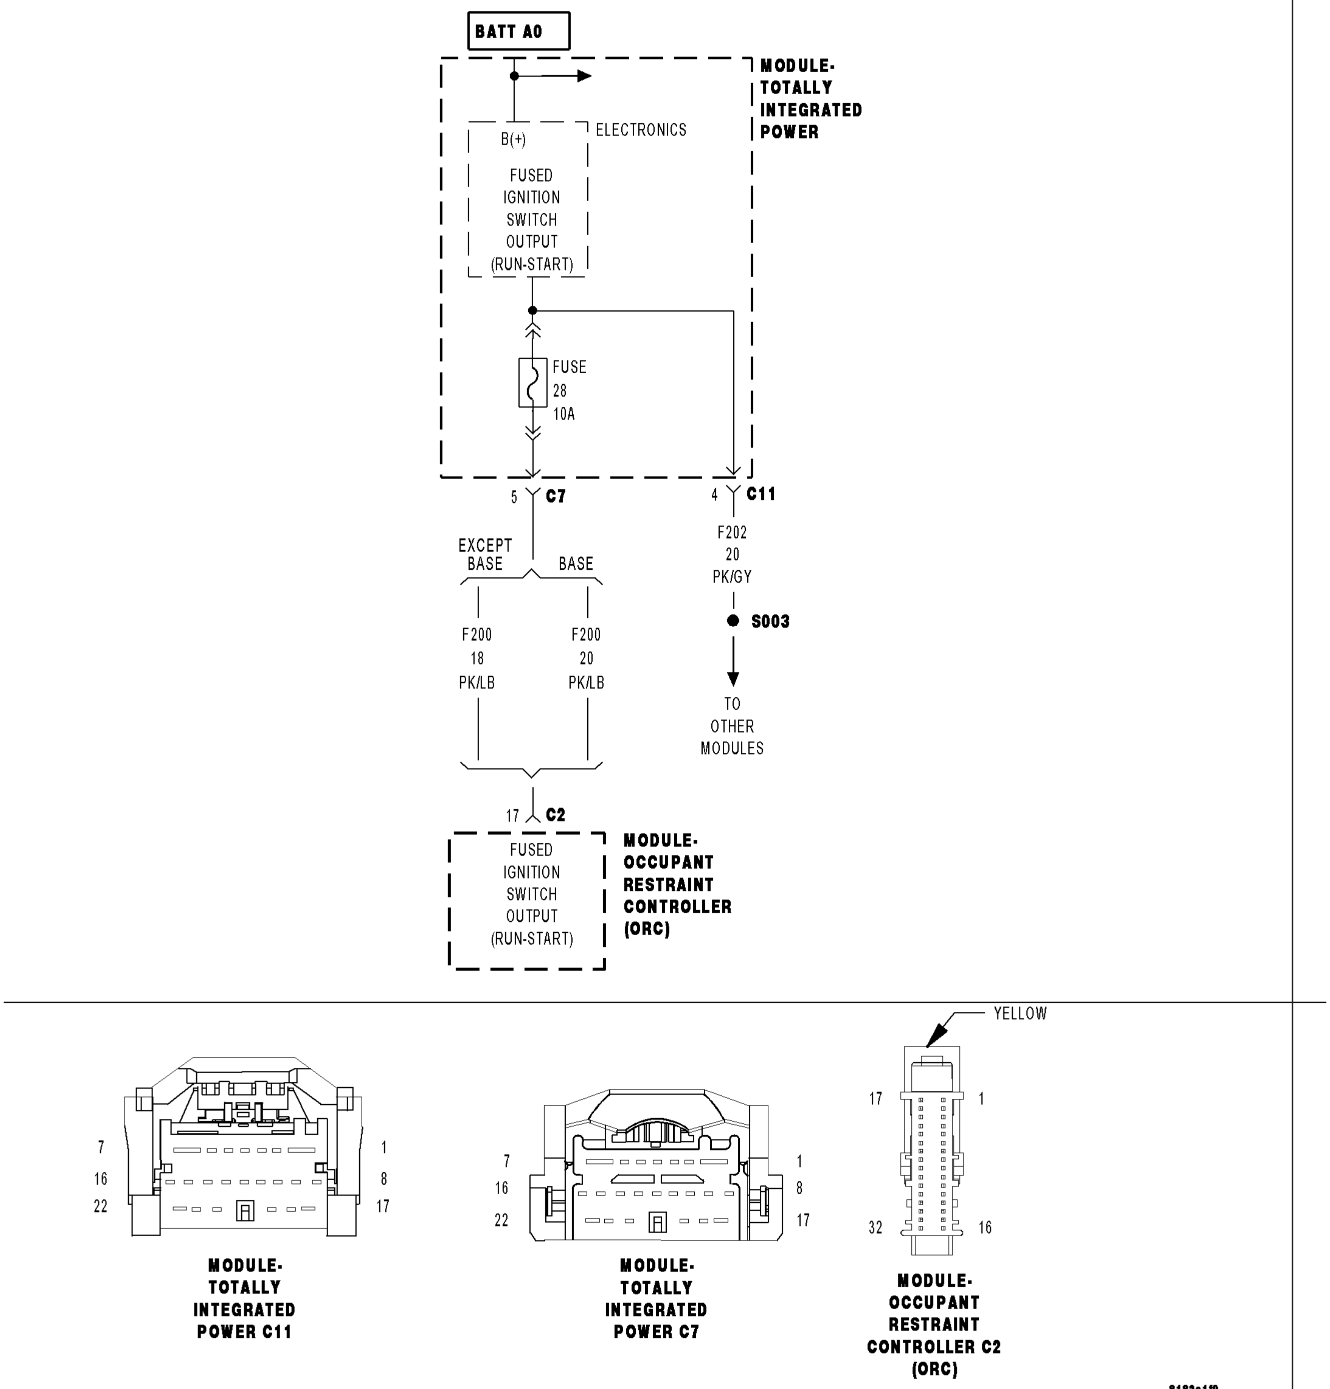
3. (F200) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Measure the resistance between ground and the (F200) Fused Ignition Switch Output (Run-Start) circuit.

Is the resistance below 10K ohms?



Yes >> Repair the (F200) Fused Ignition Switch Output (Run-Start) circuit for a short to ground.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2105-IGNITION RUN/START CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  (F200) Fused Ignition Switch Output (Run-Start) circuit high.

Possible Causes
(F200) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE
ORC
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

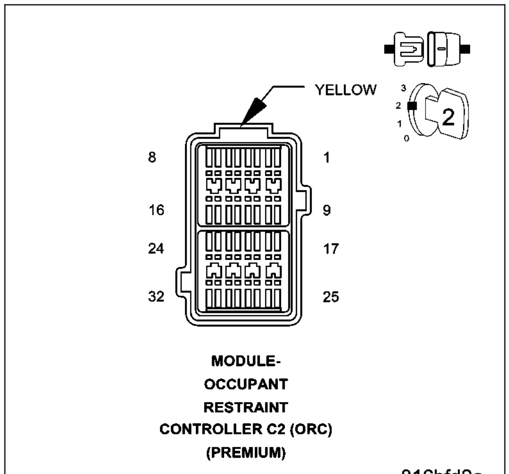
2. ORC INTERNAL SHORT TO VOLTAGE

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC C2 harness connector.

Turn the ignition on.

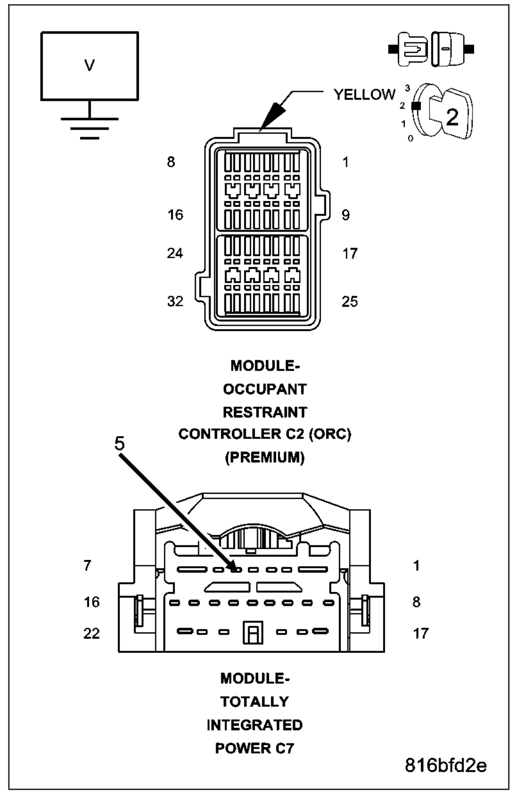
Reconnect the battery.



With the scan tool, read DTCs.

Does the scan tool display B2105-IGNITION RUN/START CONTROL CIRCUIT HIGH?

Yes >> Go To 3



No >> Replace the ORC in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

816bfd2a

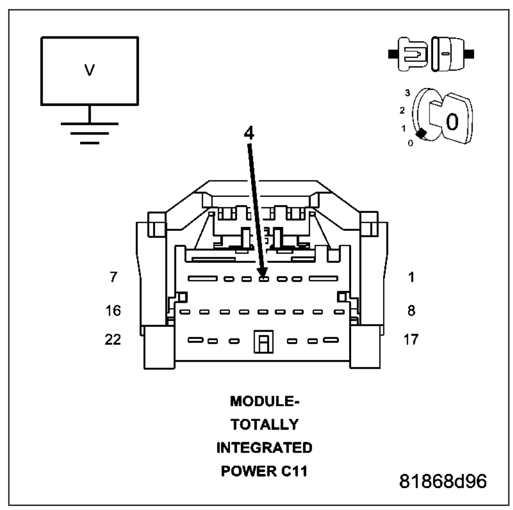
3. (F200) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Turn the ignition on.

Measure the voltage of the (F200) Fused Ignition Switch Output (Run-Start) circuit.



Is the voltage above 10 volts ?

Yes >> Repair the (F200) Fused Ignition Switch Output (Run-Start) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE

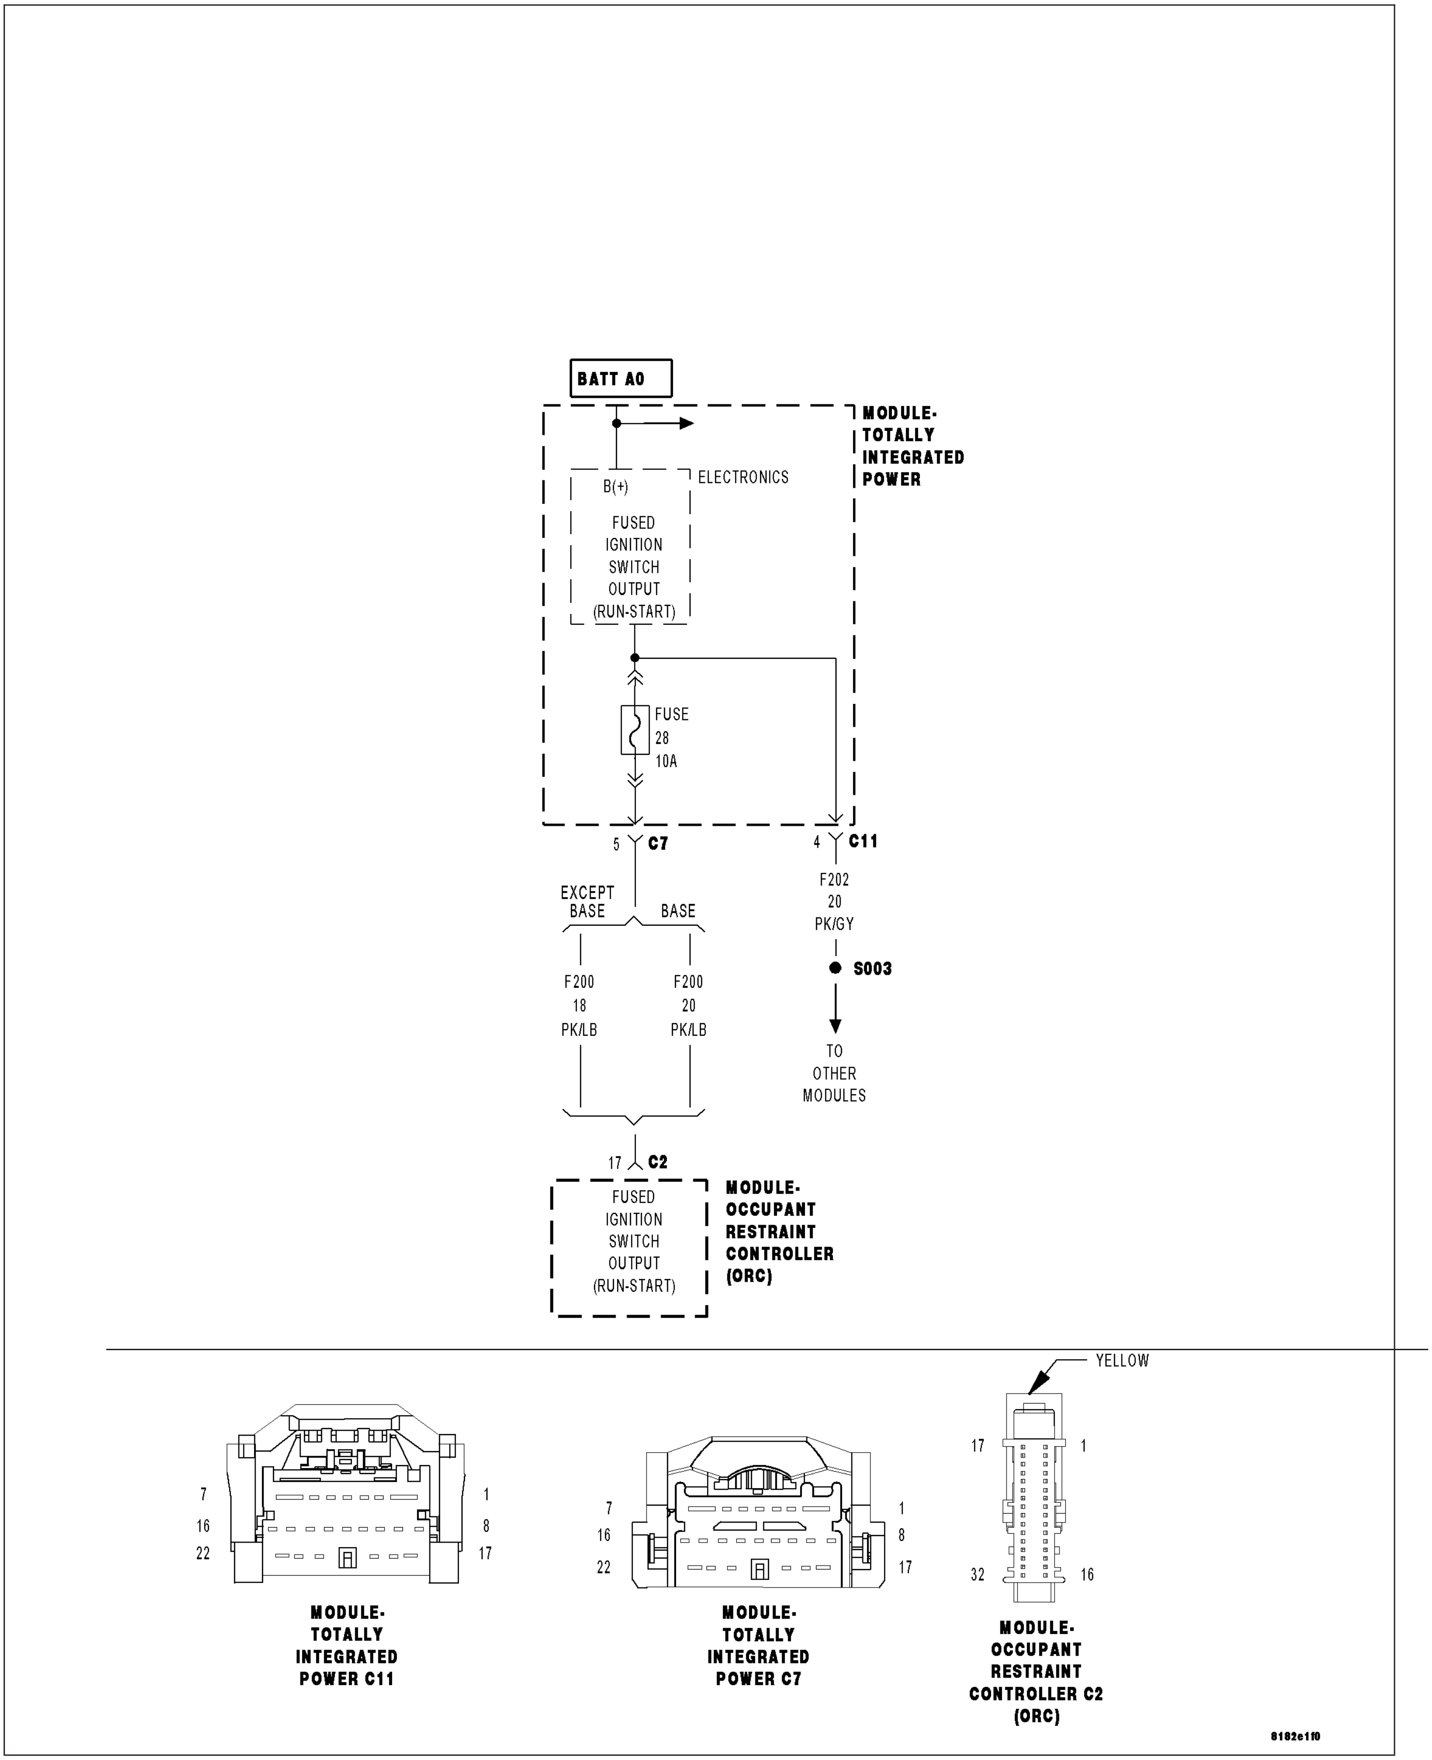
Turn the ignition off.

Disconnect the TIPM C11 harness connector.

Turn the ignition on.

Measure the voltage of the (F202) Fused Ignition Switch Output (Run-Start) circuit.

Is the voltage above 10 volts ?



Yes >> Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2106-IGNITION RUN/START CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  (F200) Fused Ignition Switch Output (Run-Start) circuit open.

Possible Causes
TIPM

Diagnostic Test

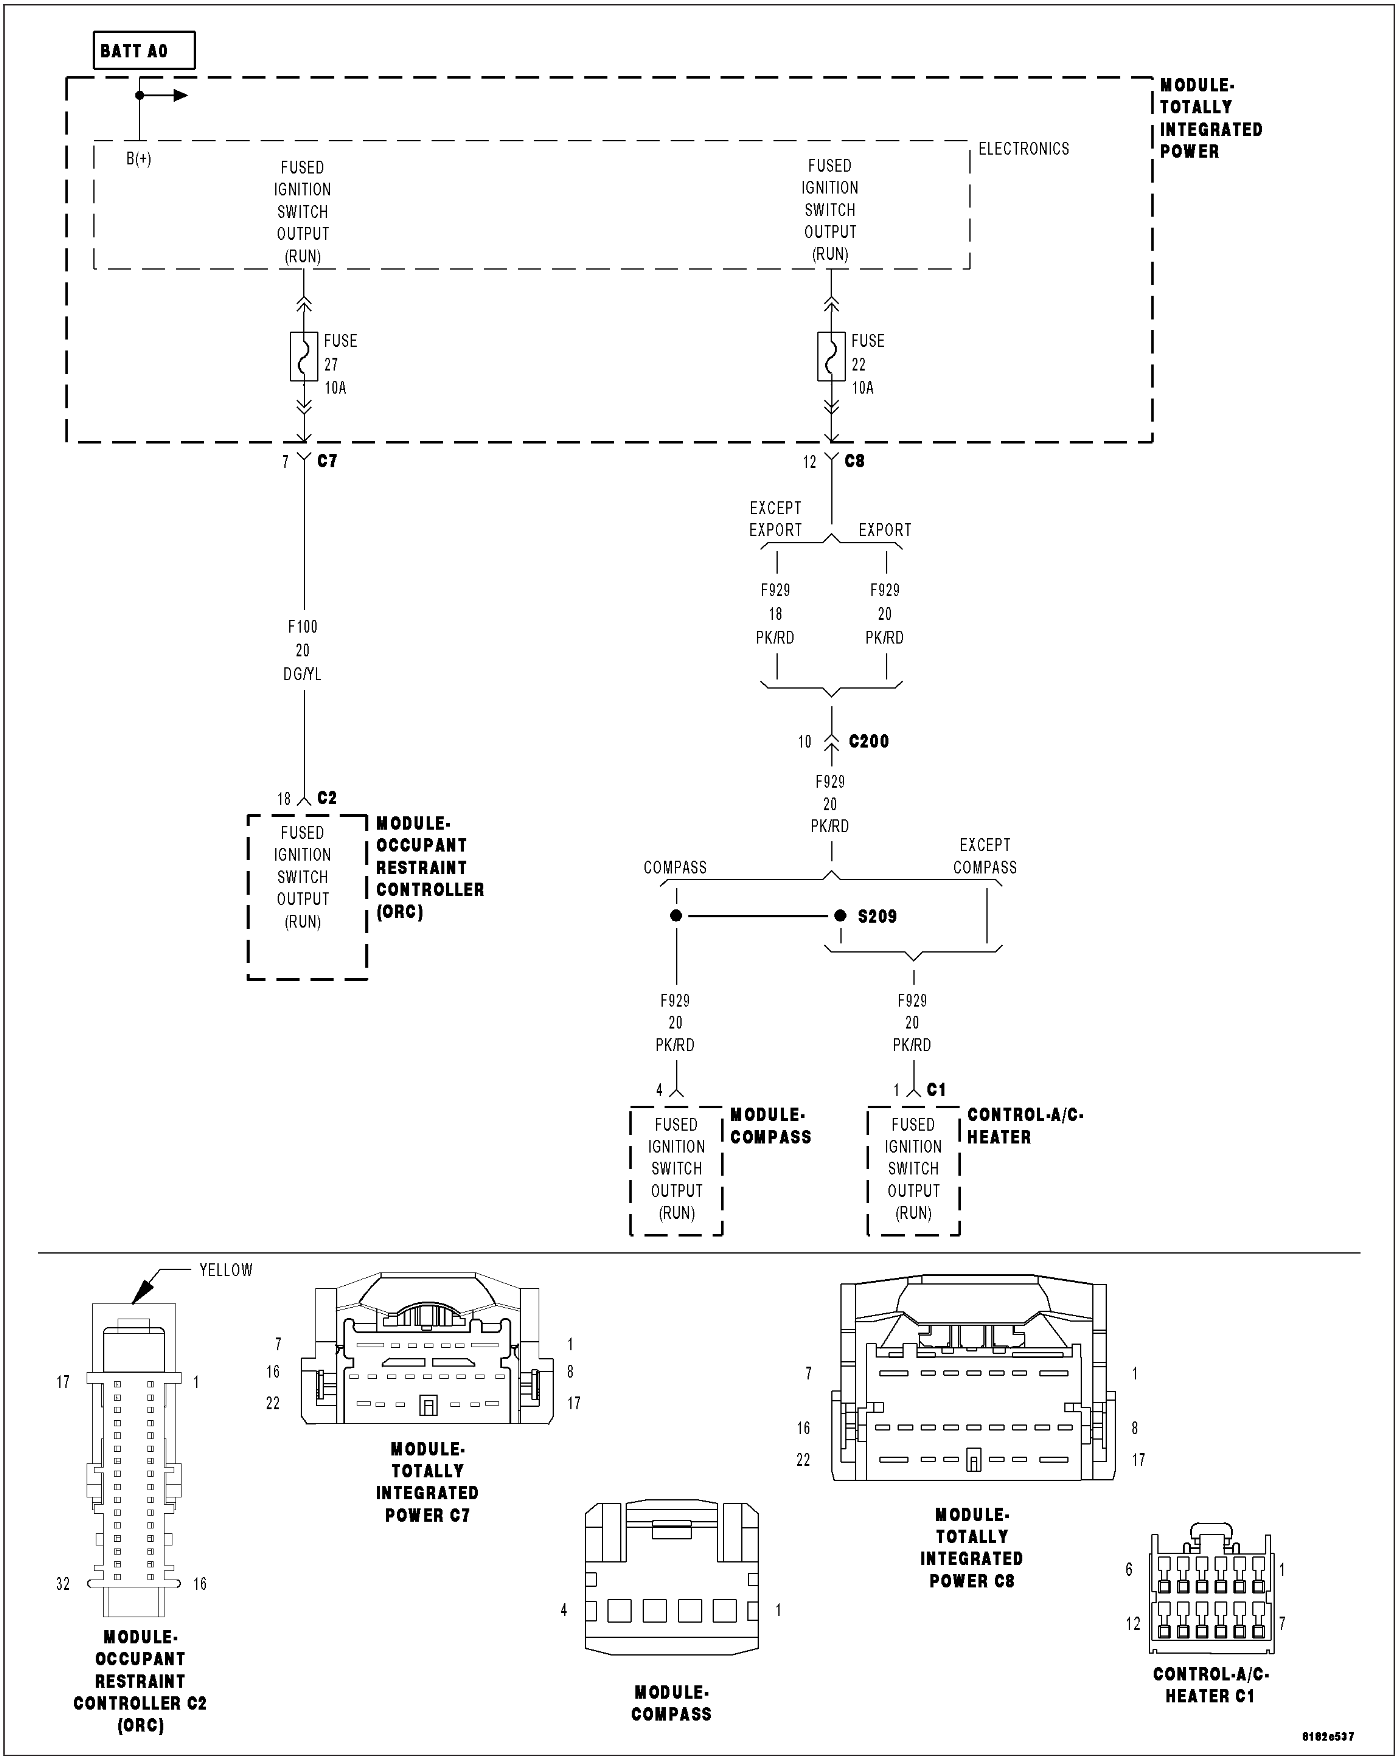
1. CHECK FOR ACTIVE DTC

Check all fuses.

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC's.



Does the scan tool display this DTC as active?

Yes >> This is an internal TIPM DTC. If this DTC is active, replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

B2122-IGNITION RUN CONTROL 1 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Low voltage on the Fused Ignition Switch Output (RUN).

Possible Causes
TIPM

Diagnostic Test

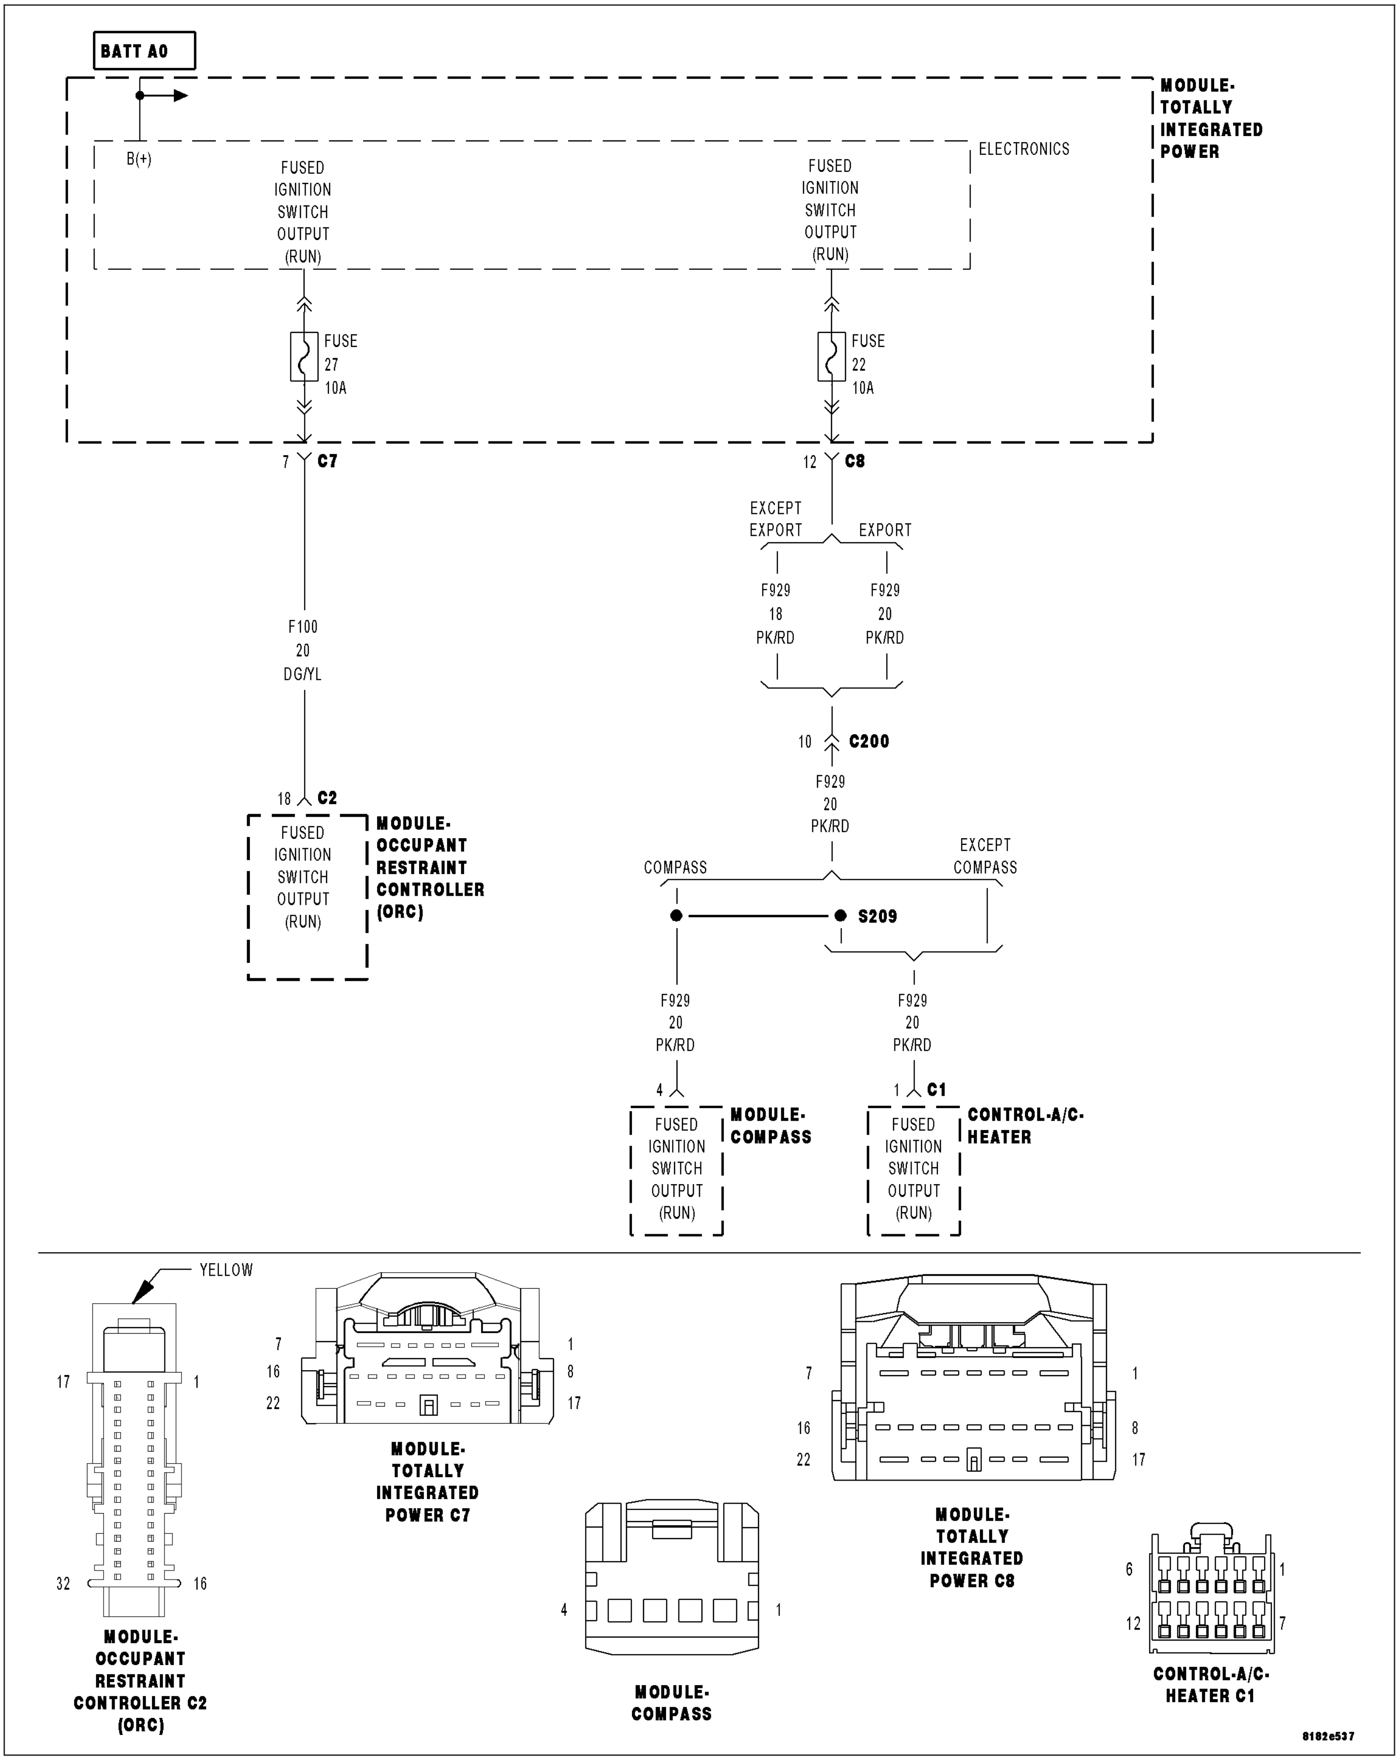
1. CHECK FOR ACTIVE DTC

Check all fuses. If any fuses are open, diagnose the appropriate circuit.

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC's.



Does the scan tool display this DTC as active?

Yes >> This is an internal TIPM DTC. If this DTC is active, replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

B2123-IGNITION RUN CONTROL 1 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  (F100), (F929) Fused Ignition Switch Output (Run) circuits High.

Possible Causes
CHECK THE (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FOR A SHORT TO VOLTAGE
CHECK THE (F929) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FOR A SHORT TO VOLTAGE
ORC
COMPASS MODULE
A/C HEATER CONTROL
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. CHECK FOR ACTIVE DTC B2123-IGNITION RUN CONTROL 1 CIRCUIT HIGH WITH THE OCCUPANT RESTRAINT CONTROLLER MODULE DISCONNECTED

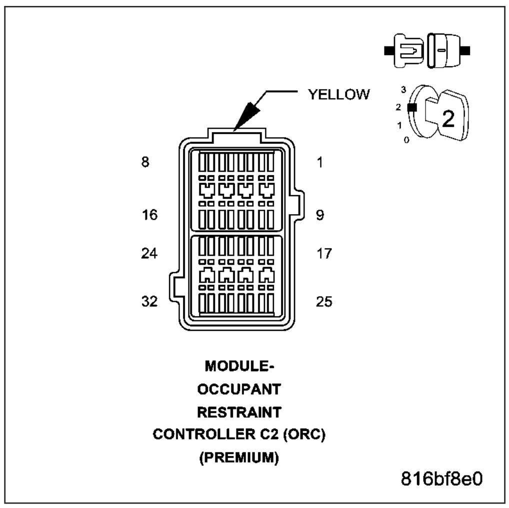
WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Turn the ignition off.

Disconnect the ORC C2 harness connector.

Turn the ignition on.

Reconnect the battery.



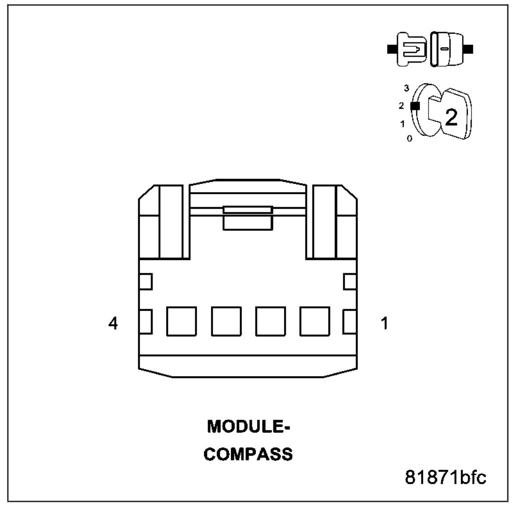
With the scan tool, read DTCs.

Does the scan tool display active: B2123-IGNITION RUN CONTROL 1 CIRCUIT HIGH?

Yes >> Go to 3

No >> Replace the Occupant Restraint Controller Module in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



3. CHECK FOR ACTIVE DTC B2123-IGNITION RUN CONTROL 1 CIRCUIT HIGH WITH THE COMPASS MODULE DISCONNECTED

Turn the ignition off.

Disconnect the Compass Module harness connector.

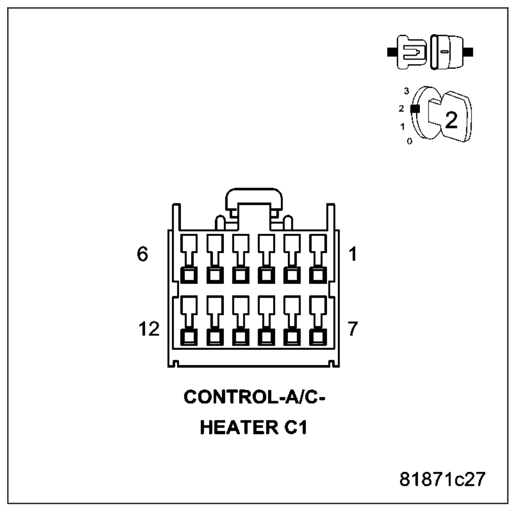
Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display active: B2123-IGNITION RUN CONTROL 1 CIRCUIT HIGH?

Yes >> Go to 4

No >> Replace the Compass Module in accordance with the service information.
Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



4. CHECK FOR ACTIVE DTC B2123-IGNITION RUN CONTROL 1 CIRCUIT HIGH WITH THE A/C HEATER CONTROL DISCONNECTED

Turn the ignition off.

Disconnect the A/C heater control harness connector.

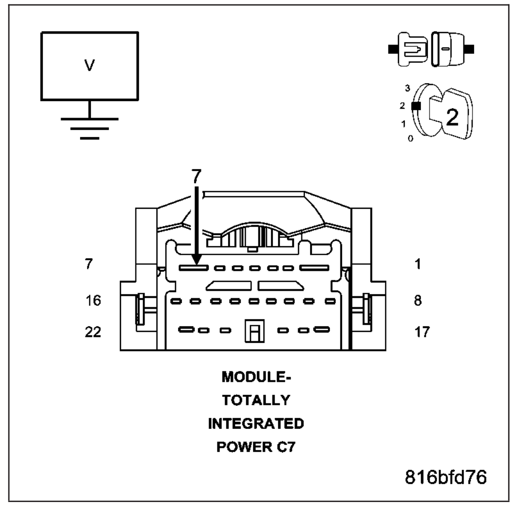
Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display active: B2123-IGNITION RUN CONTROL 1 CIRCUIT HIGH?

Yes >> Go to 5

No >> Replace the A/C Heater Control in accordance with the service information.
Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



5. CHECK THE (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Turn the ignition on.

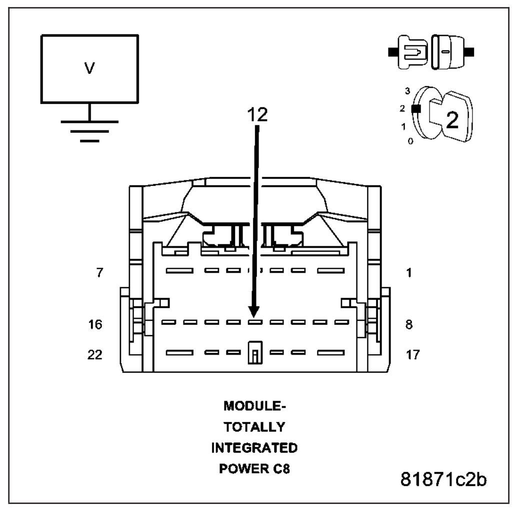
Measure the voltage of the (F100) Fused Ignition Switch Output (RUN) circuit.

Is the voltage above 10 volts?

Yes >> Repair the (F100) Fused Ignition Switch Output (RUN) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 6



6. CHECK THE (F929) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FOR A SHORT TO VOLTAGE

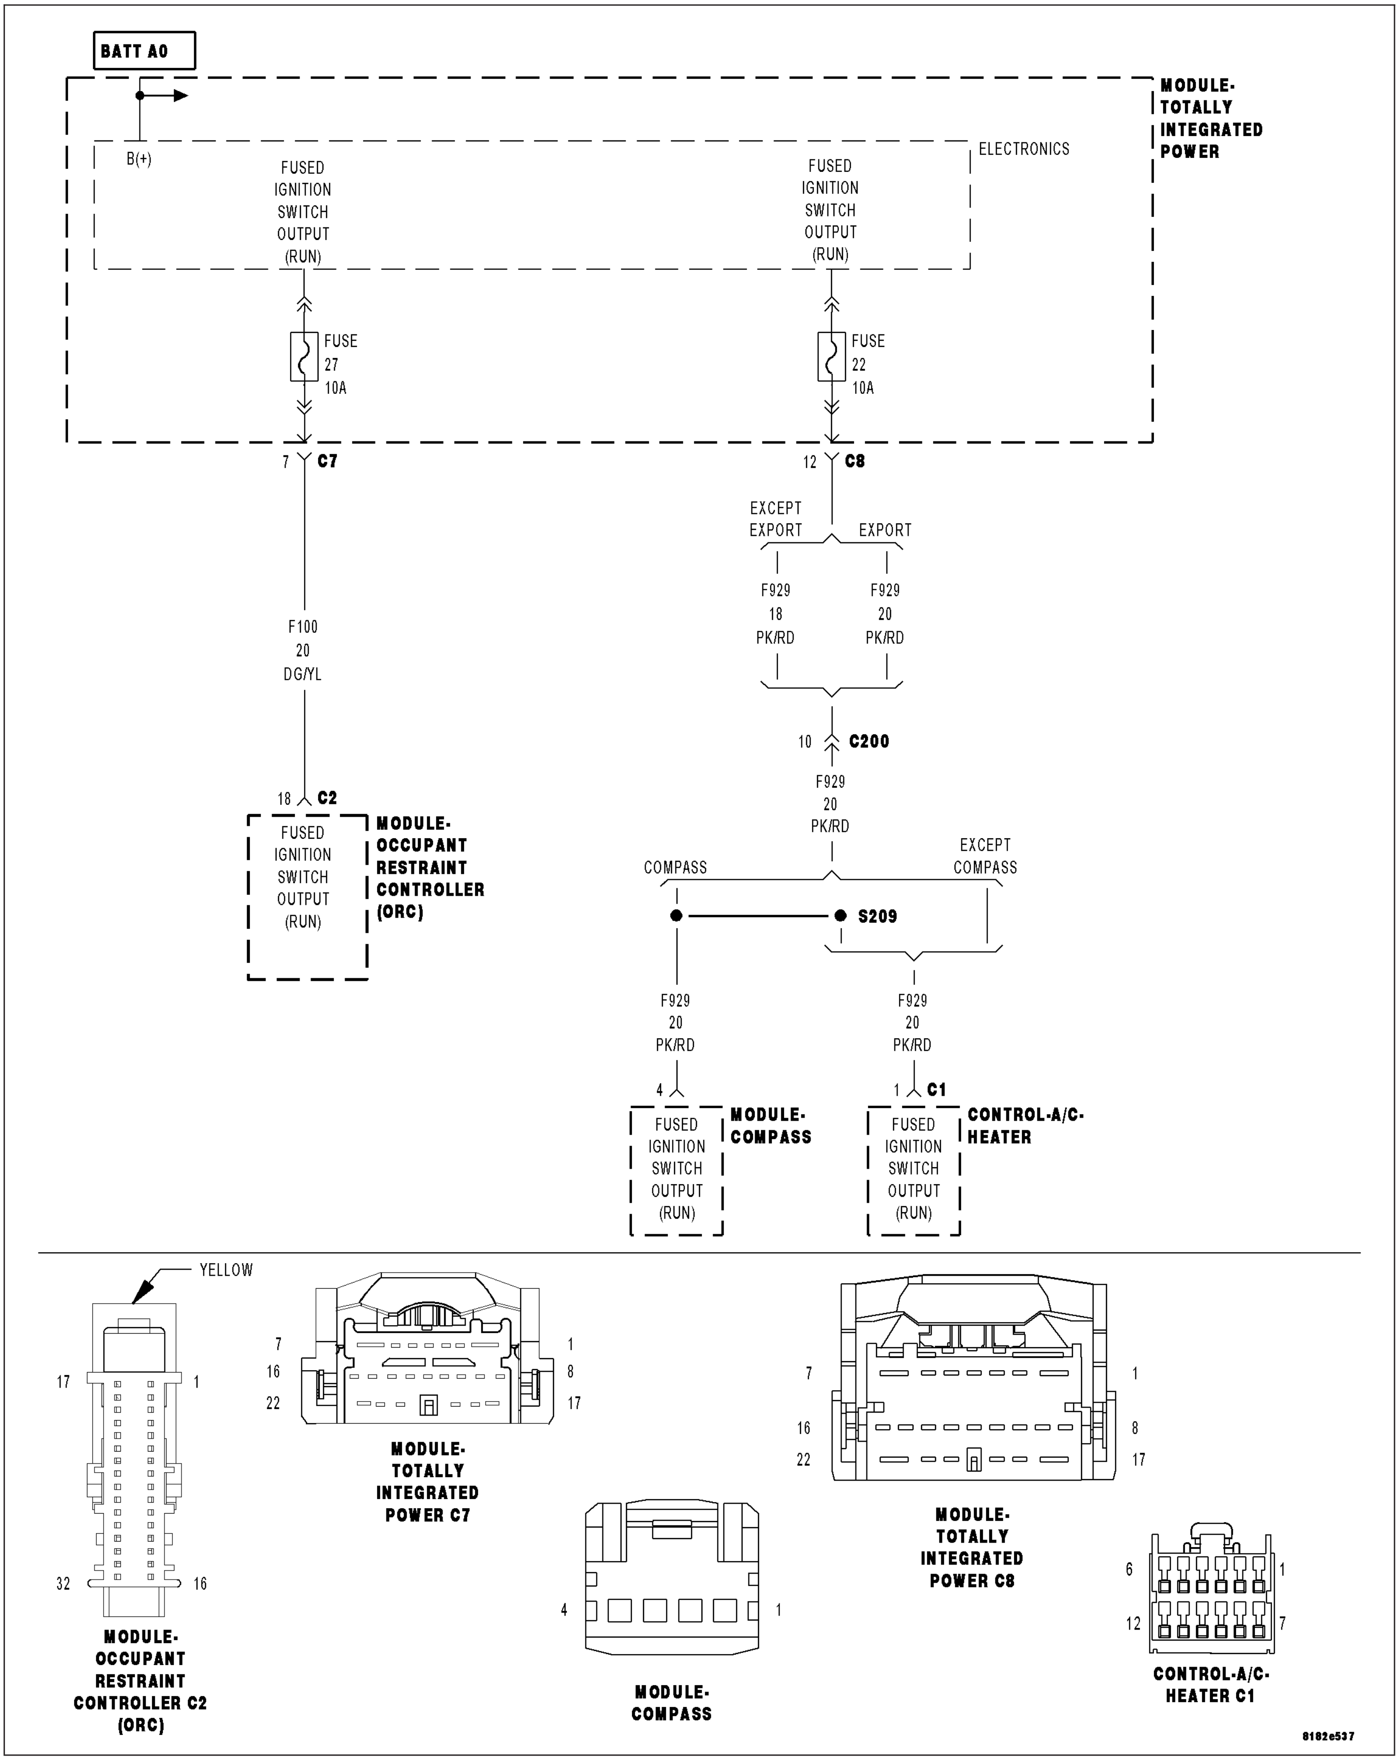
Turn the ignition off.

Disconnect the TIPM C8 harness connector.

Turn the ignition on.

Measure the voltage of the (F929) Fused Ignition Switch Output (RUN) circuit.

Is the voltage above 10 volts?



Yes >> Repair the (F929) Fused Ignition Switch Output (RUN) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2124-IGNITION RUN CONTROL 1 CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  (F100), (F929) Fused Ignition Switch Output (Run) circuits Open.

Possible Causes
TIPM

Diagnostic Test

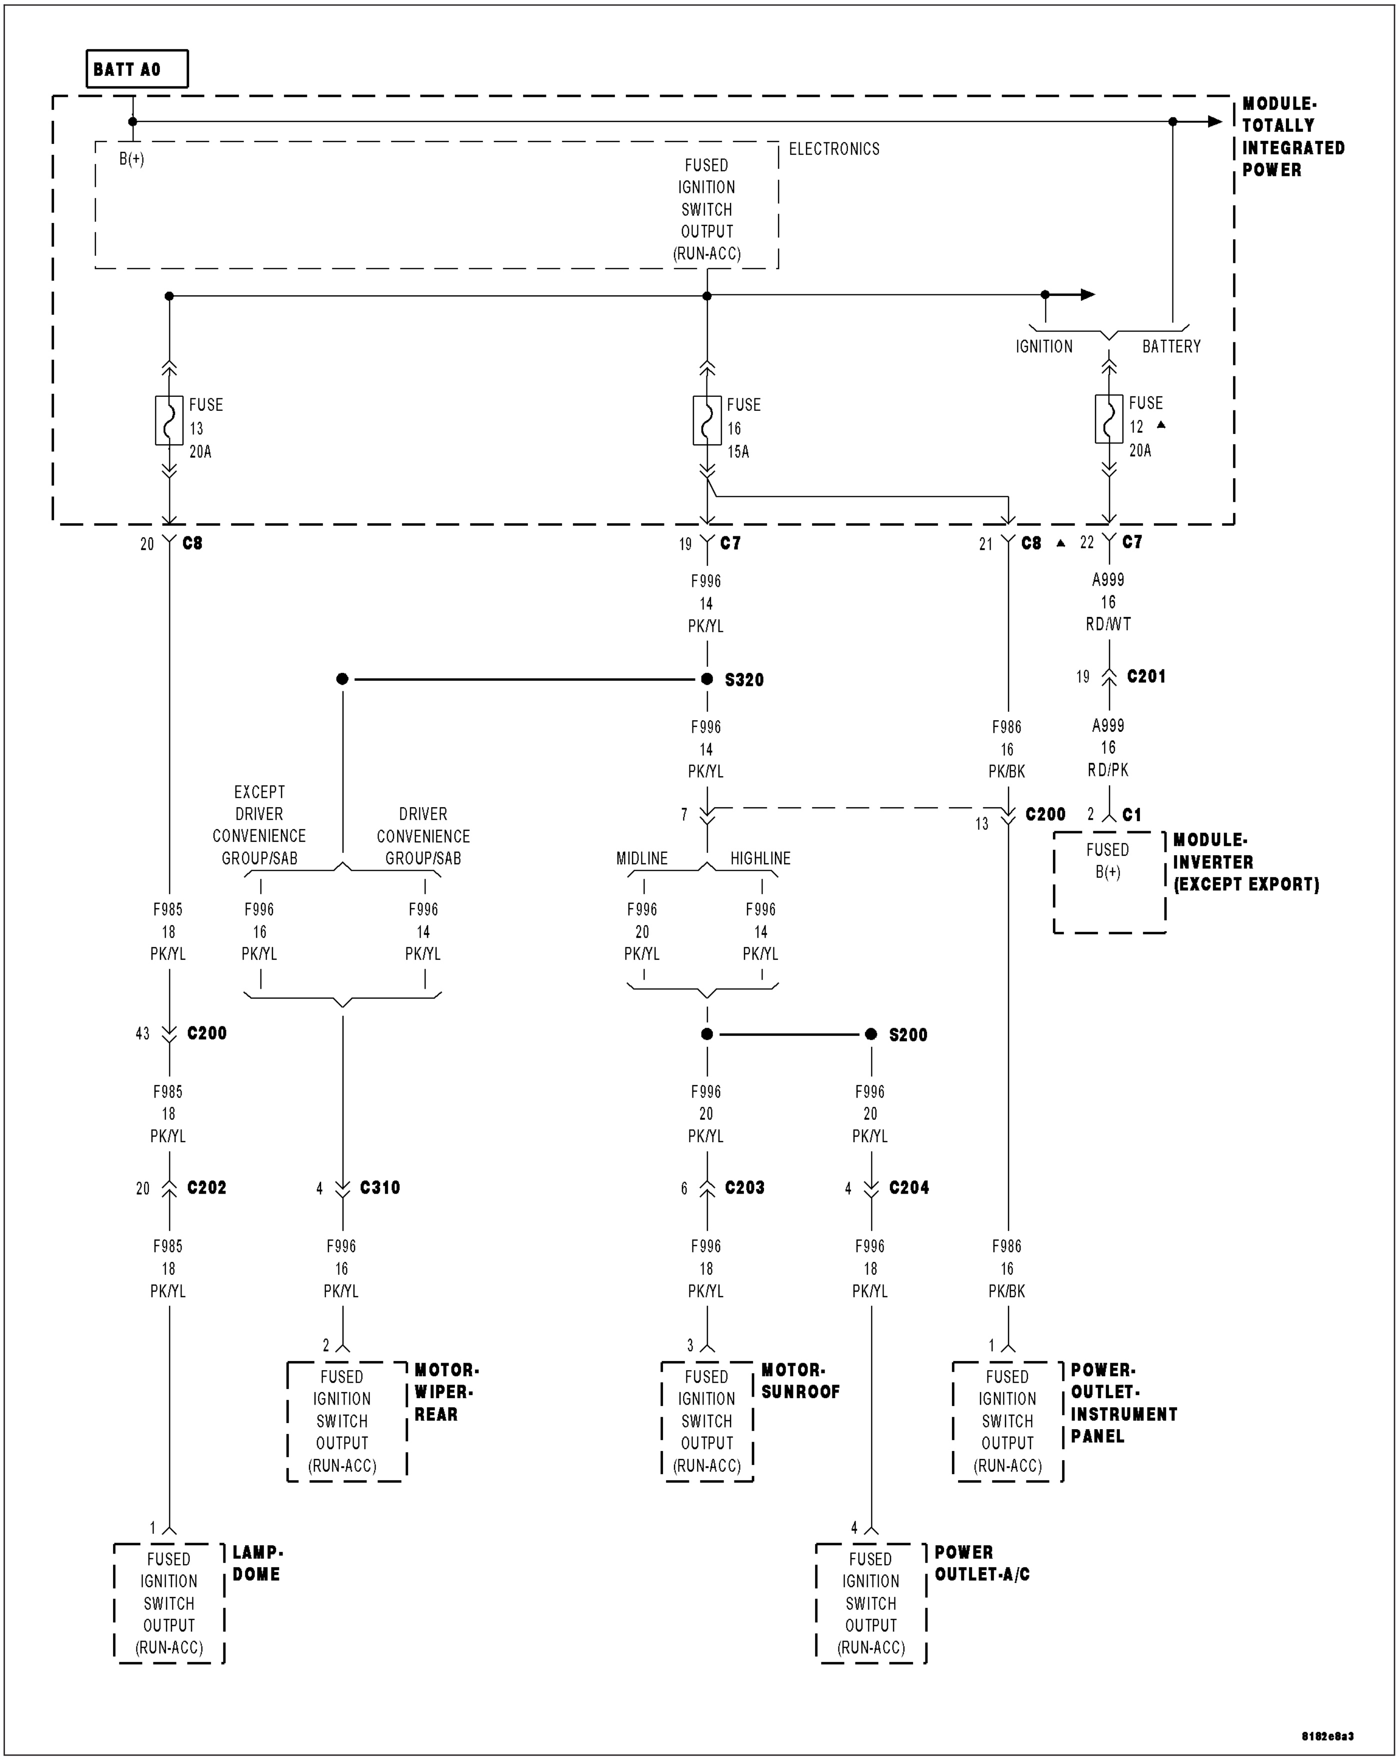
1. CHECK FOR ACTIVE DTC

Check all fuses. If any fuses are open, diagnose the appropriate circuit.

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC's.



Does the scan tool display this DTC as active?

Yes >> This is an internal TIPM DTC. If this DTC is active, replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

B212F-IGNITION RUN/ACC CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Internal TIPM failure.

Possible Causes
TIPM

Diagnostic Test

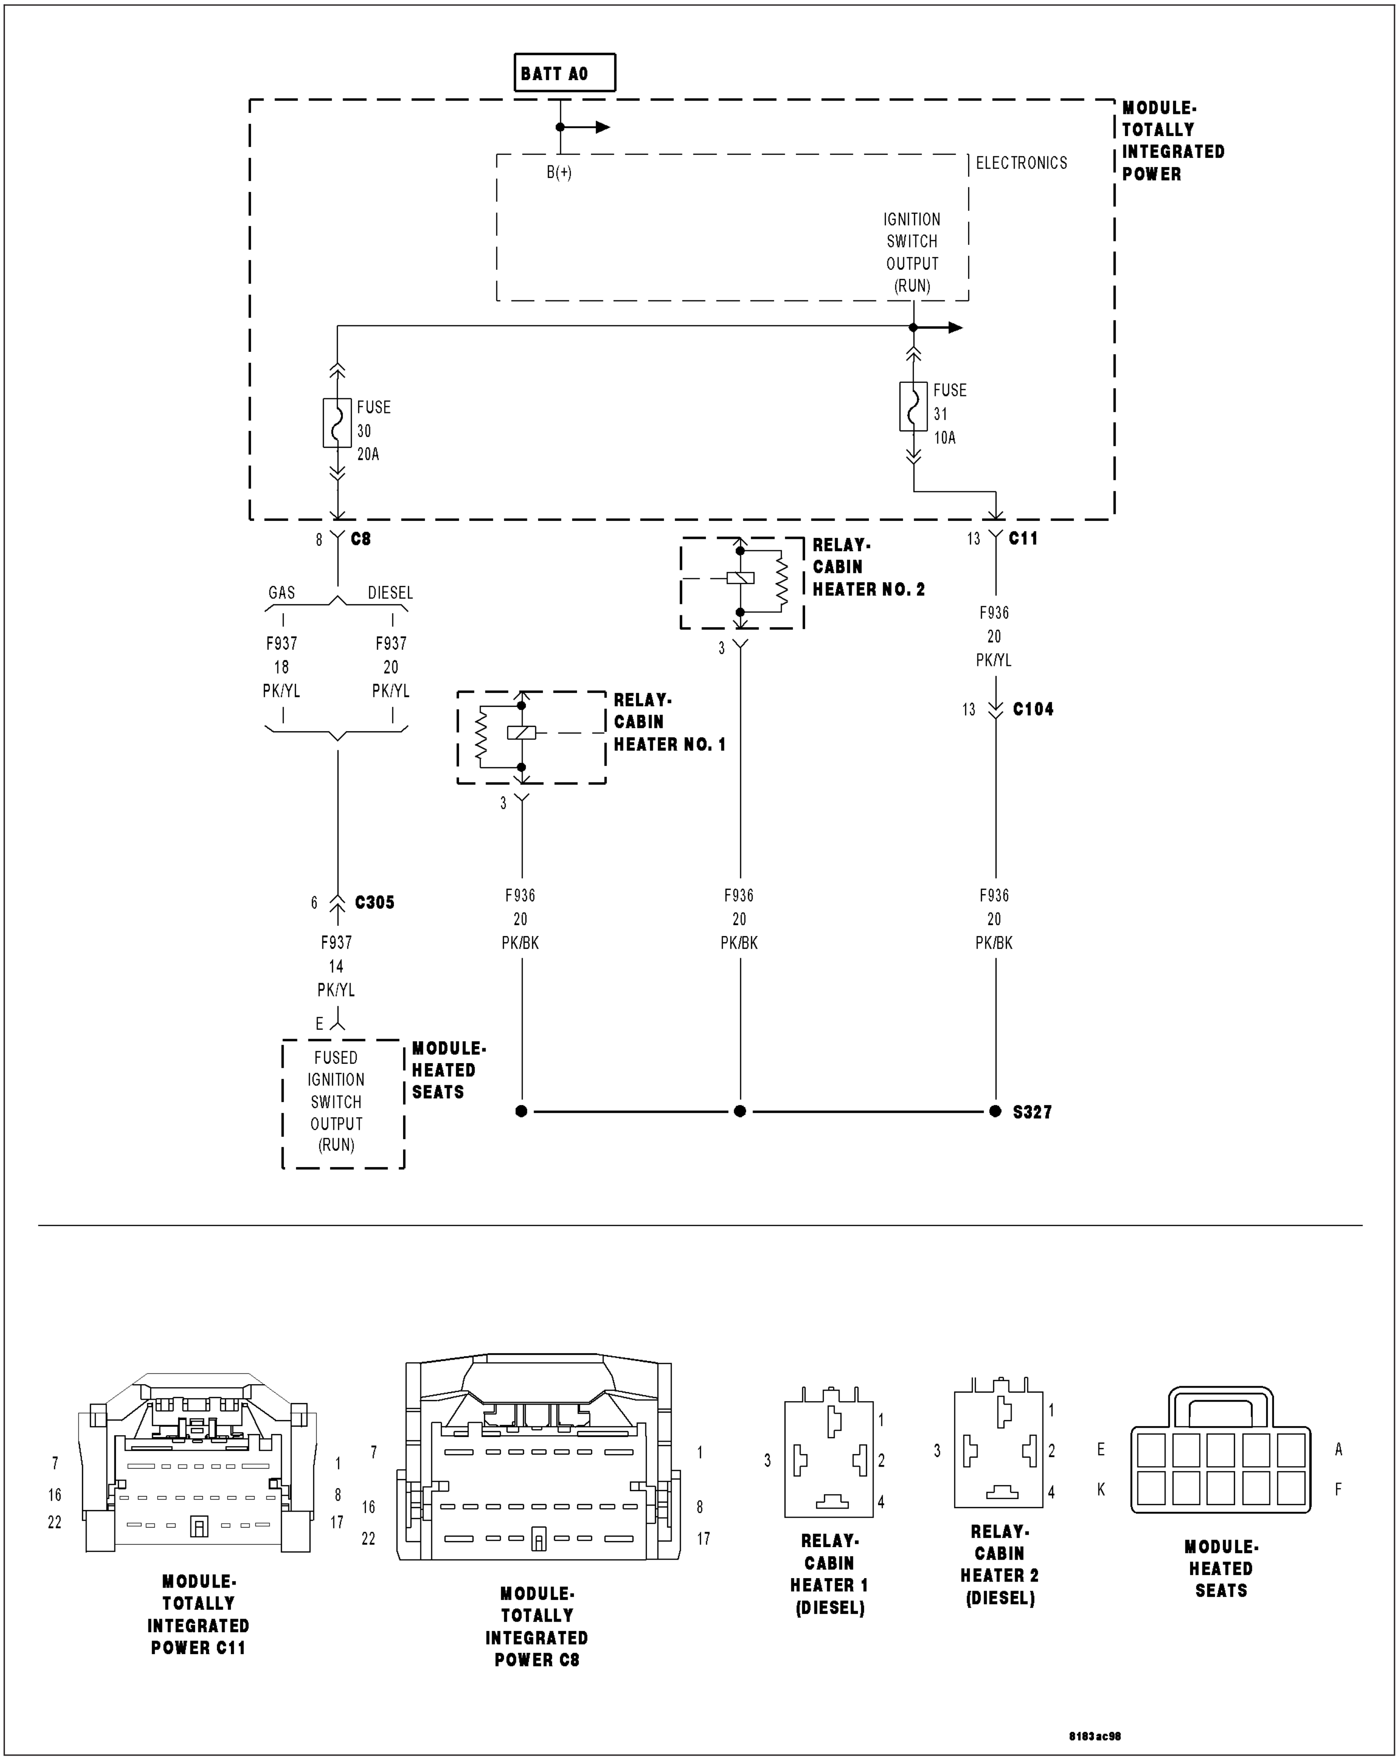
1. CHECK FOR ACTIVE DTC

Check all fuses.

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC's.



Does the scan tool display this DTC as active?

Yes >> This is an internal TIPM DTC. If this DTC is active, replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

B2148-IGNITION RUN CONTROL 2 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

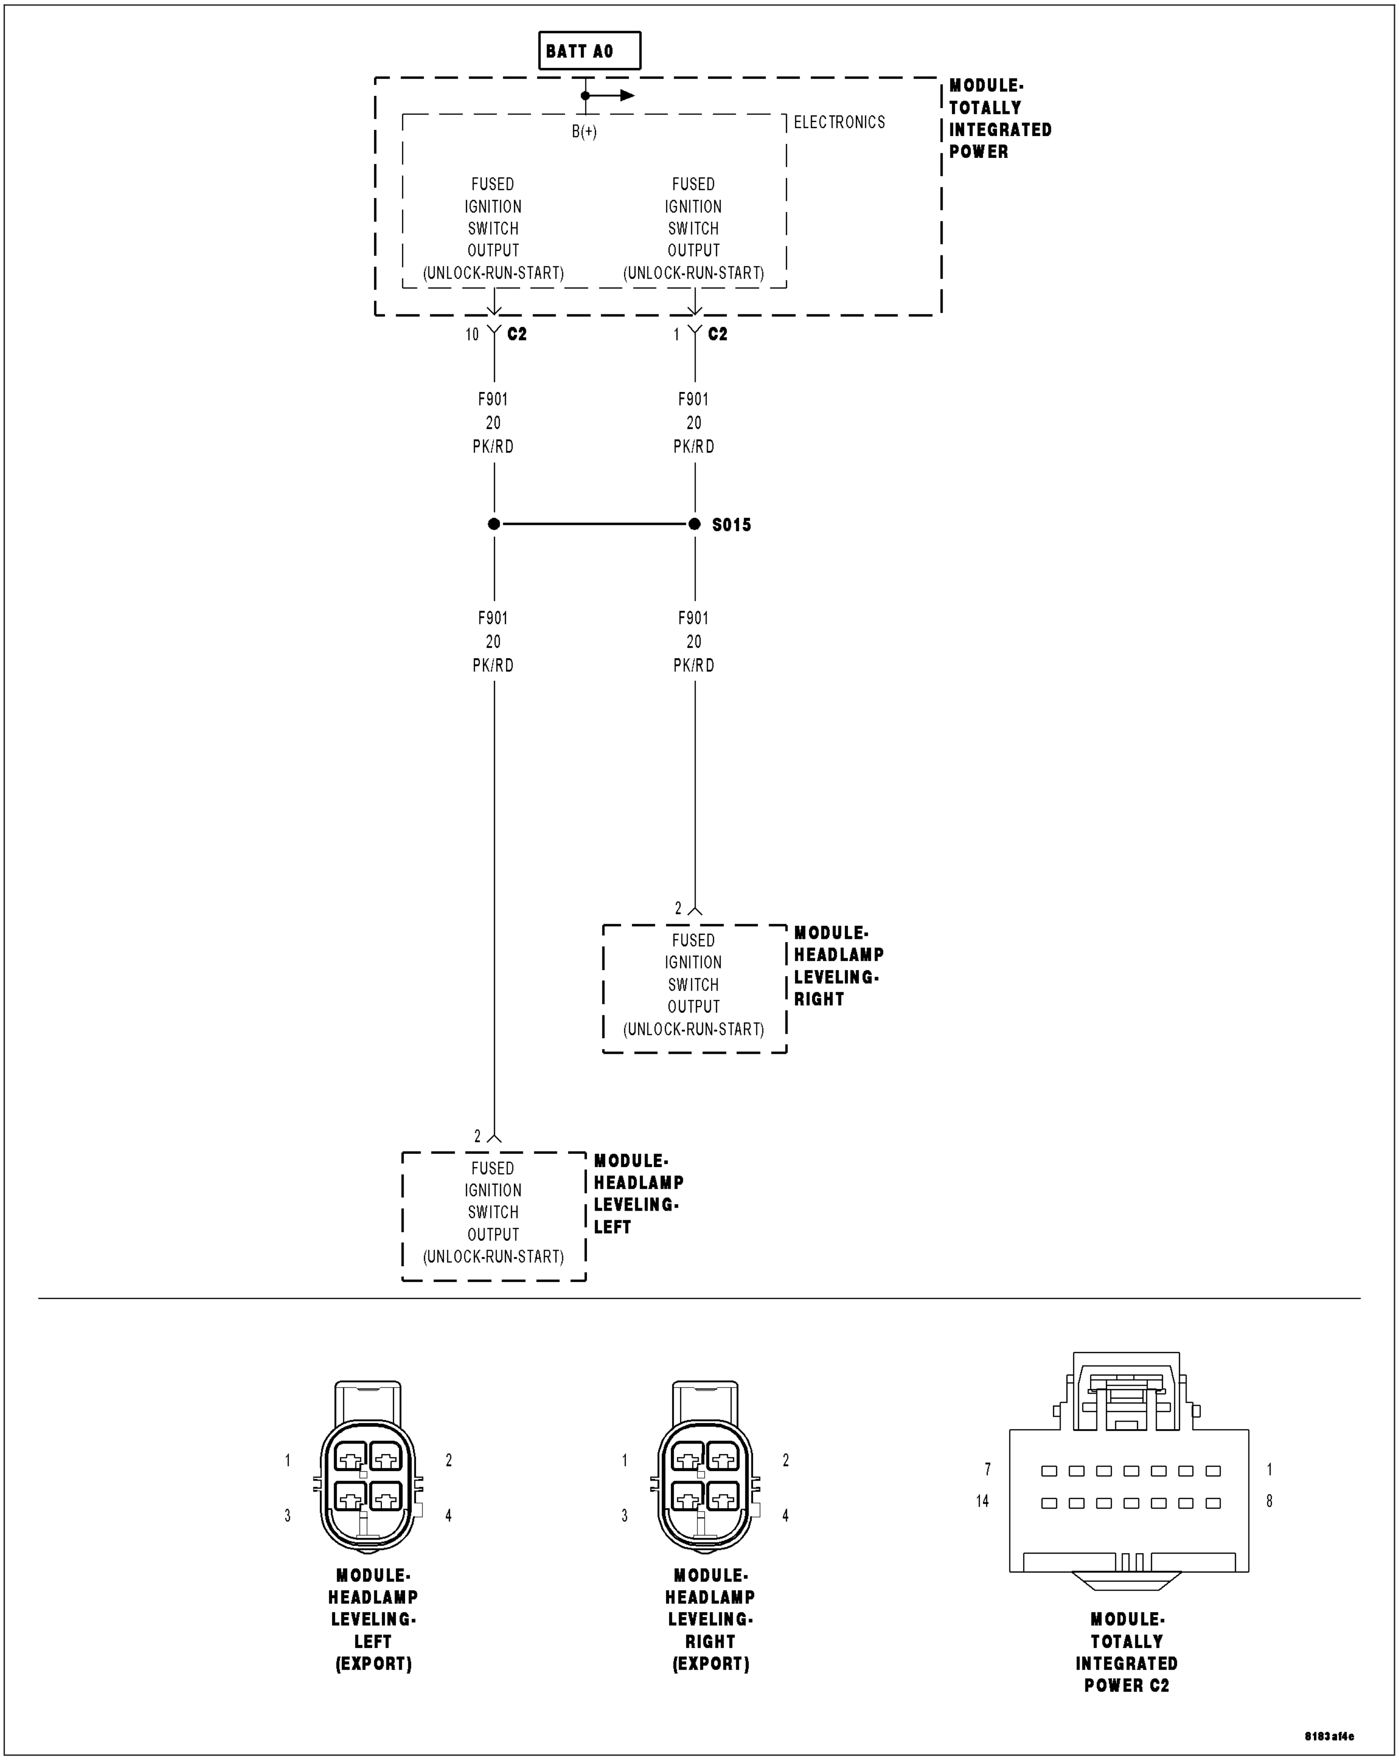
- **When Monitored:**
- **Set Condition:**

Possible Causes
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Check all fuses. If any fuses are open, diagnose the appropriate circuit.
With the scan tool, read the active DTC's.
Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.
With the scan tool, read the active DTC's.



Does the scan tool display this DTC as active?

Yes >> This is an internal TIPM DTC. If this DTC is active, replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

B2184-IGNITION UNLOCK RUN/START CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  (F901) Fused Ignition Switch Output (Unlock-Run-Start) circuit low.

Possible Causes
(F901) FUSED IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT SHORT TO GROUND
LEFT HEADLAMP LEVELING MODULE
RIGHT HEADLAMP LEVELING MODULE
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

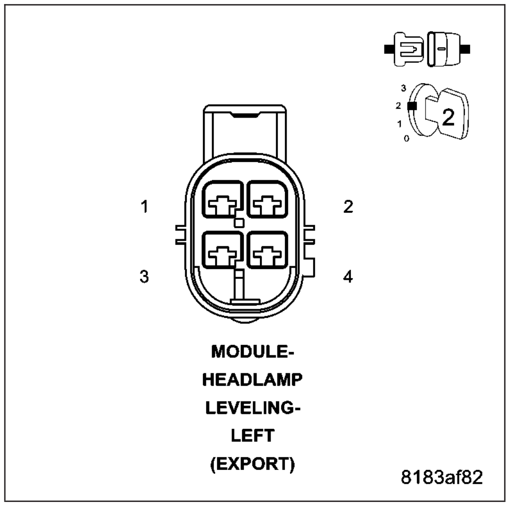
Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.



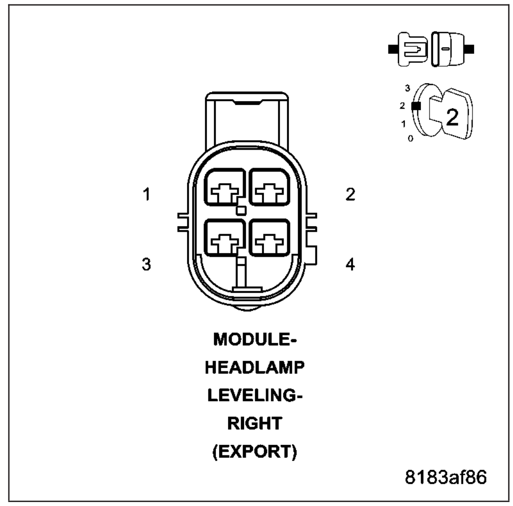
2. LEFT HEADLAMP LEVELING MODULE INTERNAL SHORT

Turn the ignition off.

Disconnect the Left Headlamp Leveling Module harness connector.

Turn the ignition on.

With the scan tool, read DTCs.



Does the scan tool display B2184-IGNITION UNLOCK RUN/ START CONTROL CIRCUIT LOW?

Yes >> Go To 3

No >> Replace the Left Headlamp Leveling Module in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

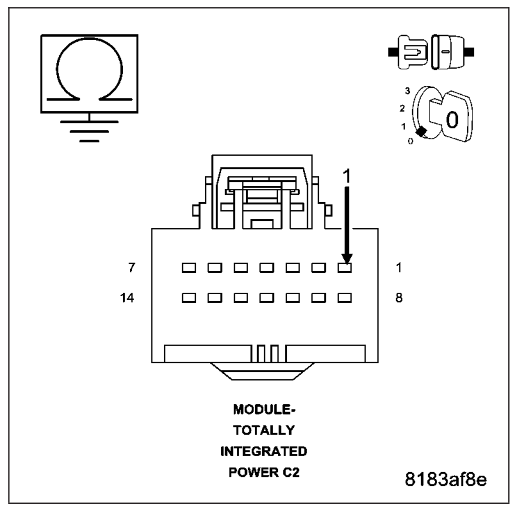
3. RIGHT HEADLAMP LEVELING MODULE INTERNAL SHORT

Turn the ignition off.

Disconnect the Right Headlamp Leveling Module harness connector.

Turn the ignition on.

With the scan tool, read DTCs.



Does the scan tool display B2184-IGNITION UNLOCK RUN/ START CONTROL CIRCUIT LOW?

Yes >> Go To 4

No >> Replace the Right Headlamp Leveling Module in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

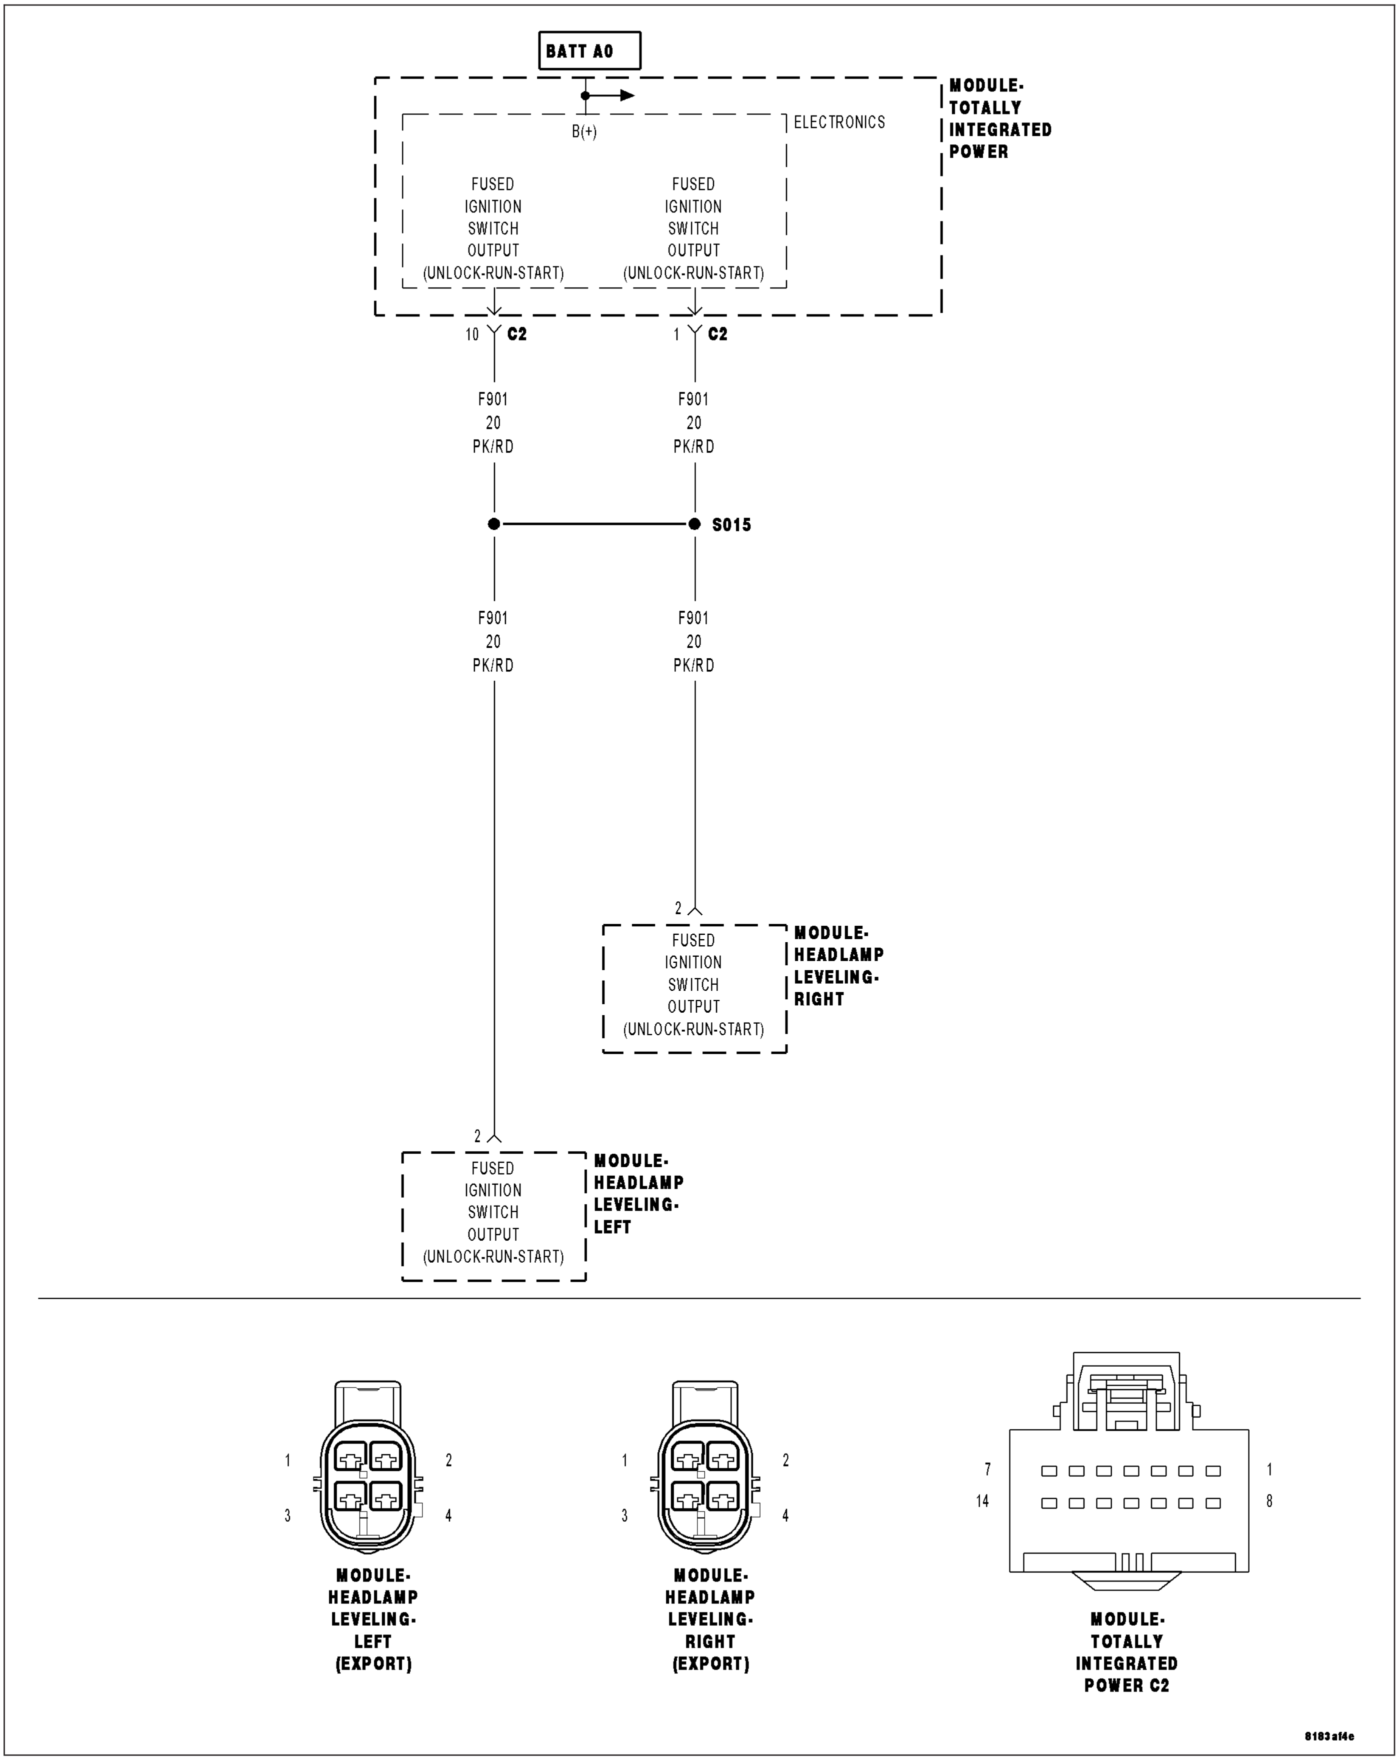
4. (F901) FUSED IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C2 harness connector.

Measure the resistance between ground and the (F901) Fused Ignition Switch Output (Unlock-Run-Start) circuit.

Is the resistance below 10K ohms?



Yes >> Repair the (F901) Fused Ignition Switch Output (Unlock-Run-Start) circuit for a short to ground.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2185-IGNITION UNLOCK RUN/START CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  (F901) Fused Ignition Switch Output (Unlock-Run-Start) circuit high.

Possible Causes
(F901) FUSED IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT SHORT TO VOLTAGE
LEFT HEADLAMP LEVELING MODULE
RIGHT HEADLAMP LEVELING MODULE
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

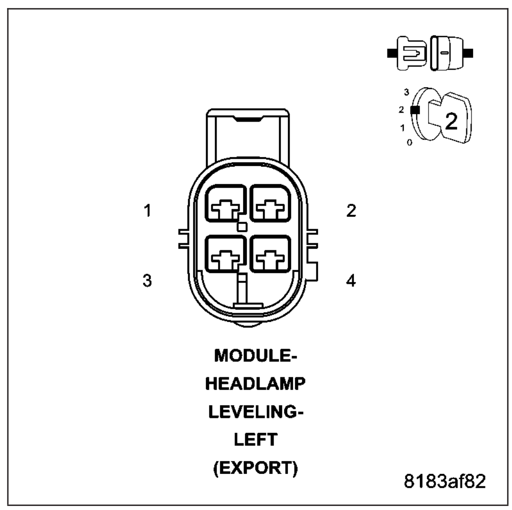
No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. LEFT HEADLAMP LEVELING MODULE INTERNAL SHORT

Turn the ignition off.

Disconnect the Left Headlamp Leveling Module harness connector.

Turn the ignition on.



With the scan tool, read DTCs.

Does the scan tool display B2185-IGNITION UNLOCK RUN/ START CONTROL CIRCUIT HIGH?

Yes >> Go To 3

No >> Replace the Left Headlamp Leveling Module in accordance with the service information.

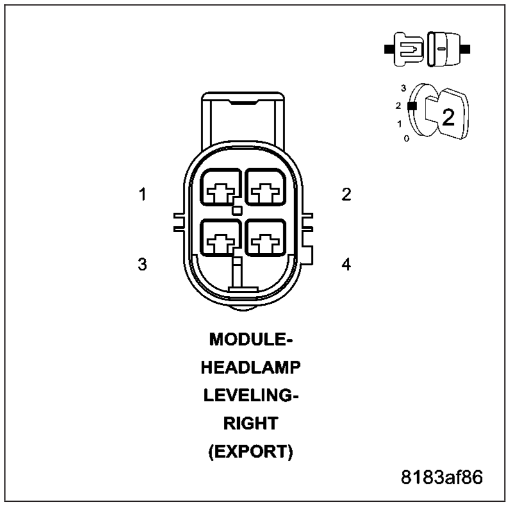
Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. RIGHT HEADLAMP LEVELING MODULE INTERNAL SHORT

Turn the ignition off.

Disconnect the Right Headlamp Leveling Module harness connector.

Turn the ignition on.



With the scan tool, read DTCs.

Does the scan tool display B2185-IGNITION UNLOCK RUN/ START CONTROL CIRCUIT HIGH?

Yes >> Go To 4

No >> Replace the Right Headlamp Leveling Module in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

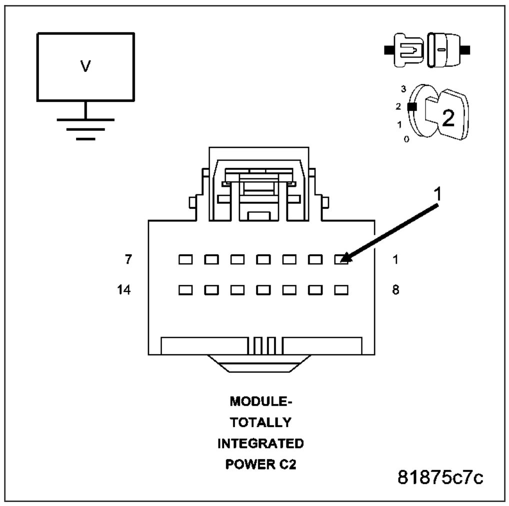
4. (F901) FUSED IGNITION SWITCH OUTPUT (UNLOCK-RUN-START) CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C2 harness connector.

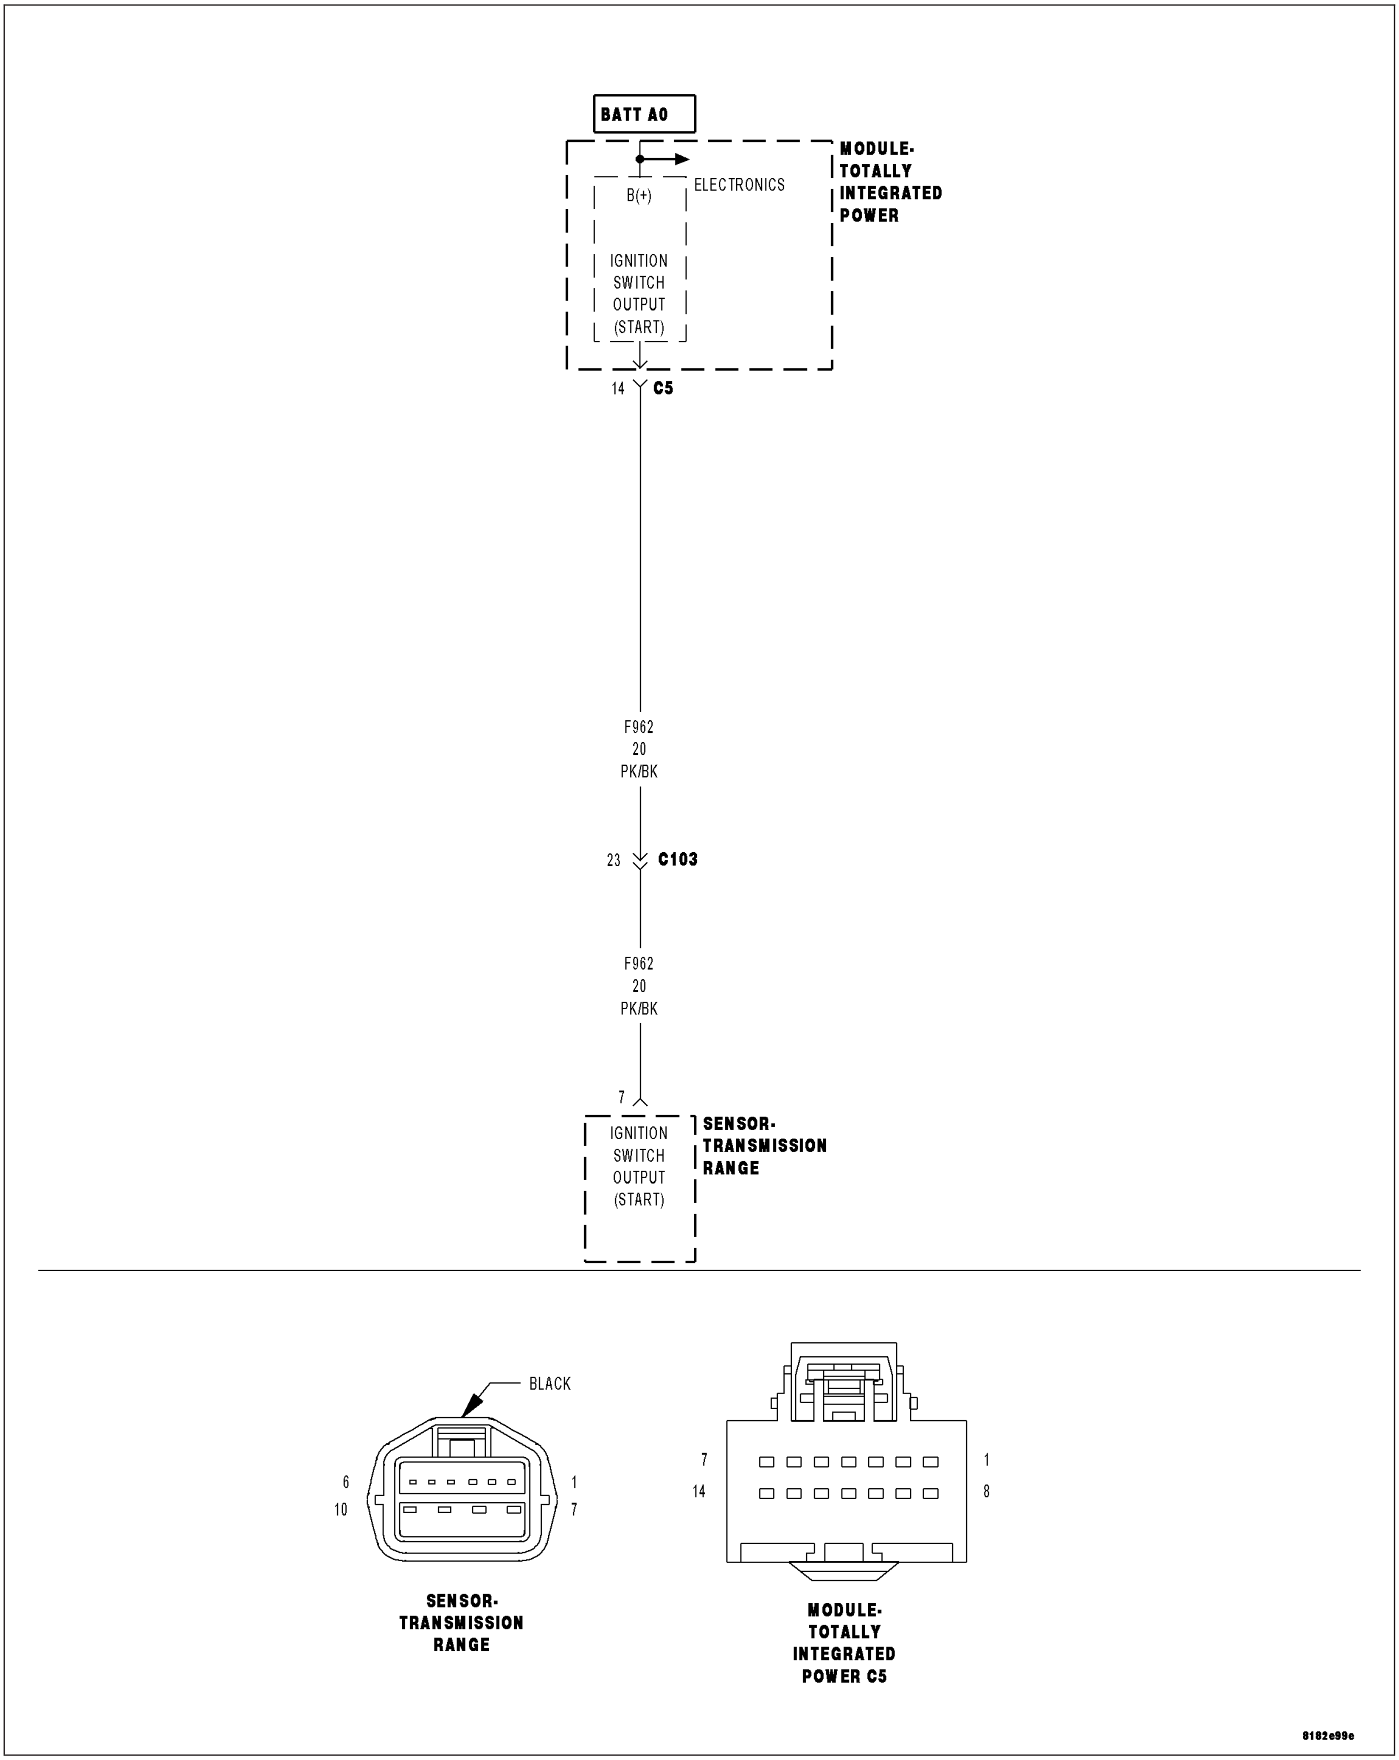
Turn the ignition on.

Measure the voltage of the (F901) Fused Ignition Switch Output (Unlock-Run-Start) circuit.



Is the resistance below 10K ohms?

Yes >> Repair the (F901) Fused Ignition Switch Output (Unlock-Run-Start) circuit for a short to voltage.



Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2188-IGNITION START CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Start position.
- **Set Condition:**
  The TIPM detects a short to ground condition in the (F962) Fused Ignition Switch Output (Start) circuit.

Possible Causes
(F962) FUSED IGNITION SWITCH OUTPUT (START) CIRCUIT SHORT TO GROUND
TRANSMISSION RANGE SENSOR
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

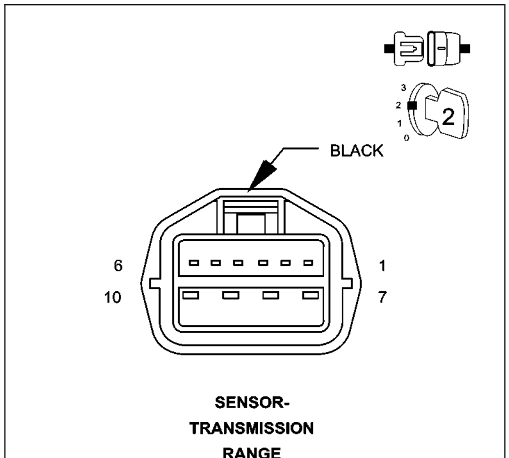
Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. TRANSMISSION RANGE SENSOR

Turn the ignition off.

Disconnect the Transmission Range Sensor harness connector.



Turn the ignition on, wait 30 seconds.

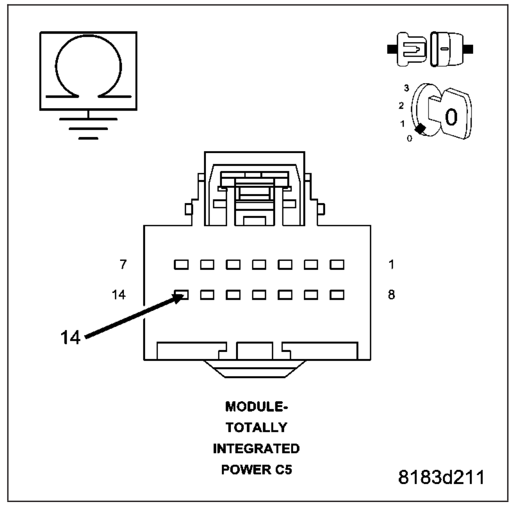
With the scan tool, read TIPM DTCs.

Did DTC B2188-IGNITION START CONTROL CIRCUIT LOW change from active to stored?

Yes >> Replace the Transmission Range Sensor in accordance with the service information.
Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

8183d1de



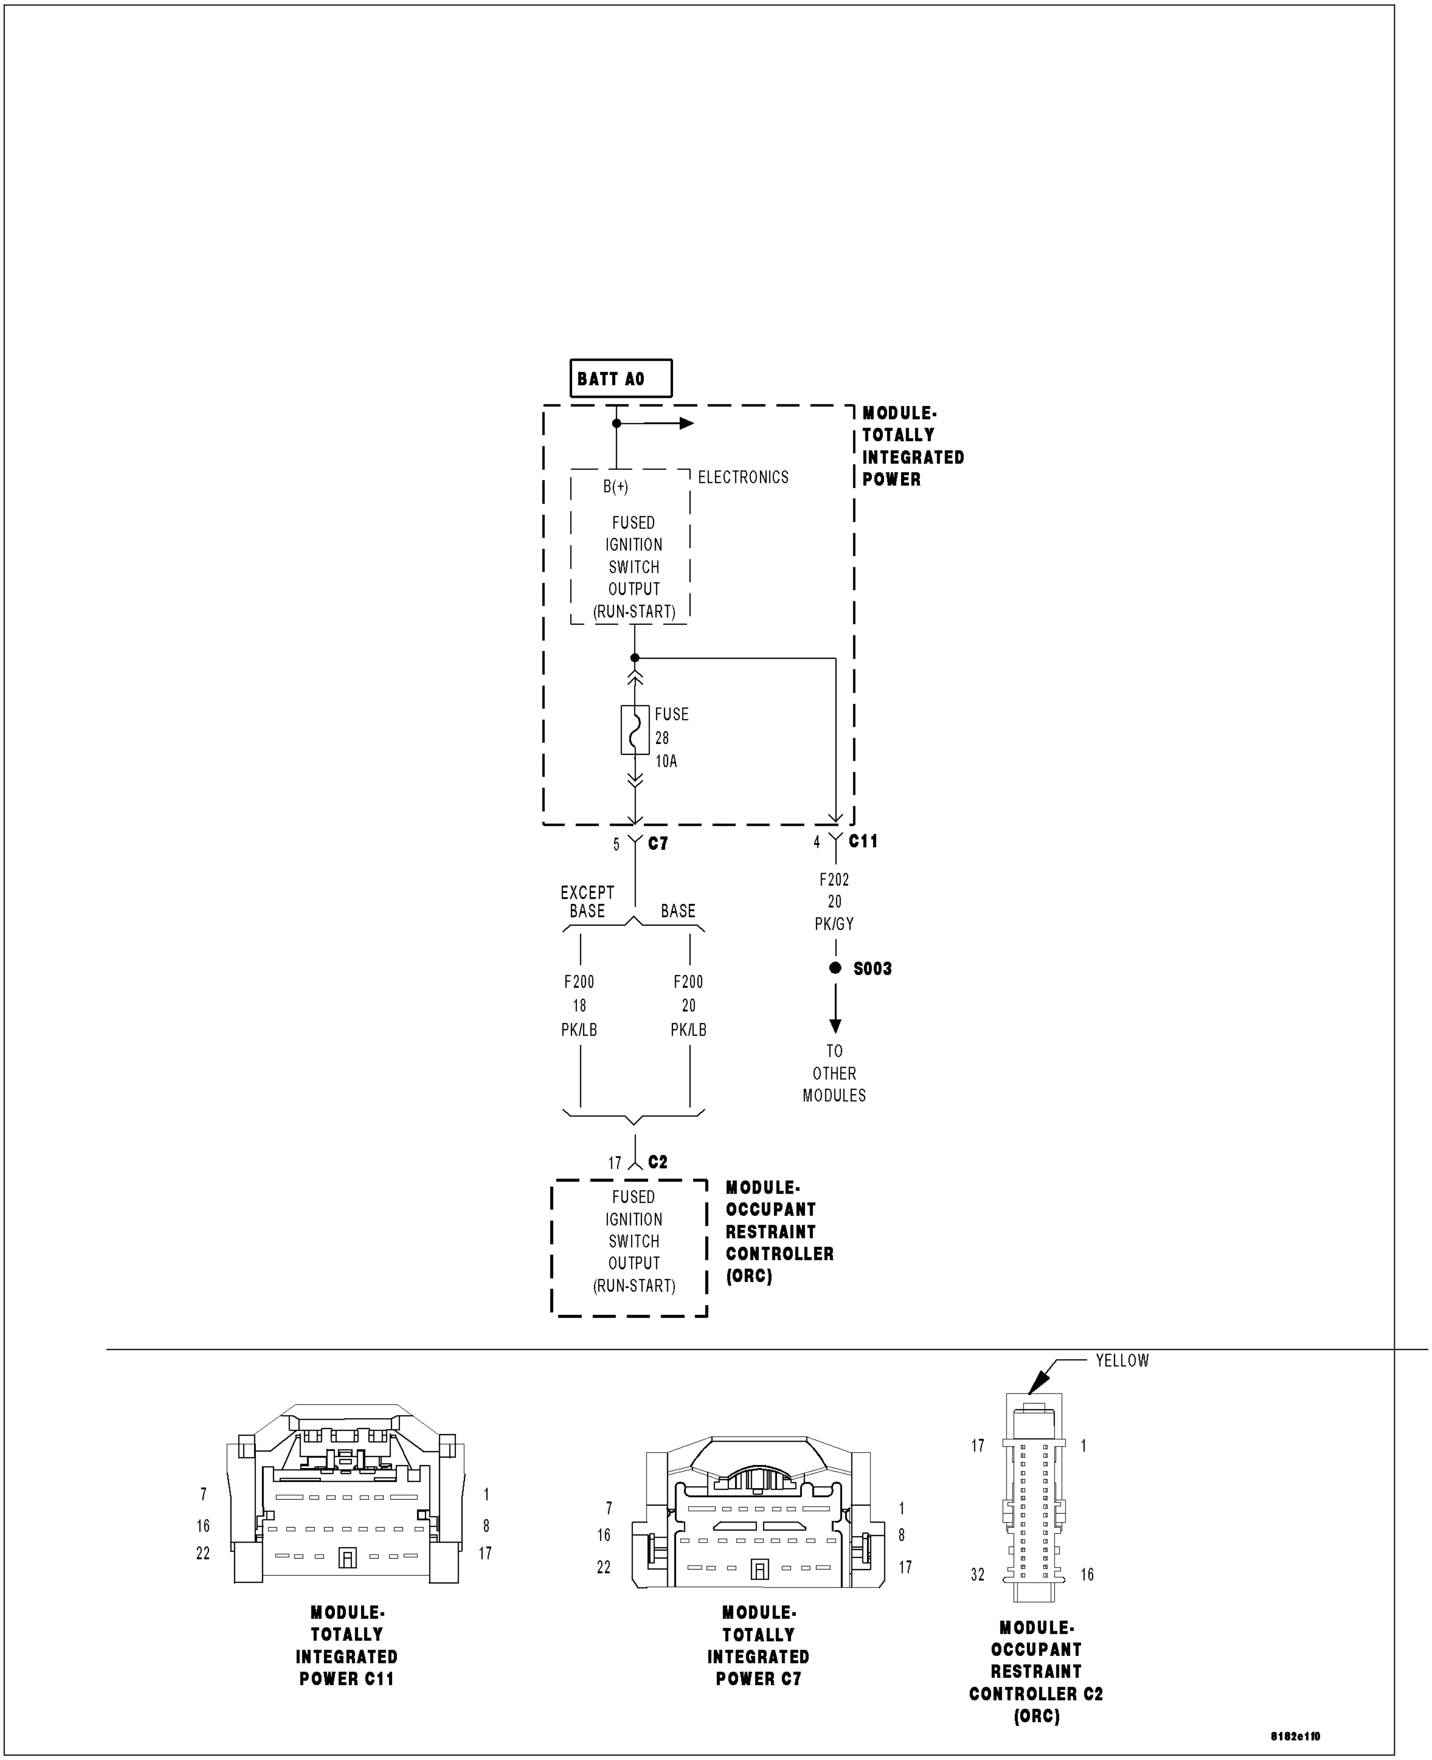
3. (F962) FUSED IGNITION SWITCH OUTPUT (START) CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C5 connector.

Measure the resistance between the (F962) Fused Ignition Switch Output (START) circuit and ground.

Is the resistance below 10K ohms?



Yes >> Repair the (F962) Fused Ignition Switch Output (START) circuit for a short to ground.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B218B-IGNITION RUN/START 1 CONTROL CIRCUIT OVERCURRENT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Over current condition detected on the Fused Ignition Switch Output (Run-Start) circuit.

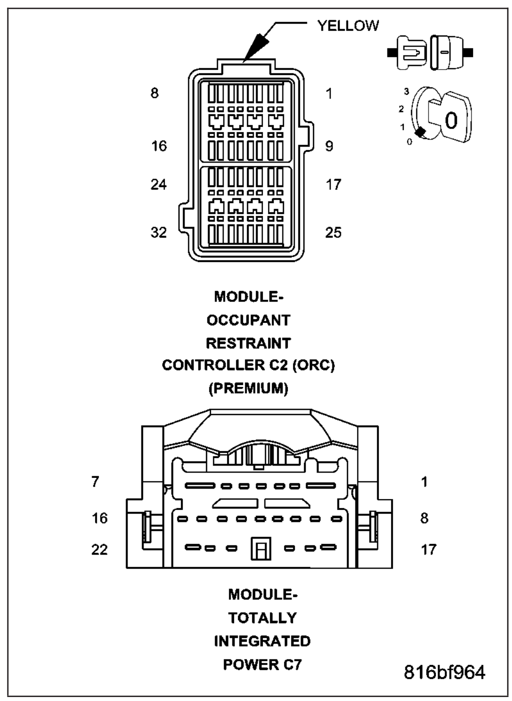
Possible Causes
TERMINAL DAMAGE OR CORROSION
HIGH RESISTANCE ON THE (F200) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT
OCCUPANT RESTRAINT CONTROLLER (ORC)
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.



With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. INSPECT THE TIPM AND ORC TERMINALS AND WIRE HARNESS FOR A CONDITION CAUSING HIGH CIRCUIT RESISTANCE

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the TIPM C7 harness connector.

Disconnect the ORC harness connector.

Inspect the connector terminal for signs of corrosion build up and damage.

Visually inspect the wiring harness for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

Yes >> Repair as necessary.
Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

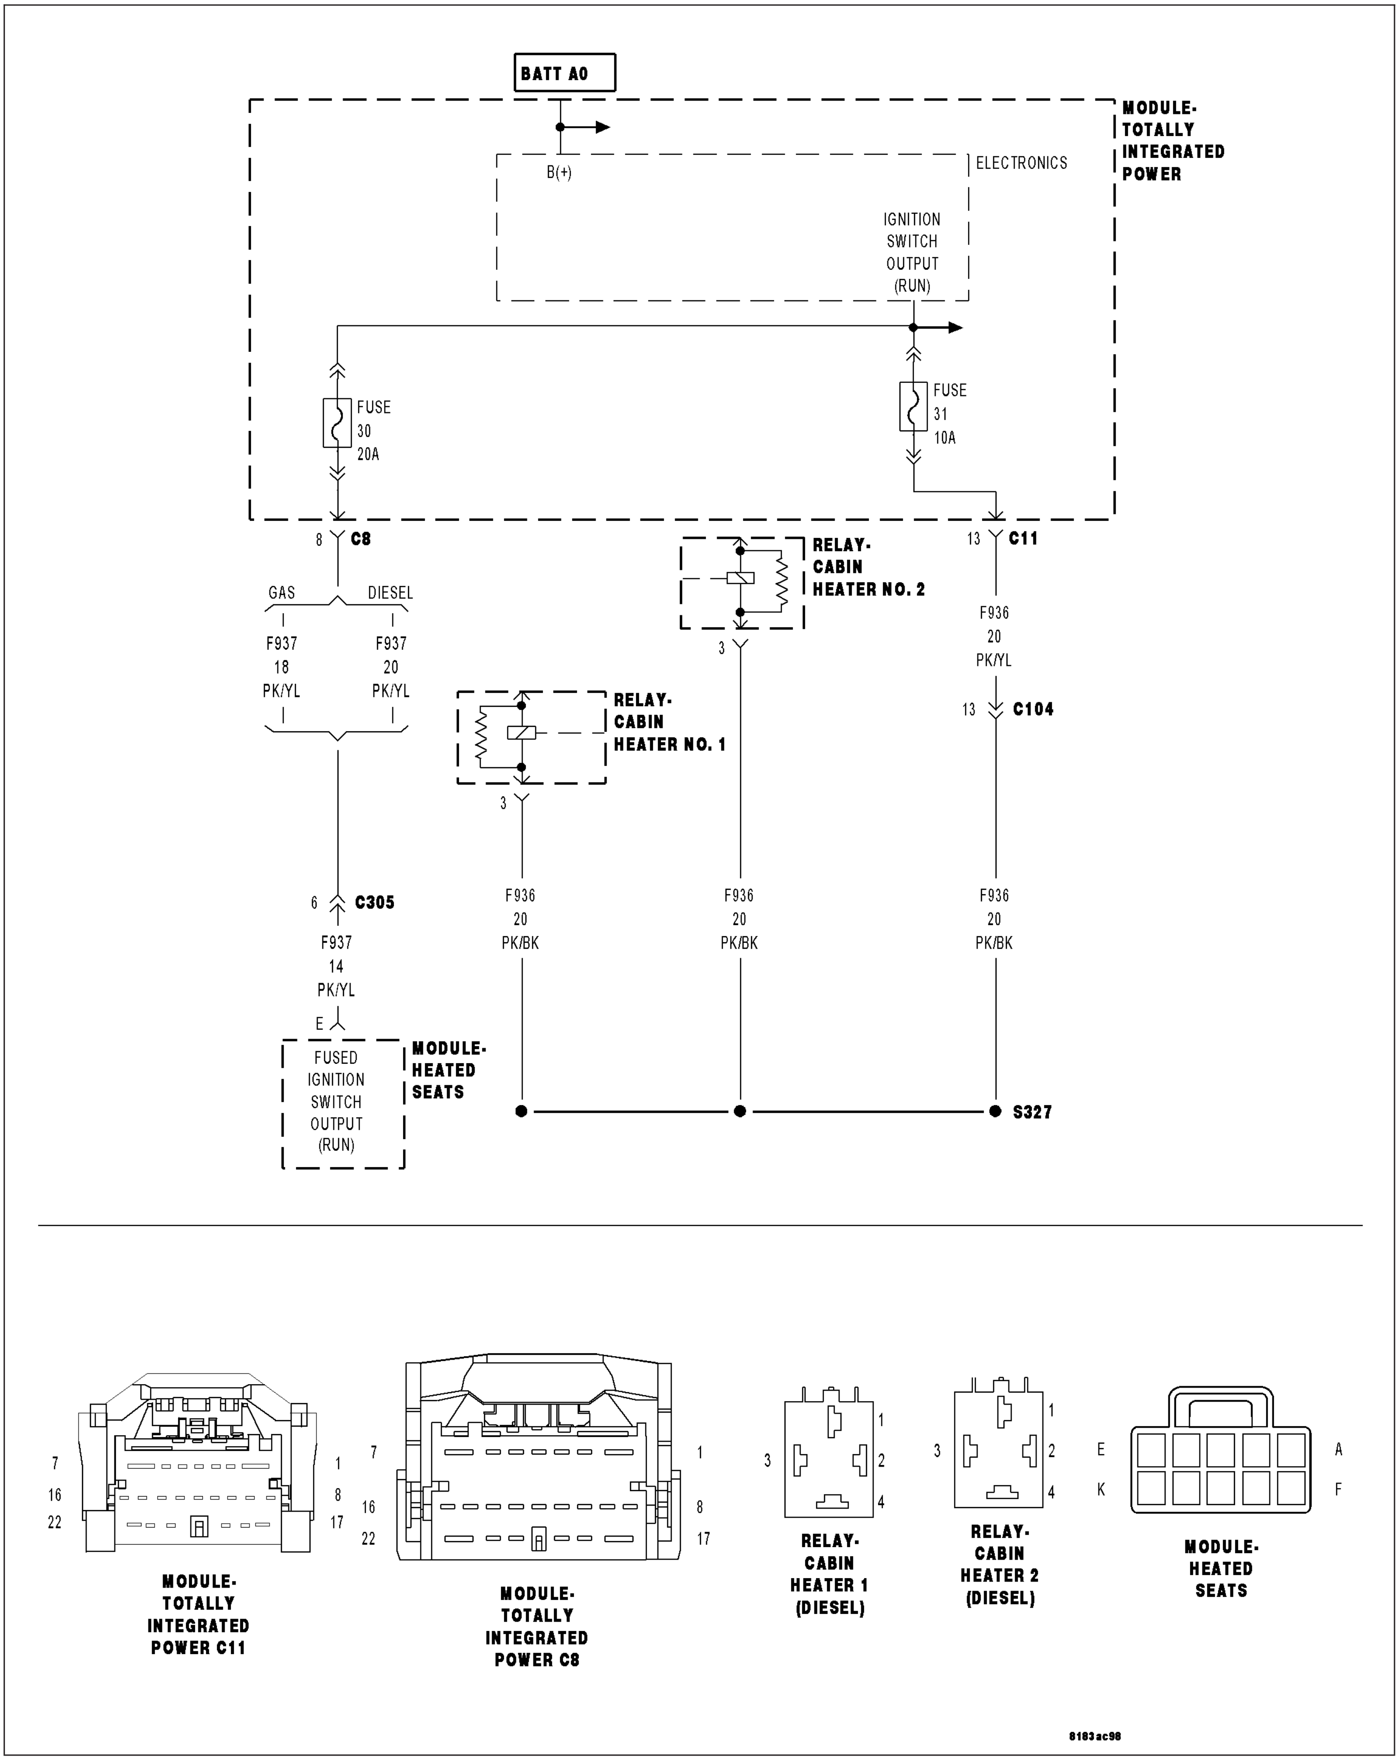
3. INSPECT THE (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR A CONDITION CAUSING HIGH CIRCUIT RESISTANCE

Disconnect the TIPM C11 harness connector.

Inspect the connector terminal for signs of corrosion build up and damage.

Using the wiring diagrams, visually inspect the associated wiring harnesses and connectors for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?



Yes >> Repair as necessary.

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the TIPM in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B218C-IGNITION RUN CONTROL 2 CIRCUIT OVERCURRENT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Over current condition detected on the (F937) Fused Ignition Switch Output (Run) circuit.

Possible Causes
TERMINAL DAMAGE OR CORROSION
HIGH RESISTANCE ON THE (F937) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT
HIGH RESISTANCE ON THE (F936) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT
HEATED SEAT MODULE
CABIN HEATER RELAYS 1 AND 2
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on, leaving the ignition off for a minimum of 30 seconds.

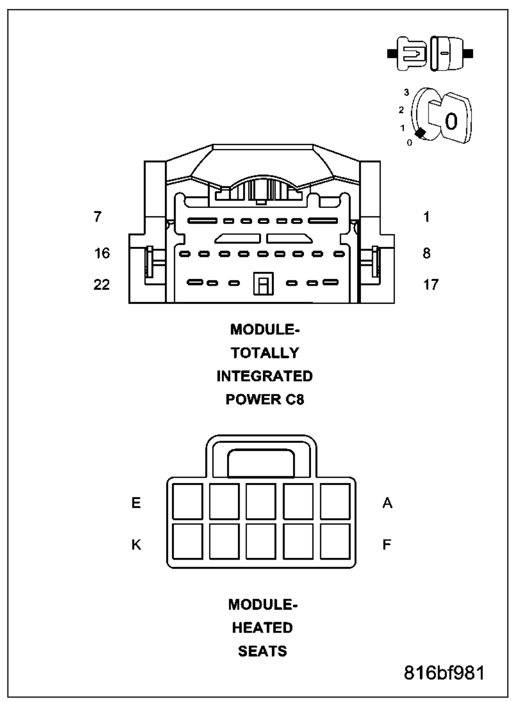
With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. INSPECT THE TIPM AND HEATED SEAT MODULE TERMINALS AND WIRE HARNESS FOR A CONDITION CAUSING HIGH CIRCUIT RESISTANCE



Turn the ignition off.

Disconnect the TIPM C8 harness connector.

Disconnect the Heated Seat Module harness connector.

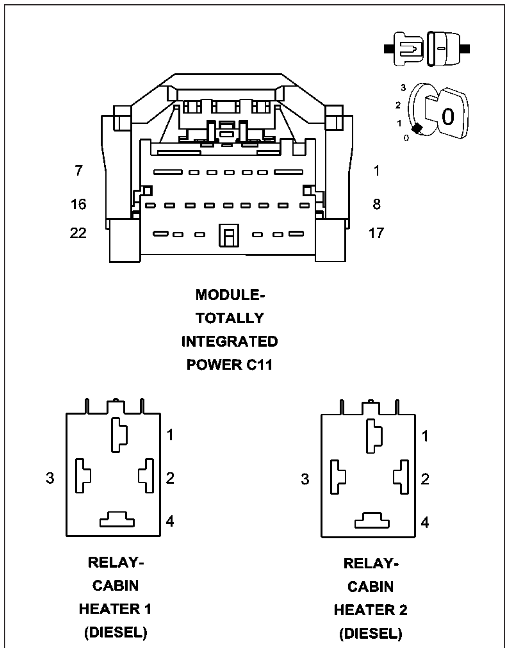
Inspect the connector terminal for signs of corrosion build up and damage.

Visually inspect the wiring harness for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

Yes >> Repair as necessary.
Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3



3. INSPECT THE CABIN HEATER RELAY TERMINALS AND WIRE HARNESS FOR A CONDITION CAUSING HIGH CIRCUIT RESISTANCE

Disconnect the Cabin Heater Relays.

Disconnect the TIPM C11 harness connector.

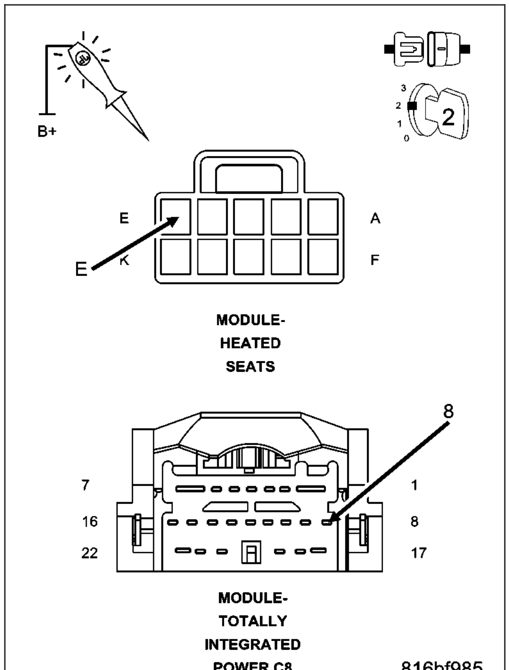
Inspect the connector terminal for signs of corrosion build up and damage.

Visually inspect the wiring harness for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

8187a148

Were any of the above conditions found?

Yes >> Repair as necessary.
Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



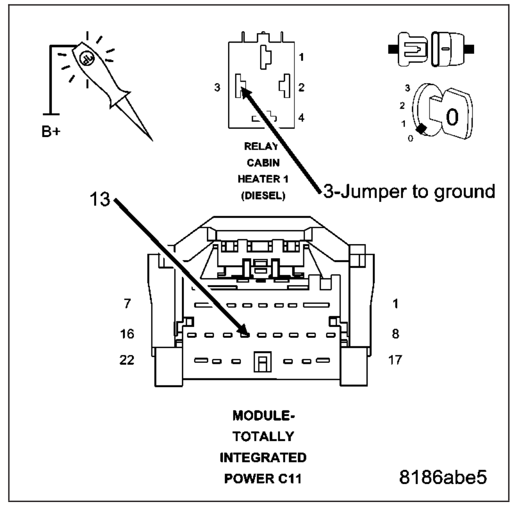
No >> Go To 4

4. CHECK THE (F937) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FUNCTION

Connect one end of a jumper wire to the (F937) Fused Ignition Switch Output (RUN) circuit at the Heated Seat Module harness connector, and connect the other end to a clean chassis ground.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to battery.

Using a 12 volt test light connected to 12 volts, probe the (F937) Fused Ignition Switch Output (RUN) circuit in the TIPM C8 harness connector.



816bf985

Does the test light illuminate brightly?

Yes >> Go To 5

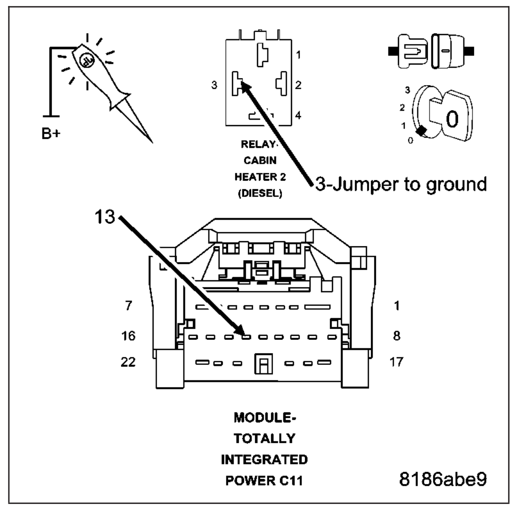
No >> Repair the (F937) Fused Ignition Switch Output (RUN) circuit for high resistance.
Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. CHECK THE (F936) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FUNCTION

Connect one end of a jumper wire to the (F936) Fused Ignition Switch Output (RUN) circuit at the number 1 Cabin Heater Relay harness connector, and connect the other end to a clean chassis ground.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to battery.

Using a 12 volt test light connected to 12 volts, probe the (F936) Fused Ignition Switch Output (RUN) circuit in the TIPM C11 harness connector.



Does the test light illuminate brightly?

Yes >> Go To 6

No >> Repair the (F936) Fused Ignition Switch Output (RUN) circuit for high resistance.

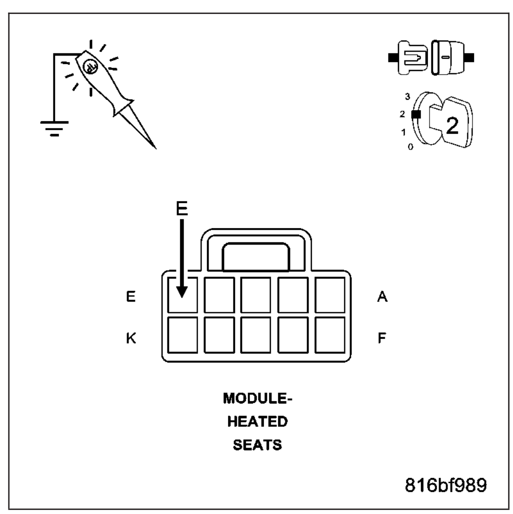
Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. CHECK THE (F936) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FUNCTION

Connect one end of a jumper wire to the (F936) Fused Ignition Switch Output (RUN) circuit at the number 2 Cabin Heater Relay harness connector, and connect the other end to a clean chassis ground.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to battery.

Using a 12 volt test light connected to 12 volts, probe the (F936) Fused Ignition Switch Output (RUN) circuit in the TIPM C11 harness connector.



Does the test light illuminate brightly?

Yes >> Go To 7

No >> Repair the (F936) Fused Ignition Switch Output (RUN) circuit for high resistance.

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

7. CHECK THE OUTPUT FROM THE TIPM ON THE (F937) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT

Reconnect the TIPM C8 harness connector.

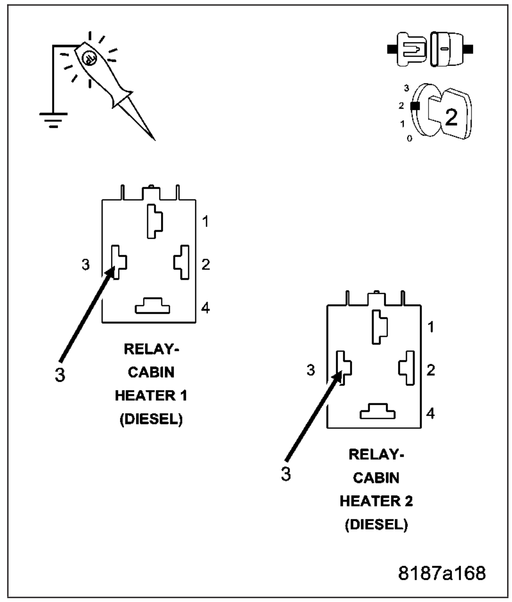
Turn the ignition on.

Using a 12 volt test light connected to ground, probe the (F937) Fused Ignition Switch Output (RUN) circuit in the Heated Seat Module harness connector.

Does the test light illuminate brightly?

Yes >> Replace the Heated Seat Module in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



No >> Go To 8

8. CHECK THE OUTPUT FROM THE TIPM ON THE (F936) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT

Reconnect the TIPM C11 harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, probe the (F936) Fused Ignition Switch Output (RUN) circuit in the Cabin Heater Relay 1 and 2 harness connectors.

Does the test light illuminate brightly?

Yes >> Replace the appropriate Cabin Heater Relay in accordance with the service information.

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the TIPM in accordance with the service information

Perform BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

IGNITION CONTROL- SERVICE INFORMATION

TABLE OF CONTENTS

IGNITION CONTROL- SERVICE INFORMATION

DESCRIPTION - IGNITION SYSTEM

NOTE: All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The ignition system used on these engines is referred to as the Direct Ignition System (DIS). The system's four main components are the coils, crankshaft position sensor, spark plugs, and camshaft position sensor. If equipped with the coil on plug ignition system it utilizes an ignition coil for every cylinder and is mounted directly over the each spark plug.

OPERATION - IGNITION SYSTEM

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate pulses that are inputs to the PCM. The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft & camshaft position. For a description of both sensors, refer to Camshaft Position Sensor and Crankshaft Position Sensor.

SPECIFICATIONS

TORQUE

Description	N·m	ft. lbs.	in. lbs.
Camshaft Position Sensor Screw	9		79.5
Crankshaft Position Sensor Screw	9	-	79.5
Coolant Temp. Sensor	18.6	-	165
Ignition Coil to Cyl. Head	8	-	71
Knock Sensor Bolt	22	-	195
Spark Plugs *	27	20	-
Coil Capacitor	12	-	105
Variable valve timing solenoid	12	9	-
Lock Cylinder to Column	12	-	110
Ignition Switch Mounting Screws	2	-	18
SKREEM/WCM Ring	2.5	-	22
* Tapered seat plugs. Imperative that torque is NOT EXCEEDED.			

SPARK PLUGS

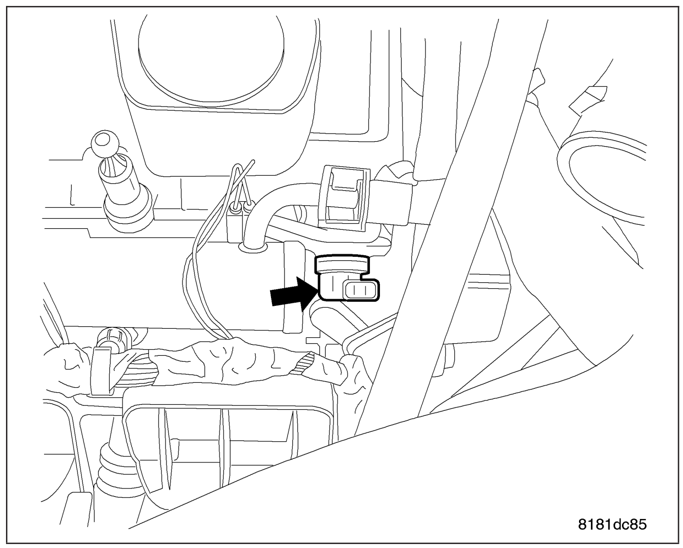
ENGINE	PLUG TYPE	ELECTRODE GAP
2.0/2.4L	Refer to the Vehicle Emission Control Information label in the engine compartment.	1.24 to 1.37 mm (0.048 to 0.053 in.)

SENSOR-CAMSHAFT POSITION

DESCRIPTION

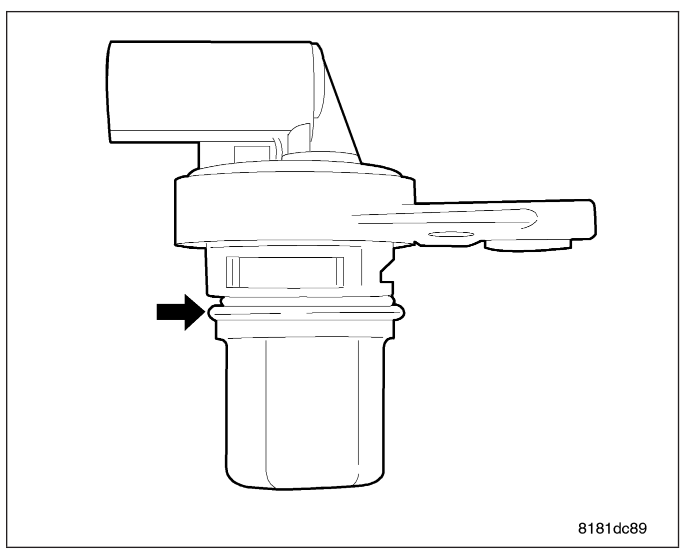
The camshaft position sensors are mounted to the front and rear of the cylinder head.

OPERATION



The PCM sends approximately 5 volts to the Hall-effect sensor. This voltage is required to operate the Hall-effect chip and the electronics inside the sensor. The input to the PCM occurs on a 5 volt output reference circuit. A ground for the sensor is provided through the sensor return circuit. The PCM identifies camshaft position by registering the change from 5 to 0 volts, as signaled from the camshaft position sensor.

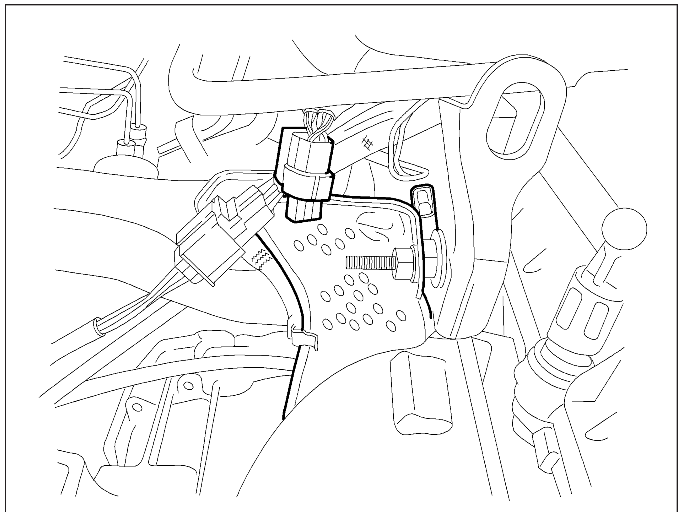
The PCM determines fuel injection synchronization and cylinder identification from inputs provided by the camshaft position sensor and crankshaft position sensor. From the two inputs, the PCM determines crankshaft position.



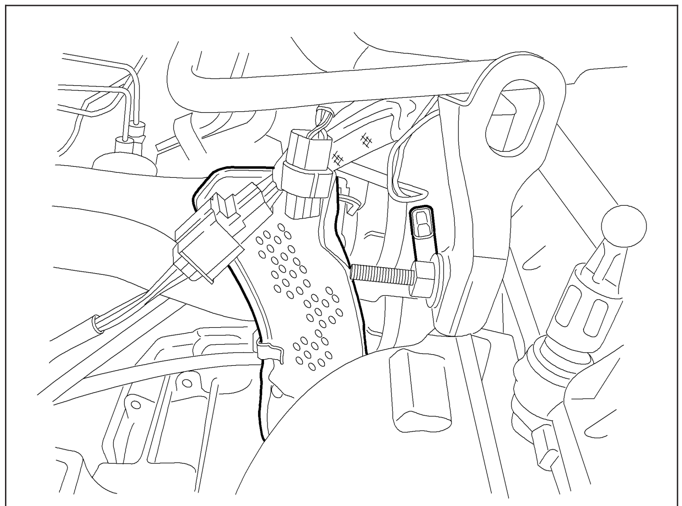
REMOVAL

FRONT CAMSHAFT POSITION SENSOR

1. Remove the air cleaner hose to throttle body, disconnect the inlet air temperature sensor electrical connector.
2. Disconnect negative battery cable.
3. Disconnect electrical connector from camshaft position sensor.
4. Remove camshaft position sensor mounting screws.

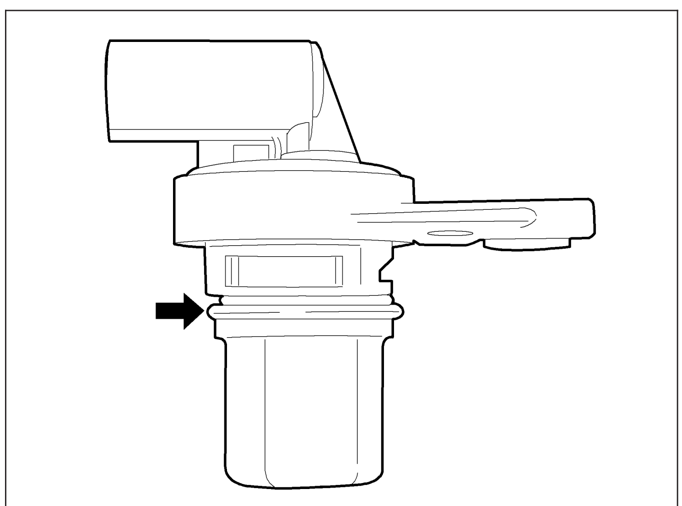


5. Remove sensor.



REAR CAMSHAFT POSITION SENSOR

1. Disconnect negative battery cable.
2. Disconnect electrical connector at sensor.
3. Remove nut retaining heat shield.

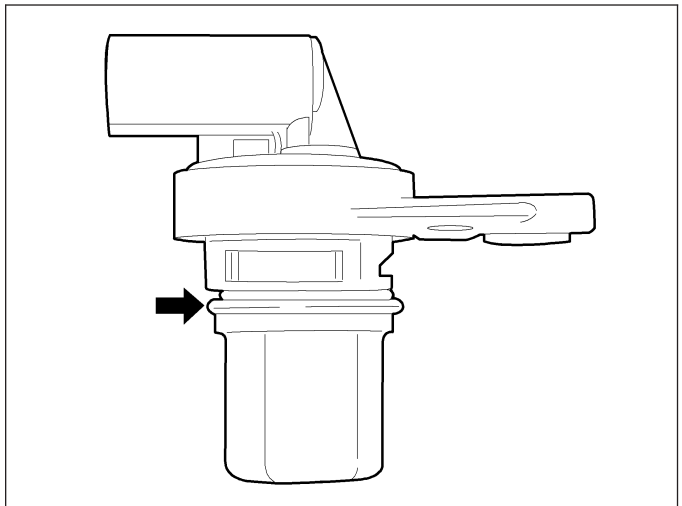


8181dd35

4. Pull heat shield out to uncover sensor.
5. Remove mounting bolt.

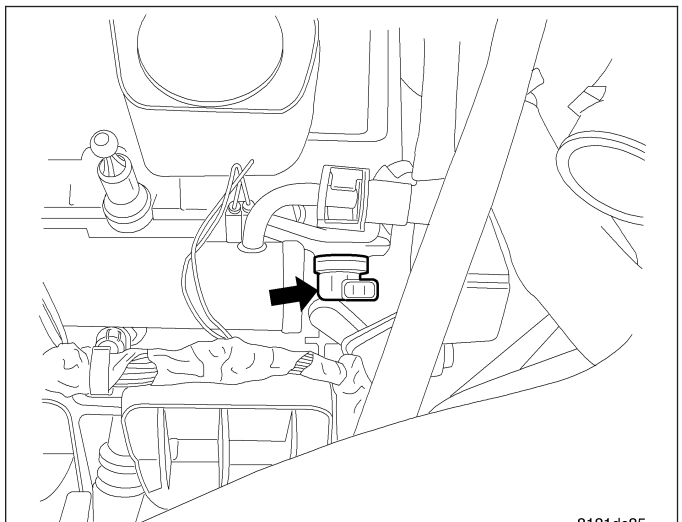
8181dd4e

6. Remove sensor.



8181dc89

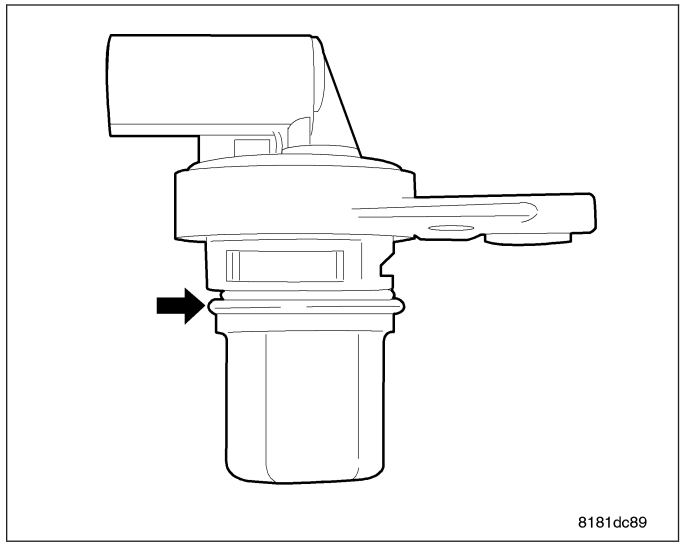
INSTALLATION



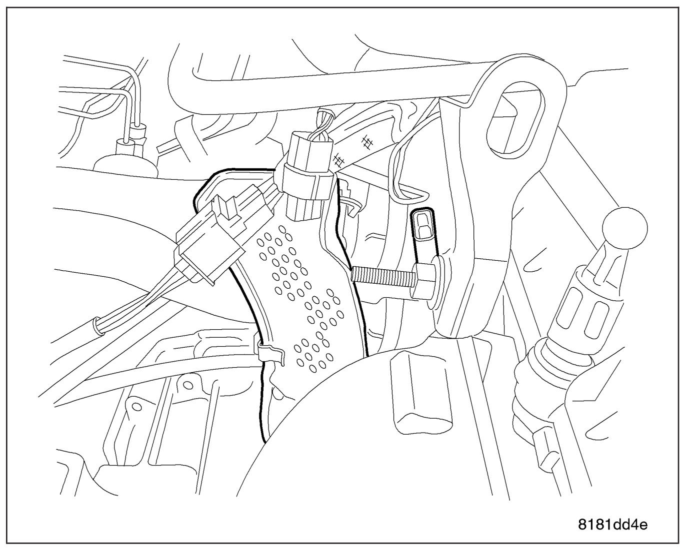
FRONT CAMSHAFT POSITION SENSOR

1. Lubricate sensor o-ring.

8181dc89

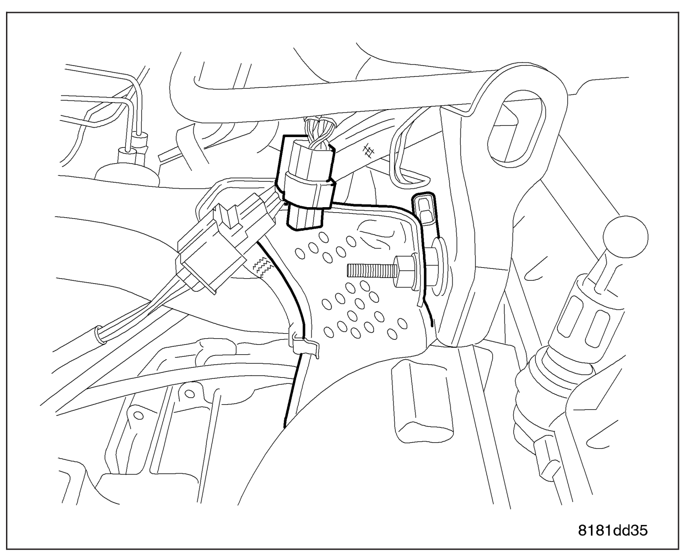


2. Install camshaft position sensor. Tighten sensor mounting screws to 9 N·m (79.5 in. lbs.) torque.
3. Carefully attach electrical connector to camshaft position sensor. Installation at an angle may damage the sensor pins.
4. Install the negative battery cable.
5. Install the air cleaner to throttle body hose, connect the inlet air temperature sensor electrical connector.



8181dc85

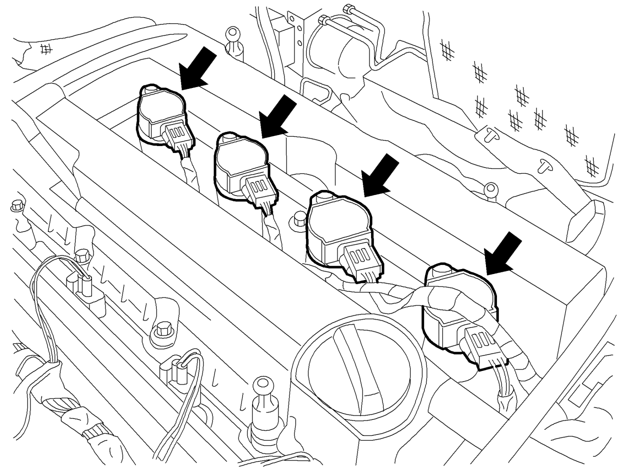
REAR CAMSHAFT POSITION SENSOR



1. Lubricate sensor o-ring.
2. Install sensor.
3. Install mounting bolt and tighten to 9 N·m (79.5 in. lbs.) torque.

4. Install heat shield onto mounting stud.
5. Install heat shield retaining nut and tighten.

6. Connect the electrical connector.
7. Connect negative battery cable.

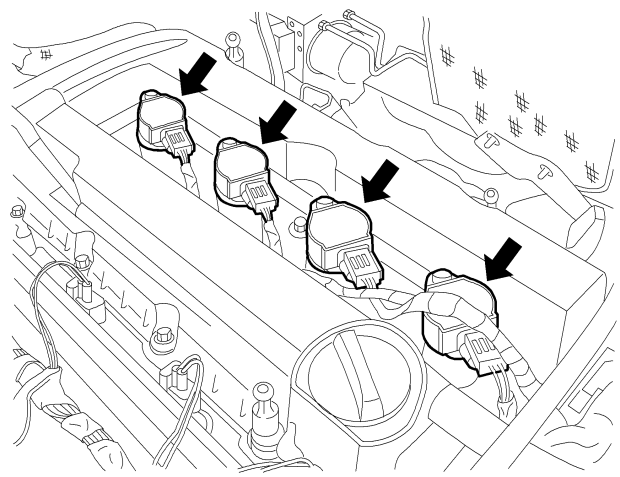


COIL-IGNITION

DESCRIPTION

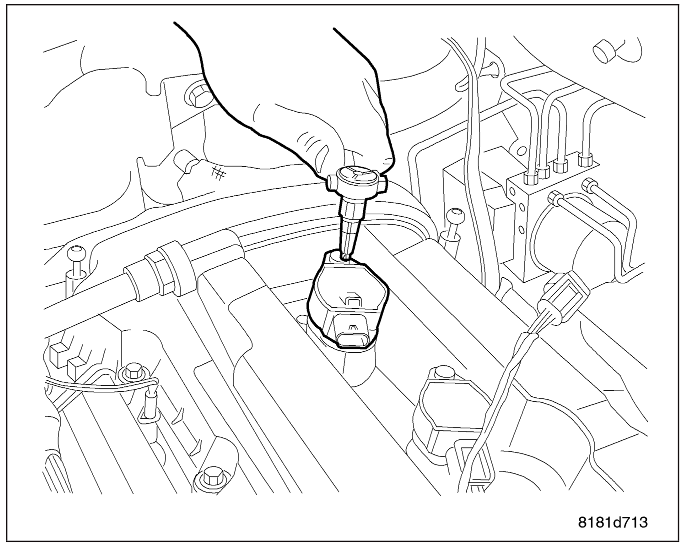
WARNING: The direct ignition system generates approximately 40,000 volts. Personal injury could result from contact with this system.

The ignition coil is mounted on the valve cover.



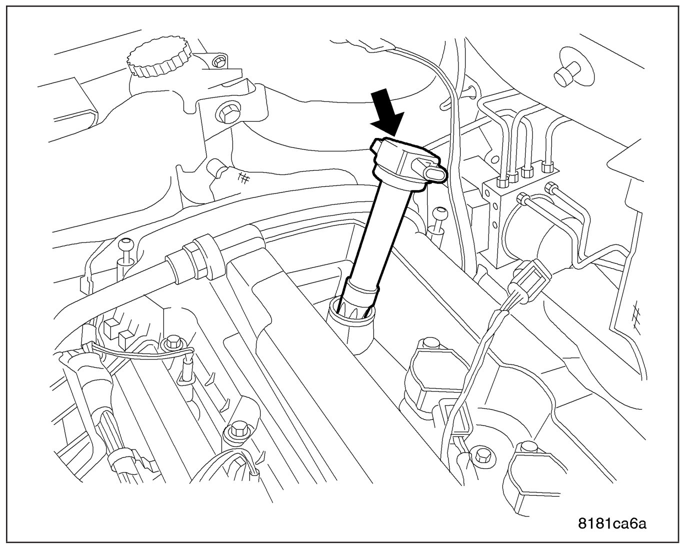
8181ca59

REMOVAL



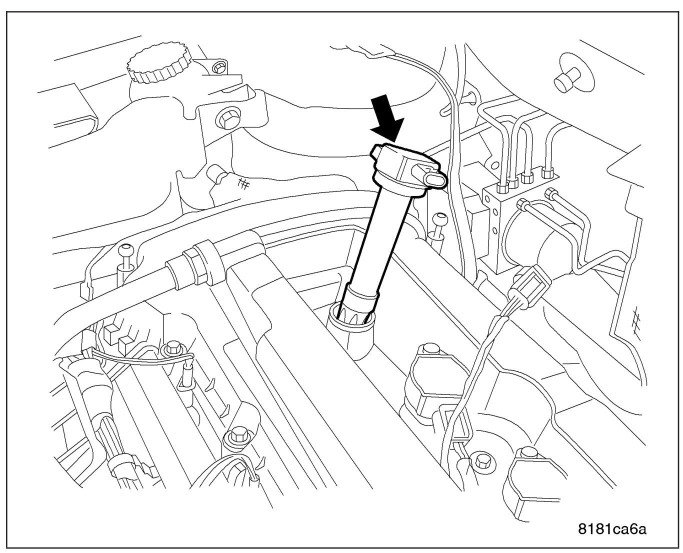
The electronic ignition coil attaches directly to the valve cover.

1. Remove the negative battery cable.
2. Disconnect electrical connector from ignition coil.

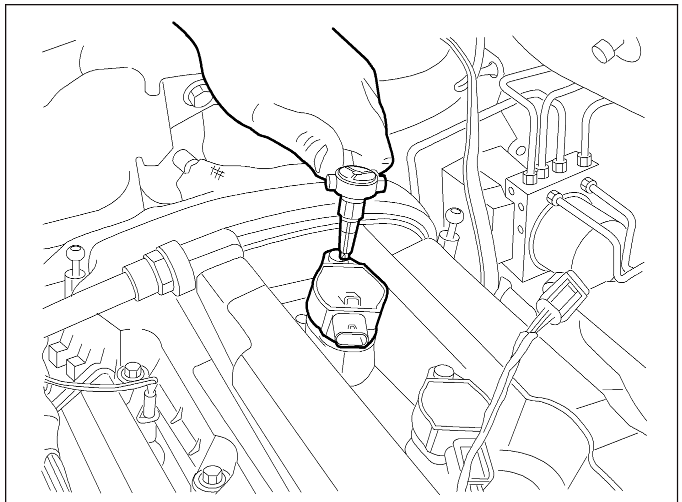


8181ca59

3. Remove ignition coil mounting bolts.

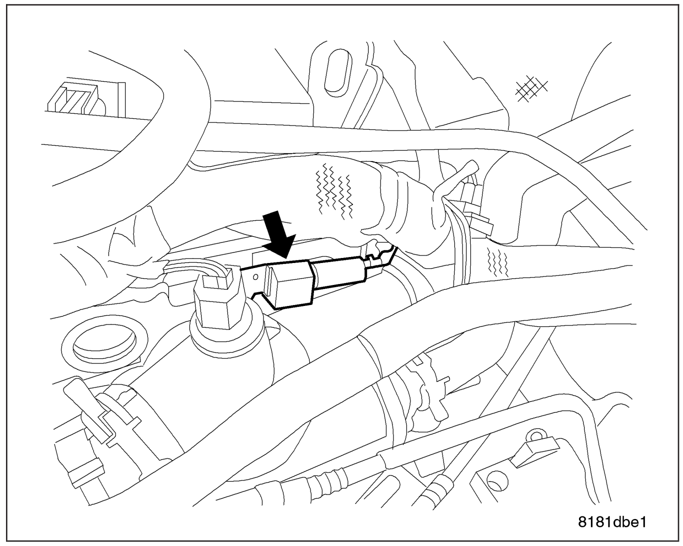


4. Remove ignition coil.



INSTALLATION

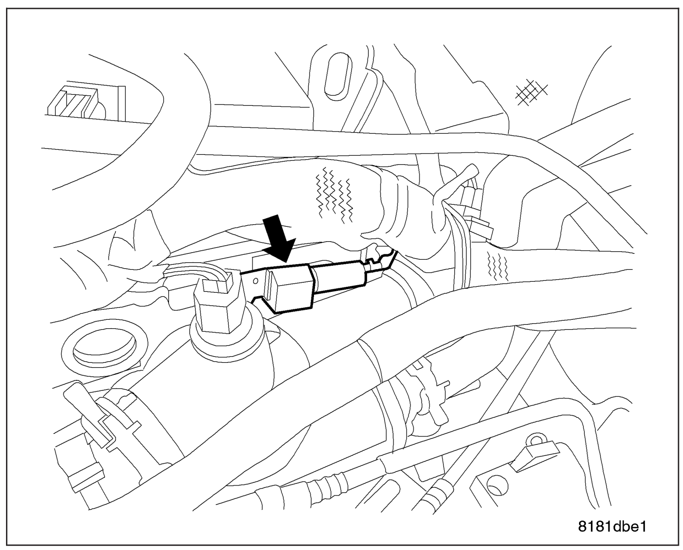
1. Install ignition coil.



2. Tighten bolt to 8 N·m (71 ins. lbs.).
3. Connect electrical connectors and lock.
4. Install the negative battery cable.

8181d713

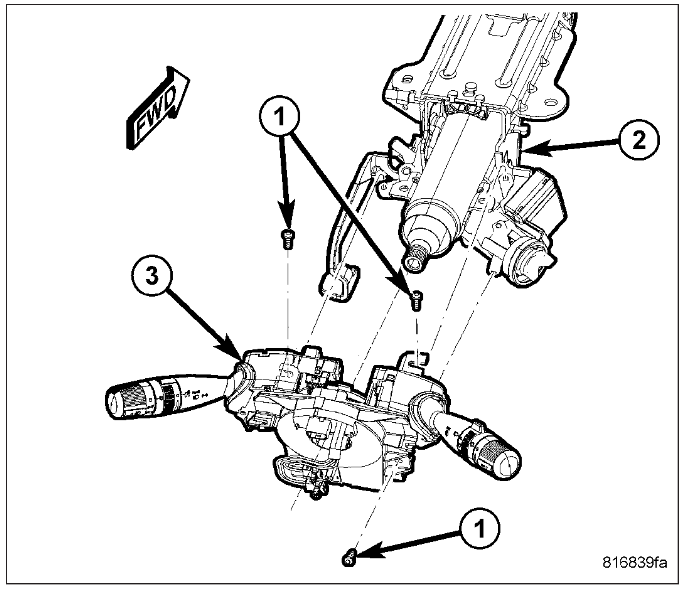
CAPACITOR-IGNITION COIL



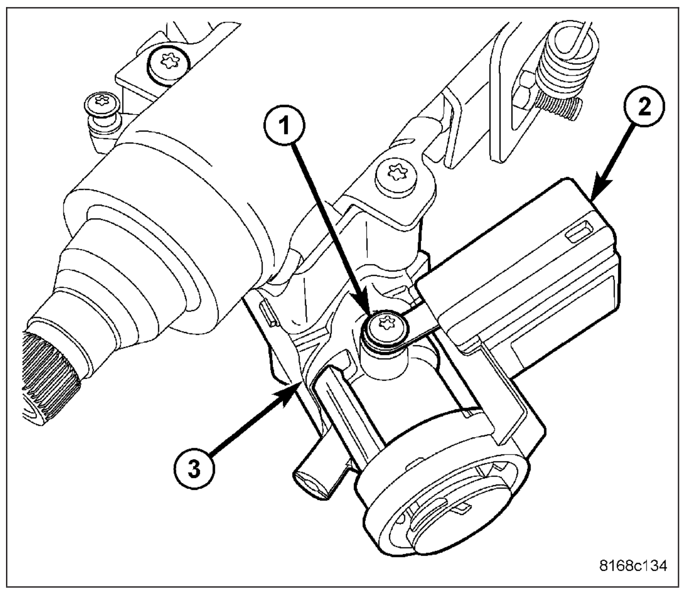
REMOVAL

1. Disconnect the negative battery cable.
2. Remove the electrical connector from the ignition coil capacitor.
3. Remove mounting bolt and remove capacitor.

INSTALLATION

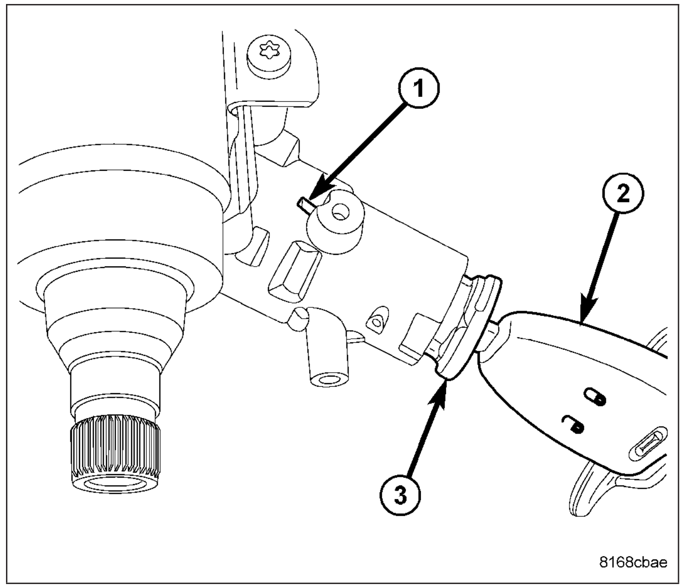


1. Install coil capacitor and mounting bolt and tighten to 12 N·m (105 in. lbs.).
2. Connect the electrical connector.
3. Connect the negative battery cable.

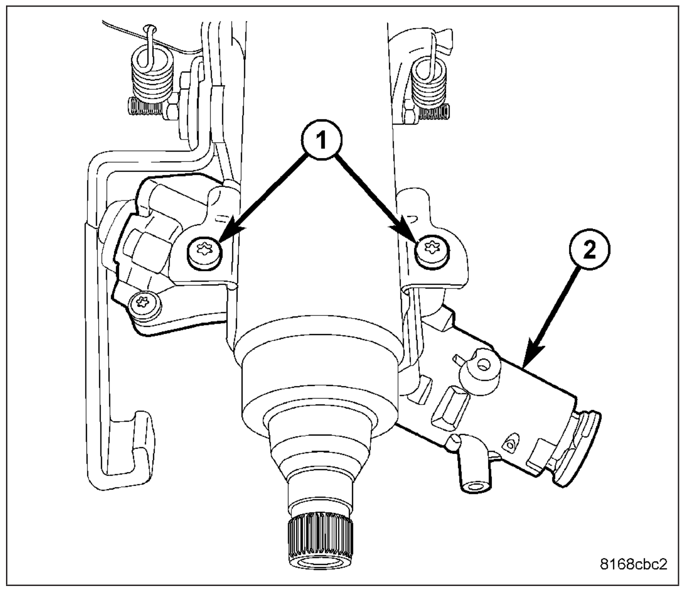


IGNITION SWITCH

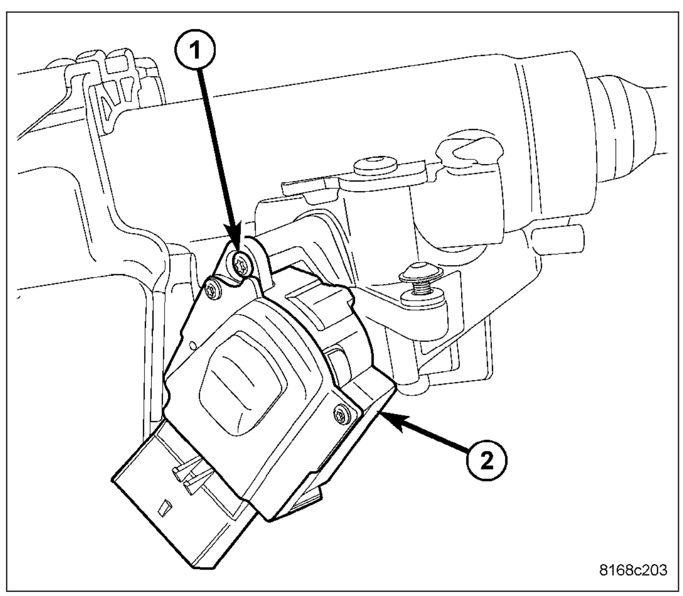
REMOVAL



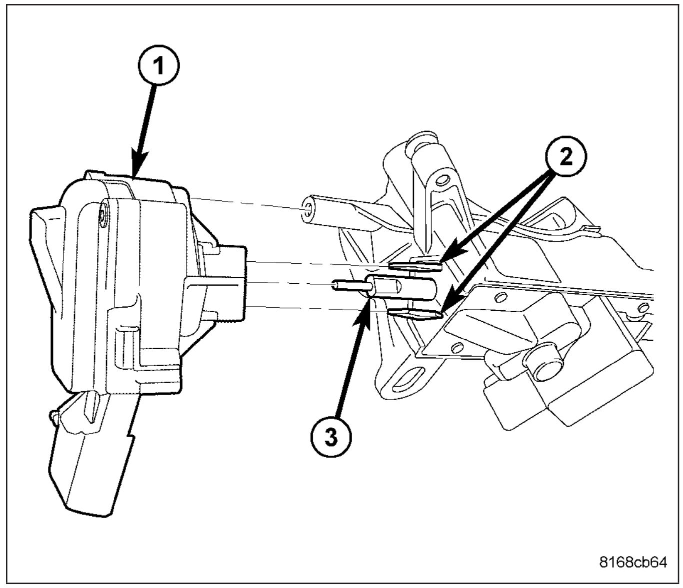
1. Access and remove the Steering Column Control Module (SCCM) (3) from the steering column (2). (Refer to 19 - STEERING/COLUMN/STEERING COLUMN CONTROL MODULE - REMOVAL)



2. Remove the screw (1) fastening the SKREEM/ WCM (2) to the lock cylinder housing (3).
3. Unhook the SKREEM/WCM (2) retainer fingers from the lock cylinder housing (3) and remove it.

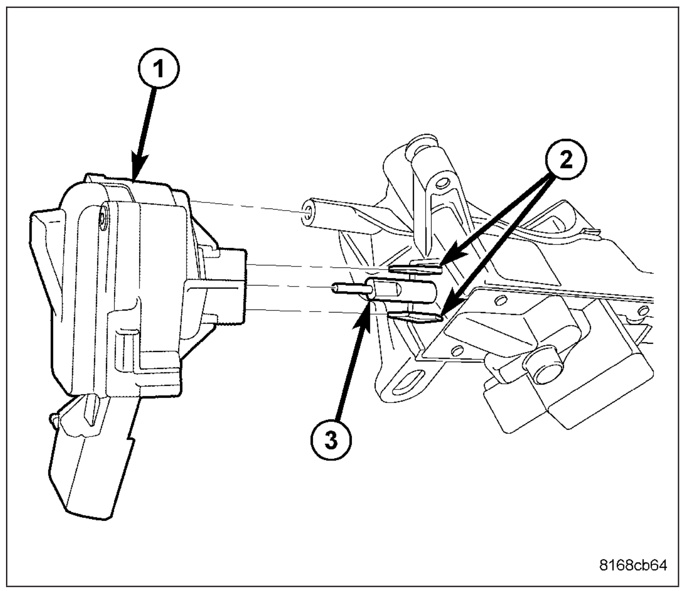


4. Insert the key (2) and turn the key cylinder (3) to the RUN position.
5. Insert an appropriate tool into the slot (1) formed into the lock cylinder housing depressing the key cylinder retaining tab.
6. Pull the key cylinder and key straight out of the lock cylinder housing as one unit.

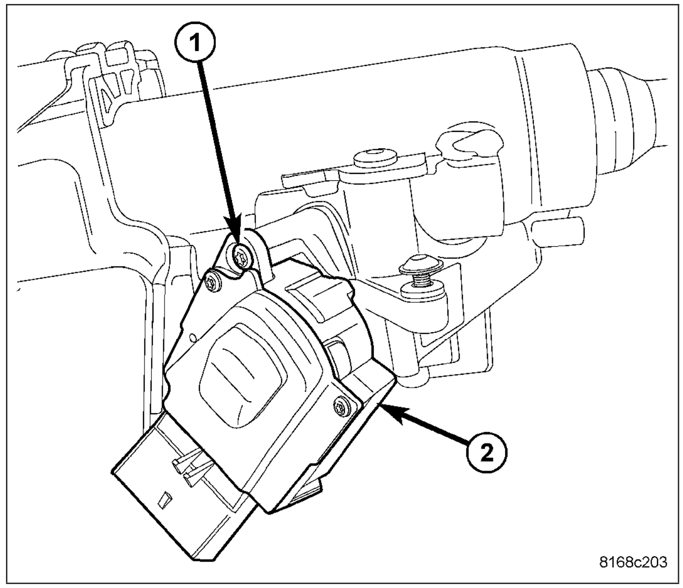


7. Using a Tamper-Proof Torx® Plus (five point) 30 bit, remove the two screws (1) fastening the lock cylinder housing (2) to the column.
8. Remove the lock cylinder housing from the steering column.

9. Remove the ignition switch (2) mounting screw (1).



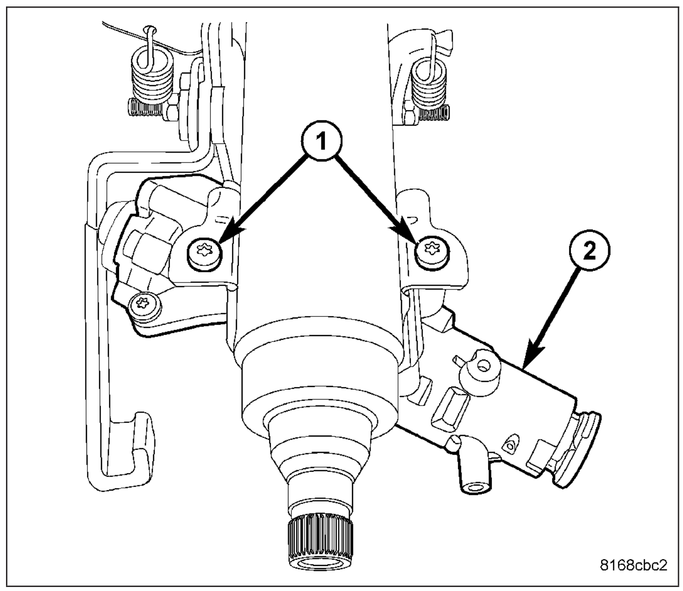
10. Pull the switch (1) straight out and off the retaining tabs (2) located on the lock cylinder housing.



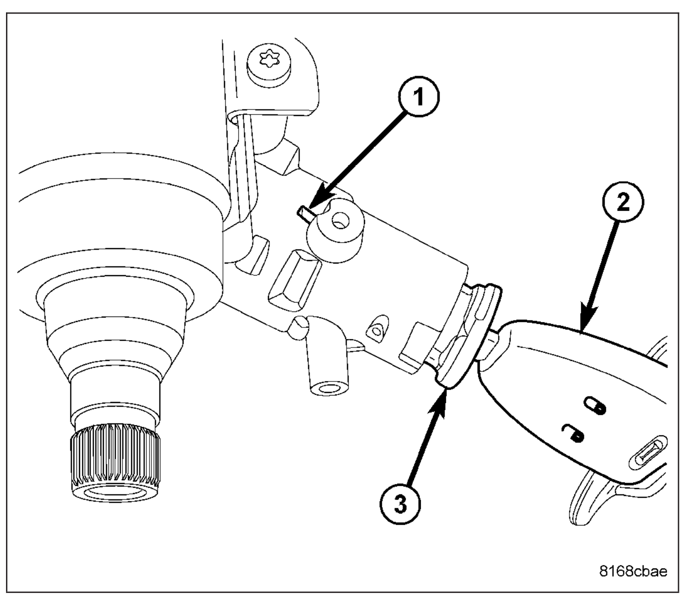
INSTALLATION

NOTE: Ignition switch must be installed prior to lock housing installation on column. Otherwise, the tilt lever will obstruct installation of ignition switch.

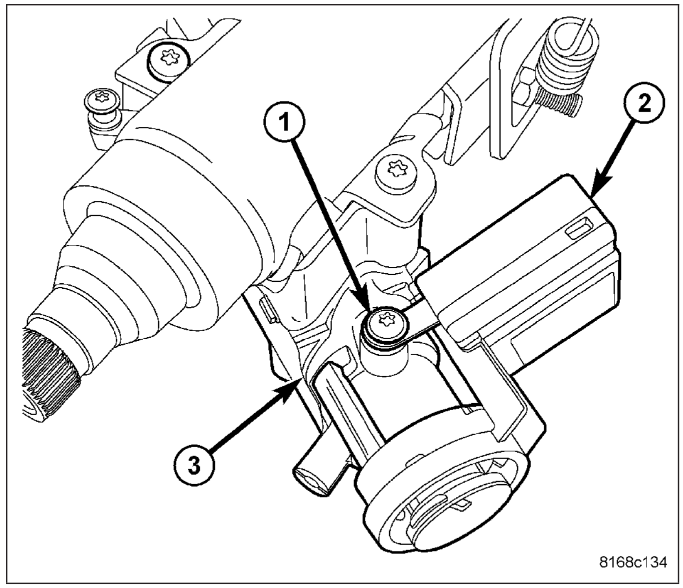
1. Ensure the ignition switch is in the RUN position and the actuator shaft in the lock housing is in the RUN position.
2. Align the ignition switch with the pin (3), actuator shaft and retaining tabs (2) located on the lock cylinder housing. Carefully install the switch, snapping it into place over the retaining tabs.



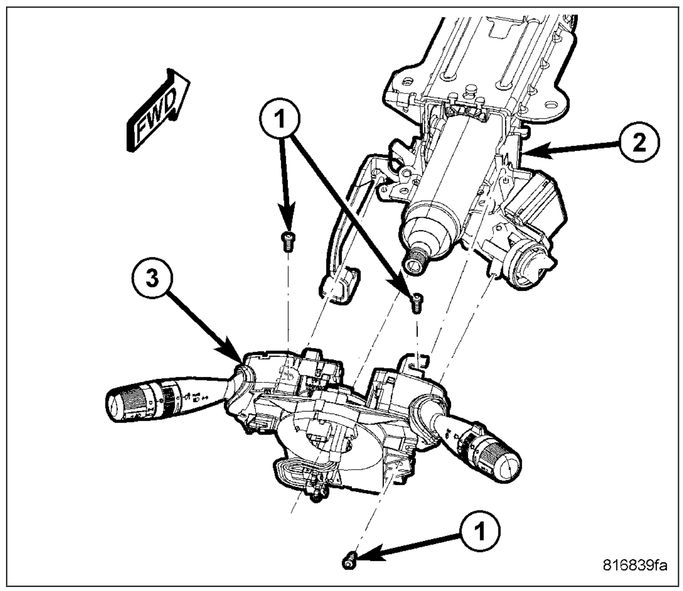
3. Install the ignition switch (2) mounting screw (1). Tighten the screw to 2 N·m (18 in. lbs.).



NOTE: Ignition switch needs to be installed on lock cylinder housing before housing installation to clear tilt lever.



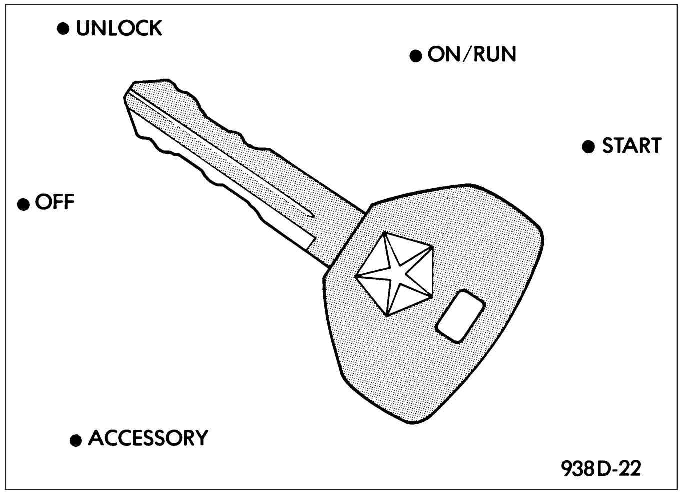
4. Position the lock cylinder housing in the RUN position.
5. Align the lock cylinder housing (2) with the steering column.
6. Install the two screws (1) fastening the lock cylinder housing (2) to the column. Tighten the screws to 12 N·m (110 in. lbs.).



7. Place the actuator in the lock cylinder housing to the RUN position (if not already there).
8. Insert the key into the key cylinder and turn the key cylinder to the RUN position.
9. Align the retaining tab on the key cylinder with the slot in the top of the lock cylinder housing.
10. Slide the key cylinder into the lock cylinder housing until the key cylinder retaining tab locks the cylinder into place.
11. Rotate the key back and forth (OFF to START), then remove and reinstall it, making sure the key cylinder and lock cylinder housing operate properly.

12. Slide the ring of the SKREEM/WCM (2) over the lock cylinder housing (3) and engage the retainer fingers in the recesses formed on the lock cylinder housing.
13. Install the screw (1) fastening the SKREEM/WCM (2) to the lock cylinder housing (3). Tighten the screw to 2.5 N·m (22 in. lbs.).

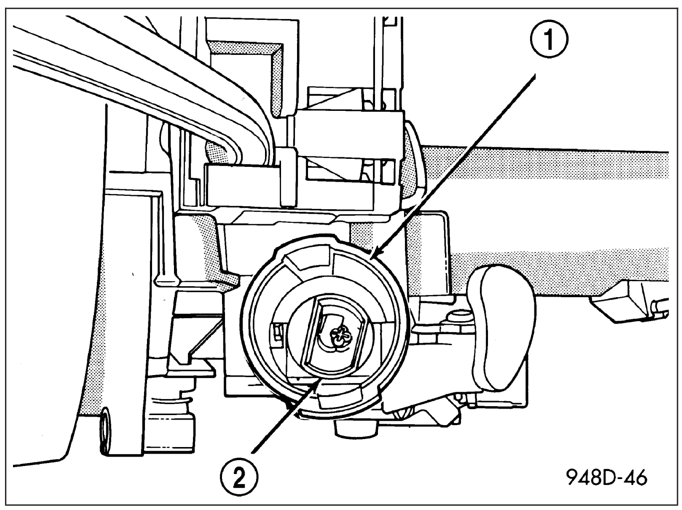
14. Install the Steering Column Control Module (SCCM) (3) and all components removed to access it. (Refer to 19 - STEERING/COLUMN/ STEERING COLUMN CONTROL MODULE - INSTALLATION)
15. Check operation of all steering column mounted components.



KEY/LOCK CYLINDER

REMOVAL

The lock cylinder is inserted in the end of the housing opposite the ignition switch. The ignition key rotates the cylinder to 5 different detentes:



- Accessory
- Off (lock)
- Unlock
- On/Run
- Start

1. Disconnect negative cable from battery.
2. Place key cylinder in RUN position. Through the hole in the lower shroud, depress lock cylinder retaining tab and remove key cylinder.

INSTALLATION

1. Install key in lock cylinder. Turn key to RUN position (retaining tab on lock cylinder can be depressed).
2. The shaft at the end of the lock cylinder aligns with the socket in the end of the housing. To align the socket with the lock cylinder, ensure the socket is in the Run position.
3. Align the lock cylinder with the grooves in the housing. Slide the lock cylinder into the housing until the tab sticks through the opening in the housing.
4. Turn the key to the Off position. Remove the key.
5. Connect negative cable to battery.

SENSOR-KNOCK

DESCRIPTION

The knock sensor is bolted to the cylinder block. The knock sensor is designed to detect engine vibration that is caused by detonation or preignition.

OPERATION

When the knock sensor detects a knock in one of the cylinders, it sends an input signal to the PCM. In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

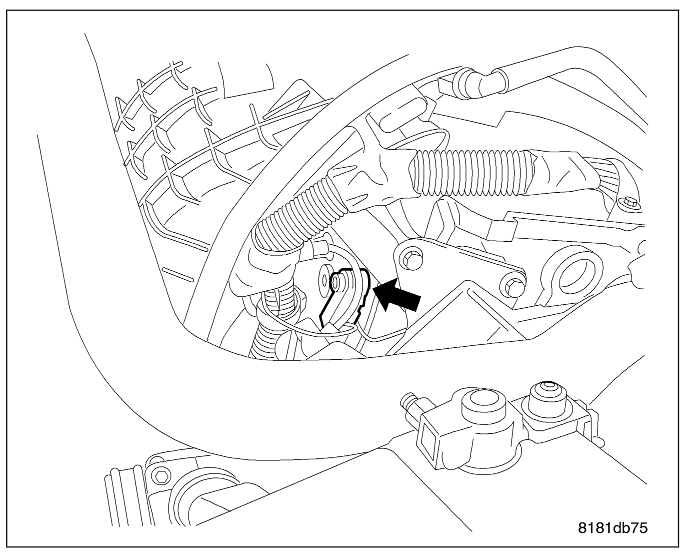
Knock sensors contain a piezoelectric material which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives as an input the knock sensor voltage signal. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

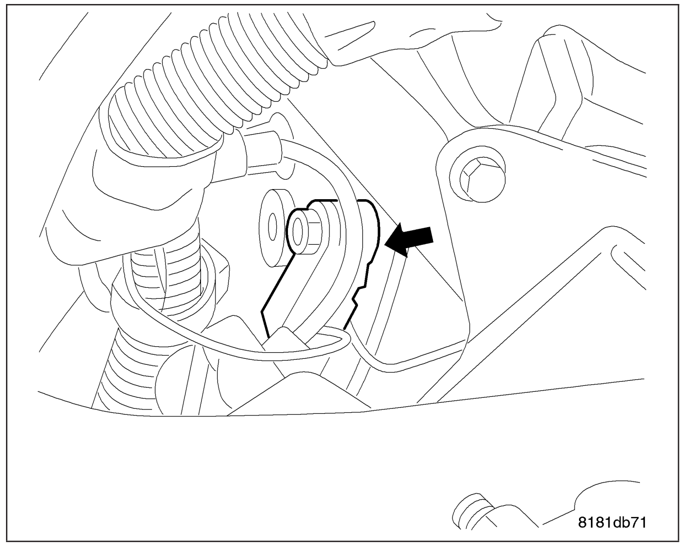
Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.



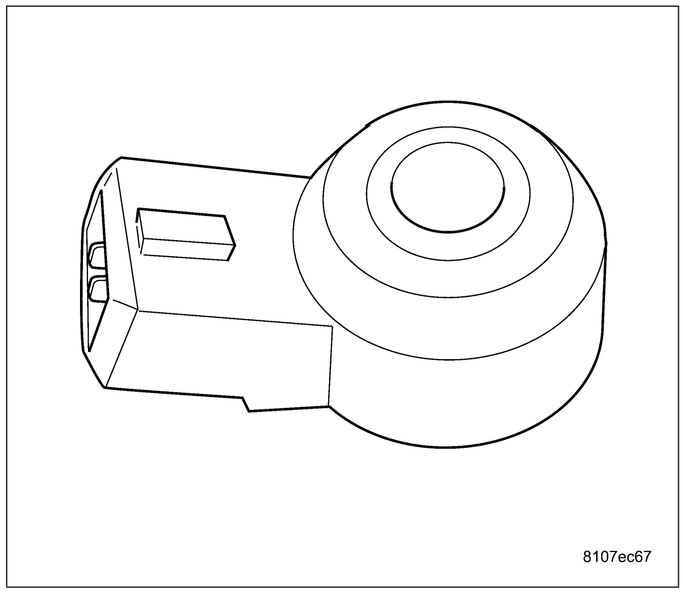
Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as rpm is above the minimum rpm) except WOT. The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: Over or under tightening affects knock sensor performance, possibly causing improper spark control.



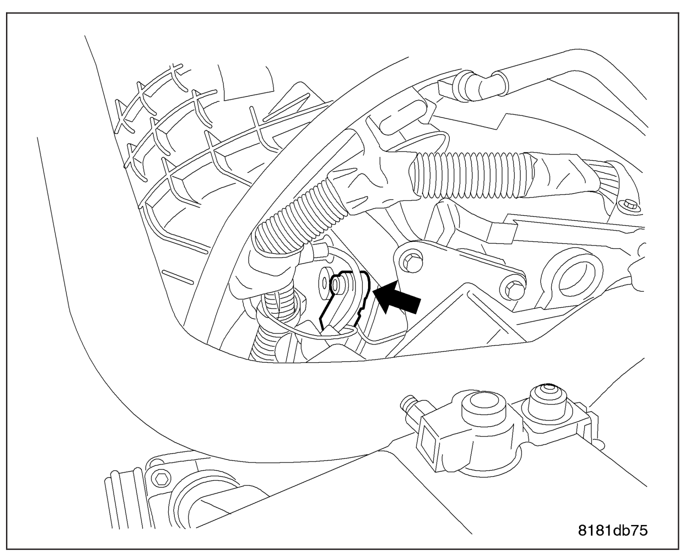
REMOVAL

The knock sensor bolts into the side of the cylinder block in front of the starter under the intake manifold.

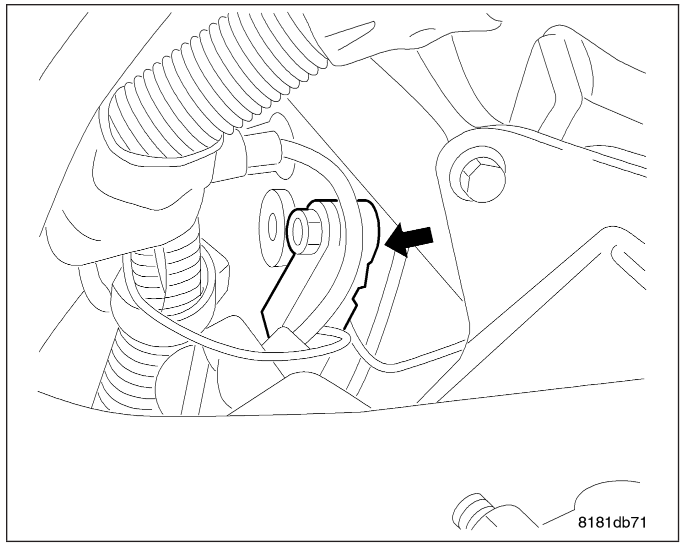


1. Disconnect the negative battery cable.

2. Remove the bolt holding the knock sensor.
3. Remove sensor with electrical connector attached.
4. Disconnect electrical connector from knock sensor.

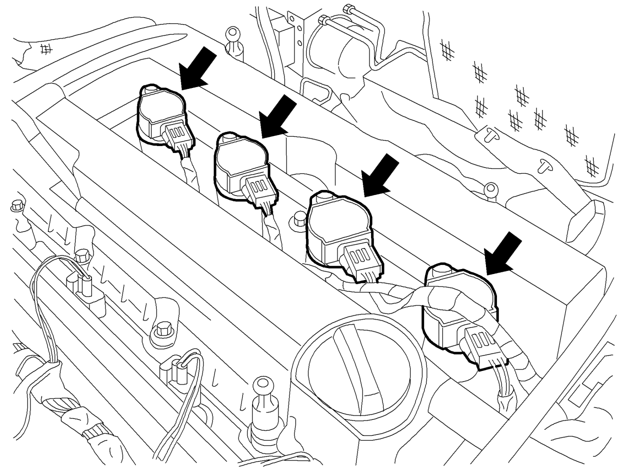


5. Remove the knock sensor.



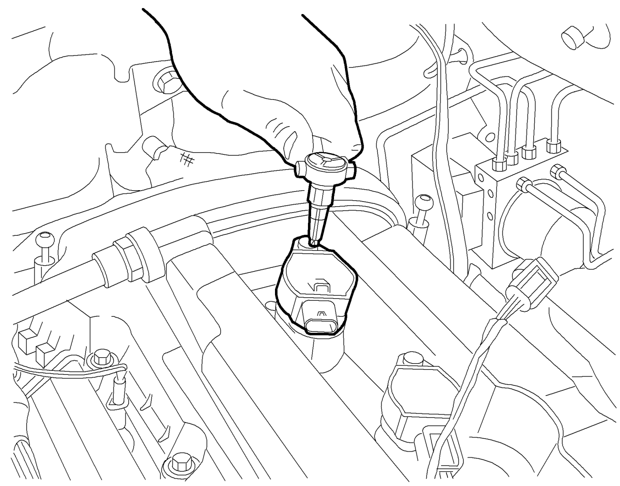
INSTALLATION

The knock sensor bolts into the side of the cylinder block in front of the starter under the intake manifold.



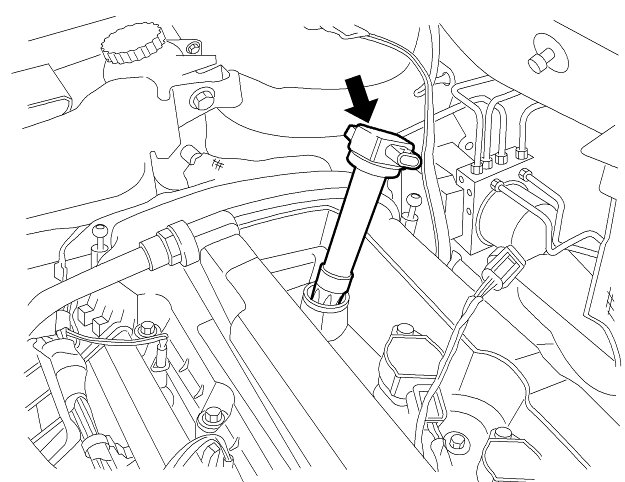
1. Attach electrical connector to knock sensor.
2. Install knock sensor. Tighten knock sensor bolt to 22 N·m (195 in. lbs.) torque. **Over or under tightening effects knock sensor performance, possibly causing improper spark control.**
3. Connect the negative battery cable.

SPARK PLUG



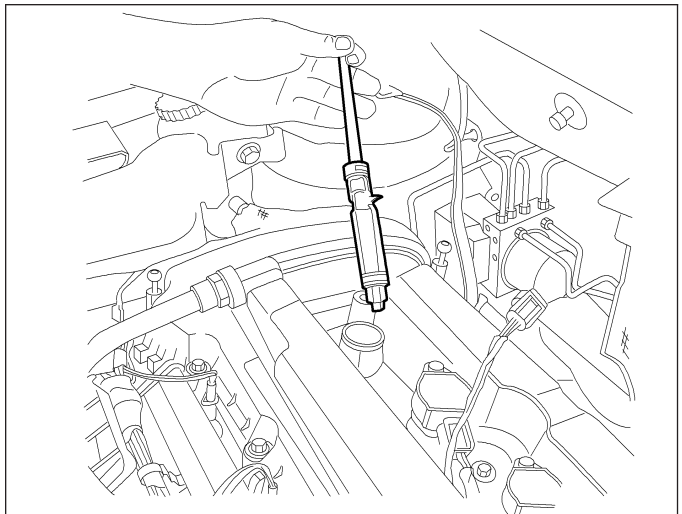
REMOVAL

1. Disconnect the negative battery cable.
2. Disconnect the electrical connectors from ignition coils.



8181ca59

3. Remove the ignition coil mounting bolt.

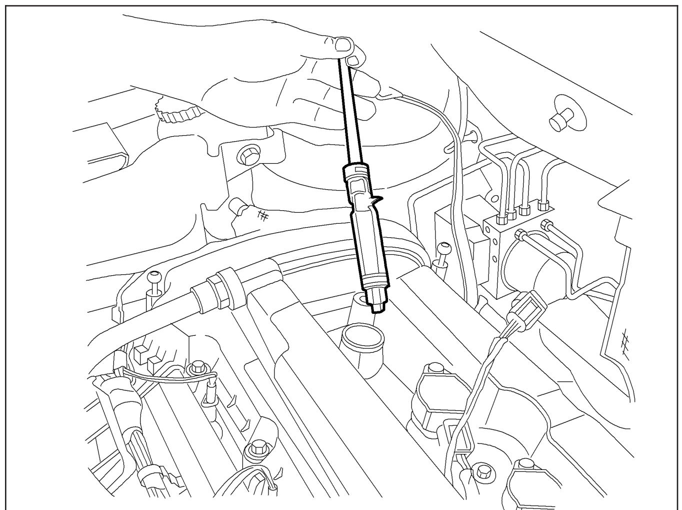


8181d713

4. Twist the ignition coil then pull straight up.

8181ca6a

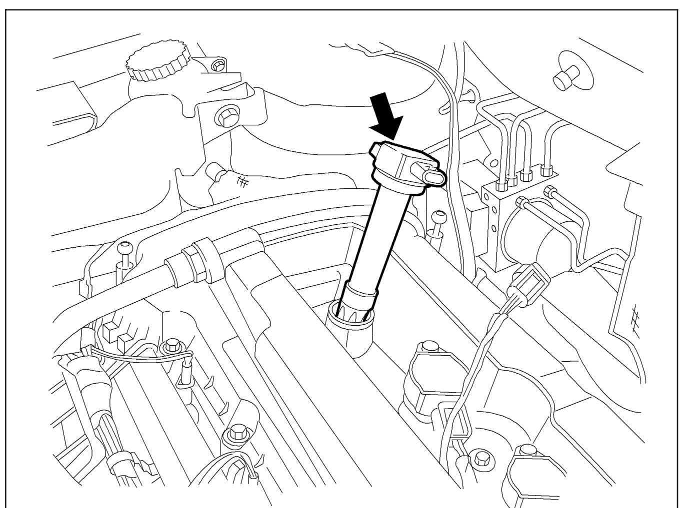
5. Remove the spark plug using a quality socket with a rubber or foam insert.
6. Inspect the spark plug condition.



8181d0d7

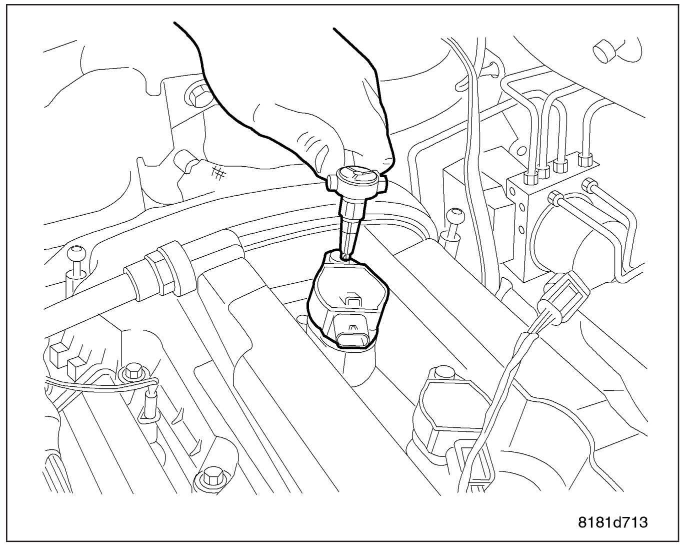
INSTALLATION

Special care should be used when installing spark plugs in the cylinder head spark plug wells. Be sure the plugs do not drop into the wells, damage to the electrodes can occur.



Always tighten spark plugs to the specified torque. Over tightening can cause distortion resulting in a change in the spark plug gap. Overtightening can also damage the cylinder head.

1. To avoid cross threading, start the spark plug into the cylinder head by hand.
2. Tighten spark plugs to 27 N·m (20 ft. lbs.) torque.



8181d0d7

3. Install ignition coil on to spark plug.

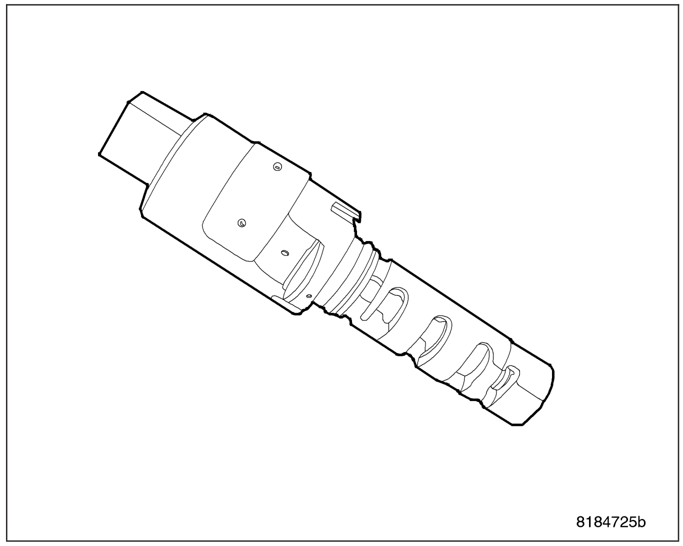
8181ca6a

4. Tighten coil mounting bolt. Tighten to N·m (ft. lbs.) torque.
5. Connect electrical connectors and lock.
6. Connect the negative battery cable.

SOLENOID-VARIABLE VALVE TIMING

DESCRIPTION

Variable valve timing solenoid assembly.



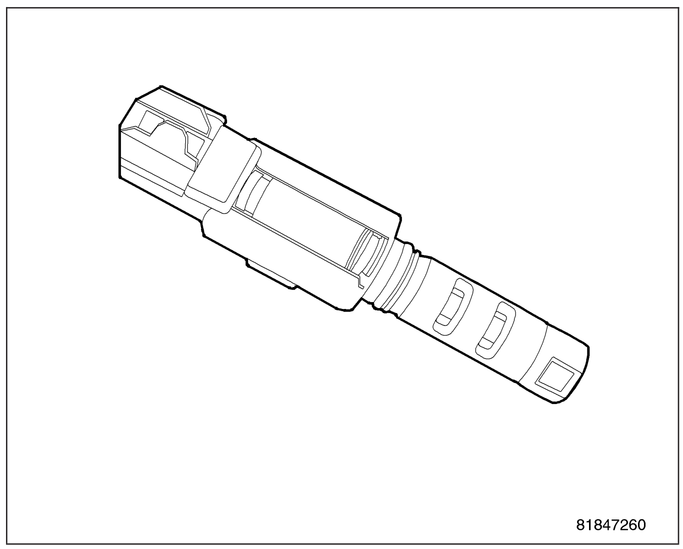


Fig. 1 SOLENOID ASSEMBLY

OPERATION

There is both an Intake and an exhaust camshaft sensor on vehicles equipped with a World Engine. The variable valve timing system used on World Engines requires the exact position of both the intake and exhaust camshaft. The GPEC1 uses camshaft sensor data along with crankshaft data to determine the actual position of the camshafts. Intake and exhaust phaser oil control valves are required on World Engine vehicles using variable valve timing. The oil valves direct oil to the Intake and exhaust phasers. Oil pressure in the phasers moves the camshafts to an advanced or retarded position.

To resolve this inherent conflict between optimum high and low speed valve timing, the GPEC1 controlled engine uses a variable valve timing system. The variable valve timing system advances and retards valve timing by rotating the position of both the intake and exhaust camshafts. With this system, the intake valve opening can range from 80 to 120 crankshaft degrees after Top Dead Center. Likewise, the exhaust valve opening can range from 85 to 120 crankshaft degrees before Top Dead Center. This degree of flexibility provides many benefits, including: Improved Engine Performance, Increased Fuel Economy, Improved Idle Stability and Decreased Engine Emissions.

The variable valve timing system is electronically controlled and hydraulically operated. The GPEC1 receives information from many sensors to determine the optimum valve timing. It then pulse-width modulates oil control valves which direct oil to the cam phasers. The cam phasers use oil pressure to rotate the intake and exhaust camshafts.

The rotation of the camshafts is referred to as cam phasing. Before the GPEC1 can begin commanding the camshaft phasing, several enabling conditions must be met:

- The engine oil temperature must be at least 20°F (-6.6°)
- The oil control valve coil temperature must be less than 280°F (138° C)
- Engine speed must be at least 600 to 1000 rpm
- Battery voltage must be at least 10 volts
- And there must be no camshaft or crankshaft sensor faults, engine timing faults, or oil control valve faults

First we will examine variable valve timing enabling conditions, and then we will take a closer look at the inputs and outputs of the system:

- Accelerator pedal position sensor
- Oil temperature sensor
- Map sensor
- Intake cam sensor
- Exhaust cam sensor
- Crankshaft sensor
- GPEC1
- Exhaust phaser oil control valve
- Intake phaser oil control valve
- Inputs
- Engine control module
- Outputs
- Sensed battery voltage

A minimum oil temperature is required to enable variable valve timing operation. Oil temperature and viscosity also have an impact on the operation of variable valve timing after start-up. Oil is used to control the movement of the camshafts. An incorrect oil viscosity could adversely affect the operation of the system or even render the system inoperative. It may even set a fault code.

The accelerator pedal position sensor indicates how far the driver wants to open the throttle plate. The GPEC1 calculates an initial camshaft set point based on whether the accelerator pedal is at part throttle or wide open throttle.

The MAP sensor provides information regarding engine load.

Sensed battery voltage provides information regarding current system voltage. Sensed battery voltage must be at least 10 volts in order for the oil control valves to function properly

This information allows the GPEC1 to adjust camshaft timing to achieve the best fuel economy, the best engine performance or a combination of both. The hall-effect crankshaft sensor provides RPM information and determines when the number one piston is approaching Top Dead Center. The sensor generates a signal as the tone wheel, attached to the crankshaft, rotates. The tone wheel has 60 teeth minus two. When the gap, created by the missing teeth passes by the sensor, a signal is produced that indicates the number one piston is at Top Dead Center. The GPEC1 uses crankshaft sensor data along with camshaft data to determine the actual position of the camshaft. There are two hall-effect camshaft sensors on engines equipped with variable valve timing. The GPEC1 uses camshaft sensor data along with crankshaft data to determine the actual position of the camshaft.

The GPEC1 individually controls each valve. It sends a pulse width modulated signal to move a spool within the outer casing of the valve. Depending upon spool movement, oil is directed through the passages to advance or retard cam timing. The oil control valve also has a special cleaning strategy at key-on. The cleaning strategy is known as ″debris crush mode″. At key-on the GPEC1 cycles the oil control valve on and off several times to crush any debris in the oil control valve and prevent the spool valve from sticking.

There are two oil control valves. One valve directs oil to the intake cam phaser, the other valve directs oil to the exhaust cam phaser. The valves are designed and function in the same manner. The outer casing of each oil valve has five oil passages. A passage for pressurized supply oil. A passage to the advance chamber of the cam phaser. A passage to the retard chamber of the cam phaser. A passage for oil return from the advance chamber of the cam phaser. A passage for oil return from the retard chamber of the cam phaser. Oil flows through the passages and applies pressure to the cam phasers to change cam timing.

There are two cam phasers. One phaser controls the position of the intake camshaft. The other phaser controls the position of the exhaust camshaft. The phasers consist of a sprocket, a rotor vane, and a housing or stator. The

exhaust cam phaser also consists of a front bushing and spring. We will discuss the purpose and function of the bushing and spring later. The housing is bolted and permanently fixed to the camshaft sprocket, while the rotor vane is bolted and permanently fixed to the camshaft. With this design, any movement of the rotor vane in relation to the housing will also move the camshaft. The phaser and sprocket are serviced as an assembly.

Camshaft and crankshaft sensors provide feedback to the GPEC1 regarding the actual position of the camshafts. The GPEC1 then compares the actual camshaft positioning with desired positioning. If the desired positioning is not achieved within a specified time, during the second key cycle a trouble code is set.

There are six new diagnostic trouble codes available to help you determine if the control circuit from the GPEC1 to the oil control valve is intact and operating properly. The codes identify whether the control circuit is open, shorted to ground, or shorted to power. Three trouble codes are related to intake camshaft positioning, the other three codes are specific to exhaust camshaft positioning.

The oil control valve contains both electrical and mechanical components. It is electrically controlled by the GPEC1. The electrical current that energizes the coil results in mechanical motion of the spool valve. It is possible to verify both the electrical and mechanical operation of the valve. The oil control valve consists of a coil that is energized to move a spool within an outer casing. The condition of the coil can be tested with a Digital Volt Ohmmeter or DVOM. With the DVOM set to measure resistance, check the coil for an open, a short to ground, or excessive resistance. The correct resistance value of the coil is between 6 and 8 ohms. The mechanical operation of the oil control valve can be tested using actuator commands on the scan tool. Remove the oil control valve, then navigate to the actuator menu and select the oil control valve. Use commands to activate the valve and watch as the spool valve moves back and forth inside the casing.

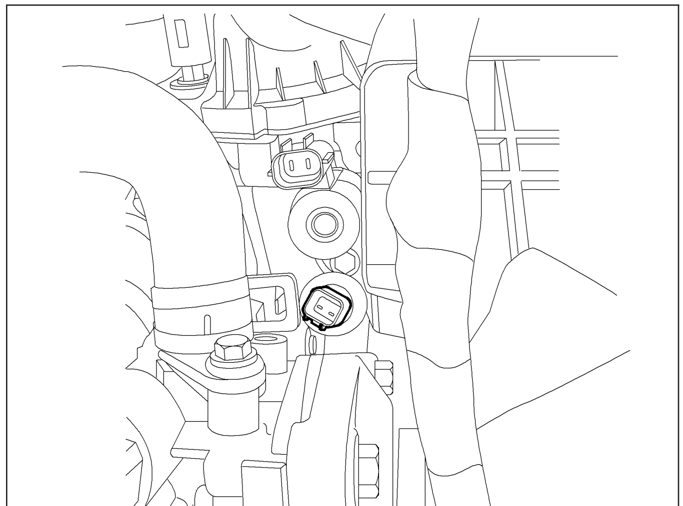
Because the cam phasers are hydraulically operated by engine oil, the condition of the oil is very important. The oil must be of the correct viscosity, not obstructed by debris, and of the correct pressure. Maintaining the correct oil viscosity is critical to the operation of the variable valve timing system. The wrong oil viscosity may cause the variable valve timing to malfunction and trouble codes to set. The correct oil viscosity for this system is 5W20. Oil must be clean, unobstructed and free to flow through the variable valve timing system. Oil could become obstructed in oil passages located in the cylinder head, cylinder block, or even in the oil screen. In the event oil flow is obstructed, further diagnosis or disassembly may be required to pin point the source of the obstruction. The variable valve timing system relies on oil pressure to advance or retard the position of the camshaft. Insufficient oil pressure will adversely affect the operation of variable valve timing. The minimum oil pressure for this system is 15 psi at normal operating temperature.

Though not directly used to change camshaft positioning, the oil screen is an important component of the variable valve timing system. It helps to remove debris going to the variable valve timing components. The oil screen is located in the cylinder block, immediately below the cylinder head. Oil must pass through the oil screen before entering the oil control valve. The cylinder head must be removed to service the oil screen.

How the cam phaser works. The cam phaser assembly has eight separate chambers; four advance chambers and four retard chambers. When camshaft advance is requested, oil enters all four advance chambers and exerts force on the rotor vane. Because the rotor vane is bolted to the camshaft, the entire camshaft profile moves along with the rotor vane. At the same time, oil is forced out of the retard chambers. When camshaft retard is requested oil enters the retard chambers to move the camshaft in the opposite direction. There is a lock pin on one side of the rotor vane that fits inside a recessed area in the housing. The lock pin ensures that the default position of the intake cam phaser is 120 crankshaft degrees full retard and the default position of the exhaust cam phaser is 120 crankshaft degrees full advance. When the engine is turned off, rotational force and inertia move the intake camshaft and rotor vane toward the retard position. The exhaust cam phaser includes a spring and bushing to work against the rotational force of the engine, allowing the exhaust cam phaser to lock in the fully advanced position. Under most conditions the cam phasers are returned to lock pin position when the engine is turned off. In the unique condition of an engine stall, which abruptly shuts off the engine, the cam phasers may not return to the lock pin position. In this case, the phasers will return to the lock pin position at the next start-up. Lock pin position is the most ideal cam timing for idle stability. When engine rpm exceeds approximately 600 to 1000 rpm, oil pressure unlocks the pins and variable valve timing resumes. Once enabling conditions are met, the GPEC1 uses input from sensors to calculate optimum valve timing.

There are four preprogrammed modes from which the GPEC1 bases initial valve timing.

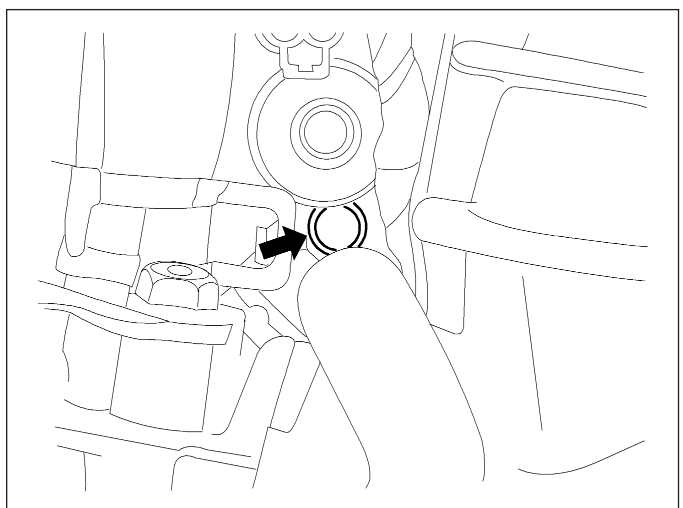
- Starting
- Idle or Part throttle
- Wide open throttle
- Limp-in or Default



From each preprogrammed mode, the GPEC1 adjusts valve timing based on operating conditions.

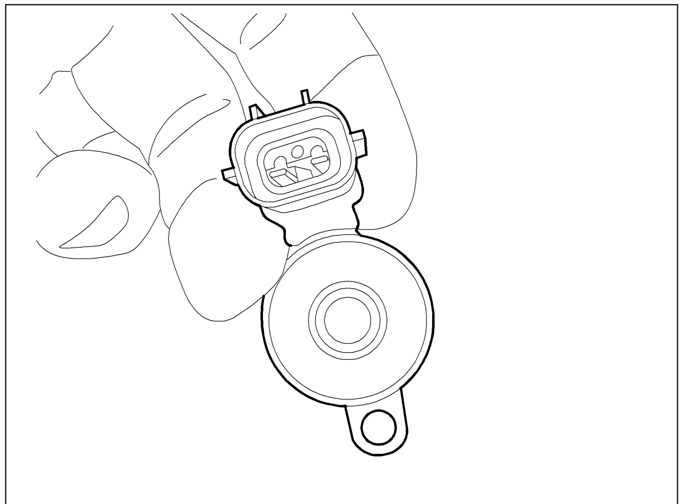
GPEC1 has calculated optimum intake valve timing of 112° after Top Dead Center and optimum exhaust valve timing of 97° before Top Dead Center. The GPEC1 pulse width modulates the oil control valves to advance or retard the camshaft to their desired location. The spool valve inside the intake oil control valve is energized and moves to allow pressurized oil into the advance chambers of the intake cam phaser. At the same time, the spool valve inside the exhaust oil control valve is energized and moves to allow pressurized oil into the retard chambers of the exhaust cam phaser. Oil enters the advance chambers of the intake phaser and the retard chambers of the exhaust phaser. Oil pressure releases the lock pin from its locked position and pushes against the rotor vane. Both the rotor vanes are moved, advancing the intake camshaft and retarding the exhaust camshaft.

REMOVAL



FRONT SOLENOID 1/1

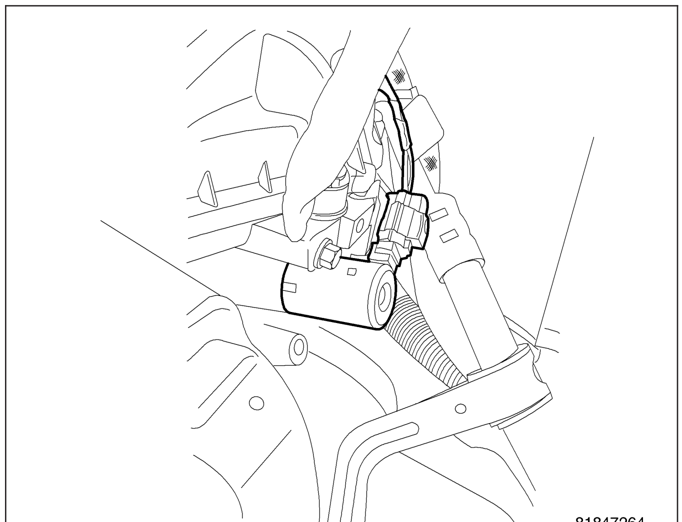
1. Disconnect negative battery cable.
2. Remove engine cover.
3. Rotate hose clamp out of way.
4. Disconnect oil pressure sensor electrical connector.
5. Remove oil pressure sensor.
6. Disconnect variable valve timing solenoid electrical connector.



81847278

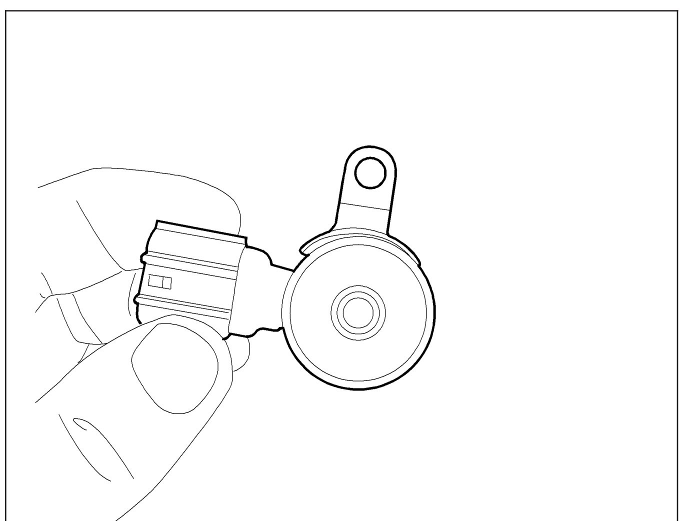
7. Remove variable valve timing solenoid mounting bolt.

81847274



8. Pull solenoid straight out of cylinder head.

8184726c

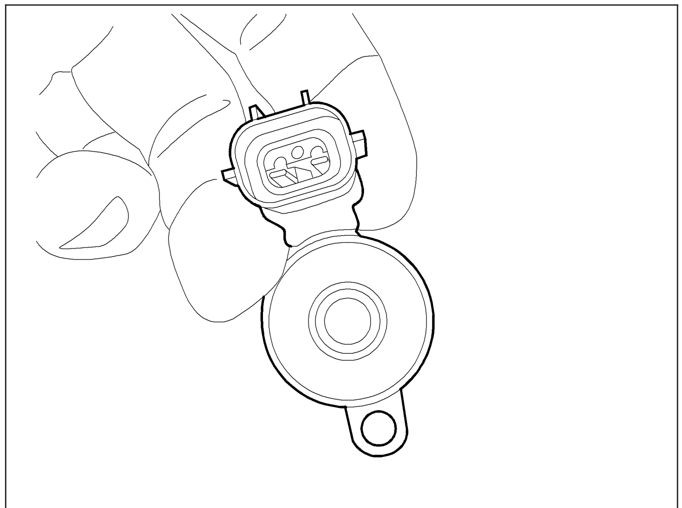


REAR SOLENOID 1/2

1. Disconnect negative battery cable.
2. Remove engine cover.
3. Disconnect variable valve timing solenoid electrical connector.
4. Remove variable valve timing solenoid mounting bolt.

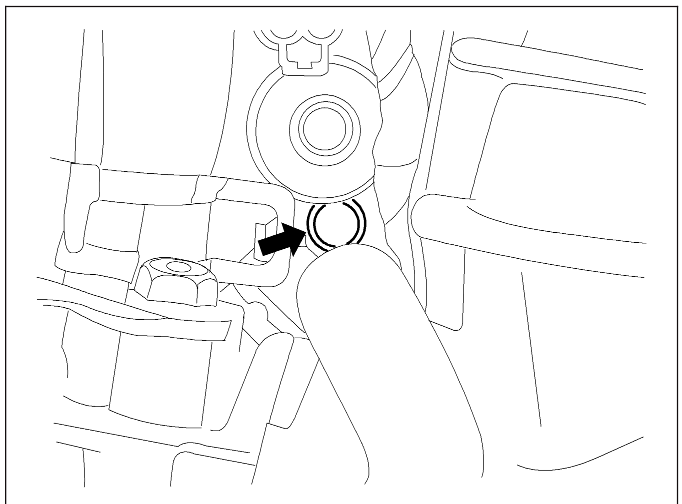
81847264

5. Pull solenoid straight out of cylinder head.



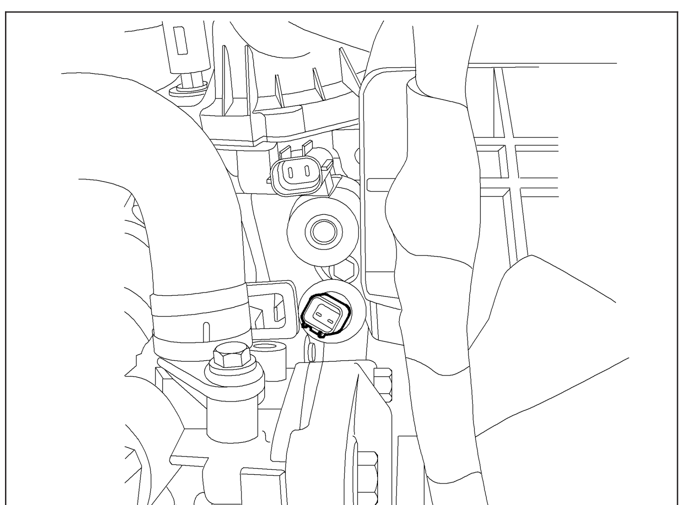
81847268

INSTALLATION



FRONT SOLENOID 1/1

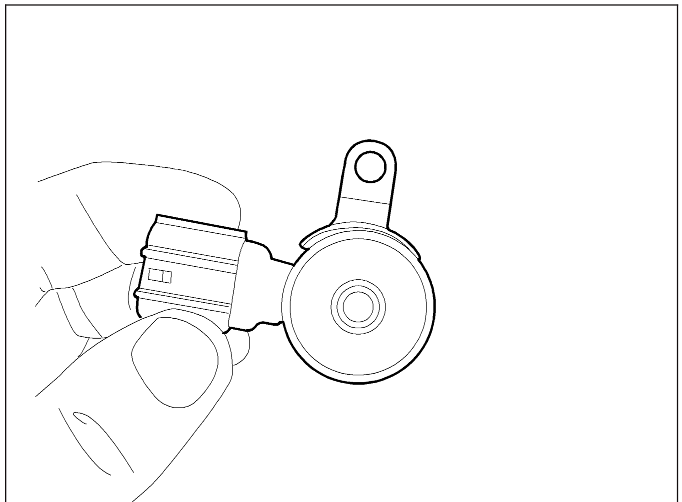
1. Solenoid for front location 1/1.



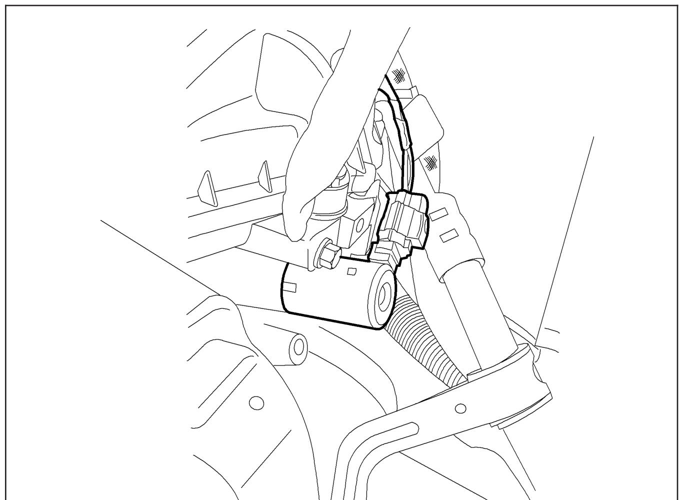
8184726c

2. Install solenoid into cylinder head.
3. Install mounting bolt and tighten to 12 N·m (9 ft. lbs.).

81847274



4. Install oil pressure sensor.
5. Connect electrical connector to oil pressure sensor.
6. Connect electrical connector to Variable valve timing solenoid.
7. Connect negative battery cable.
8. Install engine cover.



81847278

REAR SOLENOID 1/2

1. Rear variable valve timing solenoid.
2. Install solenoid into cylinder head.
3. Install mounting bolt and tighten to 12 N·m (9 ft. lbs.).
4. Connect electrical connector to Variable valve timing solenoid.

81847268

5. Connect negative battery cable.
6. Install engine cover.

81847264

INSTRUMENT CLUSTER

TABLE OF CONTENTS

INSTRUMENT CLUSTER - ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

INSTRUMENT CLUSTER - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B123F-MENU SWITCH STUCK

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Instrument Cluster detects the Menu Switch active for greater than 20 seconds.

Possible Causes
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Press the MENU switch three times.

With the scan tool, read DTCs.

Does the scan tool display: B123F-MENU SWITCH STUCK?

Yes >> Replace the Cluster in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Test complete

B1265–TRIP/TOGGLE SWITCH STUCK

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Instrument Cluster detects the TRIP/TOGGLE Switch active for greater than 20 seconds.

Possible Causes
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Press the TRIP/TOGGLE switch three times.

With the scan tool, read DTCs.

Does the scan tool display: B1265–TRIP/TOGGLE SWITCH STUCK?

Yes >> Replace the Cluster in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Test complete

B1609-PANEL DIMMER INPUT CIRCUIT/PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Headlamps activated.
- **Set Condition:**
  Panel Dimmer Input circuit incorrect performance.

Possible Causes
STEERING CONTROL MODULE

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display: B1609-PANEL DIMMER INPUT CIRCUIT/PERFORMANCE?

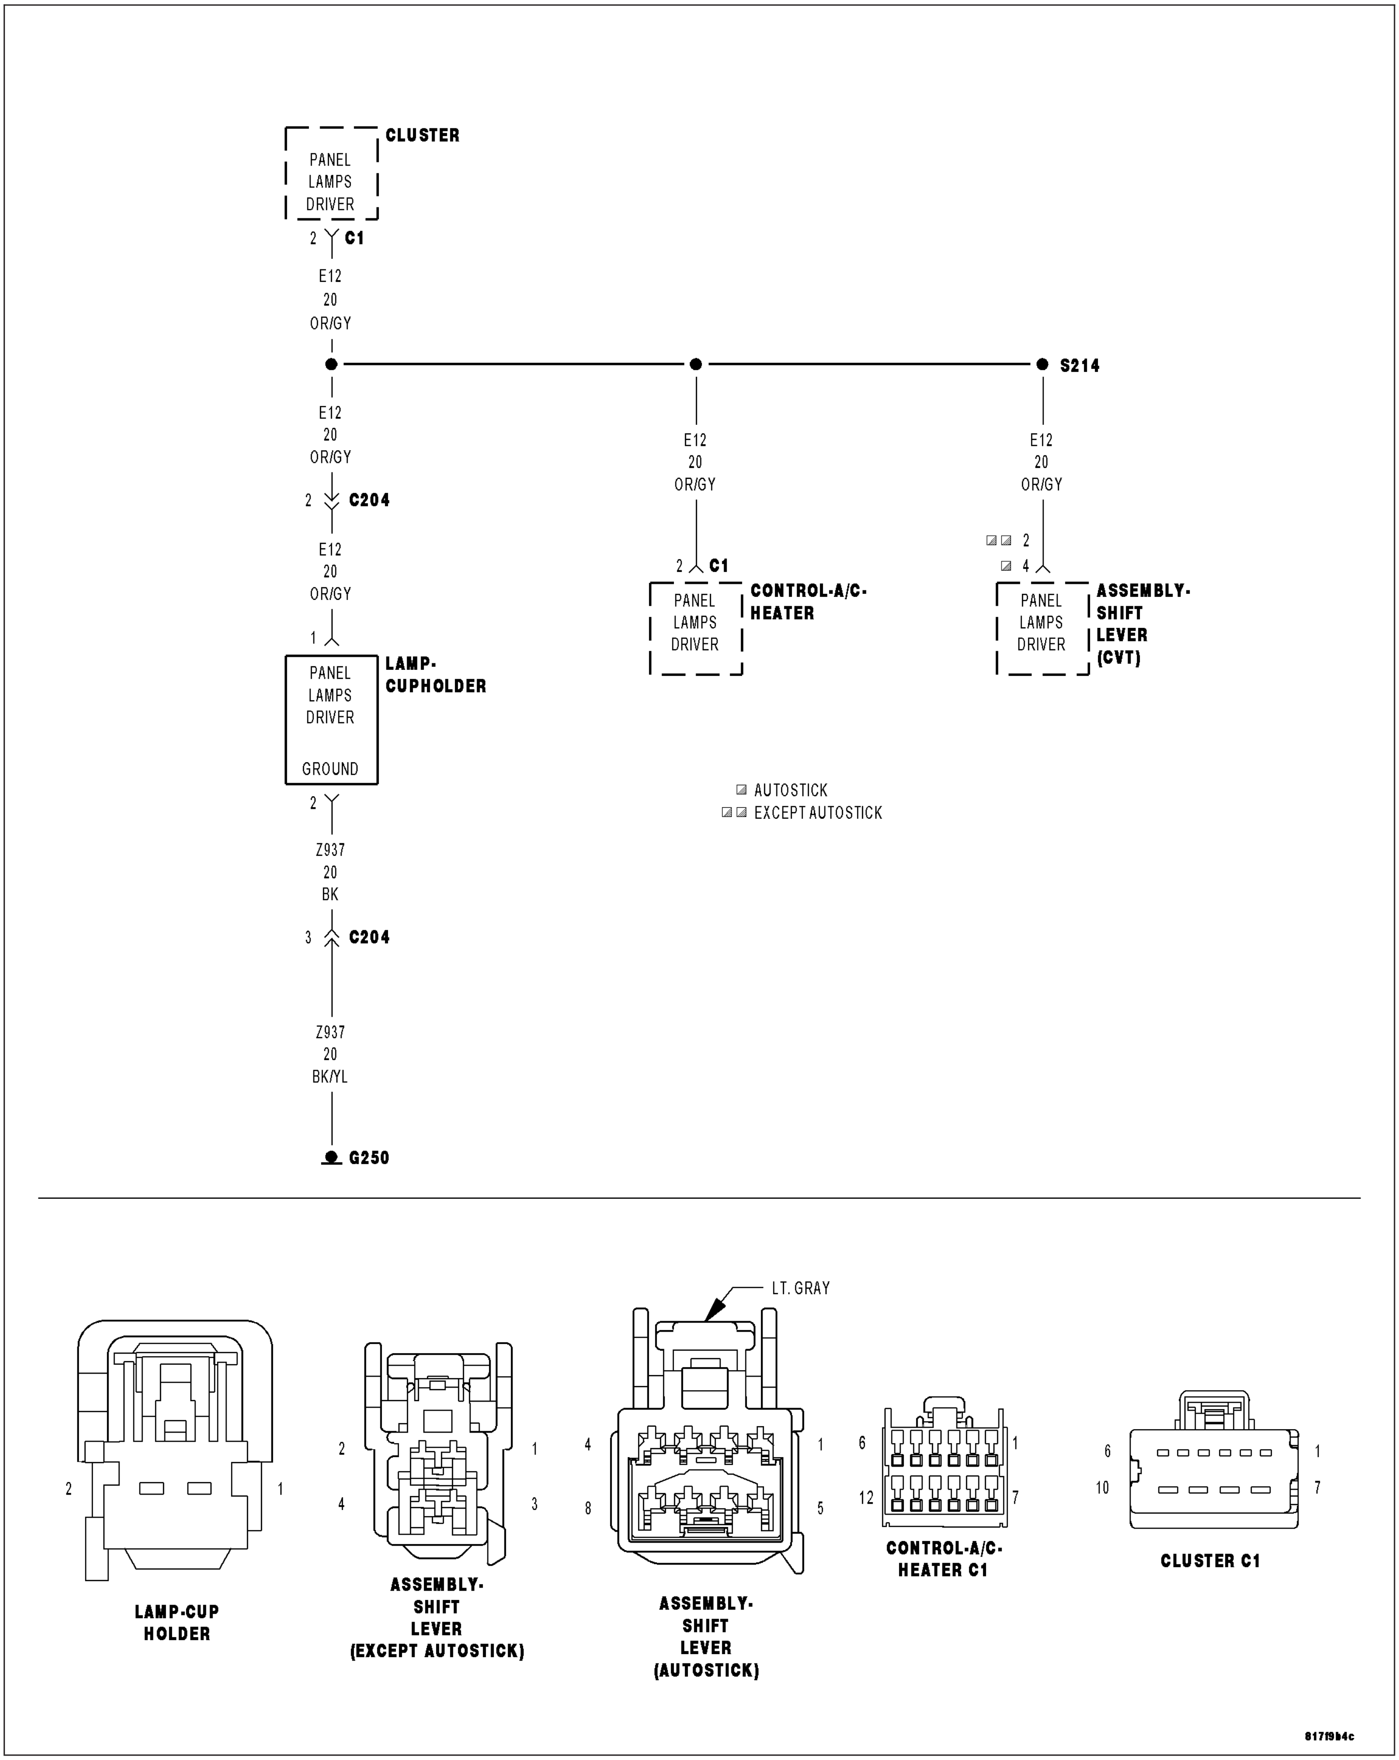
Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. STEERING CONTROL MODULE

The Panel Dimmer Signal is a LIN Bus message from the SCM.



If this DTC is set, view repair.

Continue

Replace the SCM in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1612-PANEL ILLUMINATION CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and the Panel Illumination active.
- **Set Condition:**
  Panel Illumination circuit performance.

Possible Causes
(E12) PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND
(E12) PANEL LAMPS DRIVER CIRCUIT SHORTED TO VOLTAGE
(E12) PANEL LAMPS DRIVER CIRCUIT OPEN
A/C HEATER CONTROL SHORTED TO GROUND
SHIFT LEVER ASSEMBLY SHORTED TO GROUND
CUP HOLDER LAMP SHORTED TO GROUND
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Activate the Panel Illumination.

Wait 30 seconds.

With the scan tool, read DTCs.

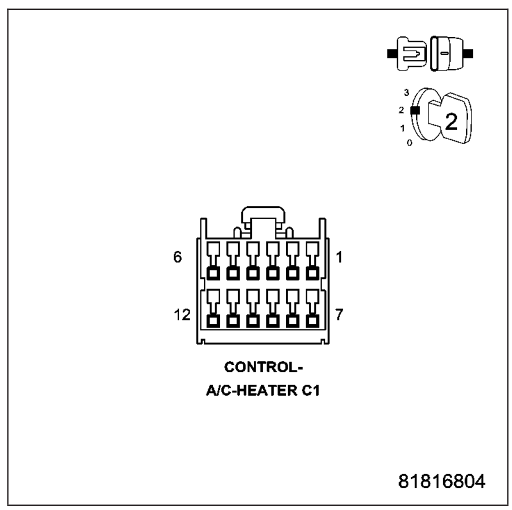
Does the scan tool display: B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE A/C HEATER CONTROL FOR A SHORT TO GROUND



Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

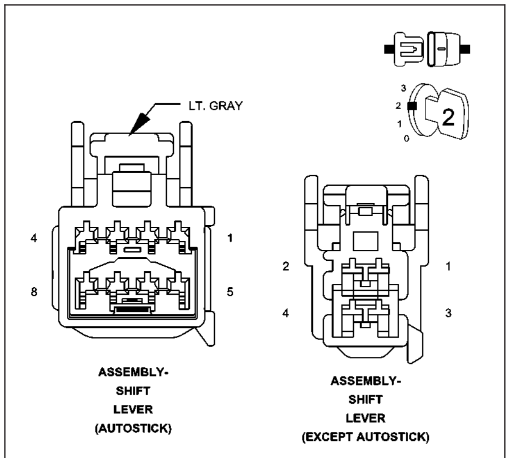
Does the scan tool display: B1612-PANEL ILLUMINATION CONTROL CIRCUIT?

Yes >> Go To 3

No >> Replace the A/C Control Head in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. CHECK THE SHIFT LEVER ASSEMBLY FOR A SHORT TO GROUND



Turn the ignition off.

Disconnect the Shift Lever Assembly harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

8181680b

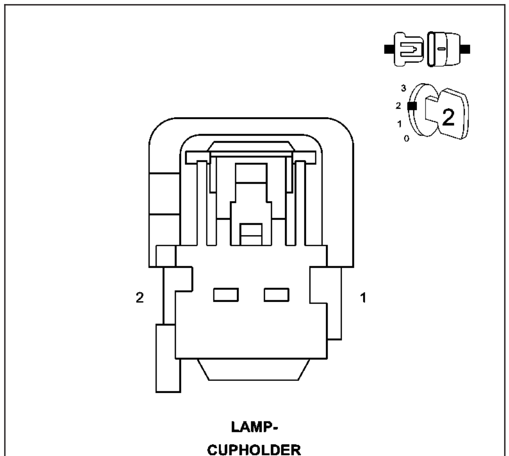
Does the scan tool display: B1612-PANEL ILLUMINATION CONTROL CIRCUIT?

Yes >> Go To 4

No >> Replace the Shift Lever Assembly in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK THE CUP HOLDER LAMP FOR A SHORT TO GROUND



Turn the ignition off.

Disconnect the Cup Holder Lamp harness connector.

Turn the ignition on.

Activate the Panel Illumination.

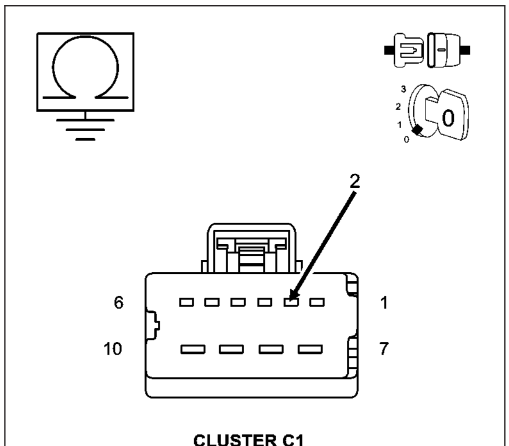
With the scan tool, read DTCs.

81816812

Does the scan tool display: B1612-PANEL ILLUMINATION CONTROL CIRCUIT?

Yes >> Go To 5

No >> Replace the Cup Holder Lamp in accordance with the service information.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

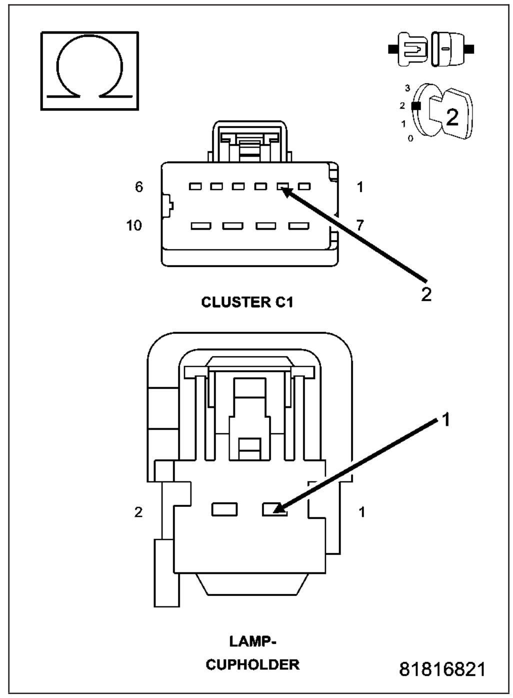
Disconnect the Instrument Cluster C1 harness connector.

With all the above components disconnected, measure the resistance to ground of the (E12) Panel Lamps Driver Circuit from the Instrument Cluster C1 harness connector.

8184e50d

Is the resistance less than 10K ohms?

Yes >> Repair the (E12) Panel Lamps Driver circuit for a short to ground.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

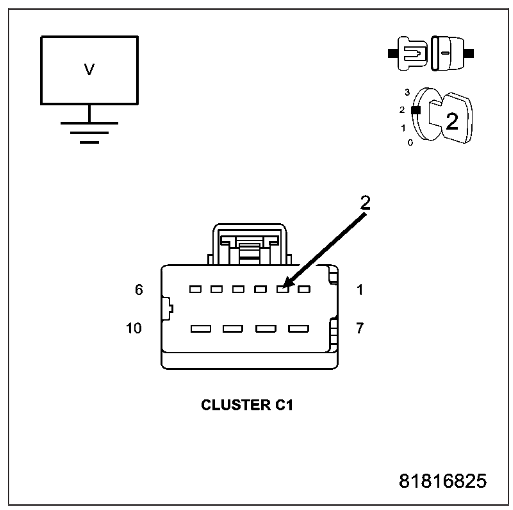
No >> Go To 6

6. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR AN OPEN

Turn the ignition off.

Measure the resistance of the (E12) Panel Lamps Driver Circuit between the Instrument Cluster C1 harness connector and the Cup Holder harness connector.

Is the resistance greater than 10K ohms?



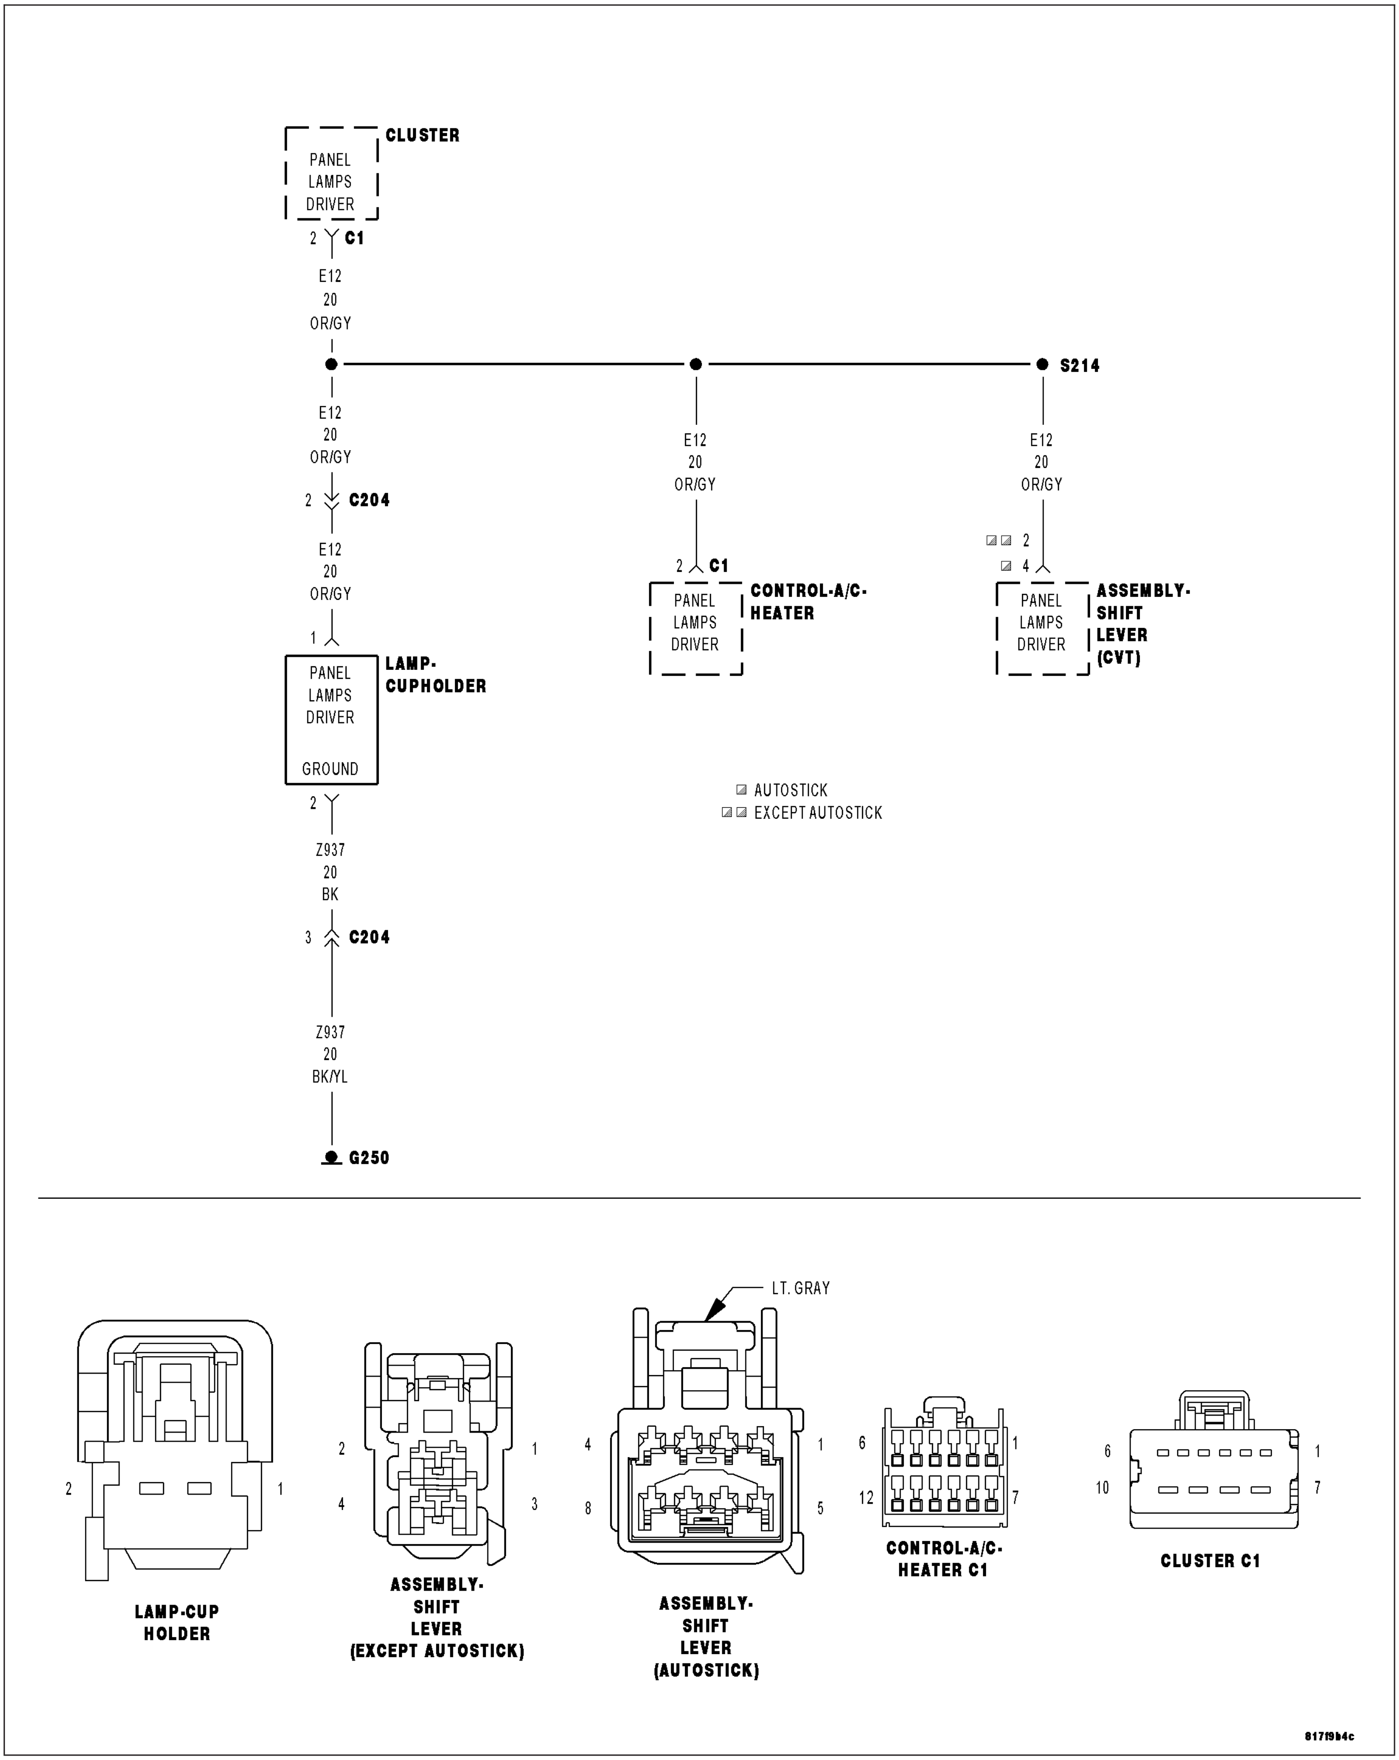
Yes >> Repair the (E12) Panel Lamps Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 7

7. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (E12) Panel Lamps Driver Circuit from the Instrument Cluster C1 harness connector.



Is the voltage above 5.0 volts?

Yes >> Repair the (E12) Panel Lamps Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Cluster in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and the Panel Illumination active.
- **Set Condition:**
  Panel Illumination Status LOW.

Possible Causes
(E12) PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND
A/C HEATER CONTROL SHORTED TO GROUND
SHIFT LEVER ASSEMBLY SHORTED TO GROUND
CUP HOLDER LAMP SHORTED TO GROUND
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Activate the Panel Illumination.

Wait 30 seconds.

With the scan tool, read DTCs.

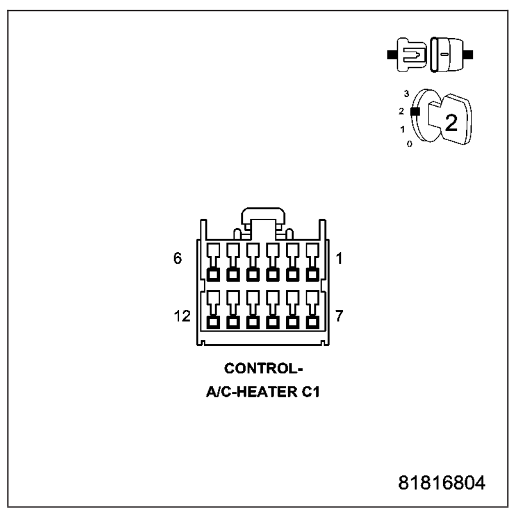
Does the scan tool display: B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE A/C HEATER CONTROL FOR A SHORT TO GROUND



Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

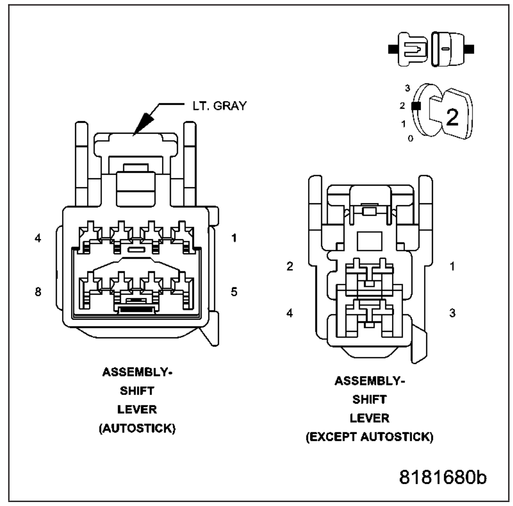
Does the scan tool display: B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW?

Yes >> Go To 3

No >> Replace the A/C Control Head in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. CHECK THE SHIFT LEVER ASSEMBLY FOR A SHORT TO GROUND



Turn the ignition off.

Disconnect the Shift Lever Assembly harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

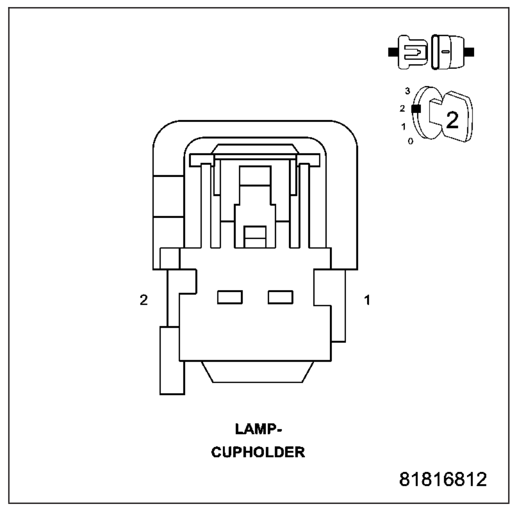
Does the scan tool display: B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW?

Yes >> Go To 4

No >> Replace the Shift Lever Assembly in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. CHECK THE CUP HOLDER LAMP FOR A SHORT TO GROUND



Turn the ignition off.

Disconnect the Cup Holder Lamp harness connector.

Turn the ignition on.

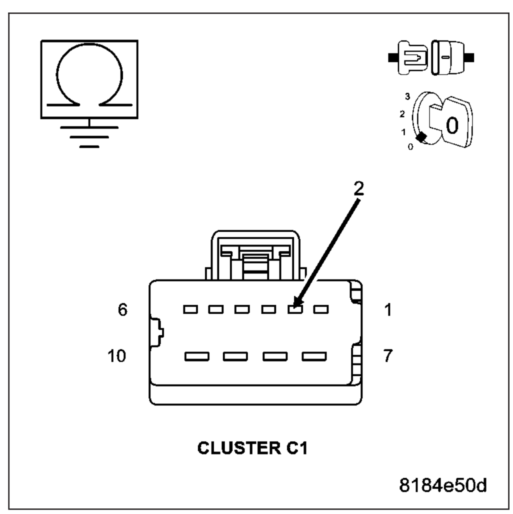
Activate the Panel Illumination.

With the scan tool, read DTCs.

Does the scan tool display: B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW?

Yes >> Go To 5

No >> Replace the Cup Holder Lamp in accordance with the service information.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR A SHORT TO GROUND

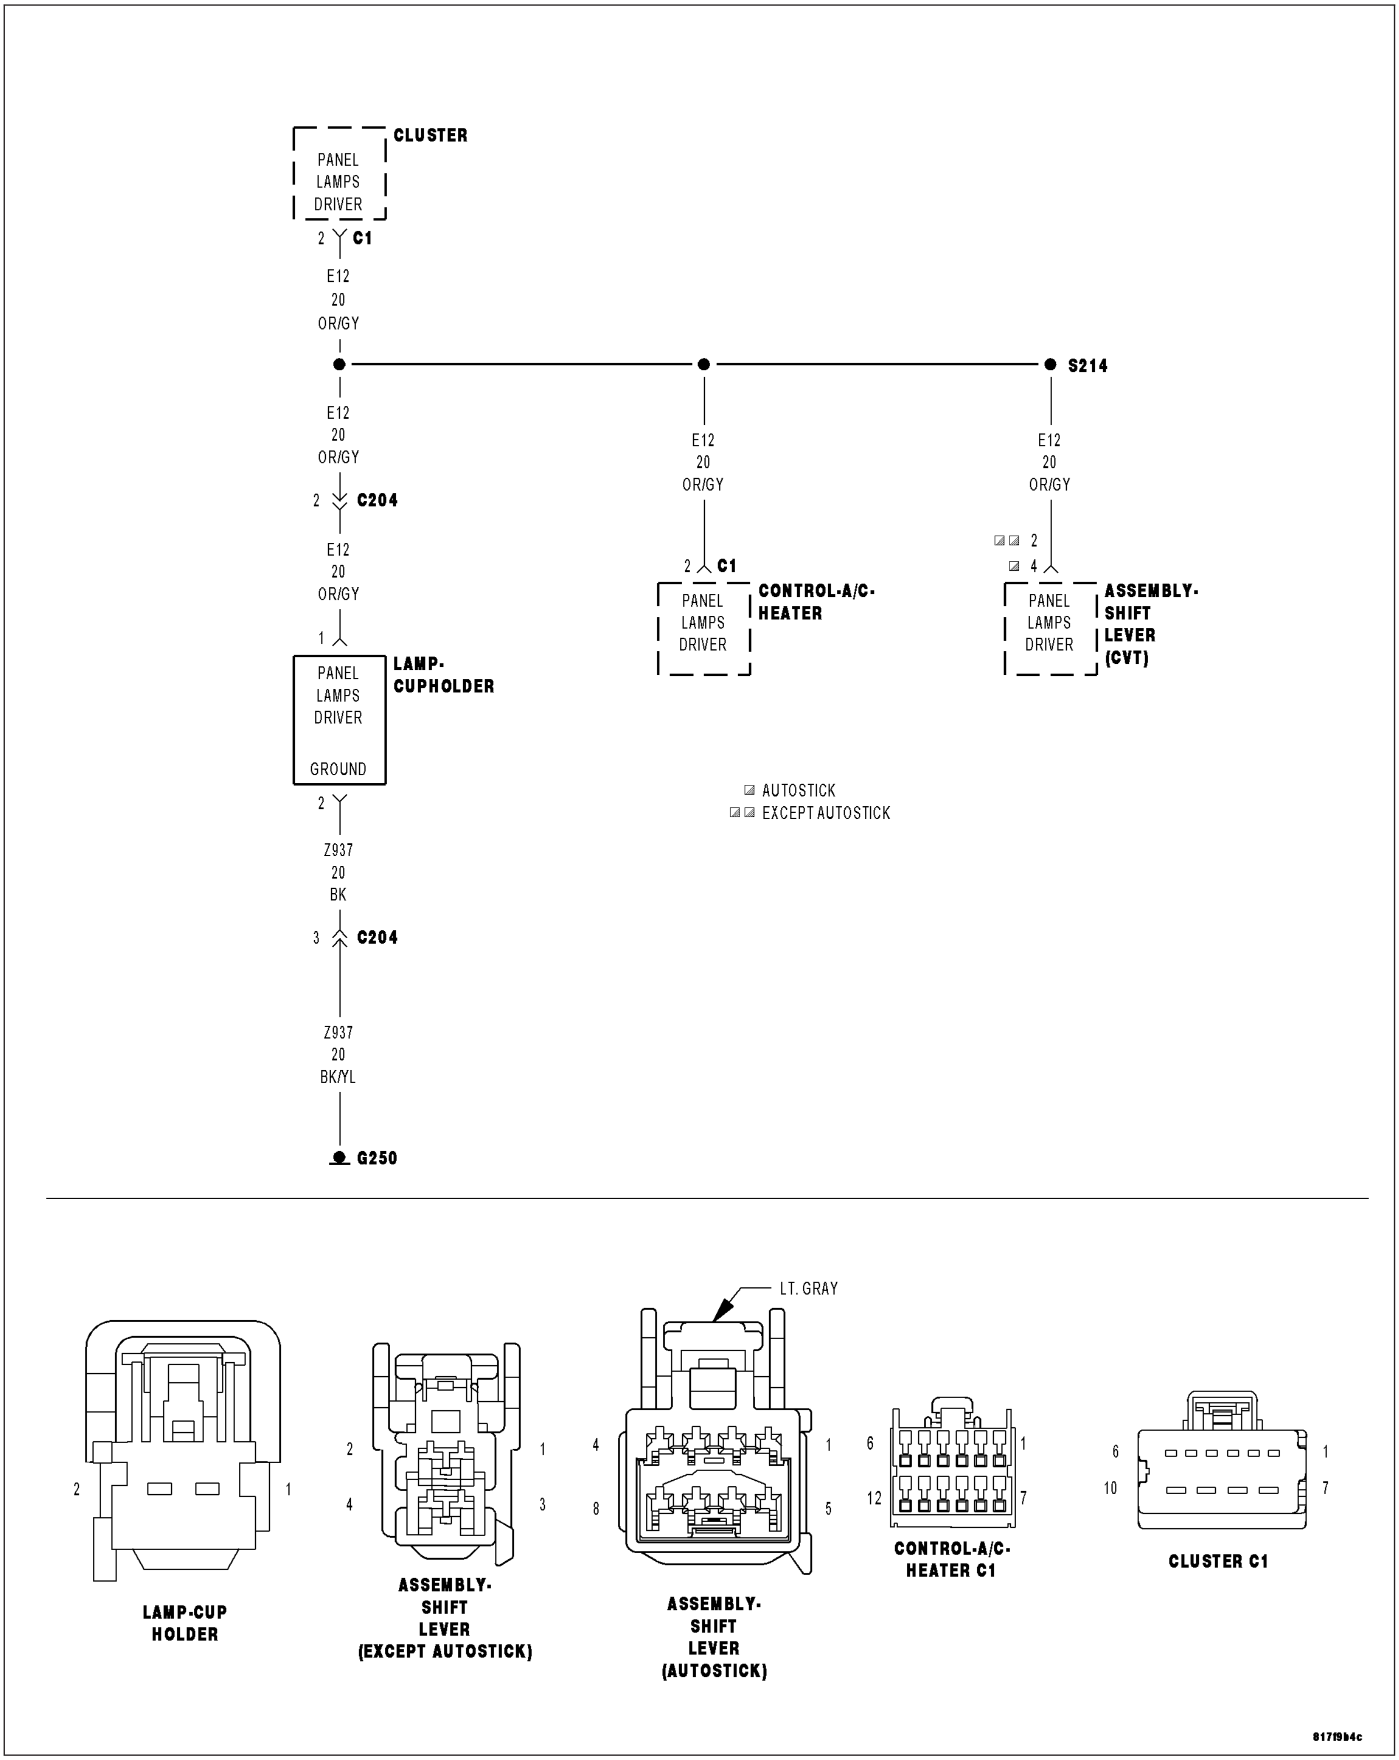
Turn the ignition off.

Disconnect the Instrument Cluster C1 harness connector.

With all the above components disconnected, measure the resistance to ground of the (E12) Panel Lamps Driver Circuit from the Instrument Cluster C1 harness connector.

Is the resistance less than 10K ohms?

Yes >> Repair the (E12) Panel Lamps Driver circuit for a short to ground.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES -

STANDARD PROCEDURE)

B1615-PANEL ILLUMINATION CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and the Panel Illumination active.
- **Set Condition:**
  Panel Illumination Status open.

Possible Causes
(E12) PANEL LAMPS DRIVER CIRCUIT SHORTED TO VOLTAGE
(E12) PANEL LAMPS DRIVER CIRCUIT OPEN
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Activate the Panel Illumination.

Wait 30 seconds.

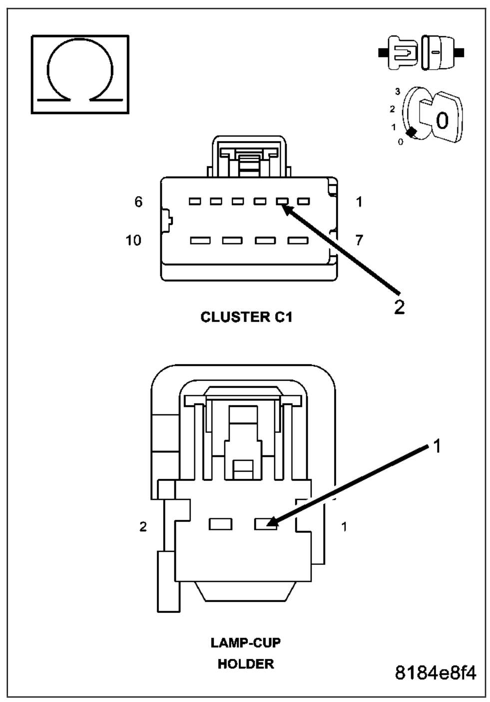
With the scan tool, read DTCs.

Does the scan tool display: B1615-PANEL ILLUMINATION CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR AN OPEN

Turn the ignition off.

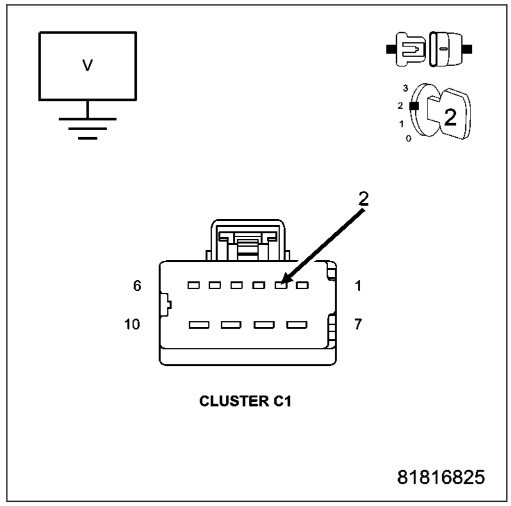
Disconnect the Cluster C1 harness connector.

Disconnect the Cup Holder Lamp harness connector.

Measure the resistance of the (E12) Panel Lamps Driver Circuit between the Instrument Cluster C1 harness connector and the Cup Holder harness connector.

Is the resistance greater than 10K ohms?

Yes >> Repair the (E12) Panel Lamps Driver circuit for an open.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (E12) Panel Lamps Driver Circuit from the Instrument Cluster C1 harness connector.

Is the voltage above 5.0 volts?

Yes >> Repair the (E12) Panel Lamps Driver circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B210D-BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Instrument Cluster detects a battery voltage of 9.0 volts or less for 5 seconds.

Possible Causes
VEHICLE CHARGING SYSTEM
CLUSTER

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B210D-BATTERY VOLTAGE LOW

Turn the ignition on.

With the scan tool, record and erase Instrument Cluster DTCs.

Wait 30 seconds.

With the scan tool, read Instrument Cluster DTCs.

Does the scan tool display: B210D-BATTERY VOLTAGE LOW?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM

NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

NOTE: Ensure the battery is fully charged.

Are any charging system DTCs present?

Yes >> Refer to appropriate DTC diagnostic information.

No >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Instrument Cluster detects a battery voltage of 16.0 volts or greater for 5 seconds.

Possible Causes
VEHICLE CHARGING SYSTEM
CLUSTER

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B210E-BATTERY VOLTAGE HIGH

Turn the ignition on.

With the scan tool, record and erase Instrument Cluster DTCs.

Wait 30 seconds.

With the scan tool, read Instrument Cluster DTCs.

Does the scan tool display: B210E-BATTERY VOLTAGE HIGH?

Yes >> Go To 2

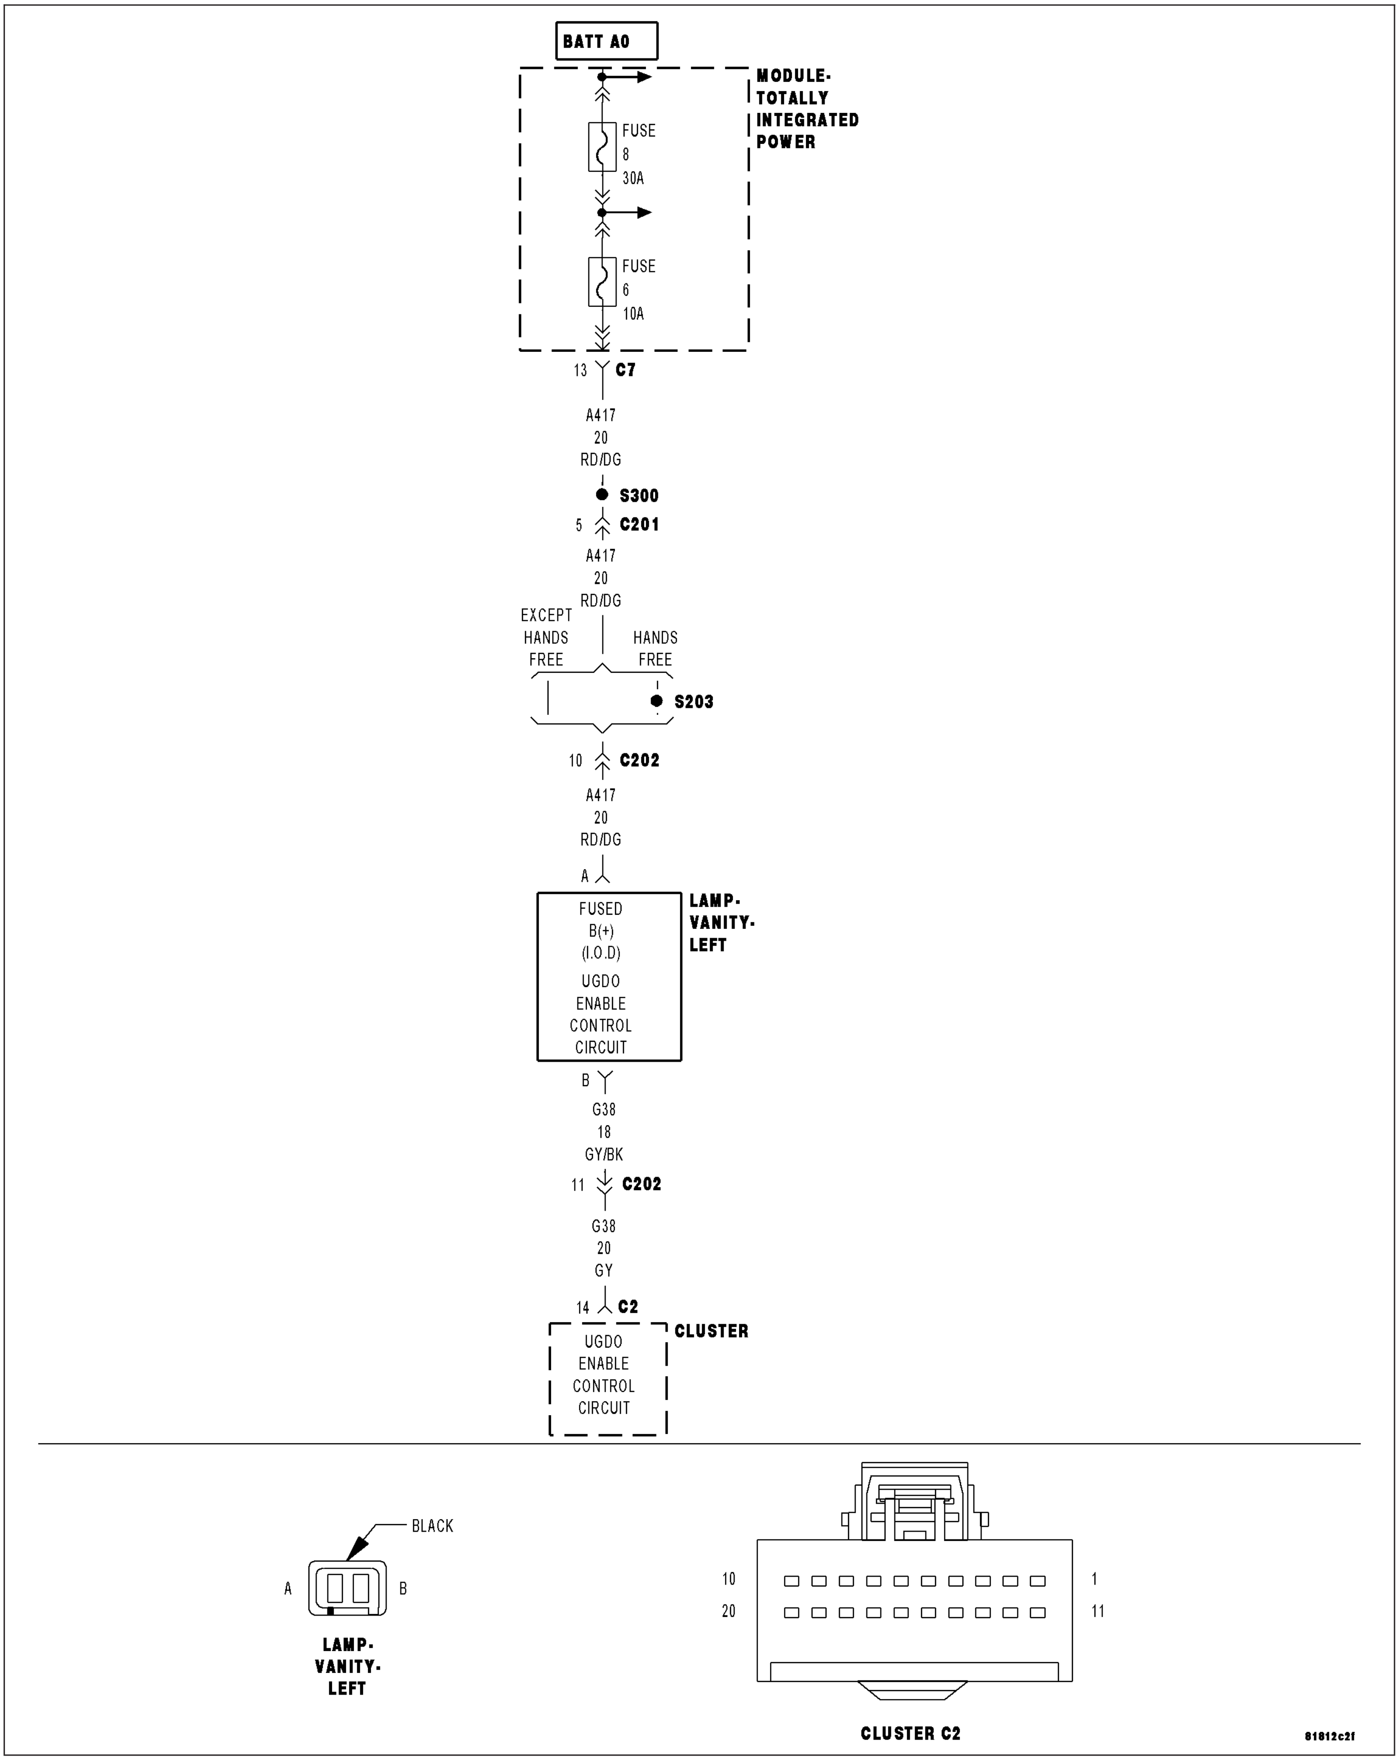
No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM

NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

NOTE: Ensure the battery is fully charged.



Are any charging system DTCs present?

Yes >> Refer to appropriate DTC diagnostic information.

No >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2143-UGDO ENABLE CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Cluster detects a fault on the (G38) UGDO Enable Control Circuit.

Possible Causes
(G38) UGDO ENABLE CONTROL CIRCUIT SHORT TO VOLTAGE
(G38) UGDO ENABLE CONTROL CIRCUIT SHORT TO GROUND
(G38) UGDO ENABLE CONTROL CIRCUIT OPEN
UGDO MODULE
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

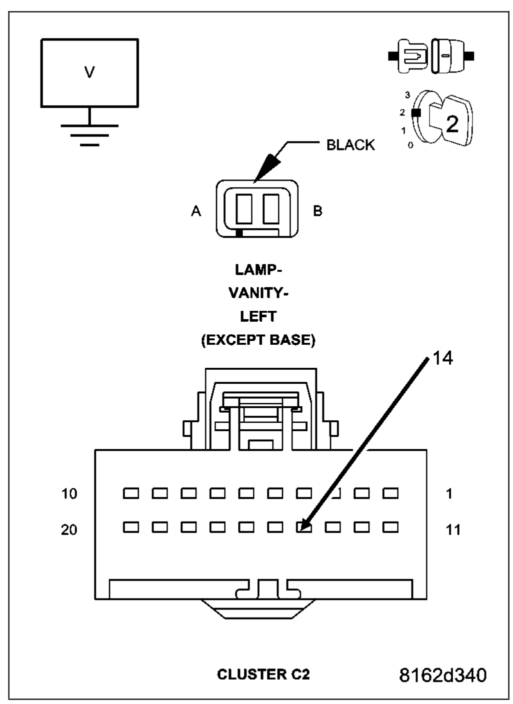
Does the scan tool display: B2143-UGDO ENABLE CONTROL CIRCUIT?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (G38) UGDO ENABLE CONTROL CIRCUIT SHORT TO VOLTAGE



Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

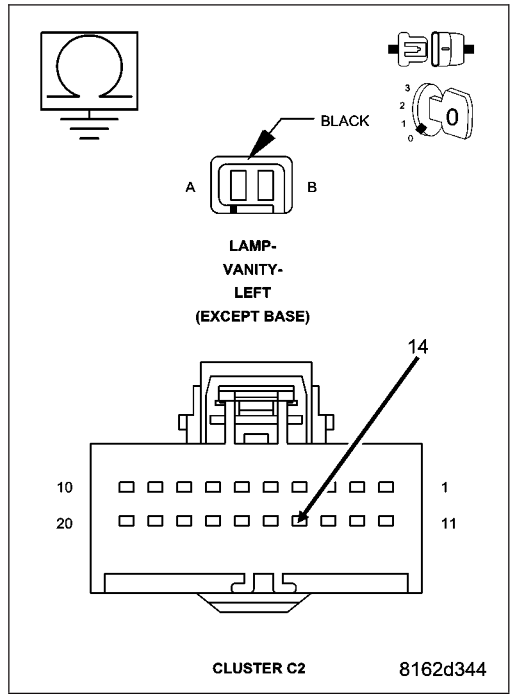
Disconnect the Left Vanity Lamp Harness connector.

Turn the ignition on.

Measure the voltage of the (G38) UGDO Enable Control Circuit.

Is voltage present?

Yes >> Repair the (G38) UGDO Enable Control Circuit for a short to voltage.



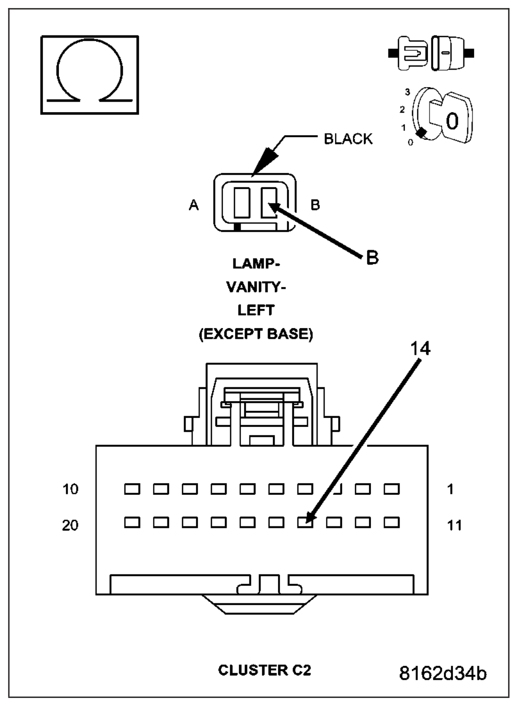
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

3. (G38) UGDO ENABLE CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (G38) UGDO Enable Control Circuit.



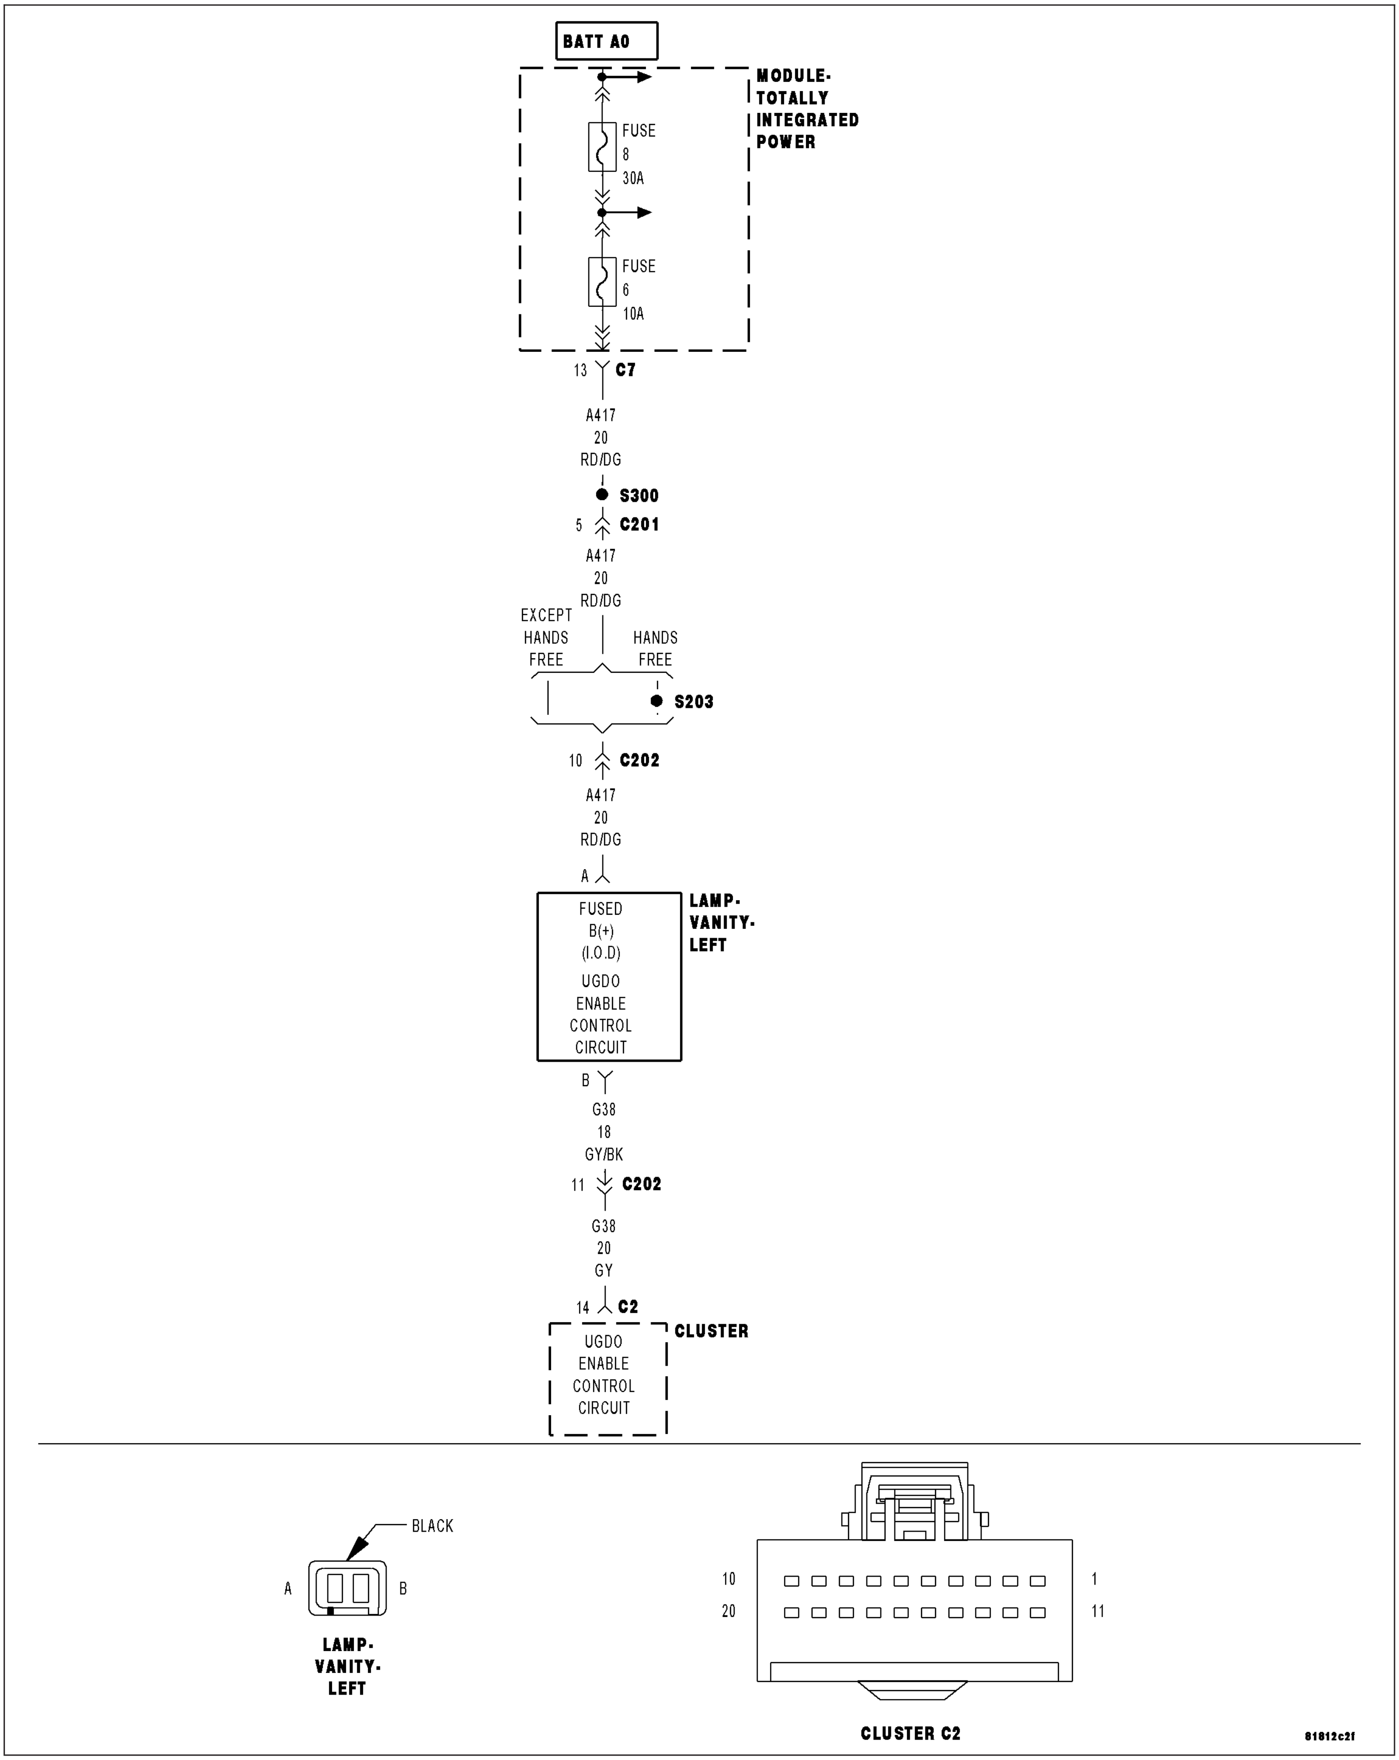
Is the resistance below 10K ohms?

Yes >> Repair the (G38) UGDO Enable Control Circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (G38) UGDO ENABLE CONTROL CIRCUIT OPEN

Measure the resistance of the (G38) UGDO Enable Control Circuit.



Is the resistance above 10K ohms?

Yes >> Repair the (G38) UGDO Enable Control Circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster inaccordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2144-UGDO ENABLE CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Cluster detects a fault on the (G38) UGDO Enable Control Circuit.

Possible Causes
(G38) UGDO ENABLE CONTROL CIRCUIT SHORT TO GROUND
UGDO MODULE
INSTRUMENT CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display: B2143-UGDO ENABLE CONTROL CIRCUIT?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. UGDO SHORTED TO GROUND

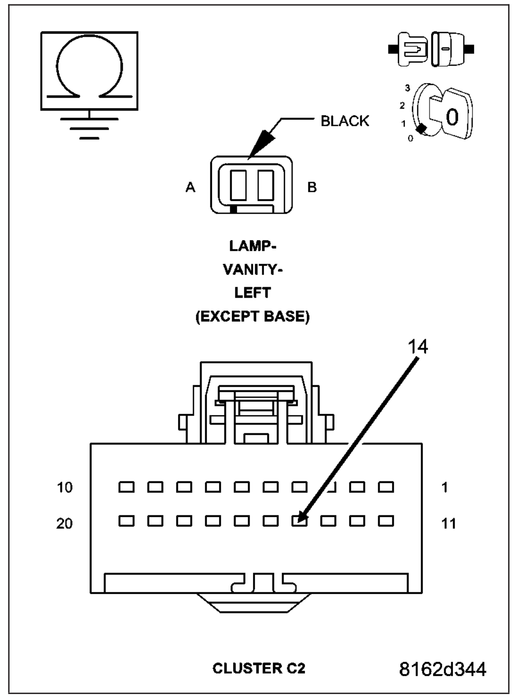
Disconnect the Left Vanity Lamp harness connector.

With the scan tool, read DTCs.

Does the scan tool display B2144-UGDO ENABLE CONTROL CIRCUIT LOW?

Yes >> Go To 3

No >> Replace the UGDO Module in accordance with the service information.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

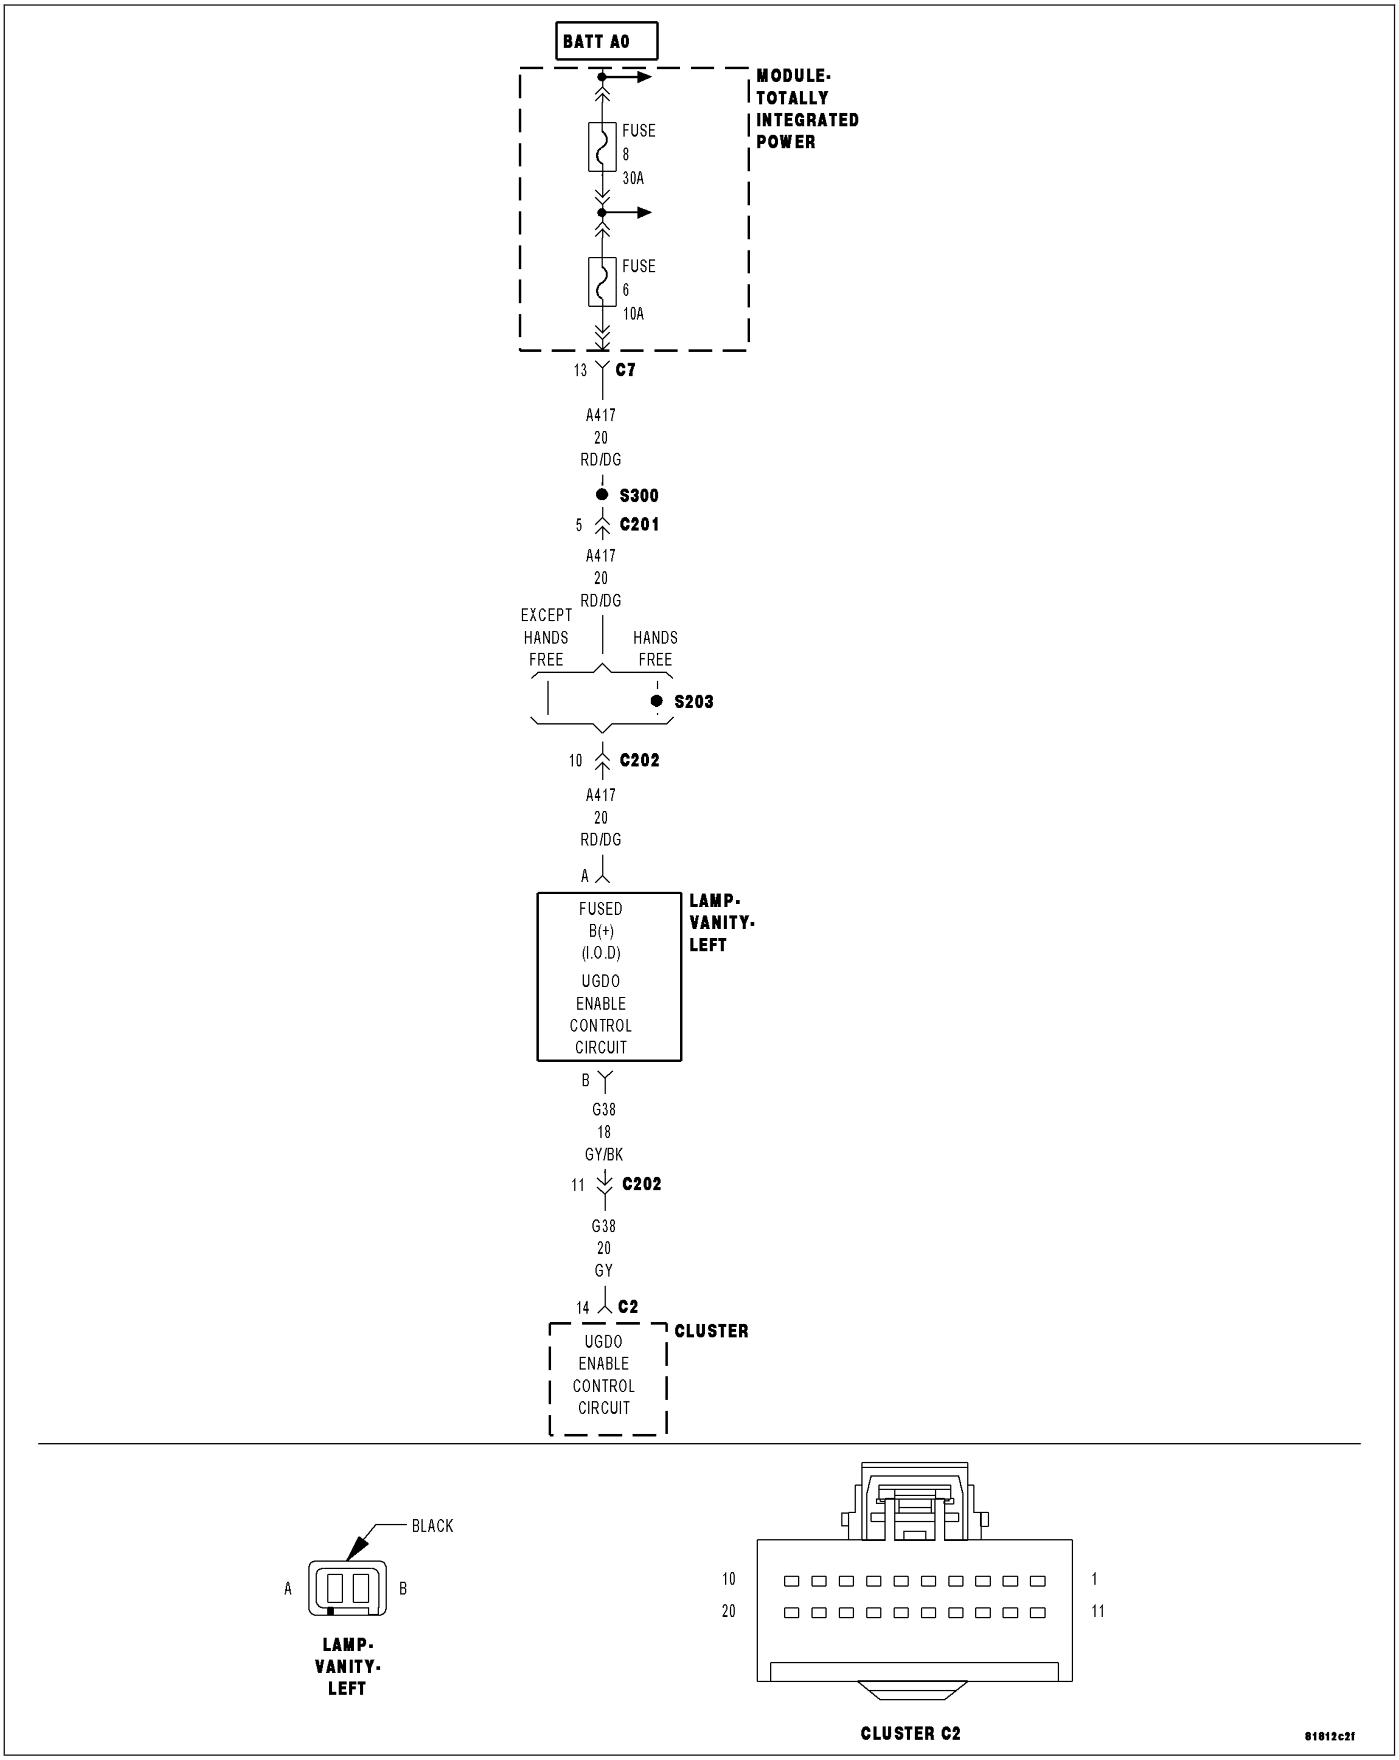
3. (G38) UGDO ENABLE CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Cluster C2 harness connector.

Measure the resistance between ground and the (G38) UGDO Enable Control Circuit.

Is the resistance below 10K ohms?



Yes >> Repair the (G38) UGDO Enable Control Circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2145-UGDO ENABLE CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Cluster detects a fault on the (G38) UGDO Enable Control Circuit.

Possible Causes
(G38) UGDO ENABLE CONTROL CIRCUIT SHORT TO VOLTAGE
UGOD MODULE
INSTRUMENT CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display: B2145-UGDO ENABLE CONTROL CIRCUIT HIGH?

Yes >> Go To 2

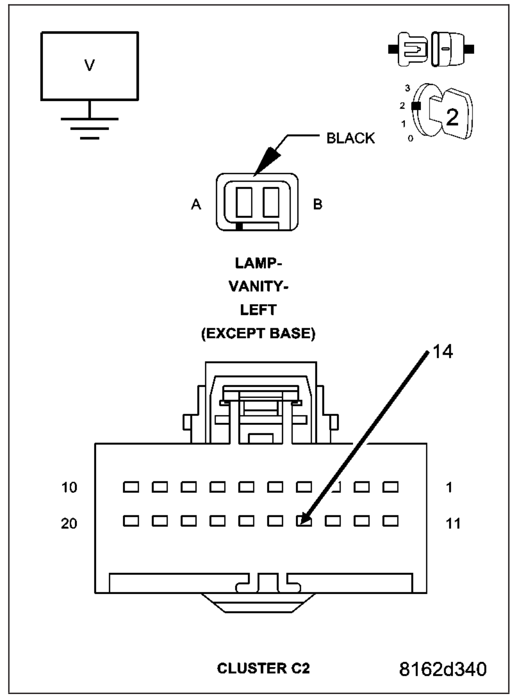
No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. UGDO SHORTED TO VOLTAGE

Disconnect the Left Vanity Lamp harness connector.

With the scan tool, read DTCs.



Does the scan tool display: B2144-UGDO ENABLE CONTROL CIRCUIT OPEN?

Yes >> Replace the UGDO Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

3. (G38) UGDO ENABLE CONTROL CIRCUIT SHORT TO VOLTAGE

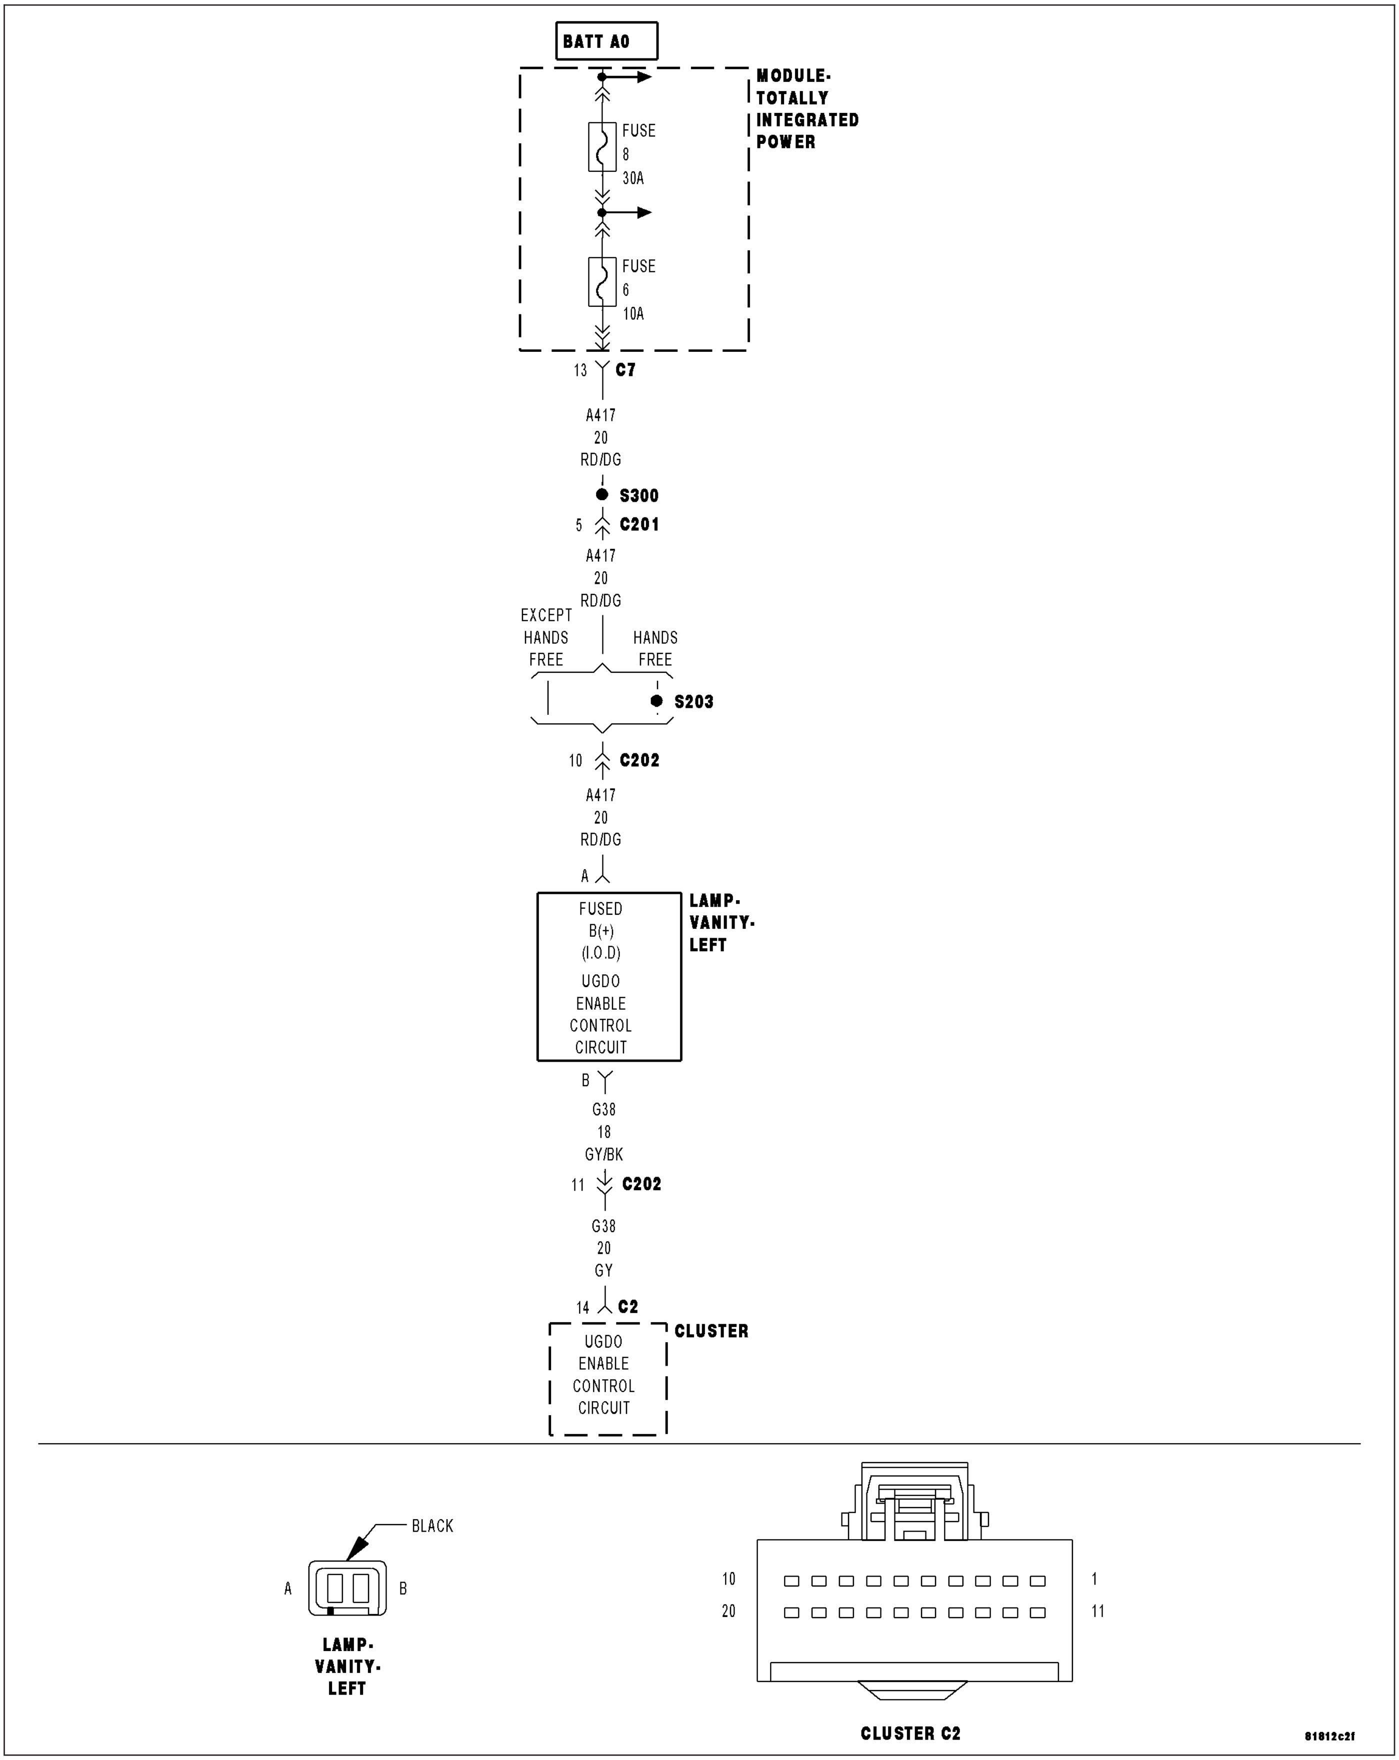
Turn the ignition off.

Disconnect the Cluster C2 harness connector.

Turn the ignition on.

Measure the voltage of the (G38) UGDO Enable Control Circuit.

Is voltage present?



Yes >> Repair the (G38) UGDO Enable Control Circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2146-UGDO ENABLE CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Cluster detects a fault on the (G38) UGDO Enable Control Circuit.

Possible Causes
(G38) UGDO ENABLE CONTROL CIRCUIT OPEN
UGDO MODULE
INSTRUMENT CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display: B2146-UGDO ENABLE CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

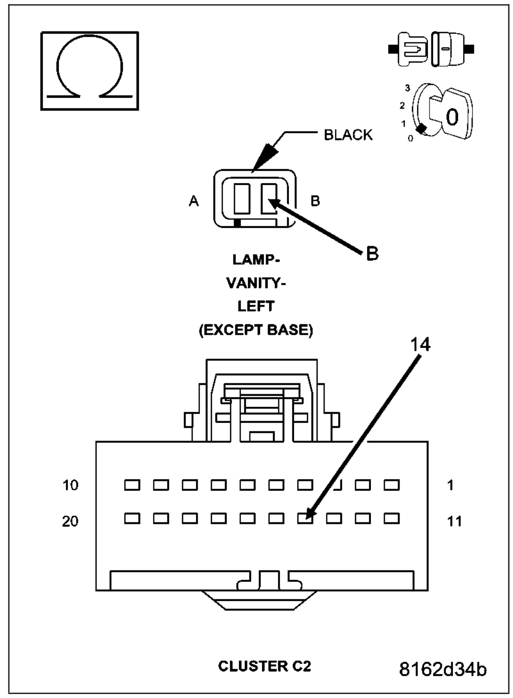
2. UGDO OPEN

Disconnect the Left Vanity Lamp harness connector.

Connect a jumper wire between ground and the (G38) UGDO Enable Control Circuit.

With the scan tool, read DTCs.

Does the scan tool display: B2144-UGDO ENABLE CONTROL CIRCUIT LOW?



Yes >> Replace the UGDO Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

3. **(G38) UGDO ENABLE CONTROL CIRCUIT OPEN**

Measure the resistance of the (G38) UGDO Enable Control Circuit.

Is the resistance above 10K ohms?

Yes >> Repair the (G38) UGDO Enable Control Circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster inaccordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

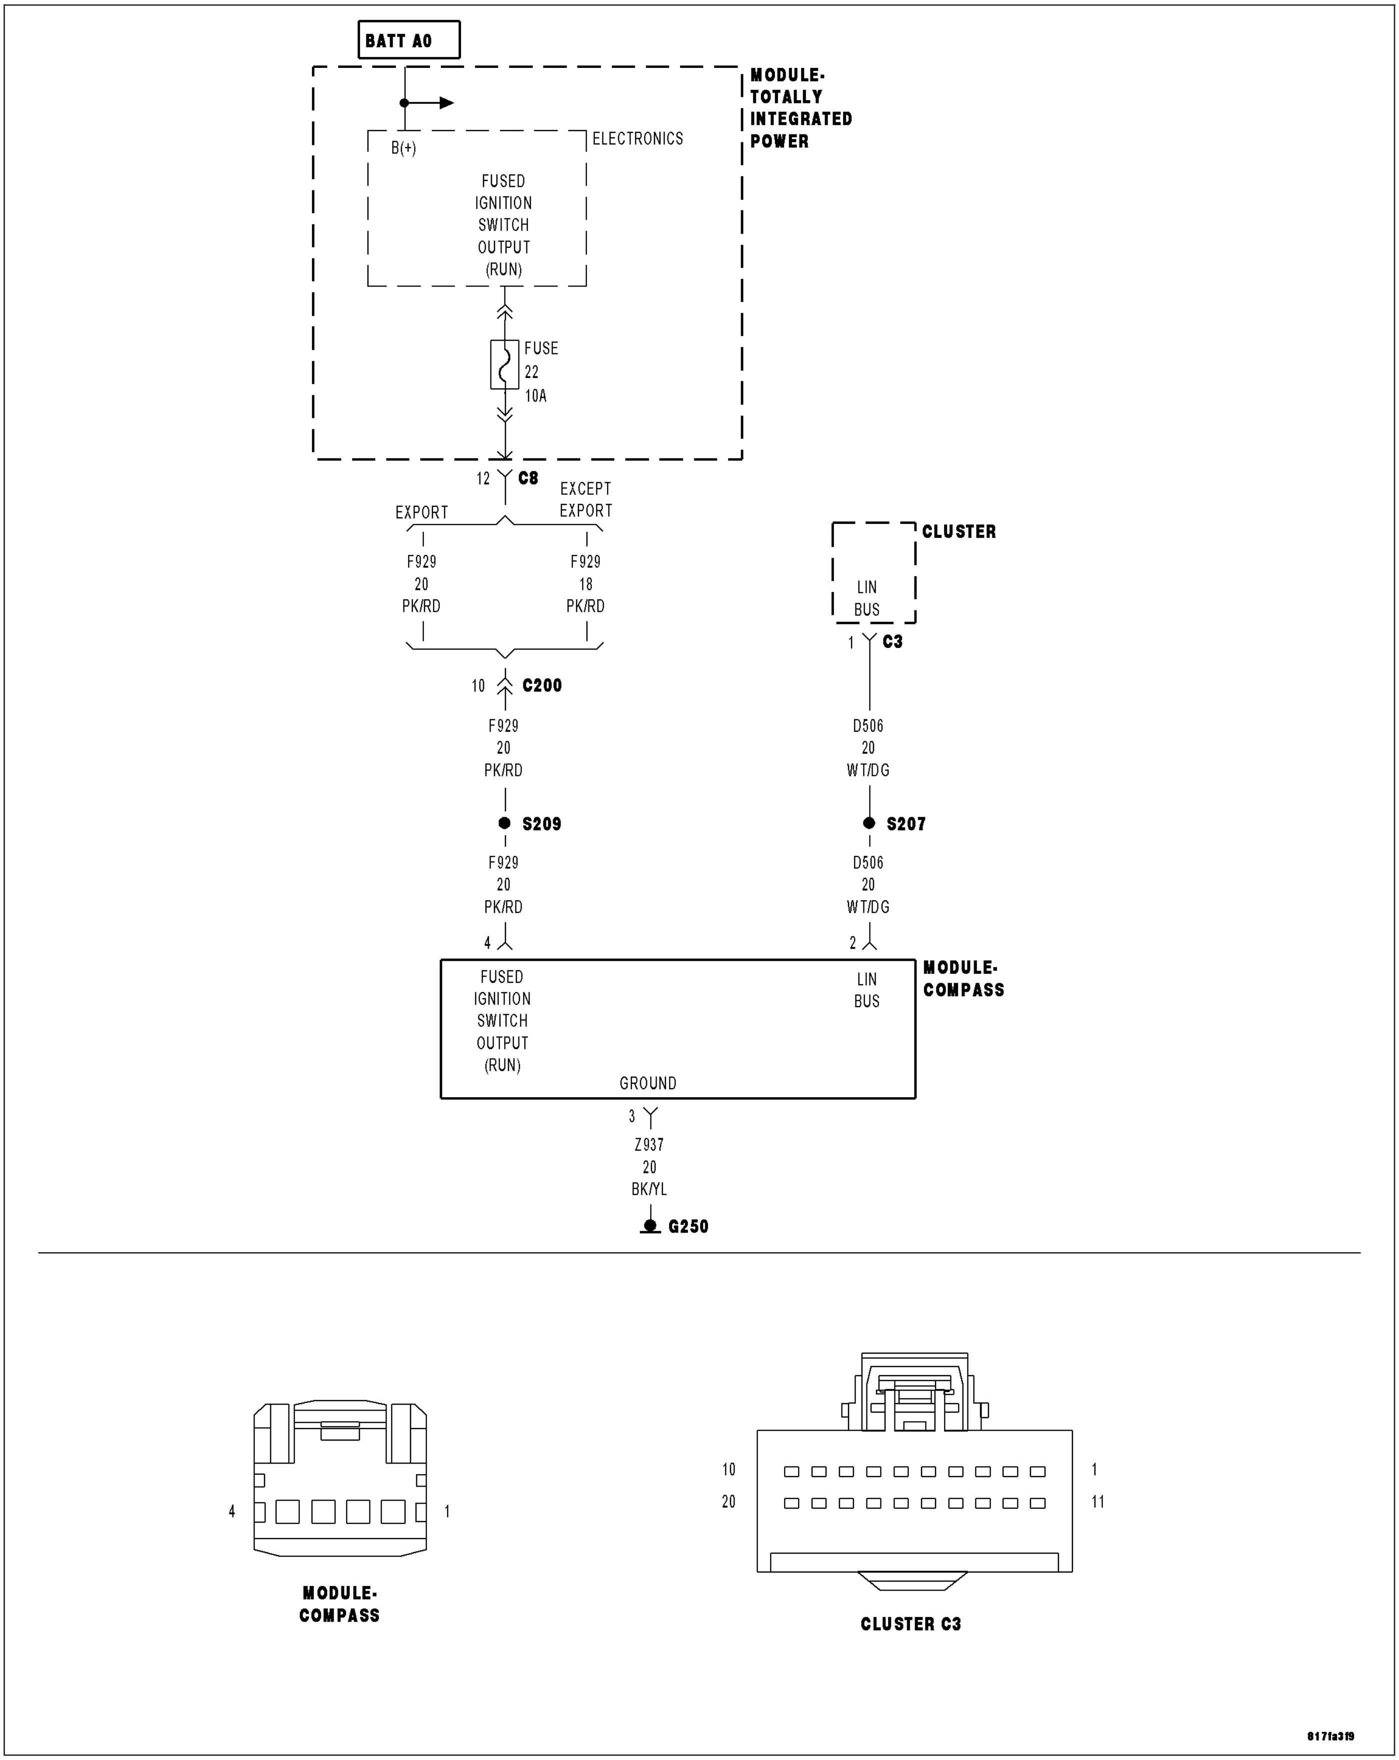
U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

For a complete wiring diagram **Refer to Section 8W**.



(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0156-LOST COMMUNICATION WITH EOM

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0161-LOST COMMUNICATION WITH COMPASS MODULE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Cluster does not receive information from the Compass Module.

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(F929) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN
(Z937) GROUND CIRCUIT OPEN
COMPASS MODULE

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display: U0161-LOST COMMUNICATION WITH COMPASS MODULE?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

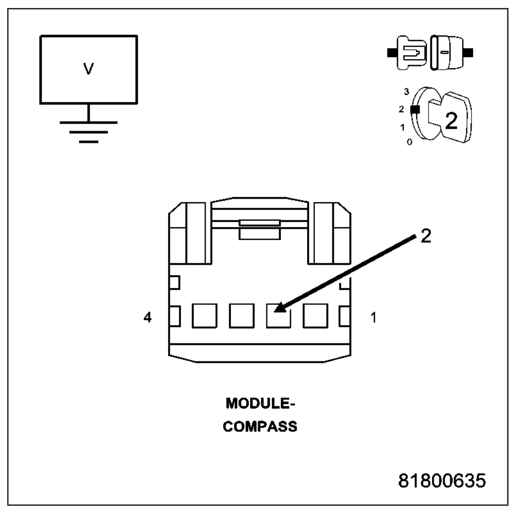
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (D506) LIN BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the Compass Module harness connector.

Turn the ignition on.



Measure the voltage of the (D506) LIN BUS circuit.

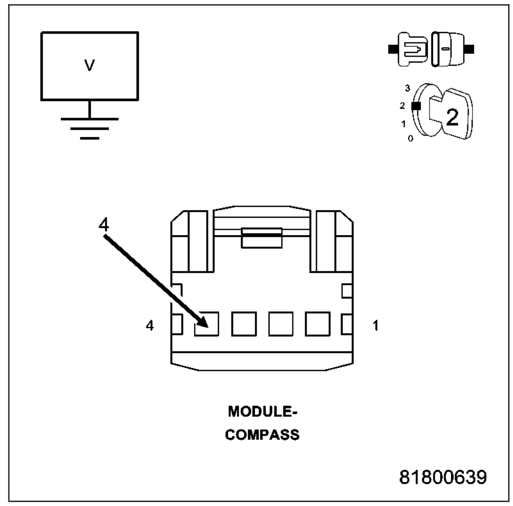
Is the voltage above 5 volts?

Yes >> Go To 3

No >> Repair the (D506) LIN BUS circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (F929) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN



Measure the voltage of the (F929) Fused Ignition Switch Output (RUN) circuit.

Is the voltage above 10 volts?

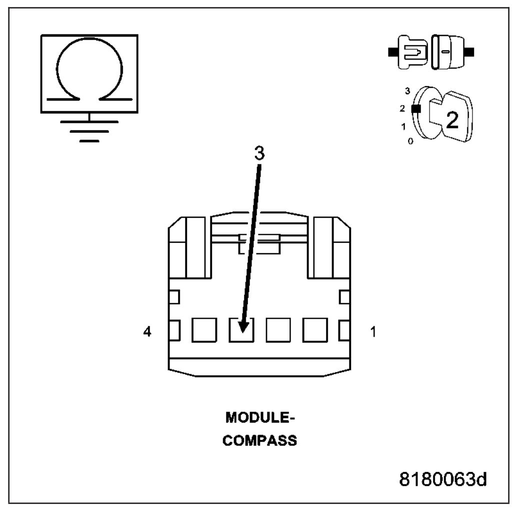
Yes >> Go To 4

No >> Repair the (F929) Fused Ignition Switch Output (RUN) circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (Z937) GROUND CIRCUIT OPEN

Measure the resistance between ground and the (Z937) Ground circuit.



Is the resistance below 10K ohms?

Yes >> Replace the Compass Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the (Z937) ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0167-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0195-LOST COMMUNICATION WITH SDARS

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

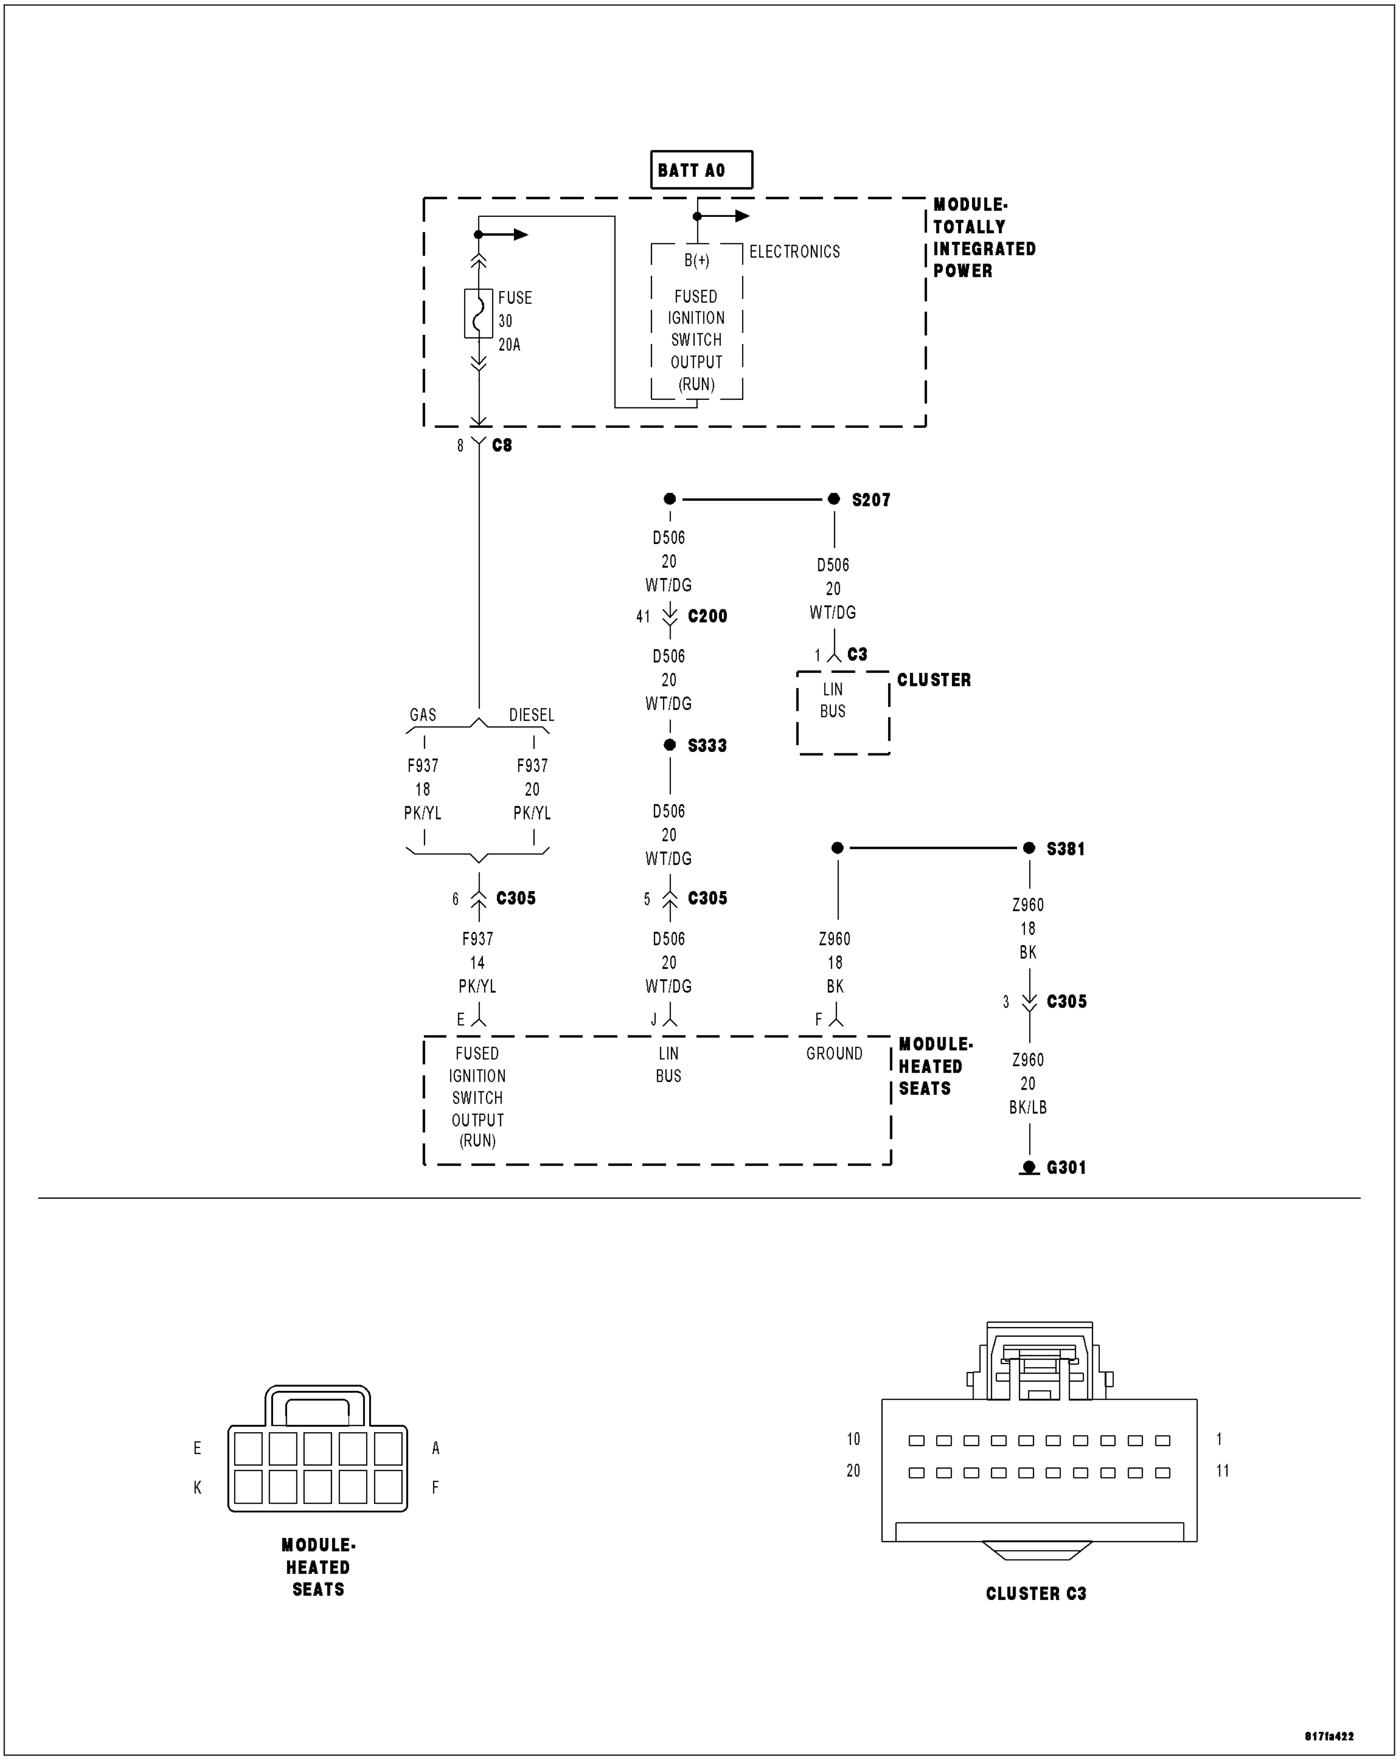
U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE

For a complete wiring diagram **Refer to Section 8W**.



(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0208-LOST COMMUNICATION WITH HEATED SEATS CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Cluster does not receive information from the Heated Seats Control Module.

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(F937) FUSED IGNITION SWITCH OUTPUT (RUN) OPEN
(Z908) GROUND CIRCUIT OPEN
HEATED SEATS MODULE

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

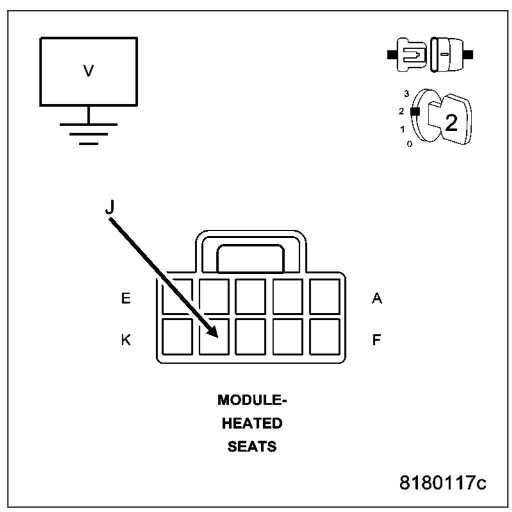
With the scan tool, read DTCs.

Does the scan tool display: U0208-LOST COMMUNICATION WITH HEATED SEATS CONTROL MODULE?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (D506) LIN BUS CIRCUIT OPEN

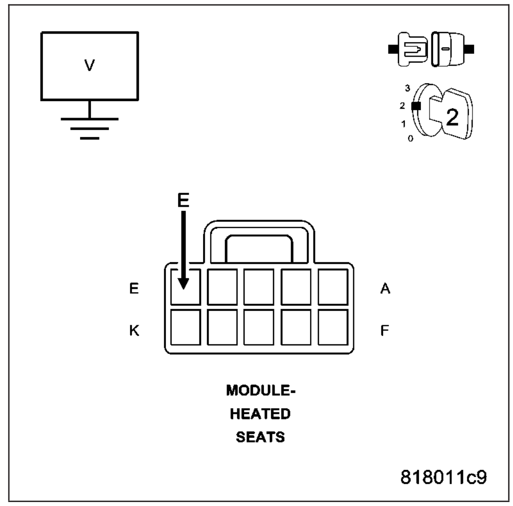
Turn the ignition off.

Disconnect the Heated Seats Module harness connector.

Turn the ignition on.

Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?



Yes >> Go To 3

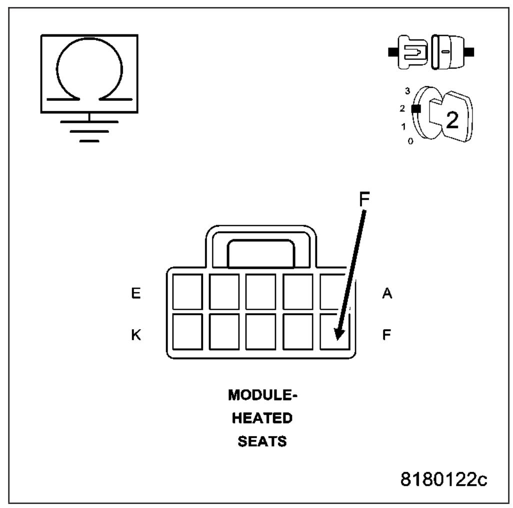
No >> Repair the (D506) LIN BUS circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (F937) FUSED IGNITION SWITCH OUTPUT (RUN) OPEN

Measure the voltage of the (F937) Fused Ignition Switch Output (RUN) circuit.

Is the voltage above 10 volts?



Yes >> Go To 4

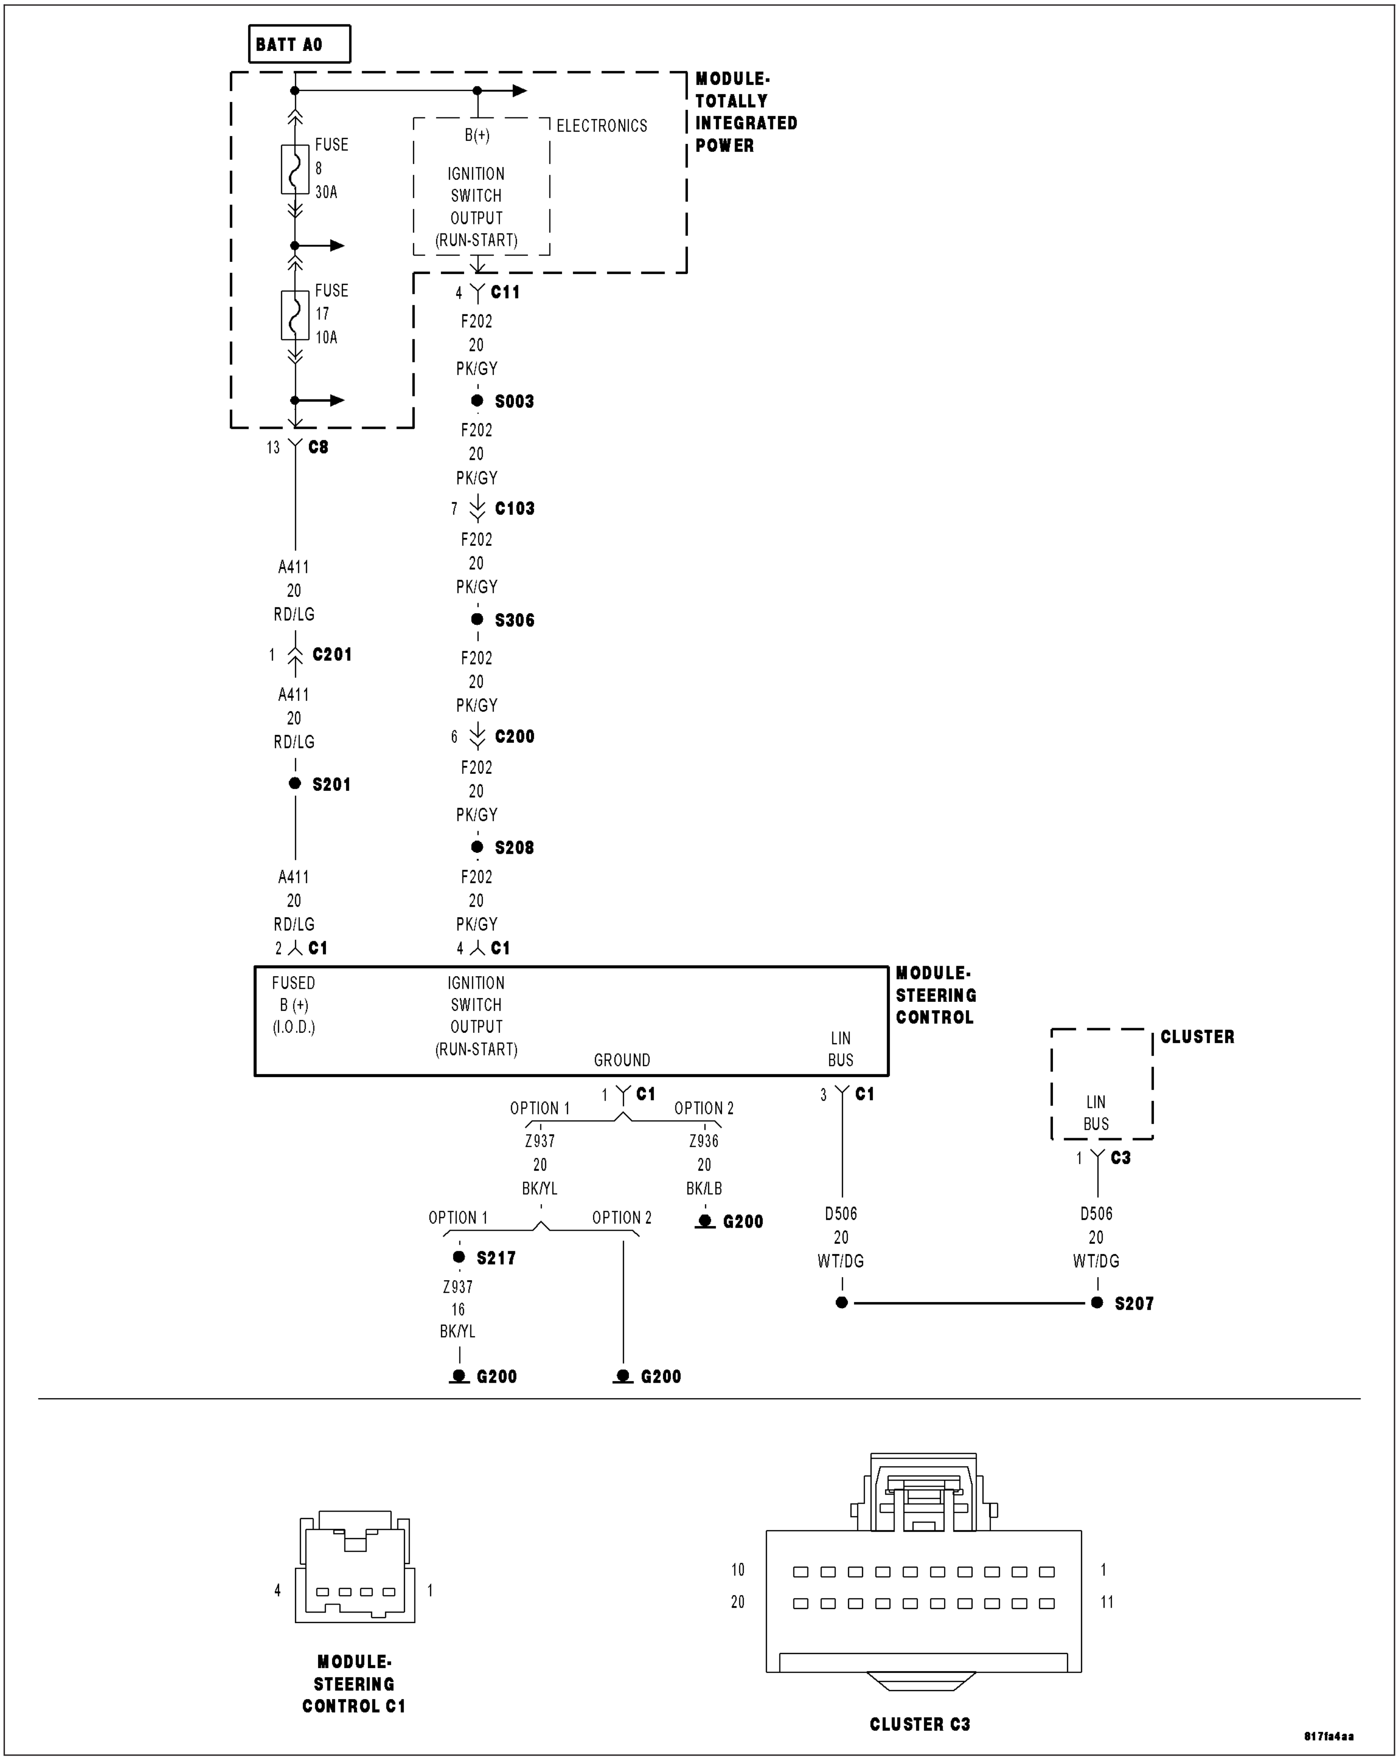
No >> Repair the (F937) Fused Ignition Switch Output (RUN) circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (Z908) GROUND CIRCUIT OPEN

Measure the resistance between ground and the (Z908) Ground circuit.

Is the resistance below 10K ohms?



Yes >> Replace the Heated Seats Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the (Z908) ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0212-LOST COMMUNICATION WITH SCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Cluster does not receive any LIN Bus messages from the SCM.

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(F20) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN
(A411) FUSED B+ (I.O.D.) CIRCUIT OPEN
(Z936/Z937) GROUND CIRCUIT OPEN
SCM

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

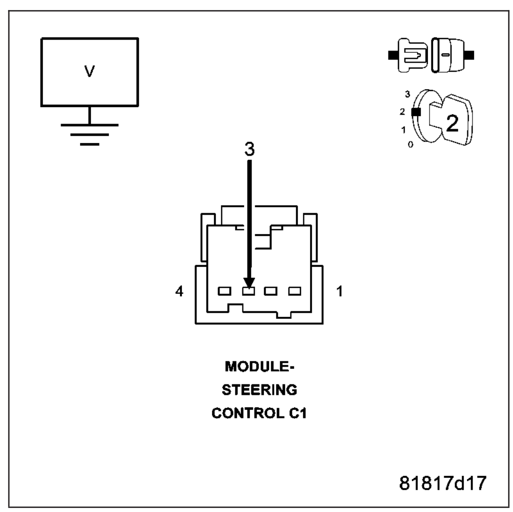
With the scan tool, read DTCs.

Does the scan tool display: U0212-LOST COMMUNICATION WITH SCM?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (D506) LIN BUS CIRCUIT OPEN

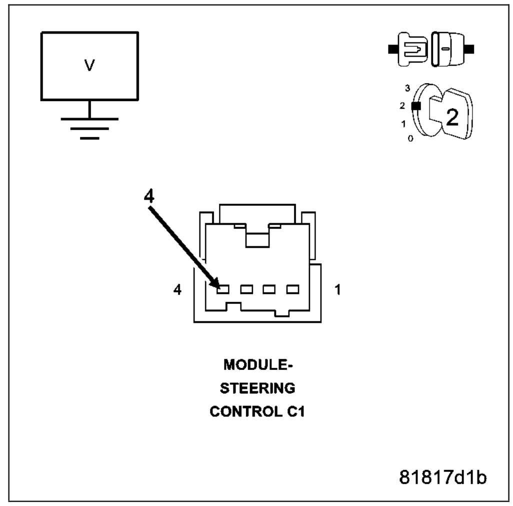
Turn the ignition off.

Disconnect the Steering Column Module C1 harness connector.

Turn the ignition on.

Measure the voltage of the (D506) LIN BUS circuit.

Is the voltage above 5 volts?



Yes >> Go To 3

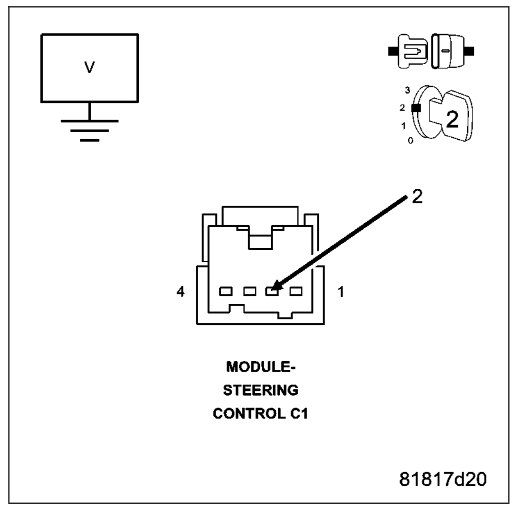
No >> Repair the (D506) LIN BUS circuit for an open

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (F202) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN

Measure the voltage of the (F202) Fused Ignition Switch Output (RUN/START) circuit.

Is the voltage above 10 volts?



Yes >> Go To 4

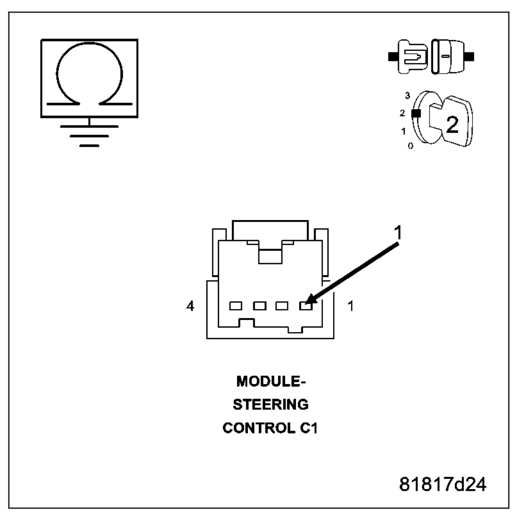
No >> Repair the (F202) Fused Ignition Switch Output (RUN/START) circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (A411) FUSED B+ (I.O.D.) CIRCUIT OPEN

Measure the voltage of the (A411) Fused B+ (I.O.D.) circuit.

Is the voltage above 10 volts?



Yes >> Go To 5

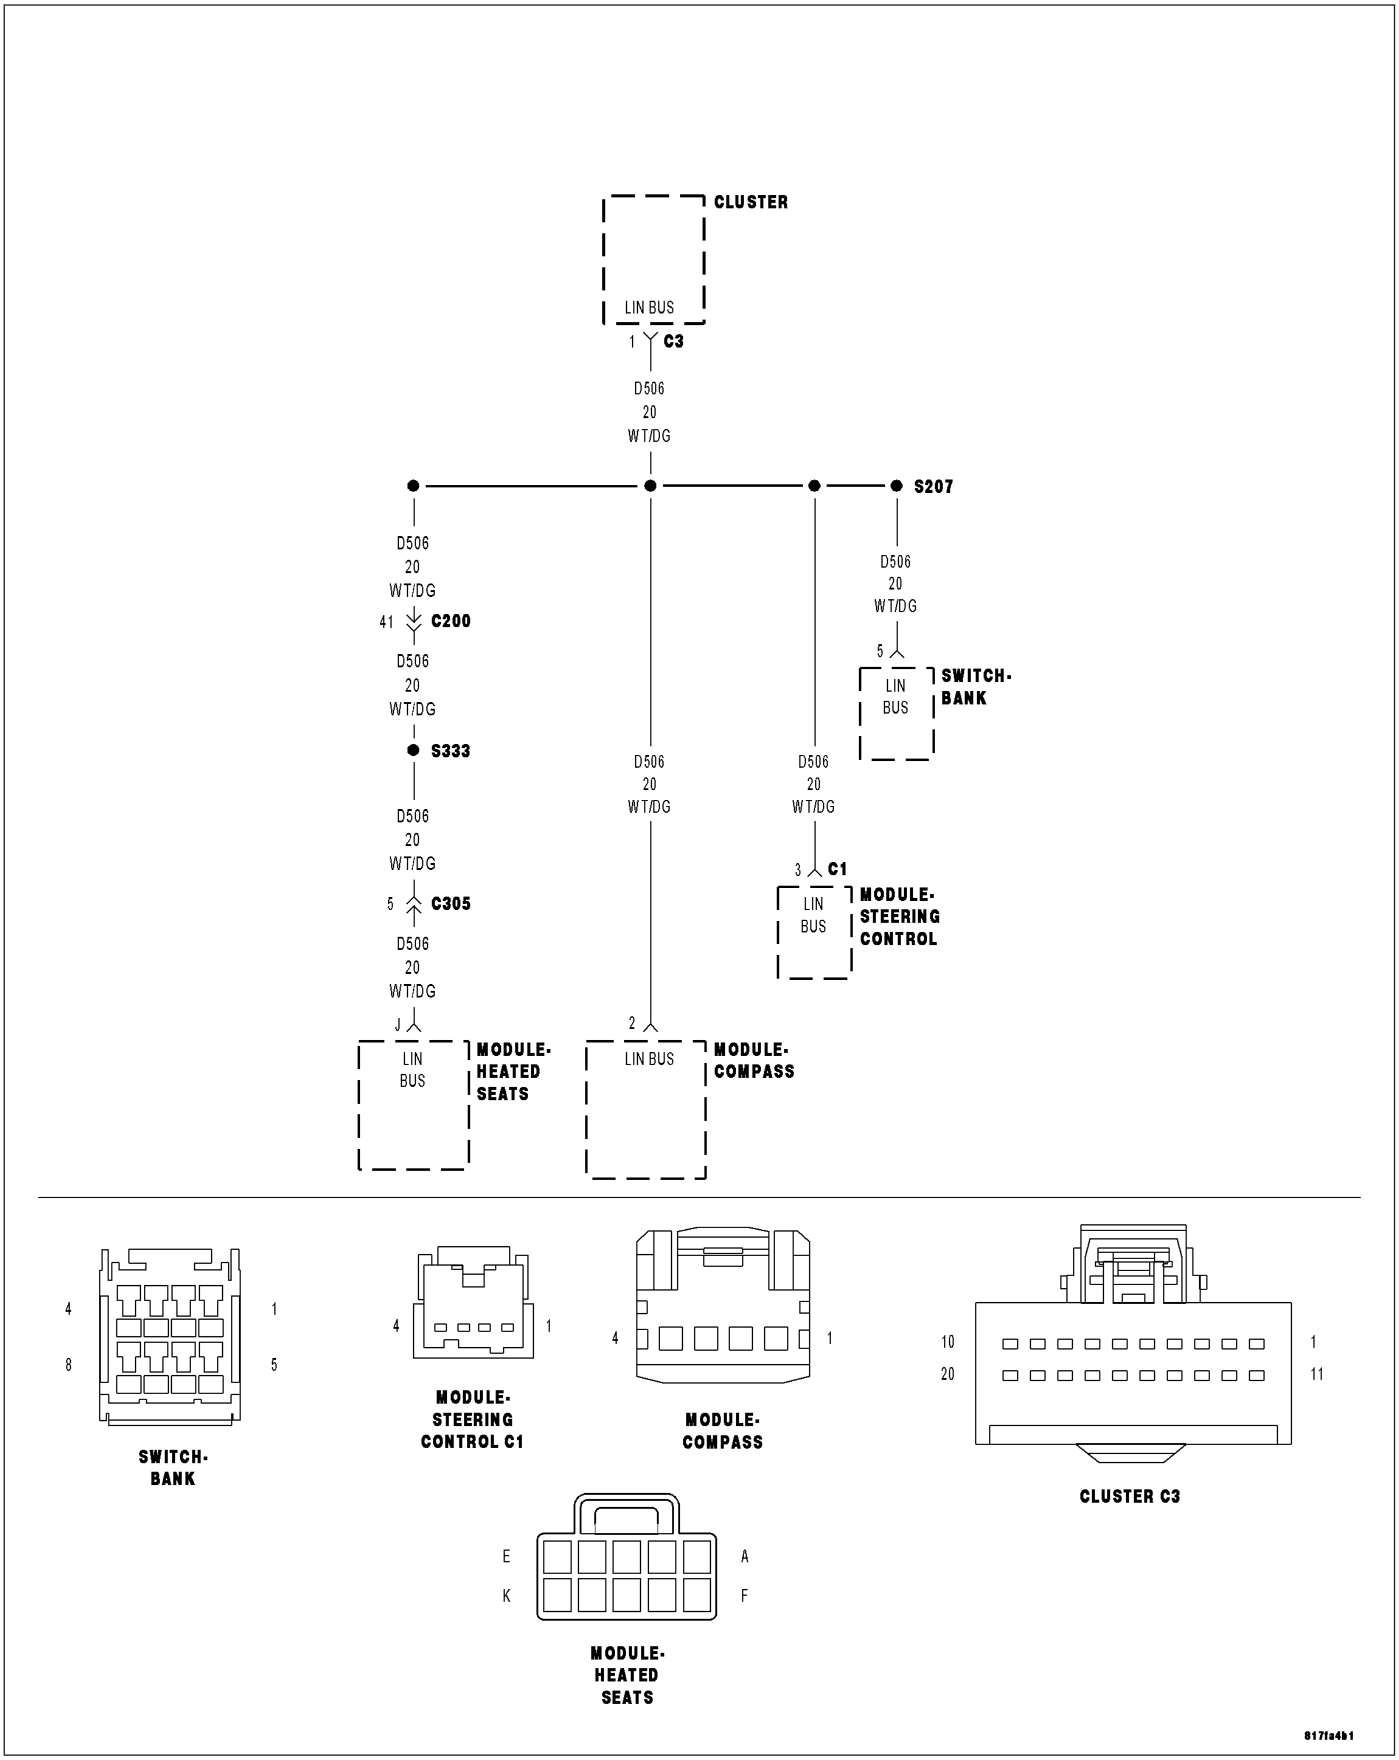
No >> Repair the (A411) Fused B+ (I.O.D.) circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. (Z936/Z937) GROUND CIRCUIT OPEN

Measure the resistance between ground and the (Z936–MTX)/(Z937–ATX) Ground circuit.

Is the resistance below 10K ohms?



Yes >> Replace the SCM in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the (Z936–MTX)/(Z937–ATX) ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U1008–LIN 1 BUS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  LIN 1 Bus Performance.

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(D506) LIN BUS CIRCUIT SHORT TO GROUND
CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Does the scan tool display: U1008–LIN 1 BUS?

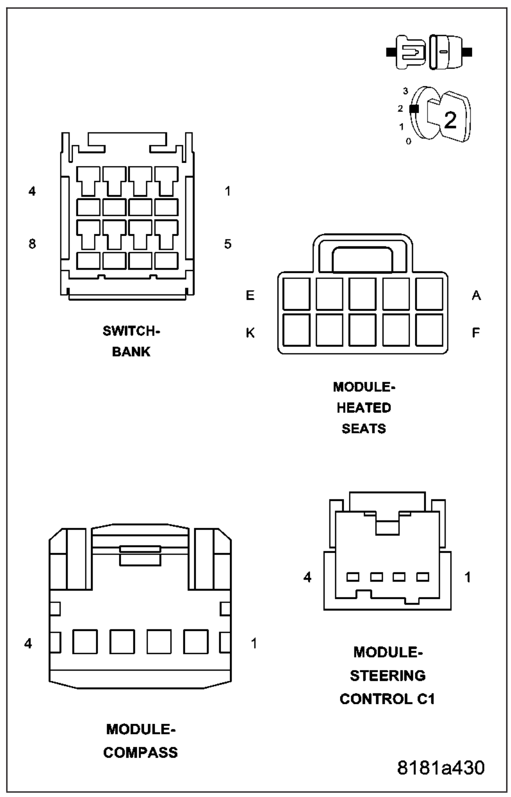
Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. SHORTED COMPONENT

NOTE: After disconnecting each component, check DTCs with the scan tool.



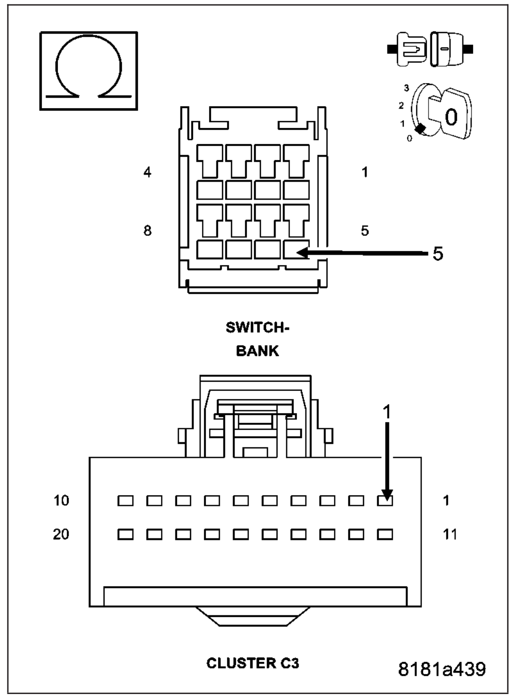
Turn the ignition on.

Disconnect the Switch Bank Module harness connector.

Disconnect the Remote Compass Module harness connector.

Disconnect the Heated Seat Module harness connector.

Disconnect the Steering Control Module C1 harness connector.



With each component disconnected, did the DTC U1008–LIN 1 BUS change from active to stored?

Yes >> Replace the component that caused the DTC U1008–LIN 1 BUS change from active to stored.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

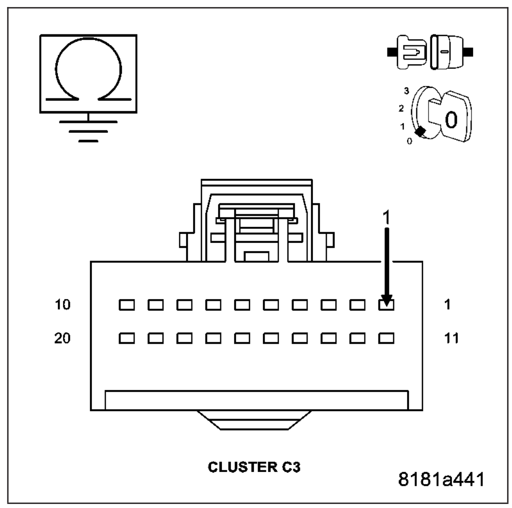
No >> Go To 3

3. (D506) LIN BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the Cluster C3 harness connector.

Disconnect the Switch Bank harness connector.



Measure the resistance of the (D506) LIN Bus circuit.

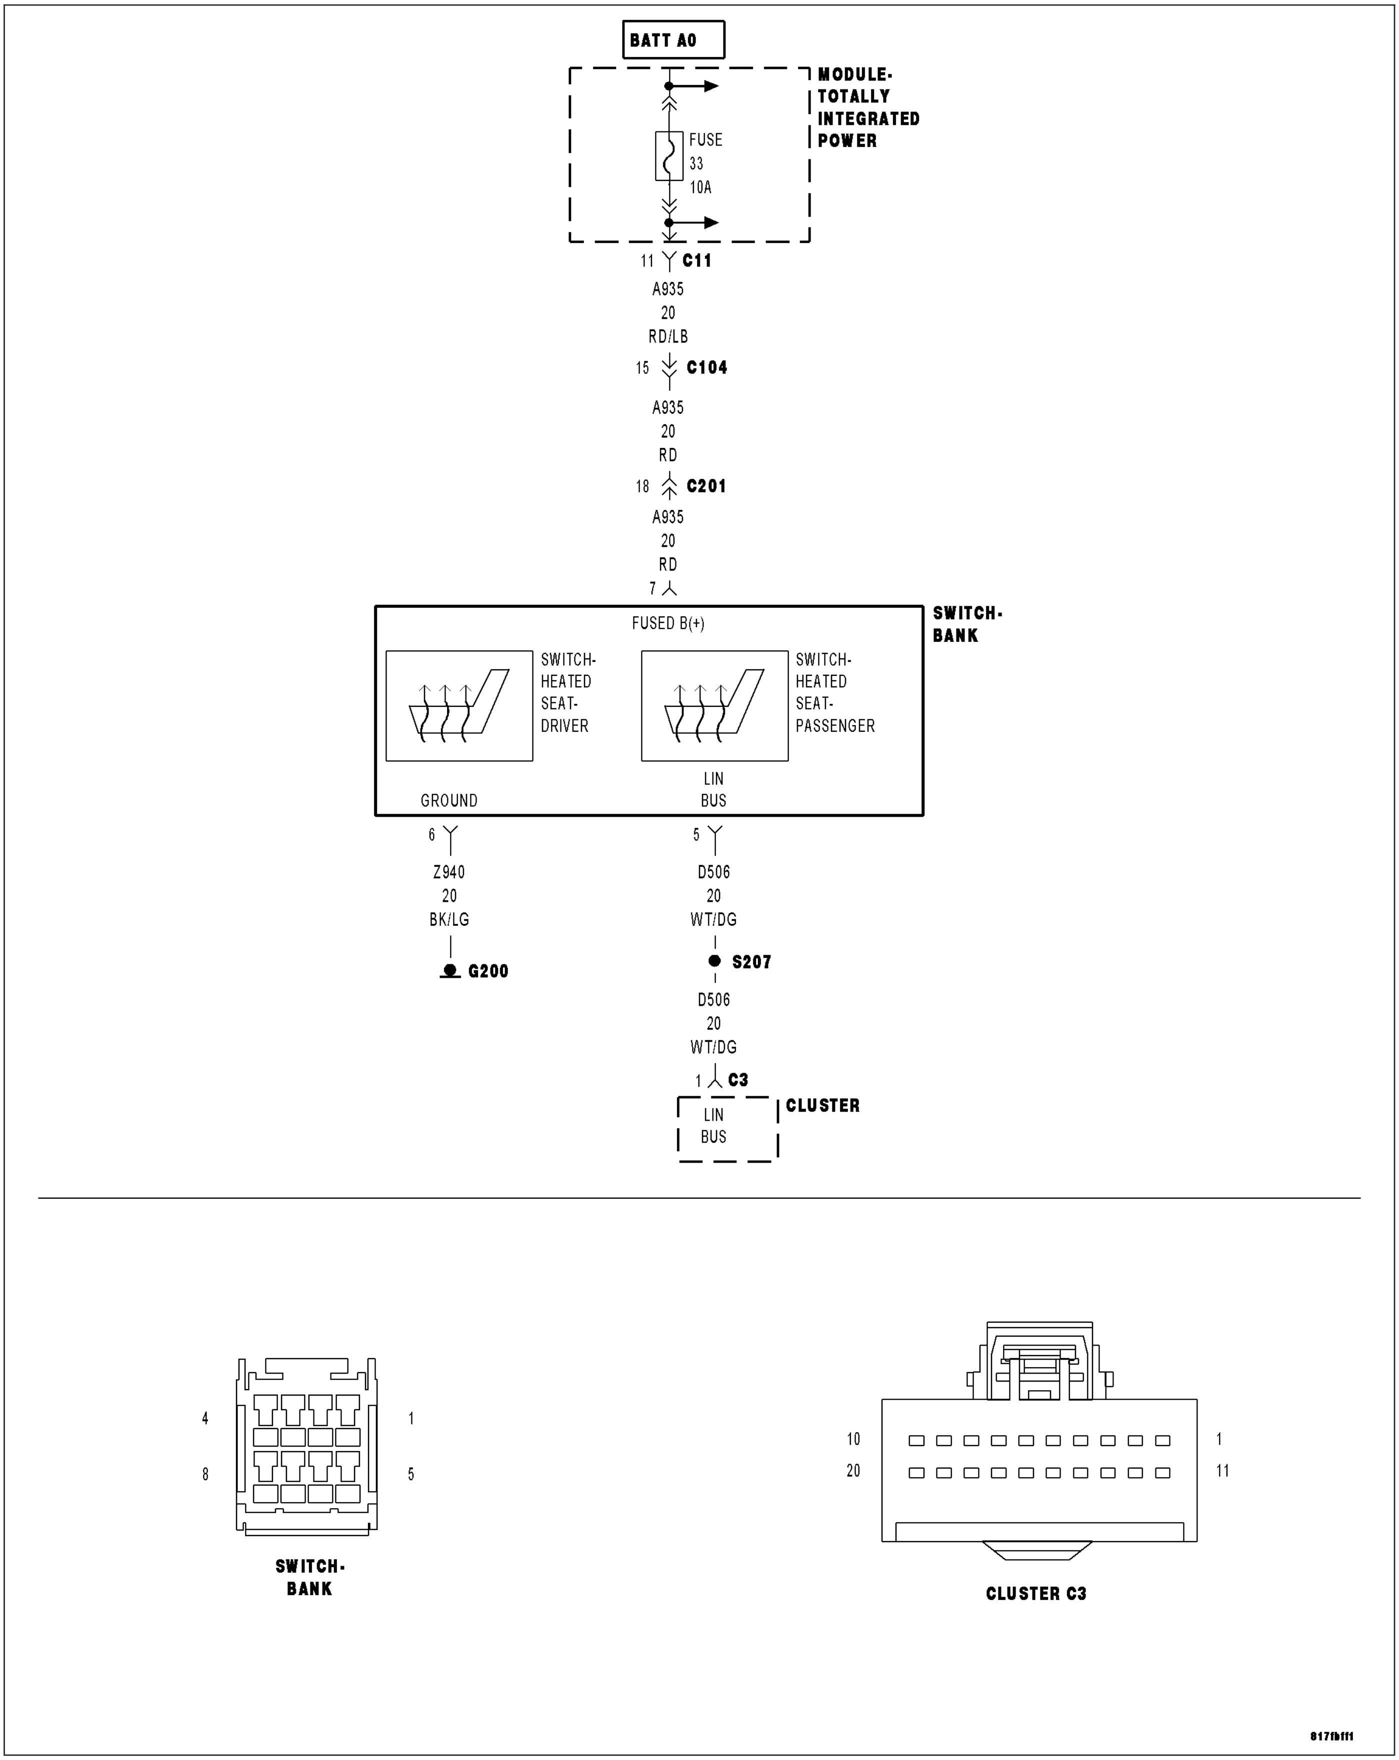
Is the resistance above 10K ohms?

Yes >> Repair the (D506) LIN Bus circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (D506) LIN BUS CIRCUIT SHORT TO GROUND

Turn the ignition off.



Measure the resistance to ground on the (D506) LIN Bus circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D506) LIN Bus circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Cluster in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U113B-LOST COMMUNICATION WITH SWITCH BANK MODULE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Cluster does not receive information from the Switch Bank Module.

Possible Causes
(D506) LIN BUS CIRCUIT OPEN
(A935) FUSED B+ CIRCUIT OPEN
(Z940) GROUND CIRCUIT OPEN
SWITCH BANK

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

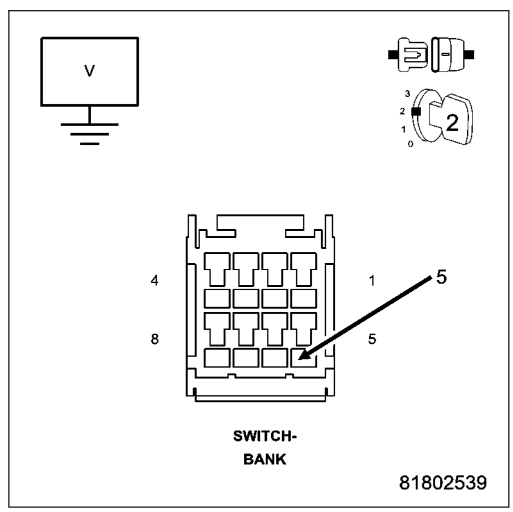
With the scan tool, read DTCs.

Does the scan tool display: U113B-LOST COMMUNICATION WITH SWITCH BANK MODULE?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (D506) LIN BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the Switch Bank harness connector.

Turn the ignition on.

Measure the voltage of the (D506) LIN BUS circuit.

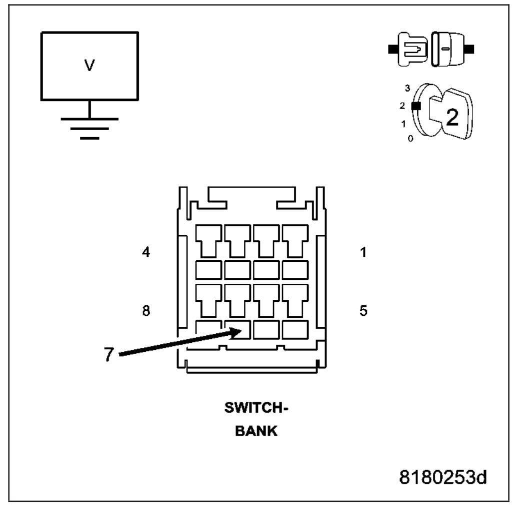
Is the voltage above 5 volts?

Yes >> Go To 3

No >> Repair the (D506) LIN BUS circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (A935) FUSED B+ CIRCUIT OPEN



Measure the voltage of the (A935) Fused B+ circuit.

Is the voltage above 10 volts?

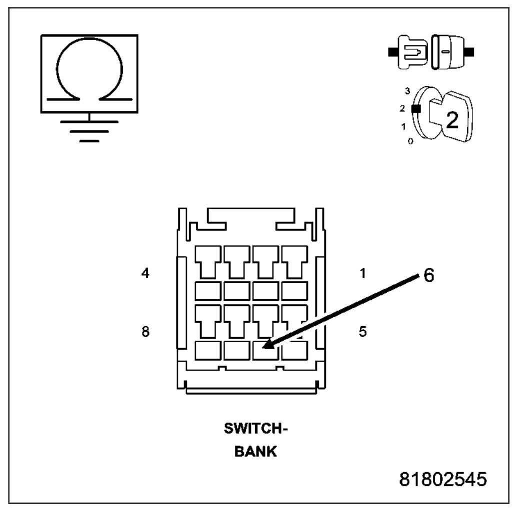
Yes >> Go To 4

No >> Repair the (A935) Fused B+ circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (Z940) GROUND CIRCUIT OPEN

Measure the resistance between ground and the (Z940) Ground circuit.



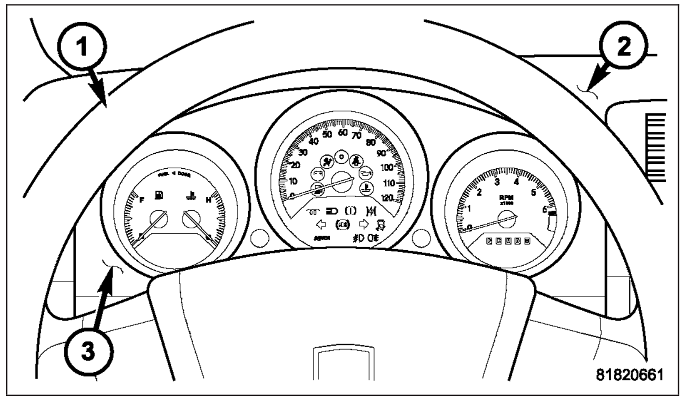
Is the resistance below 10K ohms?

Yes >> Replace the Switch Bank in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the (Z940) ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



INSTRUMENT CLUSTER - SERVICE INFORMATION

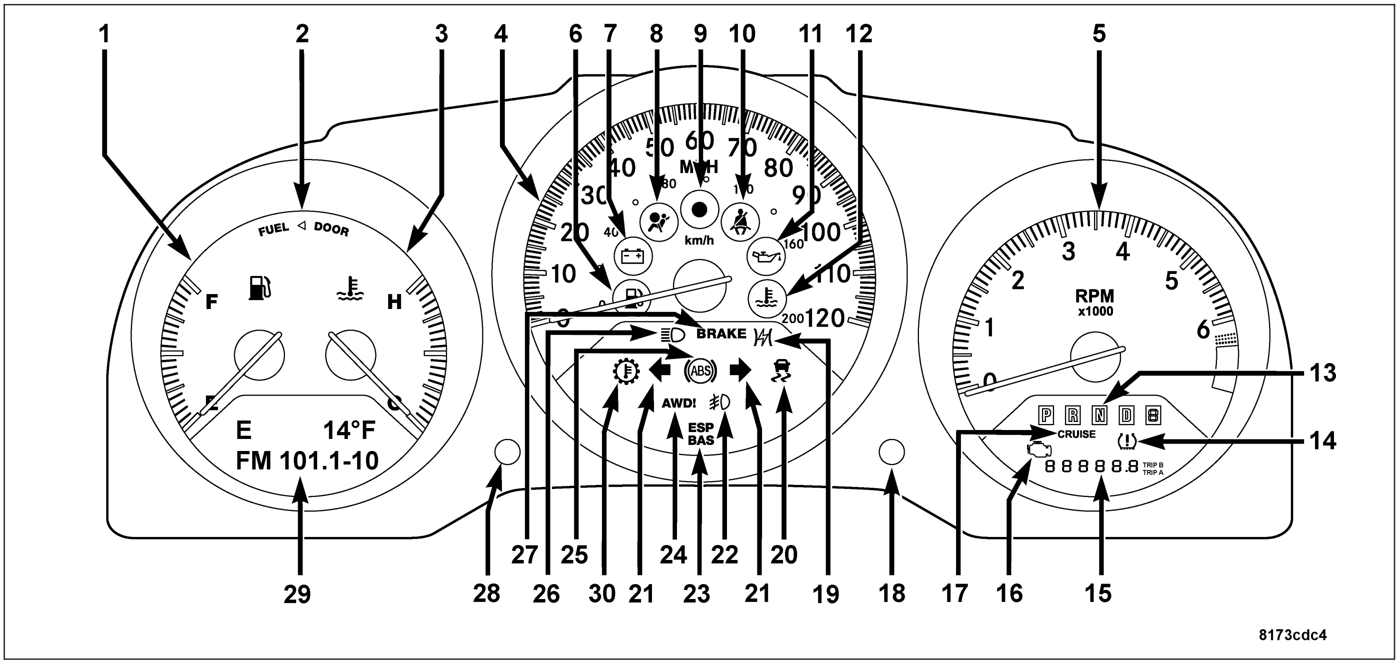
TABLE OF CONTENTS

INSTRUMENT CLUSTER - SERVICE INFORMATION

DESCRIPTION

The instrument cluster is an ElectroMechanical Instrument Cluster (EMIC) (3) that is located in the instrument panel (2) above the steering column opening, behind the steering wheel (1), directly in front of the driver. The instrument cluster includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node (CCN). The remainder of the CCN, including the mounts and the electrical connections, are concealed within the instrument panel behind the cluster bezel. Besides analog gauges and indicators, the CCN incorporates two digital Vacuum Fluorescent Display (VFD) units for displaying odometer/trip odometer information, engine hours, automatic transmission gear selector position (PRNDL), several warning or reminder indications and certain diagnostic information, and the display for the Electronic Vehicle Information Center (EVIC).

Sandwiched between the rear cover and the lens is the cluster housing. The molded plastic cluster housing serves as the carrier for the cluster circuit board and circuitry, the cluster connectors, the gauges, a Light Emitting Diode (LED) for each cluster indicator, the VFD units, an audible tone transducer, the cluster overlay, the gauge pointers, the odometer/trip odometer switch and the Electronic Vehicle Information Center Display (EVIC) switch button.



Several versions of the CCN are offered. These versions accommodate all of the variations of optional equipment and regulatory requirements for the various markets in which the vehicle will be offered. The microprocessor-based CCN utilizes integrated circuitry and information carried on the Controller Area Network (CAN) data bus along with several hard wired analog and multiplexed inputs to monitor sensors and switches throughout the vehicle. In response to those inputs, the internal circuitry and programming of the CCN allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the CAN/LIN data bus (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION).

The CCN houses four analog gauges and has provisions for up to twenty-five indicators. All of the CCN indicators are automatically configured when the CCN is connected to the vehicle electrical system for compatibility with certain optional equipment or equipment required for regulatory purposes in certain markets. While each CCN may have provisions for indicators to support every available option, the configurable indicators will not be functional in a vehicle that does not have the equipment that an indicator supports.

Each indicator in the CCN, except those located within the VFD units, is illuminated by a dedicated LED that is soldered onto the CCN electronic circuit board. Cluster illumination is accomplished by dimmable LED back lighting, which illuminates each of the gauges for visibility when the exterior lighting is turned on. The LED units are not available for service replacement and, if damaged or faulty, the entire CCN must be replaced.

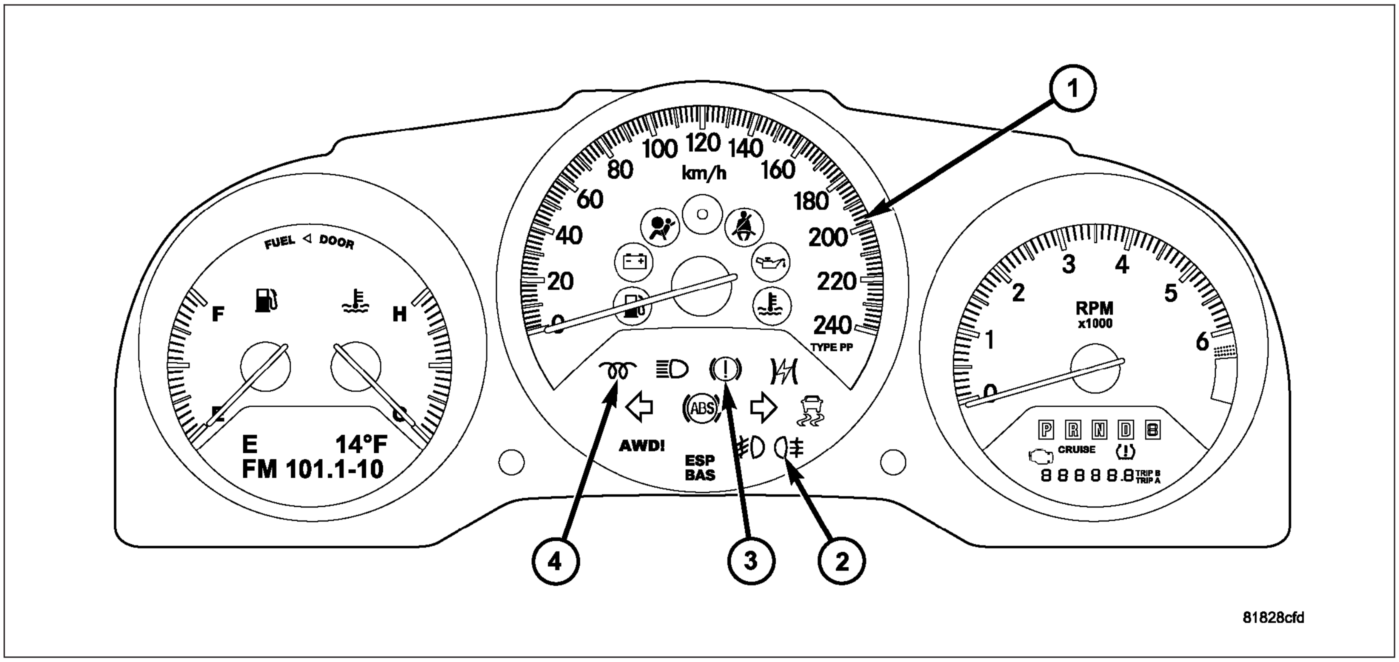
The CCN is serviced only as a complete unit. The CCN cannot be adjusted or repaired. If a gauge, an LED indicator, a VFD unit, the electronic circuit board, the circuit board hardware, the cluster overlay, or the CCN housing are damaged or faulty, the entire CCN must be replaced. The cluster lens, hood and mask unit are available for separate service replacement.

DOMESTIC CLUSTER/CCN

The Domestic CCN includes the following analog gauges:

- **Engine Temperature Gauge (3)**
- **Fuel Gauge (1)**
- **Speedometer (4)**
- **Tachometer (5)**

The CCN includes the following VFD units:



- **Gear Selector/Odometer/Trip Odometer (13 and 15)**
- **Electronic Vehicle Information Center (EVIC) Display**

The CCN includes provisions for the following indicators:

- **Airbag Warning Indicator (8)**
- **All Wheel Drive Indicator (24)**
- **Antilock Brake System (ABS) Warning Indicator (25)**
- **Park Brake/Brake Indicator (27)**
- **Charging System Warning Indicator (7)**
- **Cruise Indicator (17)**
- **Electronic Stability Program Indicator (23)**
- **Electronic Throttle Control Indicator (19)**
- **Electronic Vehicle Information Center (EVIC) Display Step Button**
- **Fog Lamp Indicator (22)**
- **Fuel Door Location (2)**
- **High Beam Indicator (26)**
- **High Engine Temperature Warning Indicator (12)**
- **Low Fuel Indicator (6)**
- **Malfunction Indicator Lamp (MIL) (16)**
- **Odometer/Trip Odometer A/B Select Button (18)**
- **Oil Pressure Warning Indicator (11)**
- **Seatbelt Indicator (10)**
- **Security Indicator (9)**
- **Tire Pressure Monitor System Indicator (14)**

- **Traction Control Indicator (20)**
- **Transmission Over Temperature Indicator (CVT transmission only) (30)**
- **Turn Signal (Right and Left) Indicators (21)**

BUX CLUSTER/CCN

The BUX CCN is relatively the same as domestic for the exception of:

- **Brake Fail/Park Brake Indicator (3)**
- **Rear Fog lamps Indicator (2)**
- **Speedometer - Kilometers per hour (km/h) (1)**
- **Wait to Start Indicator (diesel only) (4)**

OPERATION

The ElectroMechanical Instrument Cluster (EMIC) in this model also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN. The following information deals primarily with the instrument cluster functions of this unit. Additional details of the electronic body control functions of this unit may be found within the service information for the system or component that the CCN controls. For example: Additional details of the audible warning functions of the CCN are found within the Chime/Buzzer service information.

The CCN is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the CCN provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The CCN is installed in the instrument panel so that all of these monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access for service.

The microprocessor-based CCN hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus and the Local Interconnect Network (LIN) data bus. The CCN is the master of the LIN bus and there are four modules that talk to the CCN: The Heated Seat Module (HSM), Remote Compass Module (RCM), Steering Control Module (SCM), and the Accessory Switch Bank Module (ASBM) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION).

The CCN microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist such as high coolant temperature, the algorithm can drive the gauge pointer to an extreme position and the microprocessor

can sound a chime through the on-board audible tone transducer to provide distinct visual and audible indications of a problem to the vehicle operator. The CCN may also produce audible warnings for other electronic modules in the vehicle based upon electronic tone request messages received over the CAN/LIN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The CCN circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B(+) circuit, and on battery current received through a fused ignition switch output (run-start) fuse on a fused ignition switch output (run-start) circuit. This arrangement allows the/CCN to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the On or Start positions. The CCN circuitry is grounded through a ground circuit of the instrument panel wire harness.

The CCN also has a self-diagnostic actuator test capability which will test each of the CAN bus message-controlled functions of the cluster by lighting the appropriate indicators, positioning the gauge needles at several predetermined calibration points across the gauge faces, and illuminating all segments of the odometer/trip odometer/gear selector indicator Vacuum-Fluorescent Display (VFD) unit and Electronic Vehicle Information Center (EVIC). The EVIC will display the hardware/software version, and the CAN and LIN Vehicle Maintenance Monitor (VMM) used in the CCN. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

The CCN collects data and provides control signals for the following electrical equipment via the CAN data bus:

- Gauges
- Interior lighting controls
- Variable-intensity cluster lighting and illumination of instrument panel mounted equipment
- Vehicle Theft Alarm and Sentry Key Theft Deterrent System
- Power door lock system controls (automatic locking, and Remote Keyless Entry locking and unlocking)
- Headlamp switch actuation signal
- Steering wheel radio actuation signals
- Accessory power delay relay control
- Wiper control
- Turn signal flasher audible click
- Heated seat actuation signal (if equipped)
- UConnect® Hands-Free, Voice-Actuated Communication system actuation signal (if equipped)
- Display of the outputs for the HomeLink® universal home security system and compass (if equipped)
- Illuminated entry system
- Key-in-ignition warning chime
- Seat belt warning chime and lamp (Including BeltAlert®)
- Low washer fluid warning indicator
- Door ajar warning indicator
- Liftgate/trunk ajar warning indicator
- LIN master module

The CCN also provides the following enhancements to the above features:

- Time-out for interior lamps left on inadvertently
- Driver programmability of vehicle speed-sensitive automatic locking
- Driver programmability of the power locks to unlock only the driver's door or all doors with the first actuation of the RKE unlock button
- Ability to program vehicle response to lock and unlock commands from the RKE transmitter
- The improved BeltAlert® seatbelt warning indication
- Filtering of input signals to the fuel gauge, temperature gauge, and speedometer to avoid sudden, unexpected pointer movements
- Headlamp control for turning the headlamps on if the windshield wipers are operated in daylight as required by law in some states

GAUGES

All gauges receive battery current through the CCN circuitry only when the ignition switch is in the On or Start positions. With the ignition switch in the Off position battery current is not supplied to any gauges, and the CCN circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the On or Start positions.

All of the CCN gauges are stepper motors. The gauges are diagnosed using the CCN self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN data bus and the electronic data bus message inputs to the CCN that control each gauge require the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for each gauge may be found elsewhere in this service information.

VACUUM-FLUORESCENT DISPLAYS

ODOMETER/TRIP ODOMETER - The odometer and trip odometer give an indication to the vehicle operator of the distance the vehicle has traveled. The engine hours give an indication of the cumulative engine-ON time. This indicator is controlled by the instrument cluster circuitry based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) or Engine Control Module (ECM) over the Controller Area Network (CAN) data bus.

The odometer/trip odometer will display some warning messages such as “d00R” and “gATE” ajar. If equipped with the optional Electronic Vehicle Information Center (EVIC), the EVIC will display all messages except GASCAP.

The odometer, trip odometer and engine hours information are displayed by the instrument cluster Vacuum Fluorescent Display (VFD). The VFD will display the odometer information whenever the driver side front door is opened with the ignition switch in the OFF or ACCESSORY positions, and will display the last previously selected odometer or trip odometer information when the ignition switch is turned to the ON or START positions. The instrument cluster circuitry controls the VFD and provides the following features:

- **Odometer/Trip Odometer Display Toggling** - Actuating the trip odometer reset switch button momentarily with the VFD illuminated will toggle the display between the odometer and trip odometer information. Each time the VFD is illuminated with the ignition switch in the ON or START positions, the display will automatically return to the last mode previously selected (odometer or trip odometer).
- **Engine Hours Display Toggling** - When the trip odometer reset switch button is pressed and held for longer than about six seconds with the ignition switch in the ON position and the engine speed message from the PCM is zero, the trip odometer information will be momentarily displayed, then the engine hours information will be displayed. The VFD must be displaying the odometer information when the trip odometer reset switch button is pressed in order to toggle to the engine hours display. The engine hours will remain displayed for about 30 seconds, until the engine speed message is greater than zero, or until the ignition switch is turned to the OFF position, whichever occurs first.
- **Trip Odometer Reset** - When the trip odometer reset switch button is pressed and held for longer than about two seconds with the ignition switch in the ON or START position, the trip odometer will be reset to **0.0** kilometers (miles). The VFD must be displaying the trip odometer information in order for the trip odometer information to be reset.
- **GASCAP Message Display** - On vehicles manufactured with a United States country code, each time the cluster receives an electronic message from the PCM indicating a monitored leak in the evaporative emissions system, the cluster replaces the displayed odometer/trip odometer value with the textual message, **GASCAP**. This message serves as a reminder to the vehicle operator to check that the gas cap is properly installed and tightened, but could also indicate another source of air leakage in the on-board evaporative and vapor recovery emissions systems. Unless the leak is corrected, this message will latch and remain displayed during the current and each subsequent ignition cycle until the trip odometer reset button is pressed and released momentarily, which will revert the display to the odometer/trip odometer information that was last displayed for the remainder of that ignition cycle. Once the source of a leak has been corrected, either momentarily pressing the trip odometer reset button or cycling the ignition switch will unlatch the message and return the odometer/trip odometer to normal operation.
- **Communication Error** - If the cluster fails to receive an electronic **distance** message during normal operation, it will hold and display the last data received until the ignition switch is turned to the OFF position. If the cluster does not receive a **distance** message within one second after the ignition switch is turned to the ON position, it will display the last distance value stored in the cluster memory. If the cluster is unable to display distance information due to an error internal to the cluster, the VFD will display **Error**.
- **Actuator Test** - Each time the cluster is put through the actuator test, the odometer VFD will display all of its segments simultaneously, then step through each character segment individually during the VFD portion of the test to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the vehicle speed pulse information received from the Vehicle Speed Sensor (VSS) or the Controller Anti-lock Brake (CAB) and engine speed pulse information received from the crankshaft position sensor, then sends the proper messages to the ElectroMechanical Instrument Cluster (EMIC). For further diagnosis

of the odometer/trip odometer or the instrument cluster circuitry that controls these functions, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the VSS, the crankshaft position sensor, the CAB, the PCM, the EMIC, the CAN data bus or the electronic communication related to odometer/trip odometer operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ELECTRONIC VEHICLE INFORMATION CENTER DISPLAY - The Electronic Vehicle Information Center (EVIC) features a driver-interactive display. The display is located in the lower left part of the instrument cluster below the fuel and engine temperature gauges. This system conveniently allows the driver to select a variety of useful information by pressing the **STEP** button to the right of the EVIC display. The EVIC displays information related to the following:

- **Audio mode display**
- **Compass display**
- **Navigation system screens (if equipped)**
- **Outside temperature display**
- **Personal Settings (customer programmable features)**
- **System Status**
- **Trip computer functions**
- **UConnect™ hands-free communication system displays (if equipped)**
- **Vehicle information warning message displays**

The Vacuum-Fluorescent Display (VFD) units are soldered to the CCN electronic circuit board. With the ignition switch in the Off or Accessory positions, the left and right VFD displays are activated when the driver door is opened and is deactivated when the driver door is closed. Otherwise, the display units are active when the ignition switch is in the On or Start positions, and inactive when the ignition switch is in the Off or Accessory positions.

The illumination intensity of the VFD units are controlled by the CCN circuitry based upon an input from the headlamp switch and a dimming level input received from the panel dimmer switch. The CCN synchronizes the illumination intensity of other VFD units with that of the unit in the CCN by sending electronic dimming level messages to other electronic modules in the vehicle over the CAN/LIN data bus.

The CCN VFD units have several display capabilities. The right VFD unit displays odometer, trip odometer, engine hours, gear selector indication (PRNDL) for models with an automatic transmission, several warning or reminder indications, and various diagnostic information when certain fault conditions exist. An odometer/trip odometer switch on the CCN circuit board is used to control some of the display modes of the right VFD. This switch is actuated manually by depressing the odometer/trip odometer switch button that extends through the lower edge of the cluster lens, just left of the tachometer. Actuating this switch momentarily with the ignition switch in the On position will toggle the VFD between the odometer and trip odometer modes. Depressing the switch button for about two seconds while the VFD is in the trip odometer mode will reset the trip odometer value to zero. The left VFD unit displays the Electronic Vehicle Information Center (EVIC) and Compass/Temperature information. The left switch button is used as a STEP button for the EVIC display and customer programmable features (Refer to 8 - ELECTRICAL/MESSAGE CENTER/ELECT VEHICLE INFORMATION CENTER - OPERATION).

NOTE: If the vehicles OnBoard Diagnostic (OBD) system determines that the fuel filler cap is loose, improperly installed, or damaged, a “GASCAP” message will be displayed in the Odometer/Trip Odometer. In this instance, tighten the fuel filler cap and press the odometer/trip odometer reset button once to turn the message OFF. The key must be in the Run/Start position during the reset, or you may just cycle the key. If left loose for three trips, or key cycles, a DTC will set and the MIL lamp will illuminate.

Holding the right switch depressed while turning the ignition switch from the Off position to the On position will initiate the CCN self-diagnostic actuator test. Refer to the instrument cluster diagnosis and testing service information for additional details on this cluster function. The CCN microprocessor remembers which display mode is active when the ignition switch is turned to the Off position, and returns the VFD display to that mode when the ignition switch is turned On again.

The VFD unit is diagnosed using the CCN self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN data bus and the electronic data bus message inputs to the CCN that control some of the VFD functions requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for the odometer, the trip odometer, the gear selector indicator and the various warning and reminder indicator functions of the VFD unit may be found elsewhere in this service information. Refer to the vehicle owners manual for further information on various readout messages.

INDICATORS

Indicators are located in various positions within the CCN and are all connected to the CCN electronic circuit board. The door ajar indicator, cargo lamp indicator, high beam indicator, and turn signal indicators operate based upon hard wired inputs to the CCN. The brake indicator is controlled by CAN data bus messages from the Controller Antilock Brake (CAB) as well as by hard wired park brake switch inputs to the CCN. The seatbelt indicator is controlled by the CCN programming, CAN data bus messages from the Occupant Restraint Controller (ORC), and a hard wired seat belt switch input to the CCN. The Malfunction Indicator Lamp (MIL) is normally controlled by CAN data bus messages from the Powertrain Control Module (PCM); however, if the CCN loses CAN data bus communication, the CCN circuitry will automatically turn the MIL on until CAN data bus communication is restored. The CCN uses CAN data bus messages from the Totally Integrated Power Module (TIPM), the ORC, the CAB, and the Sentry Key REmote Entry Module (SKREEM) to control all of the remaining indicators.

The various CCN indicators are controlled by different strategies; some receive fused ignition switch output from the CCN circuitry and have a switched ground, while others are grounded through the CCN circuitry and have a switched battery feed. However, all indicators are completely controlled by the CCN microprocessor based upon various hard wired and electronic message inputs. The cruise indicator located within the VFD unit is dimmable. All other indicators are illuminated at a fixed intensity, which is not affected by the selected illumination intensity of the CCN general illumination LED's. The illumination intensity of the dimmable indicators is synchronized with that of the CCN general illumination LED's.

In addition, certain indicators in this instrument cluster are automatically configured or self-configured. This feature allows the configurable indicators to be enabled by the CCN circuitry for compatibility with certain optional equipment. The CCN defaults for the ABS indicator and airbag indicator are enabled, and these configuration settings must be programmatically disabled in the CCN using a diagnostic scan tool for vehicles that do not have this equipment. The automatically configured or self-configured indicators remain latent in each CCN at all times and will be active only when the CCN receives the appropriate CAN message inputs for that optional system or equipment.

The hard wired indicator inputs may be diagnosed using conventional diagnostic methods. However, the CCN circuitry and CAN/LIN bus message controlled indicators are diagnosed using the CCN self-diagnostic actuator test. Some indicators are requested to be turned on via the LIN bus. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN/LIN data bus and the electronic message inputs to the CCN that control an indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific details of the operation for each indicator may be found elsewhere in this service information.

CLUSTER ILLUMINATION

The CCN has several illumination lamps that are illuminated whenever the exterior lighting is turned On. The illumination intensity of these lamps is adjusted when the interior lighting thumbwheel on the headlamp switch is rotated (down to dim, up to brighten) to one of six available minor detent positions. The CCN monitors a resistor multiplexed input from the headlamp switch on a dimmer input circuit. In response to that input, the CCN electronic circuitry converts a fused 12-volt input it receives on a hard wired panel lamps dimmer switch signal circuit into a 12-volt Pulse Width Modulated (PWM) output.

The CCN uses this PWM output to control the illumination intensity of the cluster, the instrument panel center stack illumination, and the VFD unit on the CCN circuit board. The CCN also transmits electronic dimming level messages over the LIN data bus to other electronic modules (such as the ASBM, HVAC control head, the radio, and the clock) in the vehicle to control and synchronize their illumination intensity.

In addition, the thumbwheel on the headlamp switch has a Parade Mode position to provide a parade or funeral mode. The CCN monitors the request for this mode from the headlamp switch, then transmits an electronic dimming level message to illuminate all VFD units in the vehicle at full (daytime) intensity for easier visibility when driving in daylight with the exterior lighting turned on.

The hard wired headlamp switch and panel lamps dimmer inputs to and outputs from the CCN may be diagnosed using conventional diagnostic methods. However, proper testing of the PWM processing of the CCN and the electronic dimming level messages sent by the CCN over the CAN data bus requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

INSTRUMENT CLUSTER

If all of the instrument cluster gauges and indicators are inoperative, be certain to check the instrument cluster fused B(+) fuse and the instrument cluster fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hard wired gauge or indicator is inoperative, refer to the diagnosis and testing service information for that specific gauge or indicator. If an individual Controller Area Network (CAN) or Local Interconnect Network (LIN) data bus message-controlled gauge or indicator is inoperative, perform the Actuator Test as follows:

CAUTION: Instrument clusters used in this model automatically configure themselves for compatibility with the features and optional equipment in the vehicle in which they are initially installed. The instrument cluster is programmed to do this by embedding the Vehicle Identification Number (VIN) and other information critical to proper cluster operation into electronic memory. This embedded information is learned through electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus, and through certain hard wired inputs received when the cluster is connected to the vehicle electrically. Once configured, the instrument cluster memory may be irreparably damaged and certain irreversible configuration errors may occur if the cluster is connected electrically to another vehicle; or, if an electronic module from another vehicle is connected that provides data to the instrument cluster (including odometer values) that conflicts with that which was previously learned and stored. Therefore, the practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. Failure to observe this caution may result in instrument cluster damage, which is not reimbursable under the terms of the product warranty. Service replacement instrument clusters are provided with the correct VIN, and the certified odometer and engine hours values embedded into cluster memory, but will otherwise be automatically configured for compatibility with the features and optional equipment in the vehicle in which they are initially installed.

ACTUATOR TEST

The instrument cluster actuator test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument cluster can perform a self-diagnostic test that will confirm that the instrument cluster circuitry, the gauges, and the indicators are capable of operating as designed. During the actuator test the instrument cluster circuitry will position each of the gauge needles at various calibration points, illuminate all of the segments in the Vacuum Fluorescent Display (VFD) unit, and turn all of the indicators on and off again.

Successful completion of the actuator test will confirm that the instrument cluster is operational. However, there may still be a problem with the CAN/LIN data bus, the Powertrain Control Module (PCM), the Engine Control Module (ECM), the Totally Integrated Power Module (TIPM), the Transmission Control Module (TCM), the Occupant Restraint Controller (ORC), the Controller Anti-lock Brake (CAB), the Sentry Key REmote Entry Module (SKREEM) or the hard wired inputs to one of these electronic control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the Off position.
2. Depress the odometer/trip odometer switch button.
3. While still holding the odometer/trip odometer switch button depressed, turn the ignition switch to the On position, but do not start the engine.
4. Release the odometer/trip odometer switch button.
5. The instrument cluster will simultaneously begin to illuminate all of the operational segments in the VFD unit and perform a bulb check of each operational LED indicator. The VFD segments and LED indicators remain illuminated as each gauge needle is swept to several calibration points and back. If a VFD segment or an LED indicator fails to illuminate, or if a gauge needle fails to sweep through the calibration points and back during this test, the instrument cluster must be replaced.
6. The actuator test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test. The actuator test will be aborted if the ignition switch is turned to the Off position, or if a vehicle speed message indicating that the vehicle is moving is received from the PCM over the CAN data bus during the test.

7. Go back to Step 1 to repeat the test, if necessary.

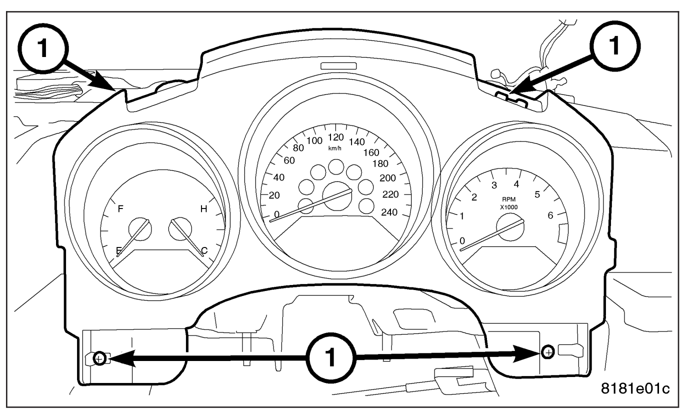
STANDARD PROCEDURE

ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or “beltminder” feature that is enabled when the vehicle is shipped from the factory. This beltminder feature provides extended and modified visual seatbelt indicator and audible chime warning responses to an unbuckled driver side or both driver and passenger front seat belts. The beltminder feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool.

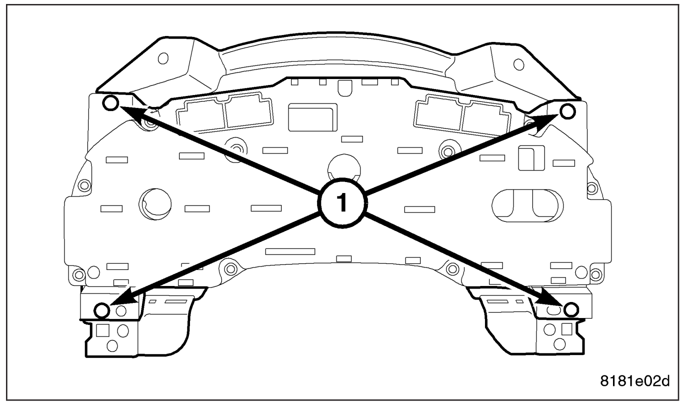
CUSTOMER PROGRAMMING SEQUENCE

NOTE: The following sequence of events must occur within sixty (60) seconds of the ignition switch being placed in the On position in order for the programming to be completed successfully. Even if the vehicle is equipped with both driver and passenger side front seat belt switches, this programming sequence MUST be performed using the driver side front seat belt. The passenger side front seat belt switch has no programming functionality.



1. With all doors closed and the ignition switch in any position except On or Start, buckle the driver side front seat belt.
2. Turn the ignition switch to the On position and wait for the seatbelt indicator reminder function to conclude (about six seconds).
3. Unbuckle and buckle the driver side front seat belt three or more times, ending with the belt buckled.

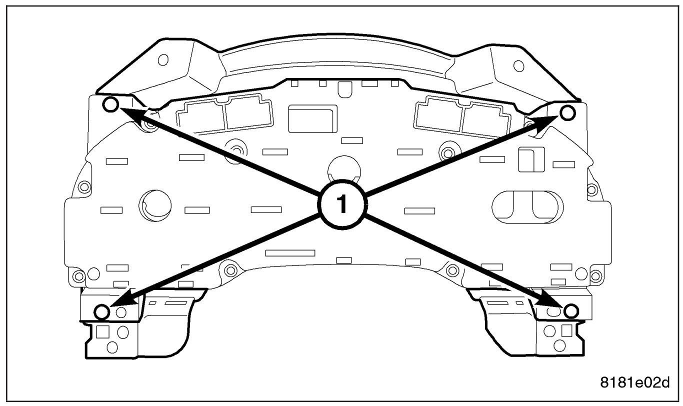
NOTE: The occupant must be sure to fully retract the seatbelt each time during this cycle because the actual switch is located in the seatbelt retractor and not the buckle. Each time the seatbelt is buckled or unbuckled, and fully retracted, the seatbelt indicator will illuminate or turn OFF, depending on switch state.



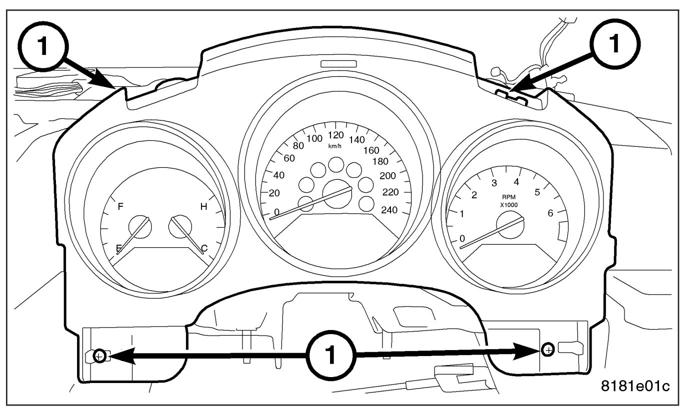
4. Turn the ignition switch to any position except On or Start to toggle the beltminder feature from its current setting (from active to inactive, or from inactive to active). A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel upper panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL UPPER PANEL - REMOVAL).
3. Remove the four retaining screws (1) to the instrument cluster bezel.



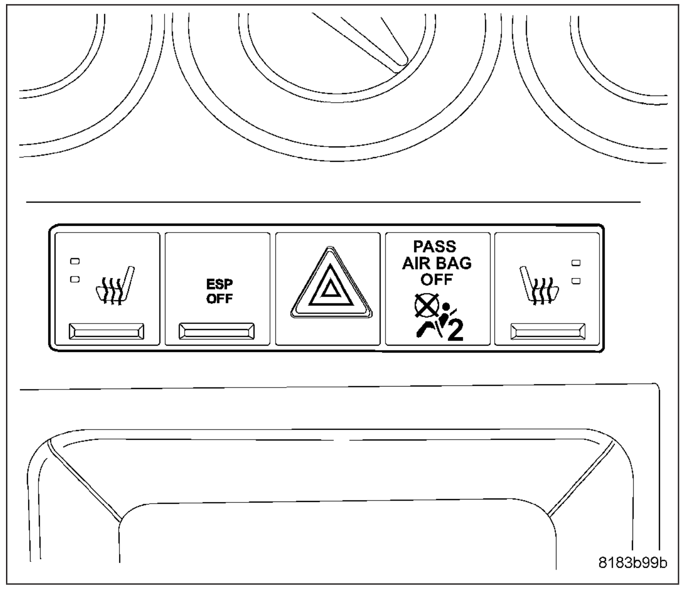
4. Pull instrument cluster rearward to expose the four electrical connectors.
5. Disconnect the electrical connectors and remove cluster from instrument panel.
6. Separate cluster bezel from cluster by removing the four retaining screws (1).



INSTALLATION

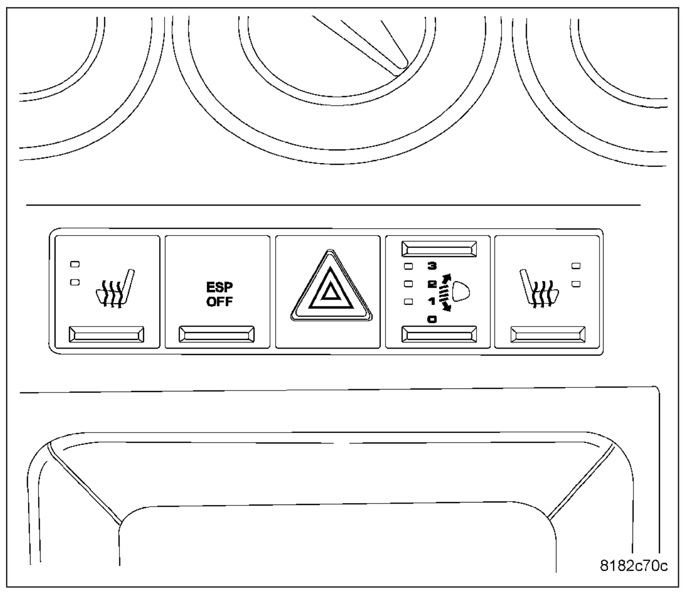
1. Install the cluster bezel onto the cluster by installing the four retaining screws (1).
2. Position the cluster in the instrument panel opening.
3. Connect the four electrical connectors.
4. Push instrument cluster forward.

5. Install the four retaining screws (1) to the instrument cluster bezel.
6. Install the instrument panel upper panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL UPPER PANEL - INSTALLATION).
7. Connect the battery negative cable.



ACCESSORY SWITCH BANK MODULE

DESCRIPTION

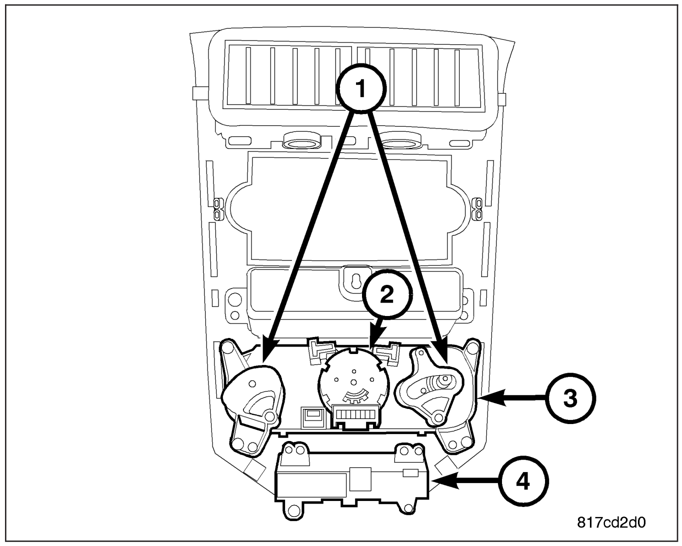


There is an Accessory Switch Bank Module (ASBM) located in the instrument panel center stack just below the heater a/c control. Included in this switch bank are:

- Electronic Stability Program (ESP)/Traction Control Switch (TCS) Off (if equipped) - (Refer to 5 - BRAKES/ELECTRICAL/ESP SWITCH - DESCRIPTION)
- Hazard Switch (all models) - (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HAZARD SWITCH - DESCRIPTION)
- Heated Seat Switch (if equipped) - (Refer to 8 - ELECTRICAL/HEATED SEATS/SEAT SWITCH - DESCRIPTION)
- Passenger Airbag Disabled Lamp (PADL) Indicator (if equipped with OCS) - (Refer to 8 - ELECTRICAL/RESTRAINTS - DESCRIPTION).

The BUX version of the ASBM will vary from the domestic a bit. Following are the various BUX switches:

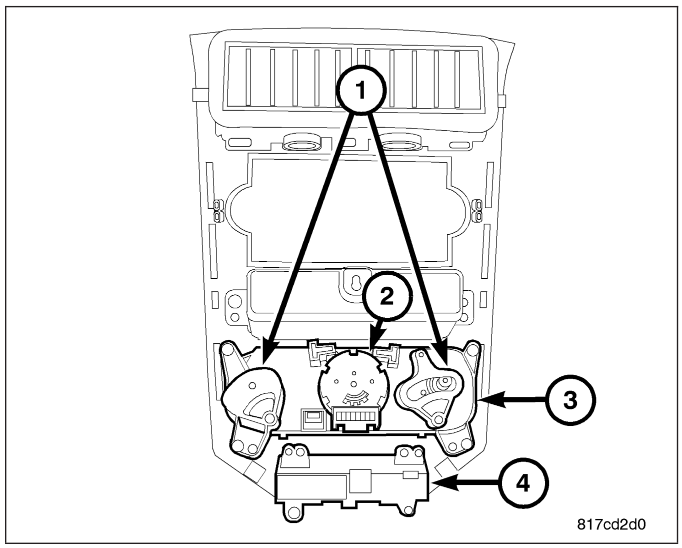
- Anti-Skid Control (ASC) (if equipped) - This is the same as the ESP/TCS off switch in the domestic version.
- Hazard Switch (all models)
- Heated Seat Switch (if equipped)
- Headlamp Leveling Switch (if equipped) - (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP LEVELING SWITCH - DESCRIPTION)



Each individual switch is not available for service replacement. If one or more switches are inoperative, the entire ASBM must be replaced (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/ACCESSORY SWITCH BANK MODULE - REMOVAL). To diagnose the ASBM switches, use a scan tool and the appropriate diagnostic information.

OPERATION

For more information on the individual switches refer to the owners manual in the vehicles glove box.



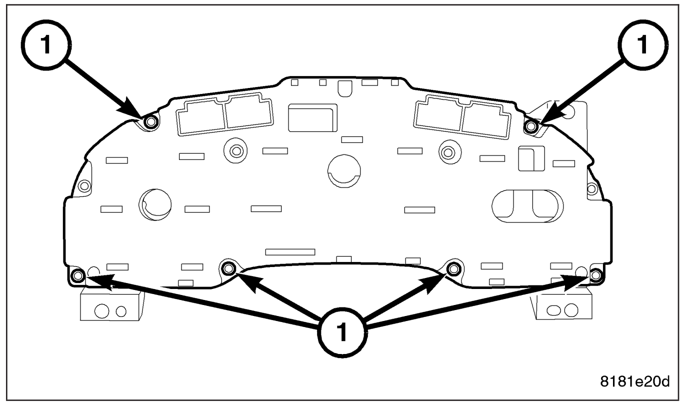
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Remove the screws to the Accessory Switch Bank Module (ASBM) (4).

INSTALLATION

1. Position the Accessory Switch Bank Module (ASBM) (4) in the center bezel.
2. Install the screws to the ASBM.
3. Install the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
4. Connect the battery negative cable.

CLUSTER MASK/LENS

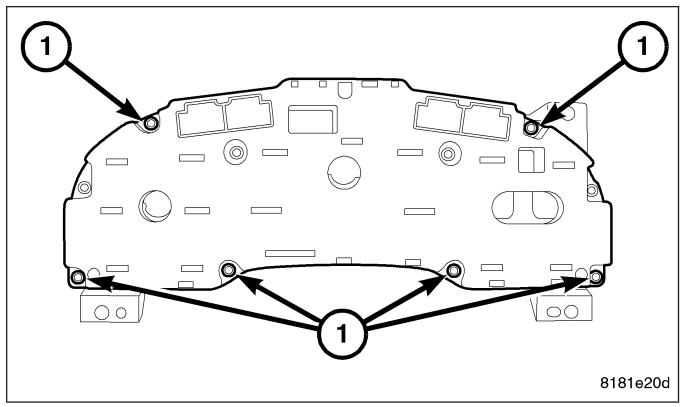


REMOVAL

The mask and lens are serviced together as a unit. If replacement is required for either of these components, they both will be replaced as a unit.

1. Remove instrument cluster (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

NOTE: You must separate the cluster bezel from the cluster to remove the mask/lens.



2. To separate the mask/lens from the cluster housing, remove the four screws (1) along the bottom back of the cluster and the two top screws (1).

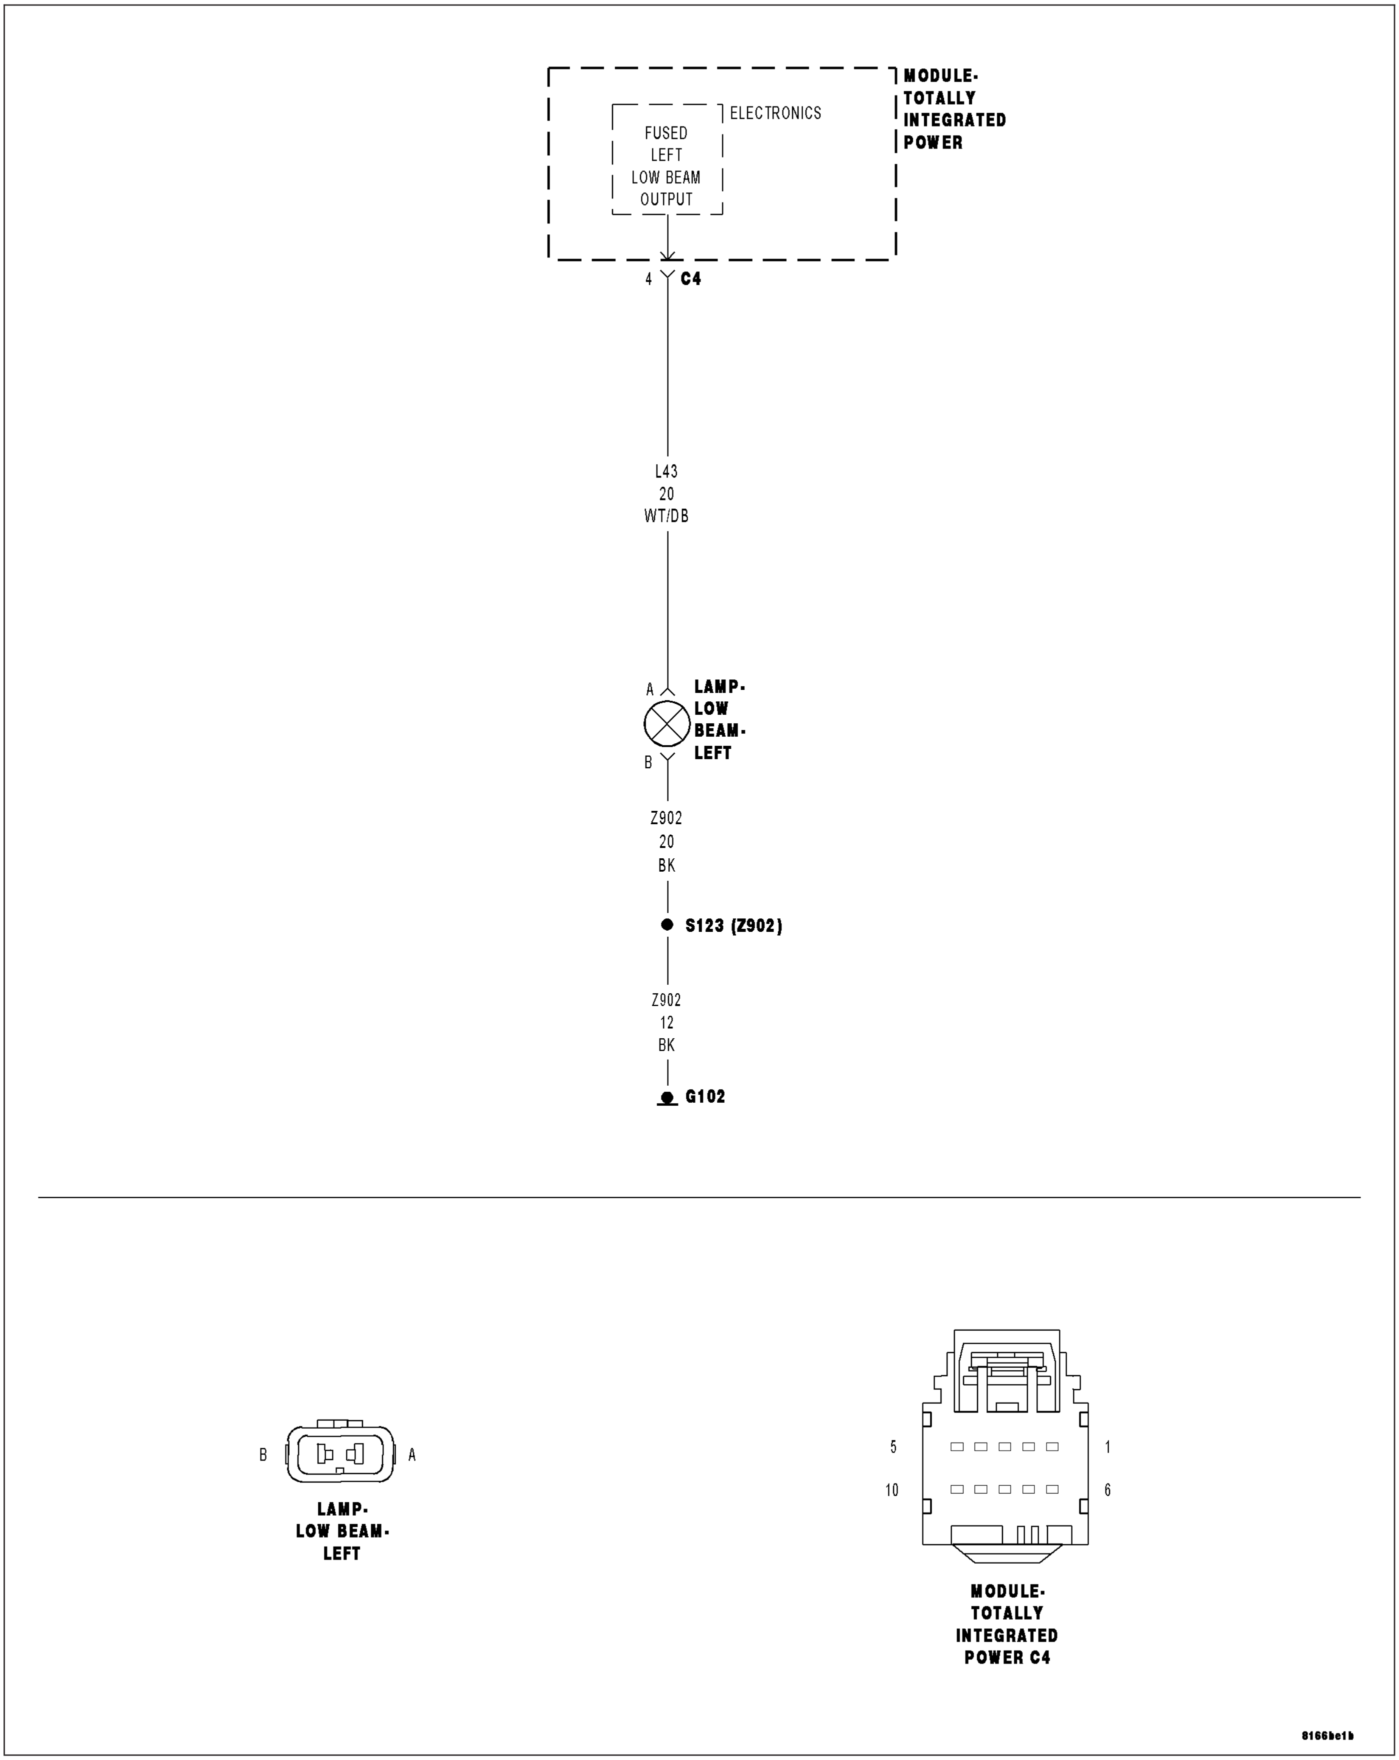
INSTALLATION

The mask and lens are serviced together as a unit. If replacement is required for either of these components, they both will be replaced as a unit.

1. Position the mask/lens on the cluster housing, install the four screws (1) along the bottom back of the cluster and the two top screws (1).
2. Install the instrument cluster (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).

LAMPS

TABLE OF CONTENTS



LAMPS/LIGHTING - EXTERIOR - ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

LAMPS/LIGHTING - EXTERIOR - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

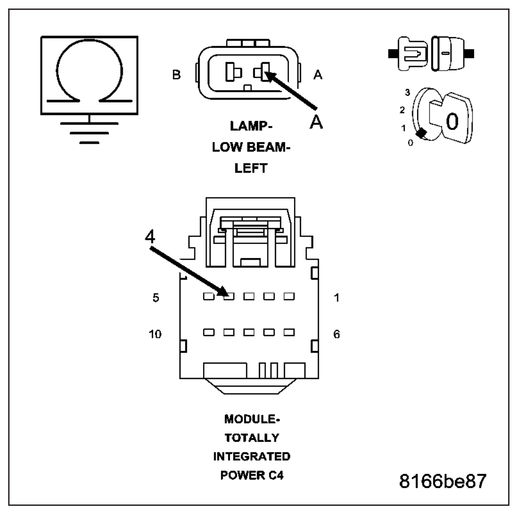
- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L43) LEFT LOW BEAM CONTROL CIRCUIT SHORT TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all TIPM DTC's.
Turn the Headlamps on.
With the Scan Tool read the DTC information.



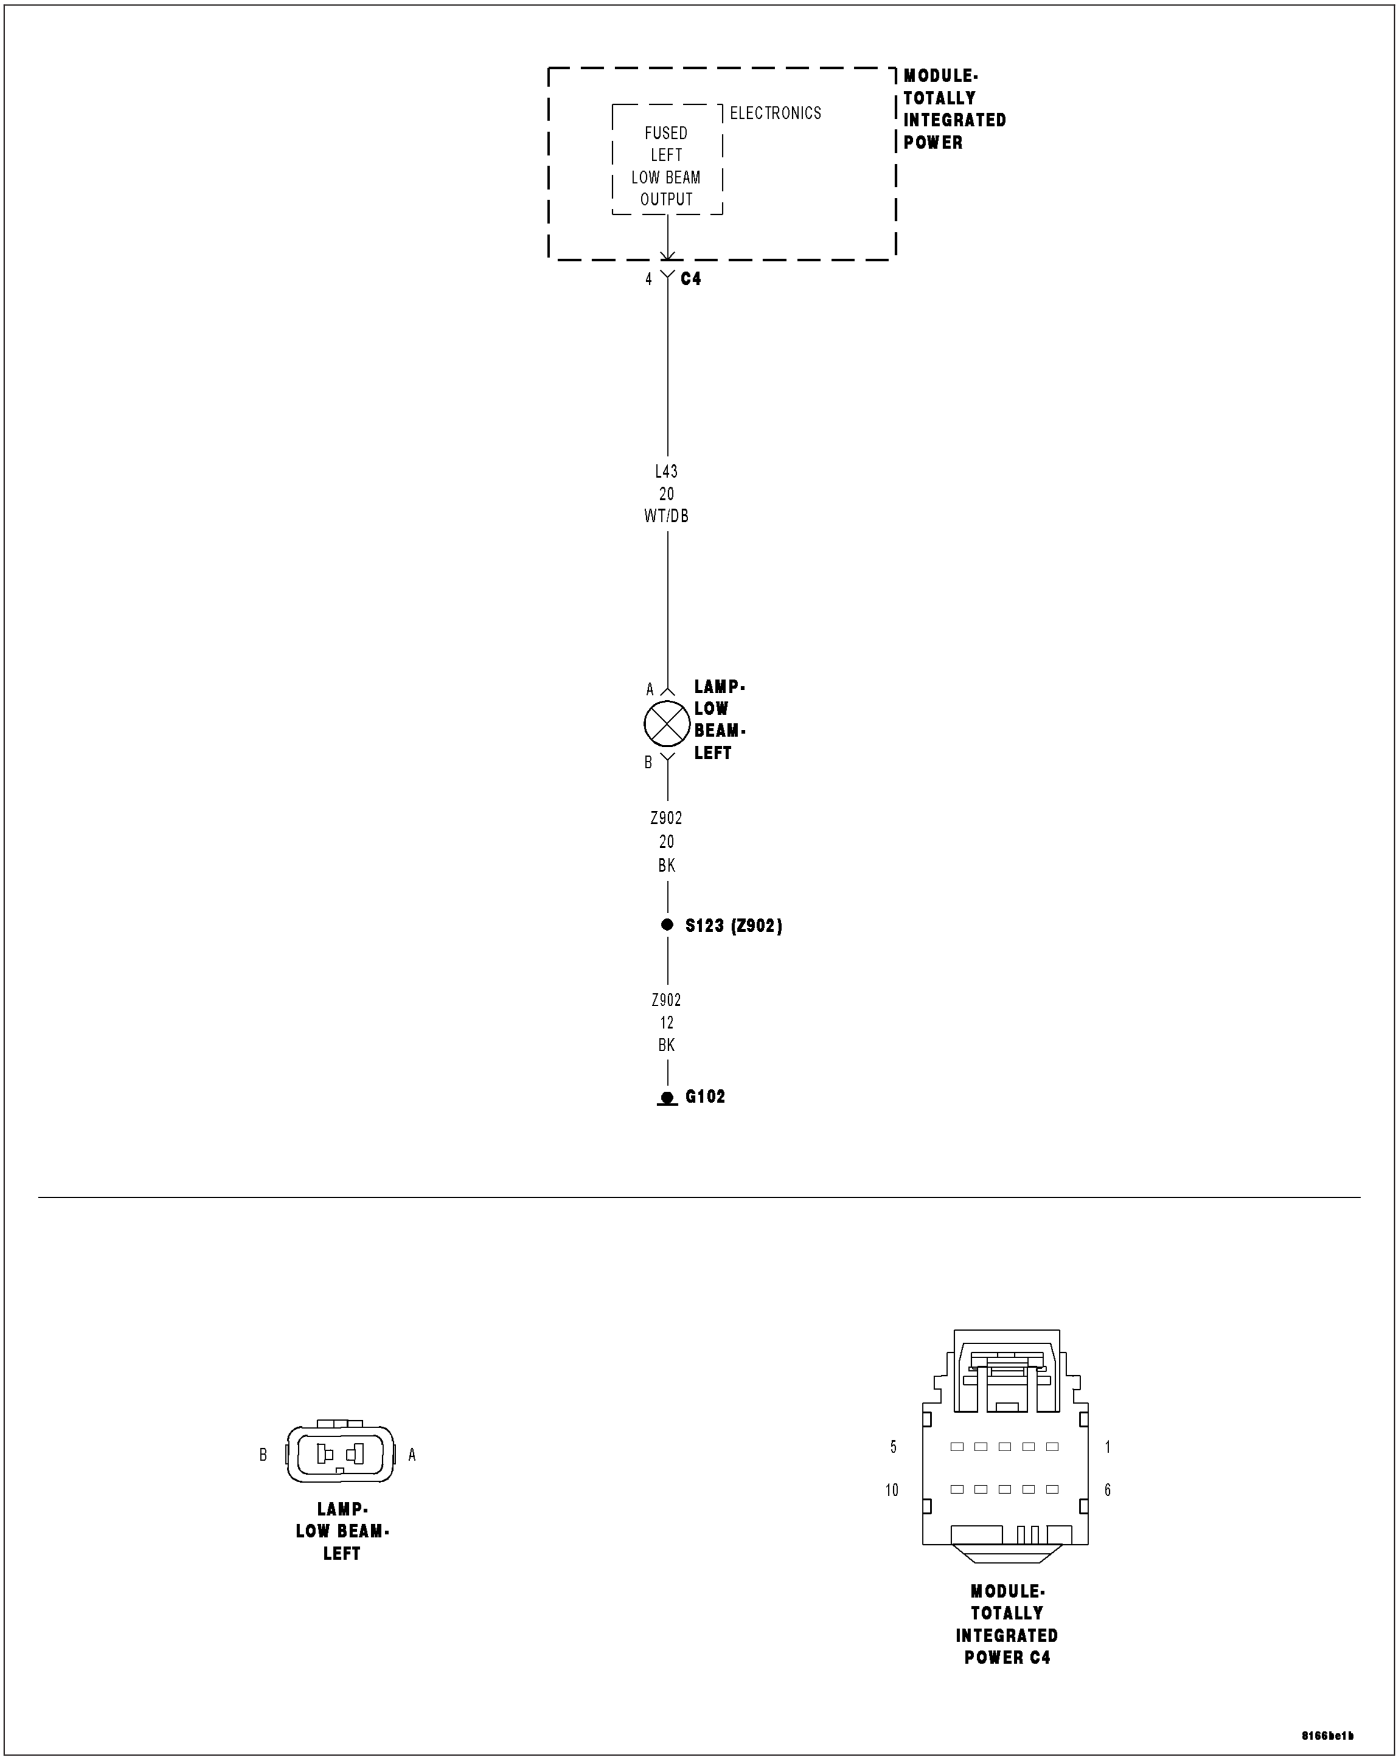
Does the Scan Tool read: B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (L43) LEFT LOW BEAM CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.
Disconnect the TIPM C4 harness connector.
Disconnect the Left Headlamp harness connector.
Measure the resistance between ground and the (L43) Left Low Beam Control circuit.



Is the resistance below 5.0 ohms?

Yes >> Repair the (L43) Left Low Beam Control circuit for a short to ground condition.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B162C-LEFT LOW BEAM CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L43) LEFT LOW BEAM CONTROL CIRCUIT OPEN
(L43) LEFT LOW BEAM CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Headlamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B162C-LEFT LOW BEAM CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT LOW BEAM BULB

Turn the ignition off.

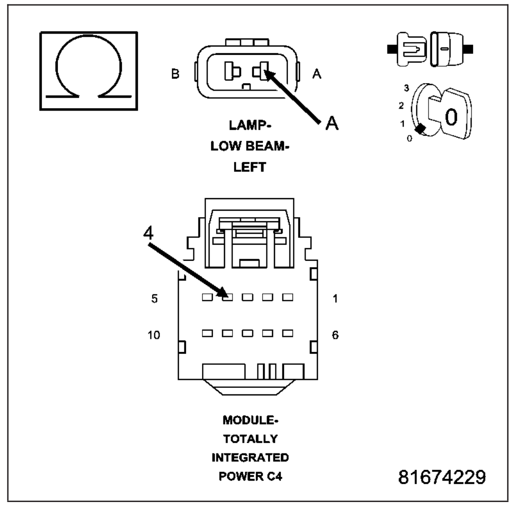
Inspect the Left Low Beam Bulb Assembly.

Is the inoperative bulb OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



3. (L43) LEFT LOW BEAM CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Disconnect the Left Low Beam Lamp harness connector.

Measure the resistance of the (L43) Left Low Beam Control circuit.

Is the resistance above 5.0 ohms?

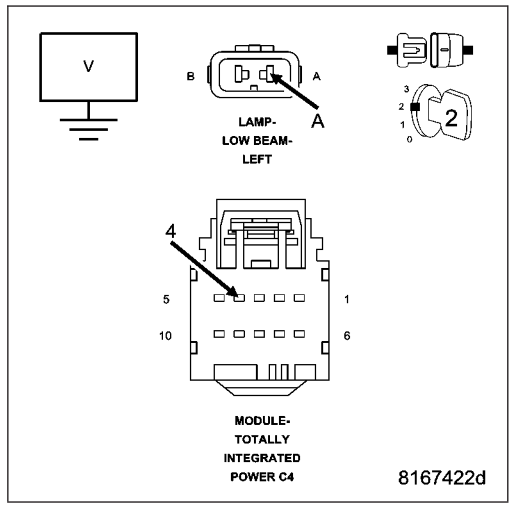
Yes >> Repair the (L43) Left Low Beam Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (L43) LEFT LOW BEAM CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

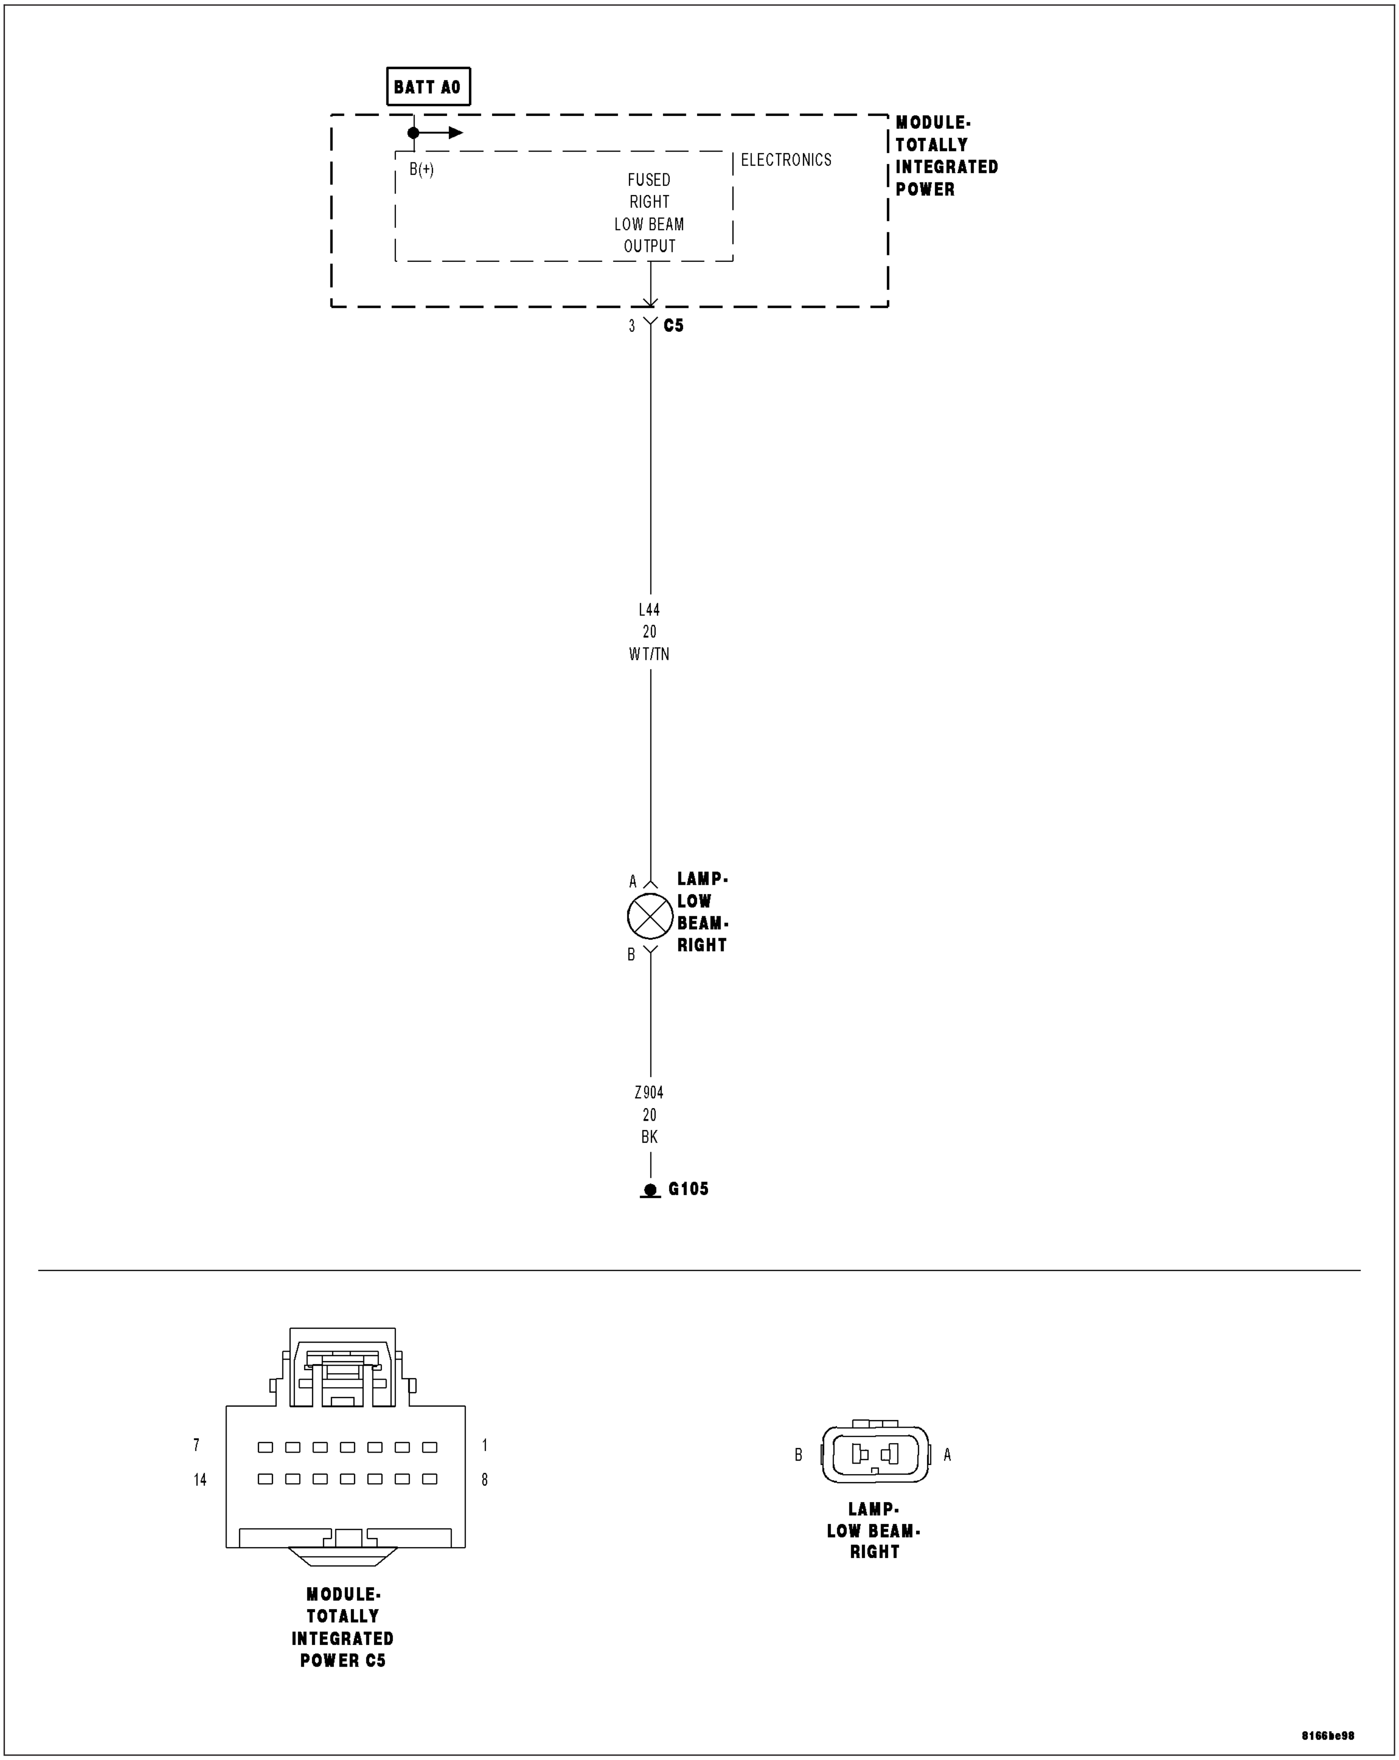
Disconnect the TIPM C4 harness connector.

Disconnect the Left Low Beam Lamp harness connector.

Turn the ignition on.

Measure for voltage on the (L43) Left Low Beam Control circuit.

Is the voltage above 10.0 volts?



Yes >> Repair the (L43) Left Low Beam Control circuit for a short to voltage condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L44) RIGHT LOW BEAM CONTROL CIRCUIT
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Headlamps on.

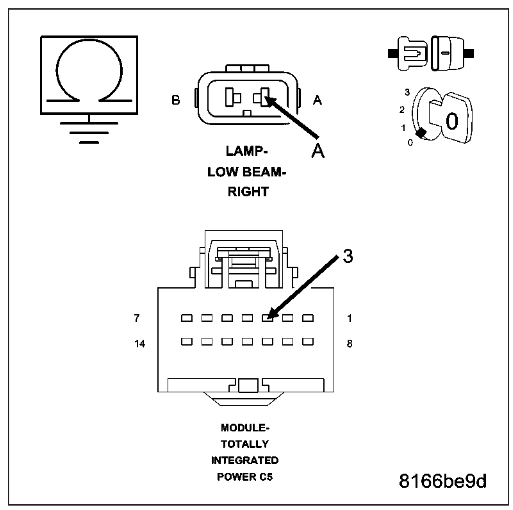
With the Scan Tool read the DTC information.

Does the Scan Tool read: B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L44) RIGHT LOW BEAM CONTROL CIRCUIT

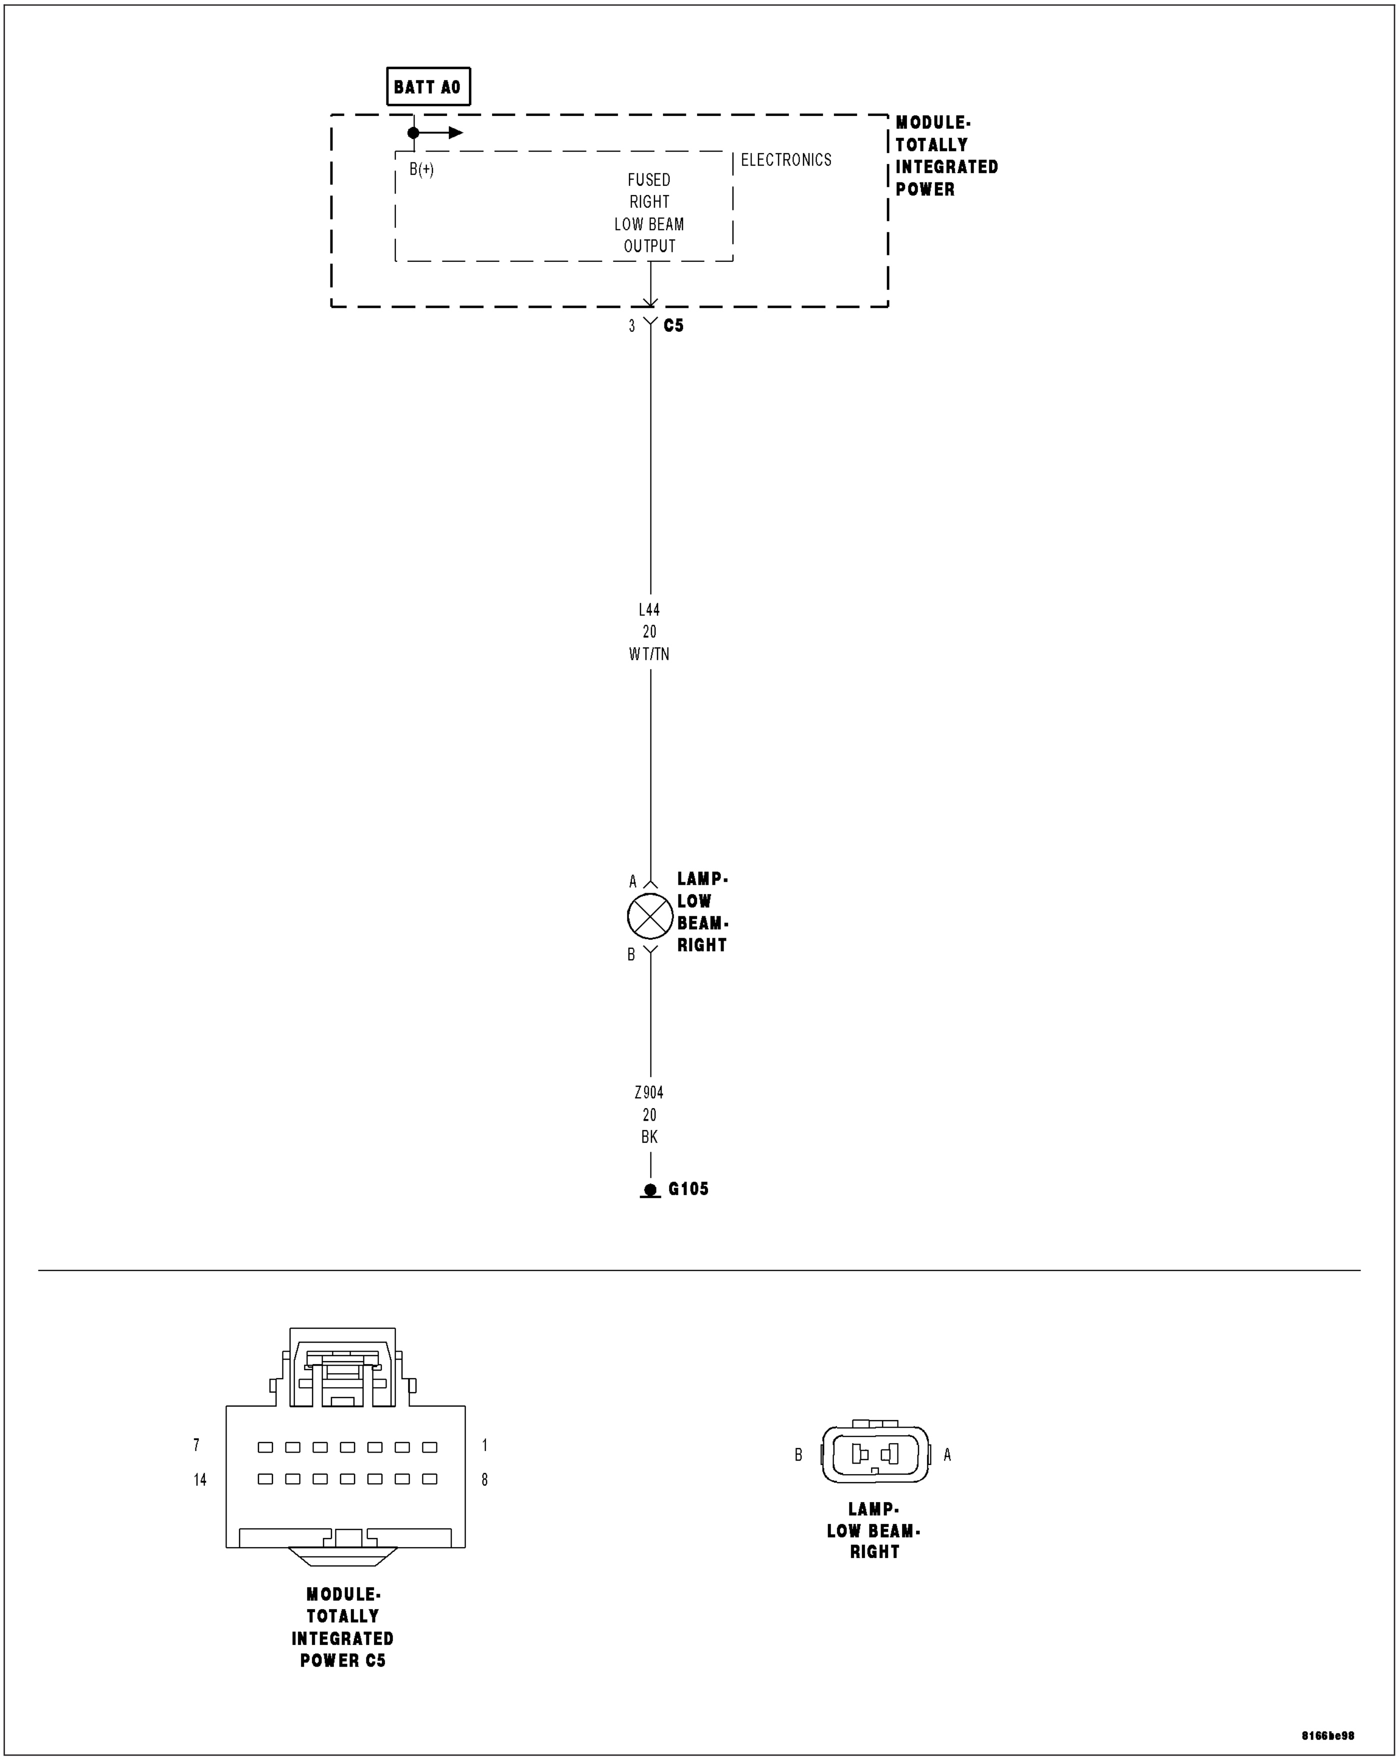
Turn the ignition off.

Disconnect the TIPM C5 harness connector.

Disconnect the Right Headlamp harness connector.

Measure the resistance between ground and the (L44) Right Low Beam Control circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (L44) Right Low Beam Control circuit for a short to ground condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L44) RIGHT LOW BEAM CONTROL CIRCUIT OPEN
(L44) RIGHT LOW BEAM CONTROL CIRCUIT SHORTED TO VOLTAGE
RIGHT LOW BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Headlamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH?

Yes >> Go To 2

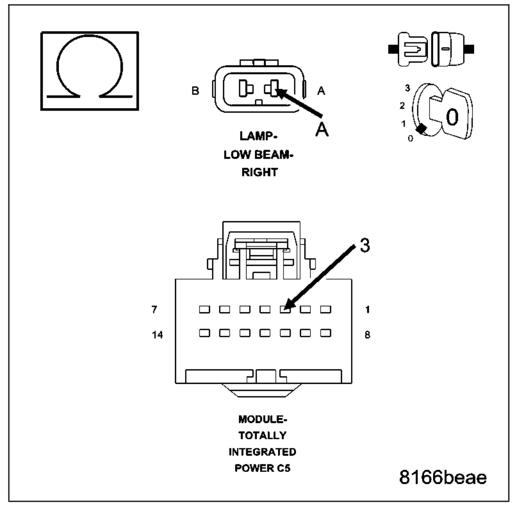
No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. RIGHT LOW BEAM BULB

Turn the ignition off.

Inspect the Right Low Beam Bulb Assembly.



Is the inoperative bulb OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L44) RIGHT LOW BEAM CONTROL CIRCUIT OPEN

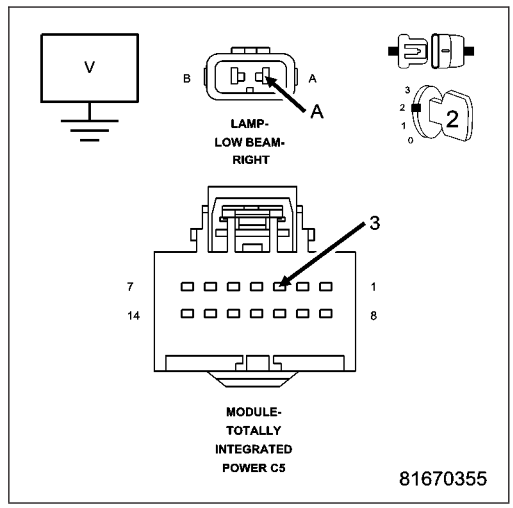
Turn the ignition off.

Disconnect the TIPM C5 harness connector.

Disconnect the Right Low Beam Lamp harness connector.

Measure the resistance of the (L44) Right Low Beam Control circuit.

Is the resistance above 5.0 ohms?



Yes >> Repair the (L44) Right Low Beam Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (L44) RIGHT LOW BEAM CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

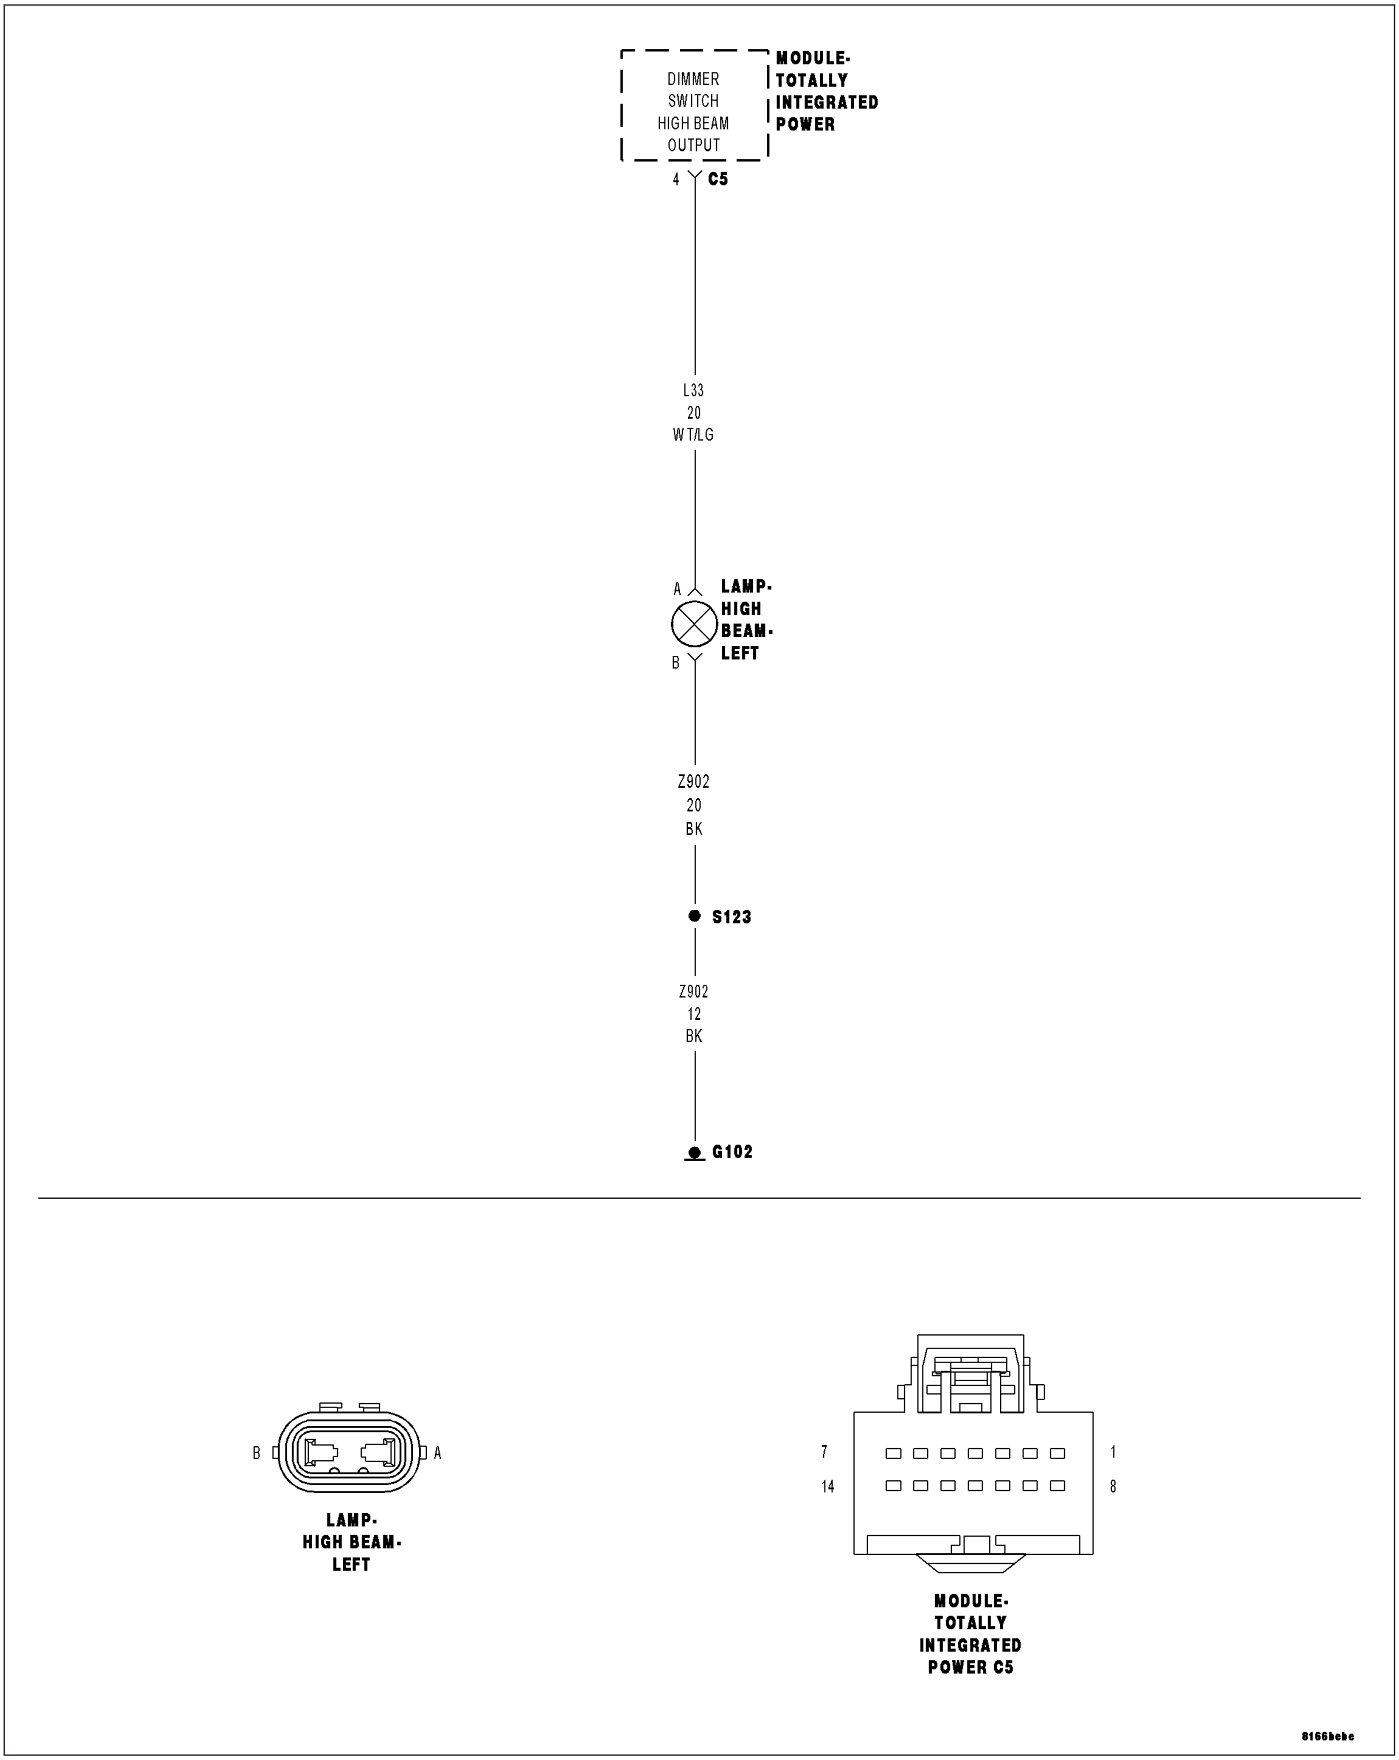
Disconnect the TIPM C5 harness connector.

Disconnect the Right Low Beam Lamp harness connector.

Turn the ignition on.

Measure for voltage on the (L44) Right Low Beam Control circuit.

Is the voltage above 10.0 volts?



Yes >> Repair the (L44) Right Low Beam Control circuit for a short to voltage condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1633-LEFT HI BEAM CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

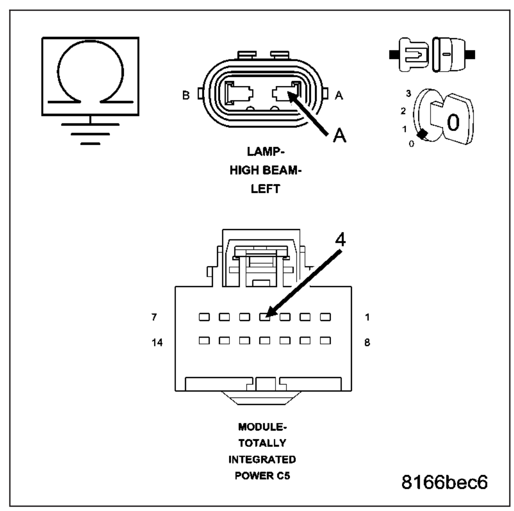
- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L33) LEFT HIGHBEAM OUTPUT CIRCUIT
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all TIPM DTC's.
Turn the Highbeam Headlamps on.
With the Scan Tool read the DTC information.



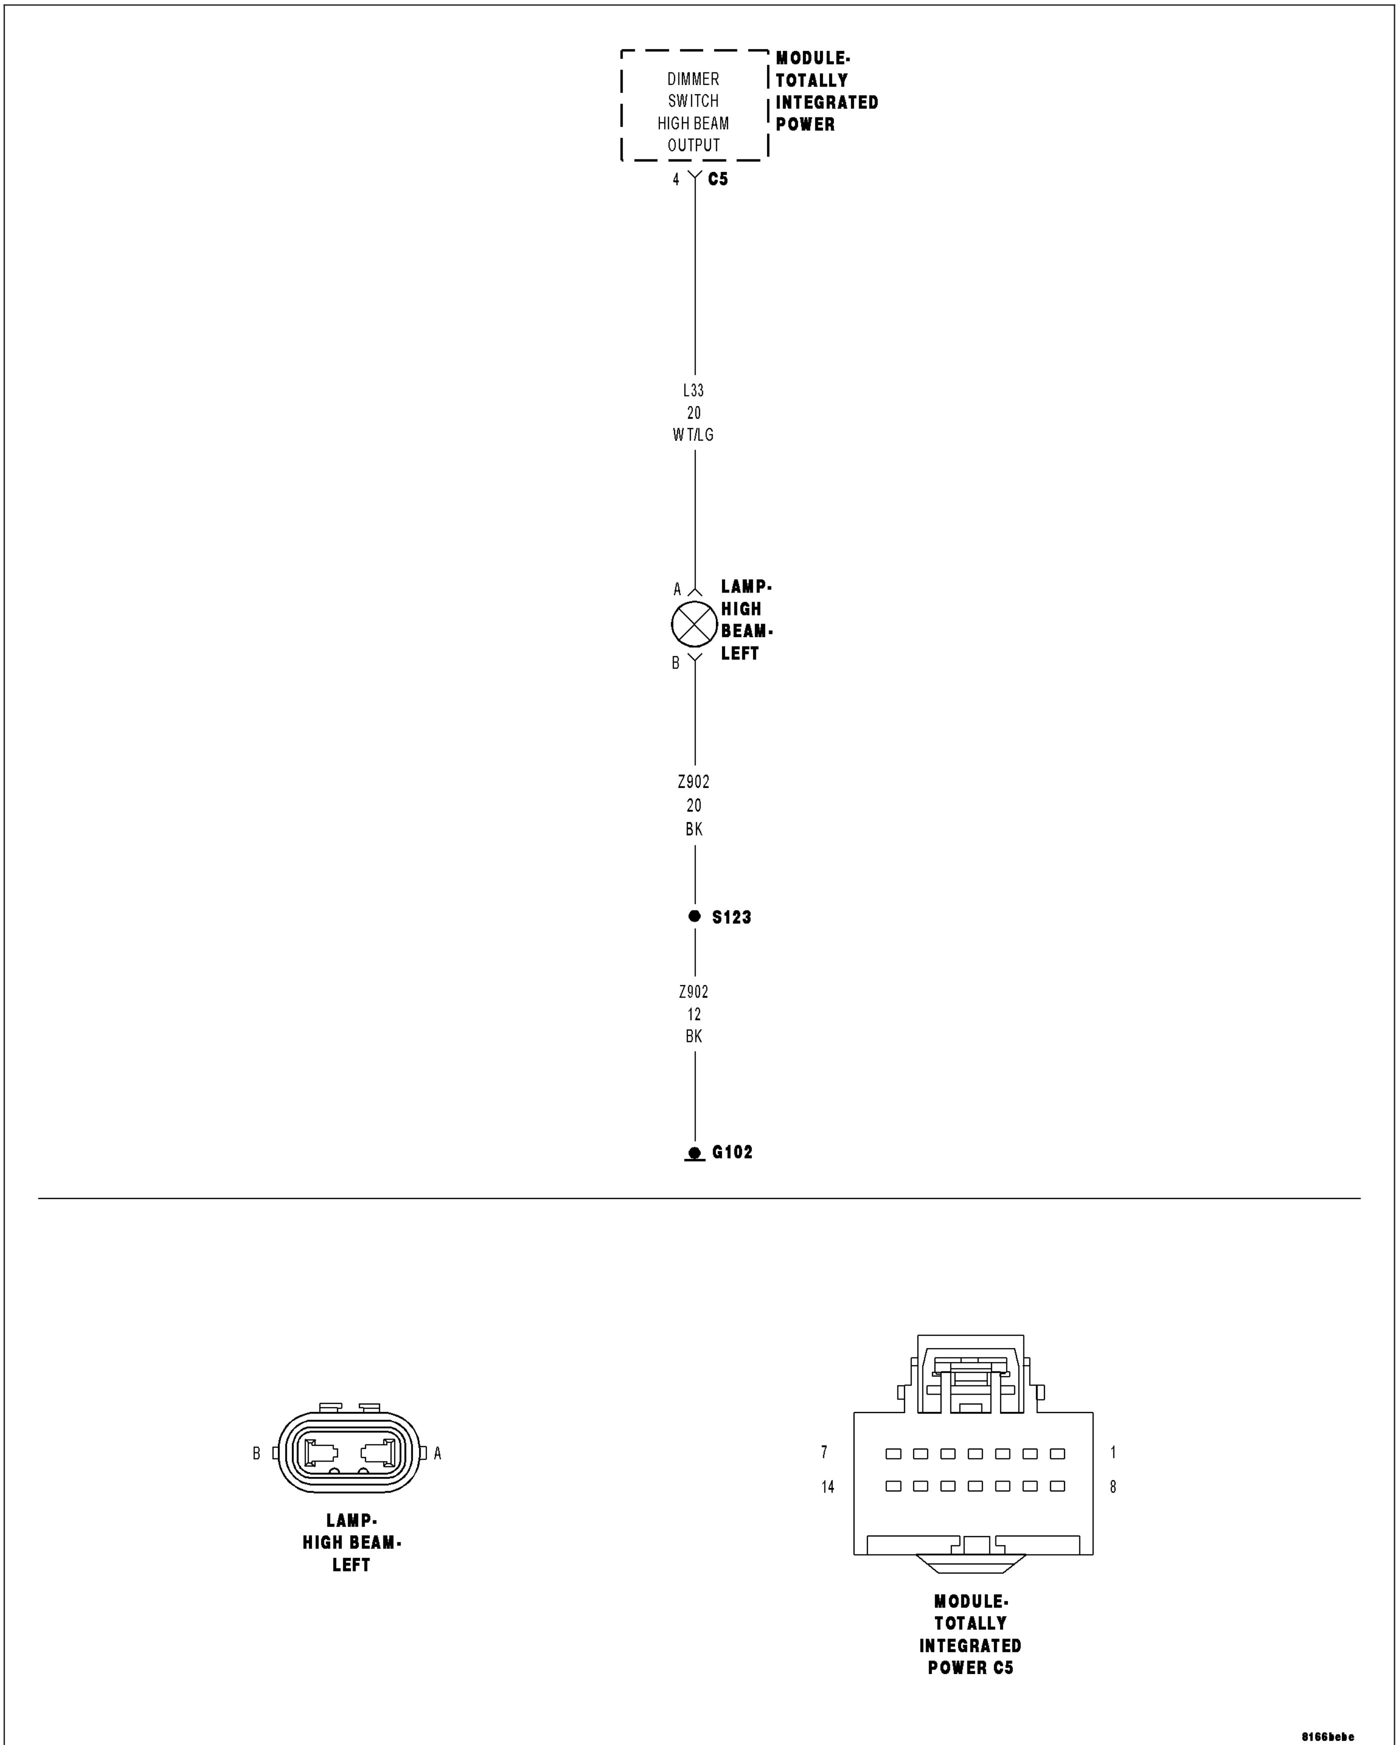
Does the Scan Tool read: B1633-LEFT HI BEAM CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (L33) LEFT HIGHBEAM OUTPUT CIRCUIT

Turn the ignition off.
Disconnect the TIPM C5 harness connector.
Disconnect the Left Headlamp harness connector.
Measure the resistance between ground and the Left Highbeam Output circuit.



Is the resistance below 5.0 ohms?

Yes >> Repair the (L33) Left Highbeam Output circuit for a short to ground condition.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L33) HIGH BEAM CONTROL CIRCUIT OPEN
(L33) HIGH BEAM CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Headlamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1.

2. LEFT HIGH BEAM BULB

Turn the ignition off.

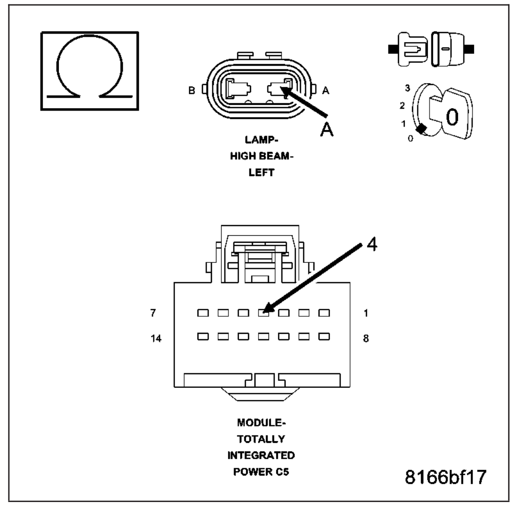
Inspect the Left High Beam Bulb Assembly.

Is the inoperative bulb OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



3. (L33) HIGH BEAM CONTROL CIRCUIT

Turn the ignition off.

Disconnect the TIPM C5 harness connector.

Disconnect the Left High Beam Lamp harness connector.

Measure the resistance of the (L33) High Beam Control circuit.

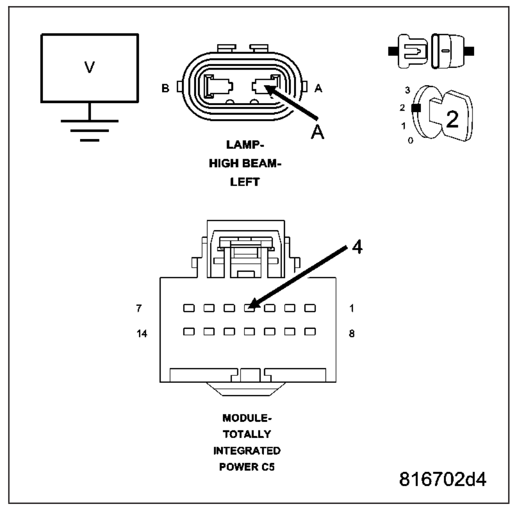
Is the resistance above 5.0 ohms?

Yes >> Repair the (L33) High Beam Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (L33) HIGH BEAM CONTROL CIRCUIT SHORT TO VOLTAGE



Turn the ignition off.

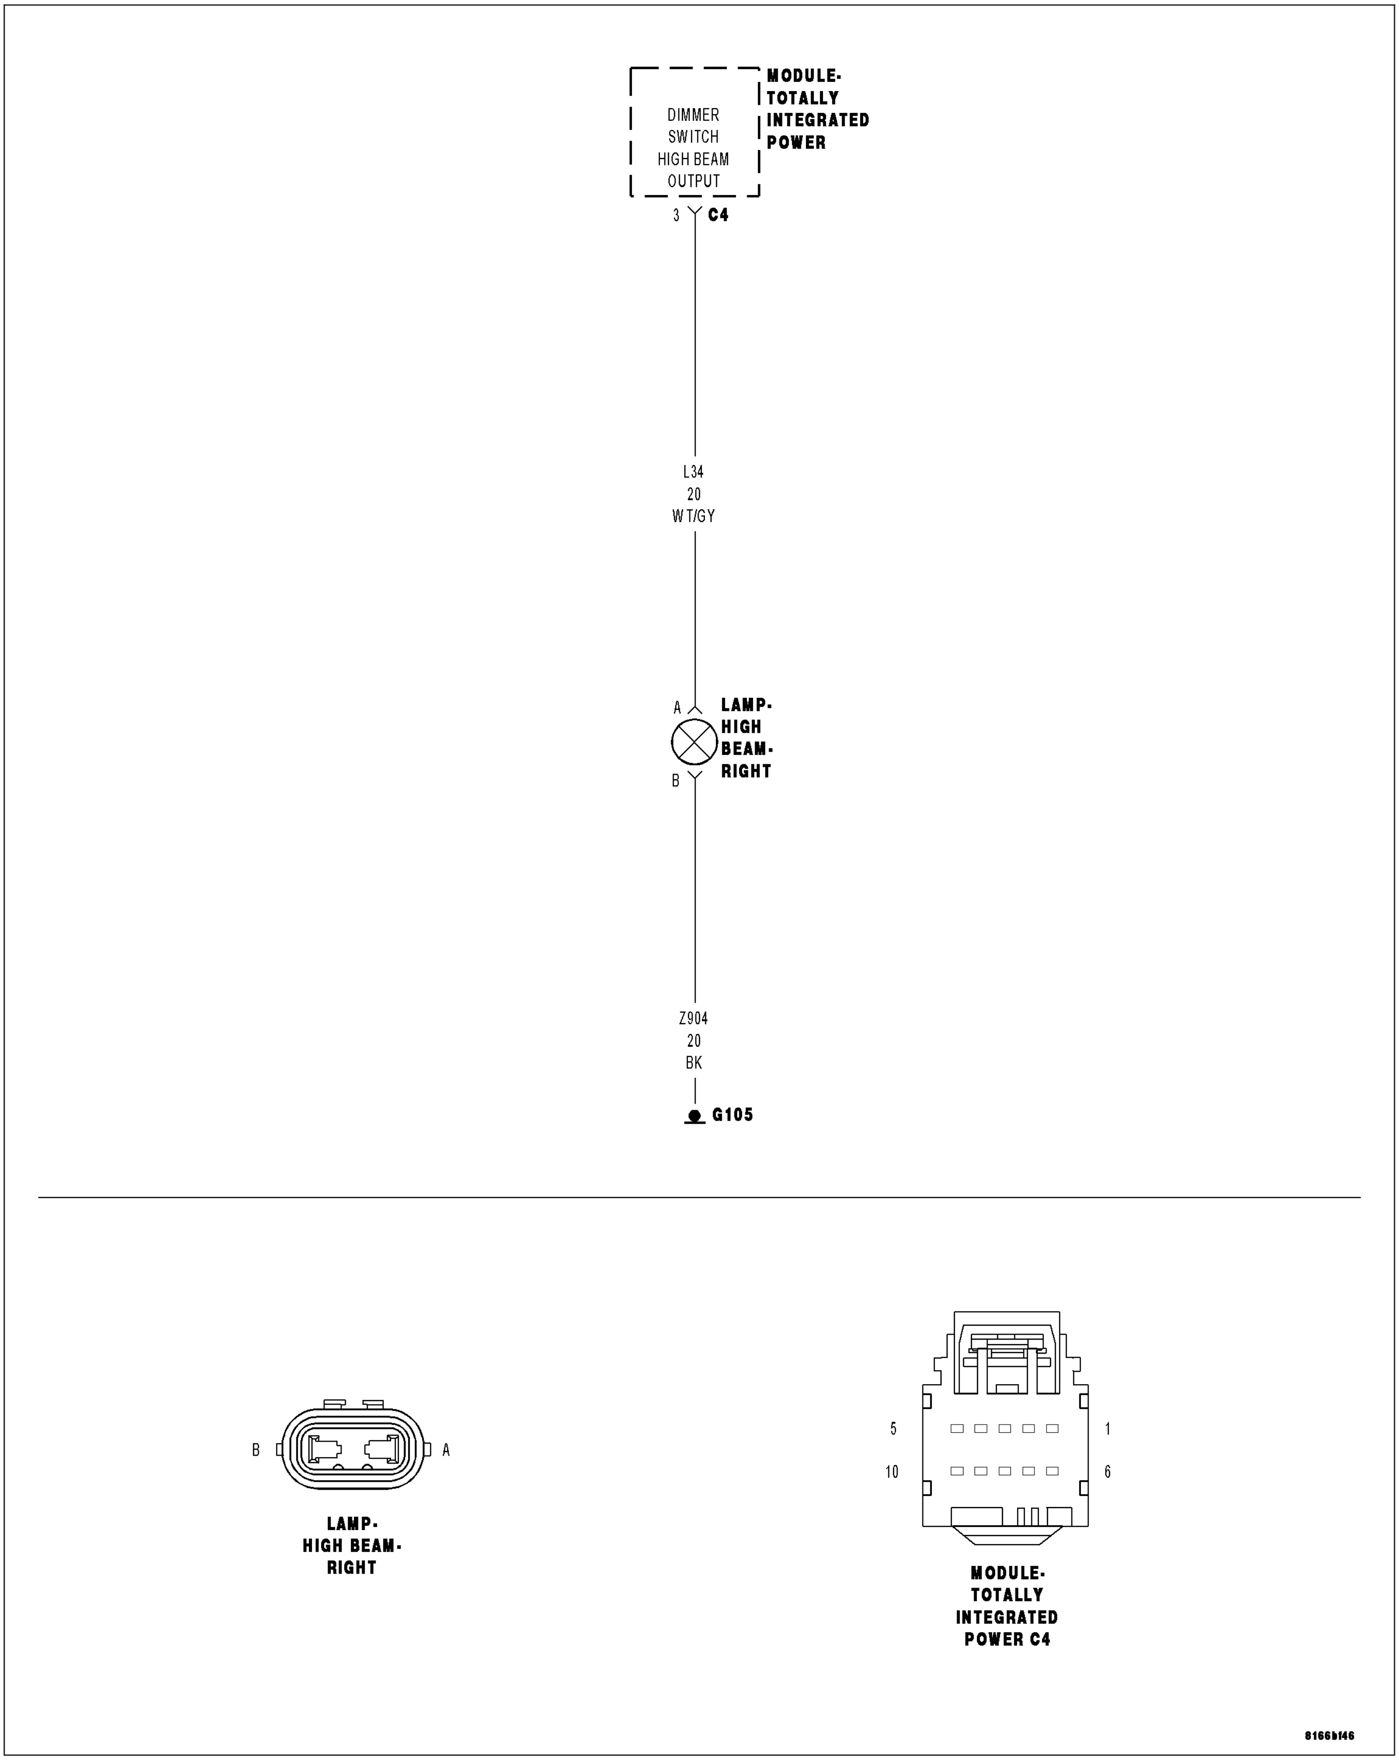
Disconnect the TIPM C5 harness connector.

Disconnect the Left High Beam Lamp harness connector.

Turn the ignition on.

Measure for voltage on the (L33) High Beam Control circuit.

Is the voltage above 10.0 volts?



Yes >> Repair the (L33) High Beam Control circuit for a short to voltage condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1637-RIGHT HIGH BEAM CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the High Beam Headlamps activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L34) RIGHT HIGHBEAM OUTPUT CIRCUIT
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Highbeam Headlamps on.

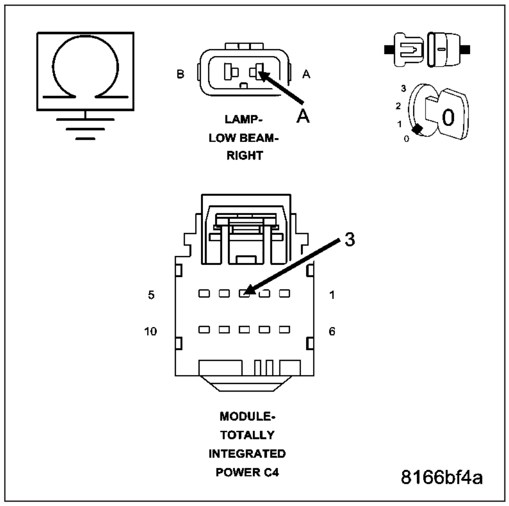
With the Scan Tool read the DTC information.

Does the Scan Tool read: B1637-RIGHT HI BEAM CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L34) RIGHT HIGHBEAM OUTPUT CIRCUIT

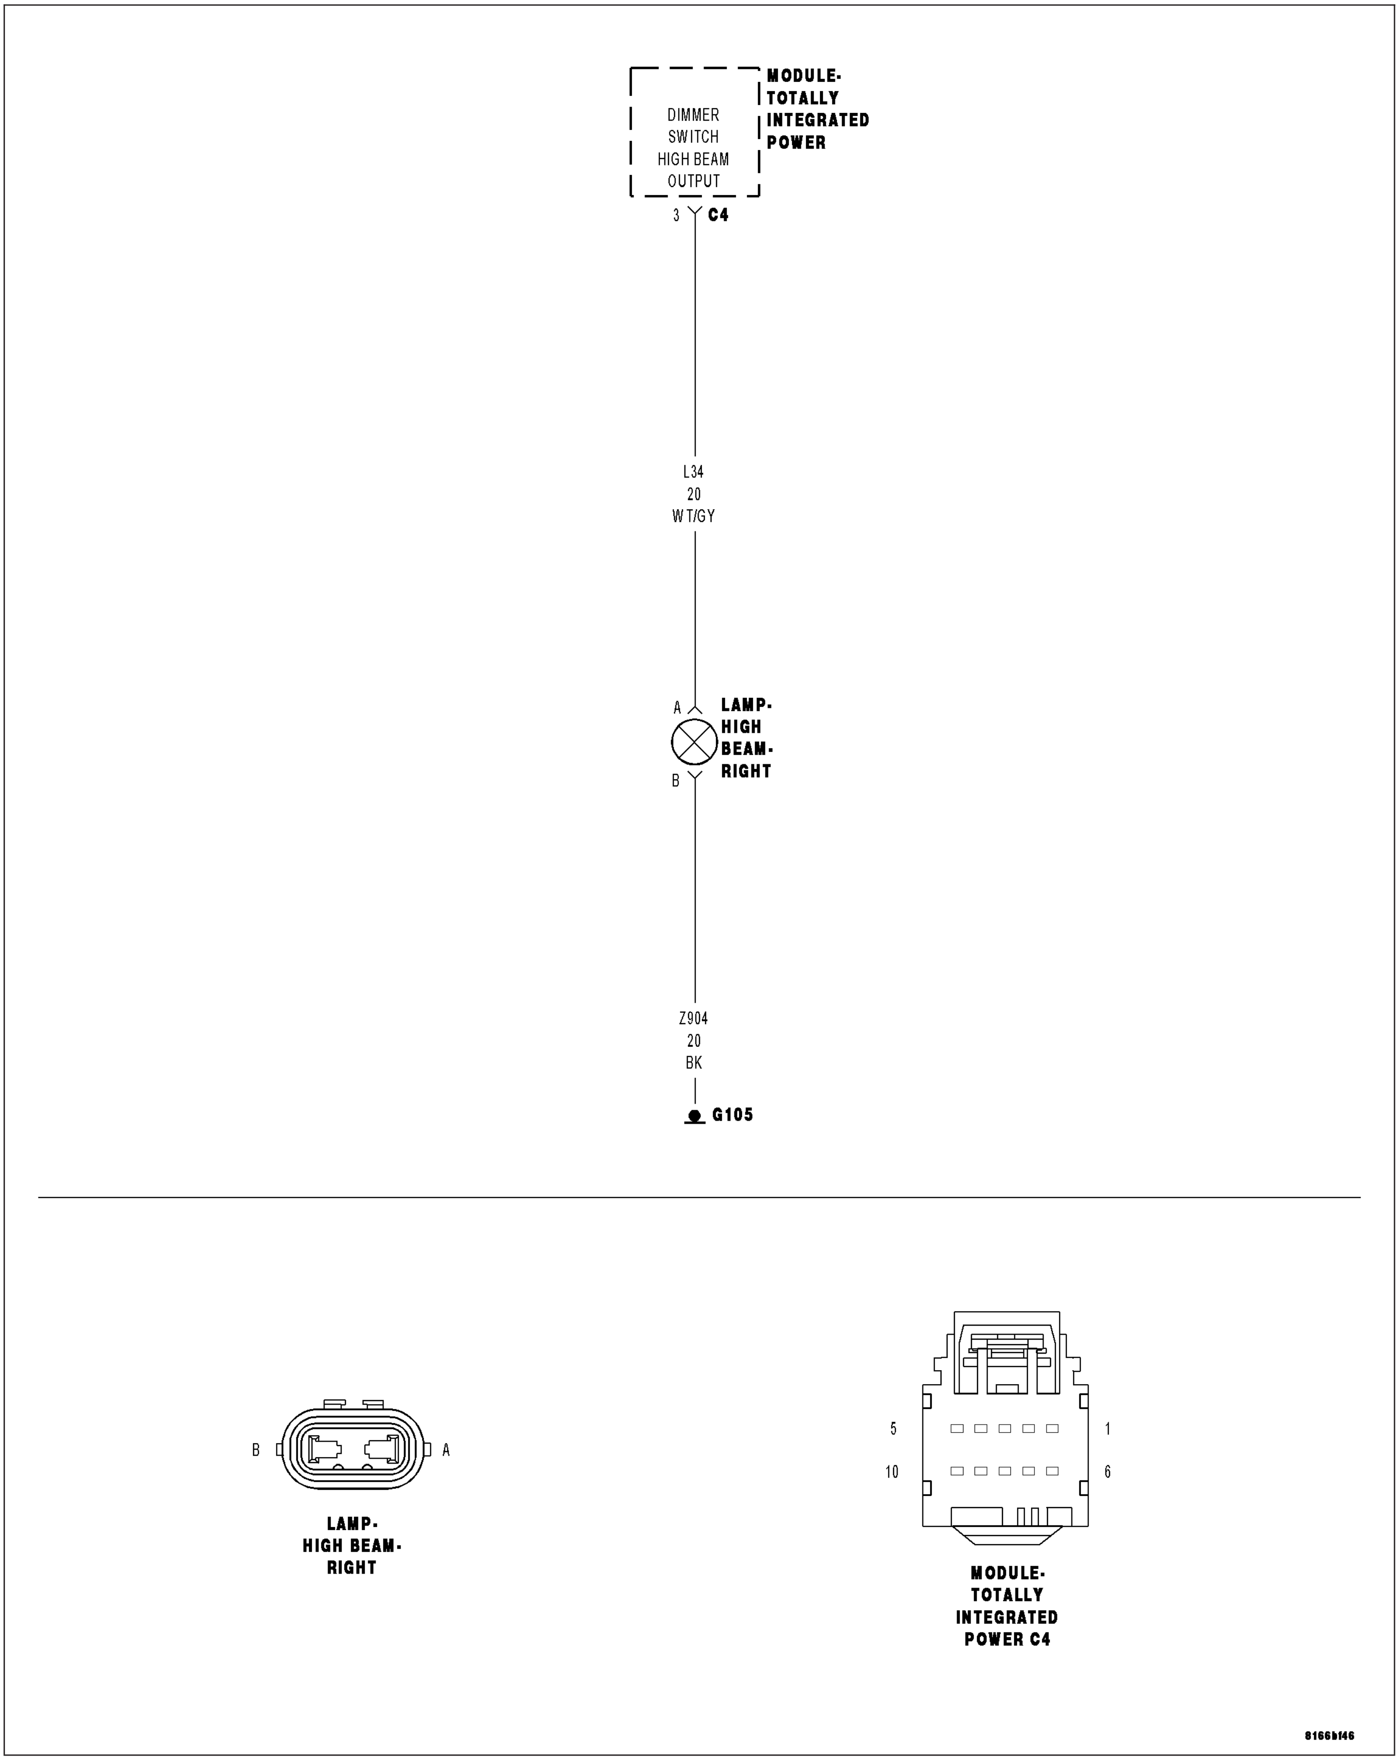
Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Disconnect the Right Highbeam Lamp harness connector.

Measure the resistance between ground and the Right Highbeam Output circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (L34) Right Highbeam Output circuit for a short to ground condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L34) HIGH BEAM CONTROL CIRCUIT OPEN
(L34) HIGH BEAM CONTROL SHORT TO VOLTAGE
RIGHT HIGH BEAM BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Headlamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. RIGHT LOW BEAM BULB

Turn the ignition off.

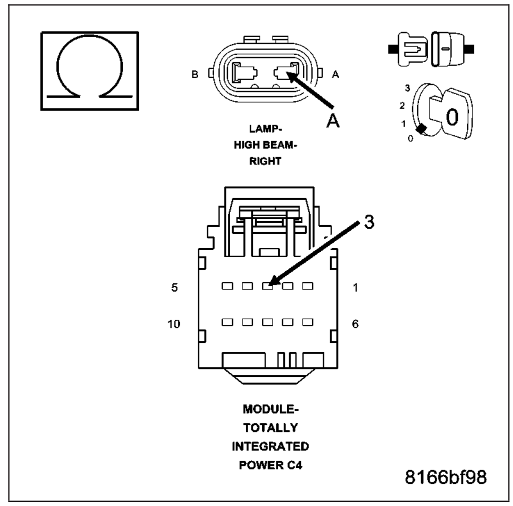
Inspect the Right High Beam Bulb Assembly.

Is the inoperative bulb OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



3. (L34) HIGH BEAM CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Disconnect the Right Highbeam Lamp harness connector.

Measure the resistance of the (L34) High Beam Control circuit.

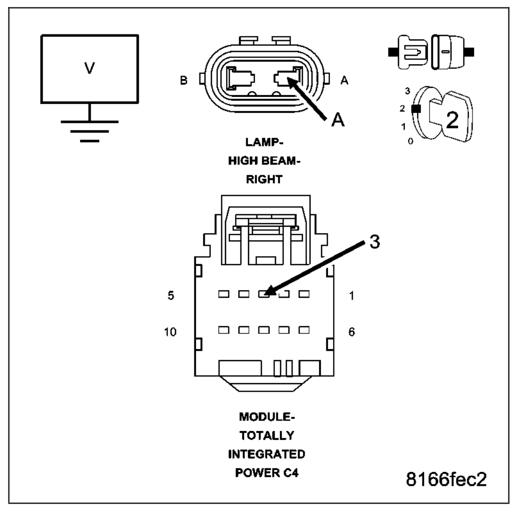
Is the resistance above 5.0 ohms?

Yes >> Repair the (L34) High Beam Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (L34) HIGH BEAM CONTROL CIRCUIT SHORT TO VOLTAGE



Turn the ignition off.

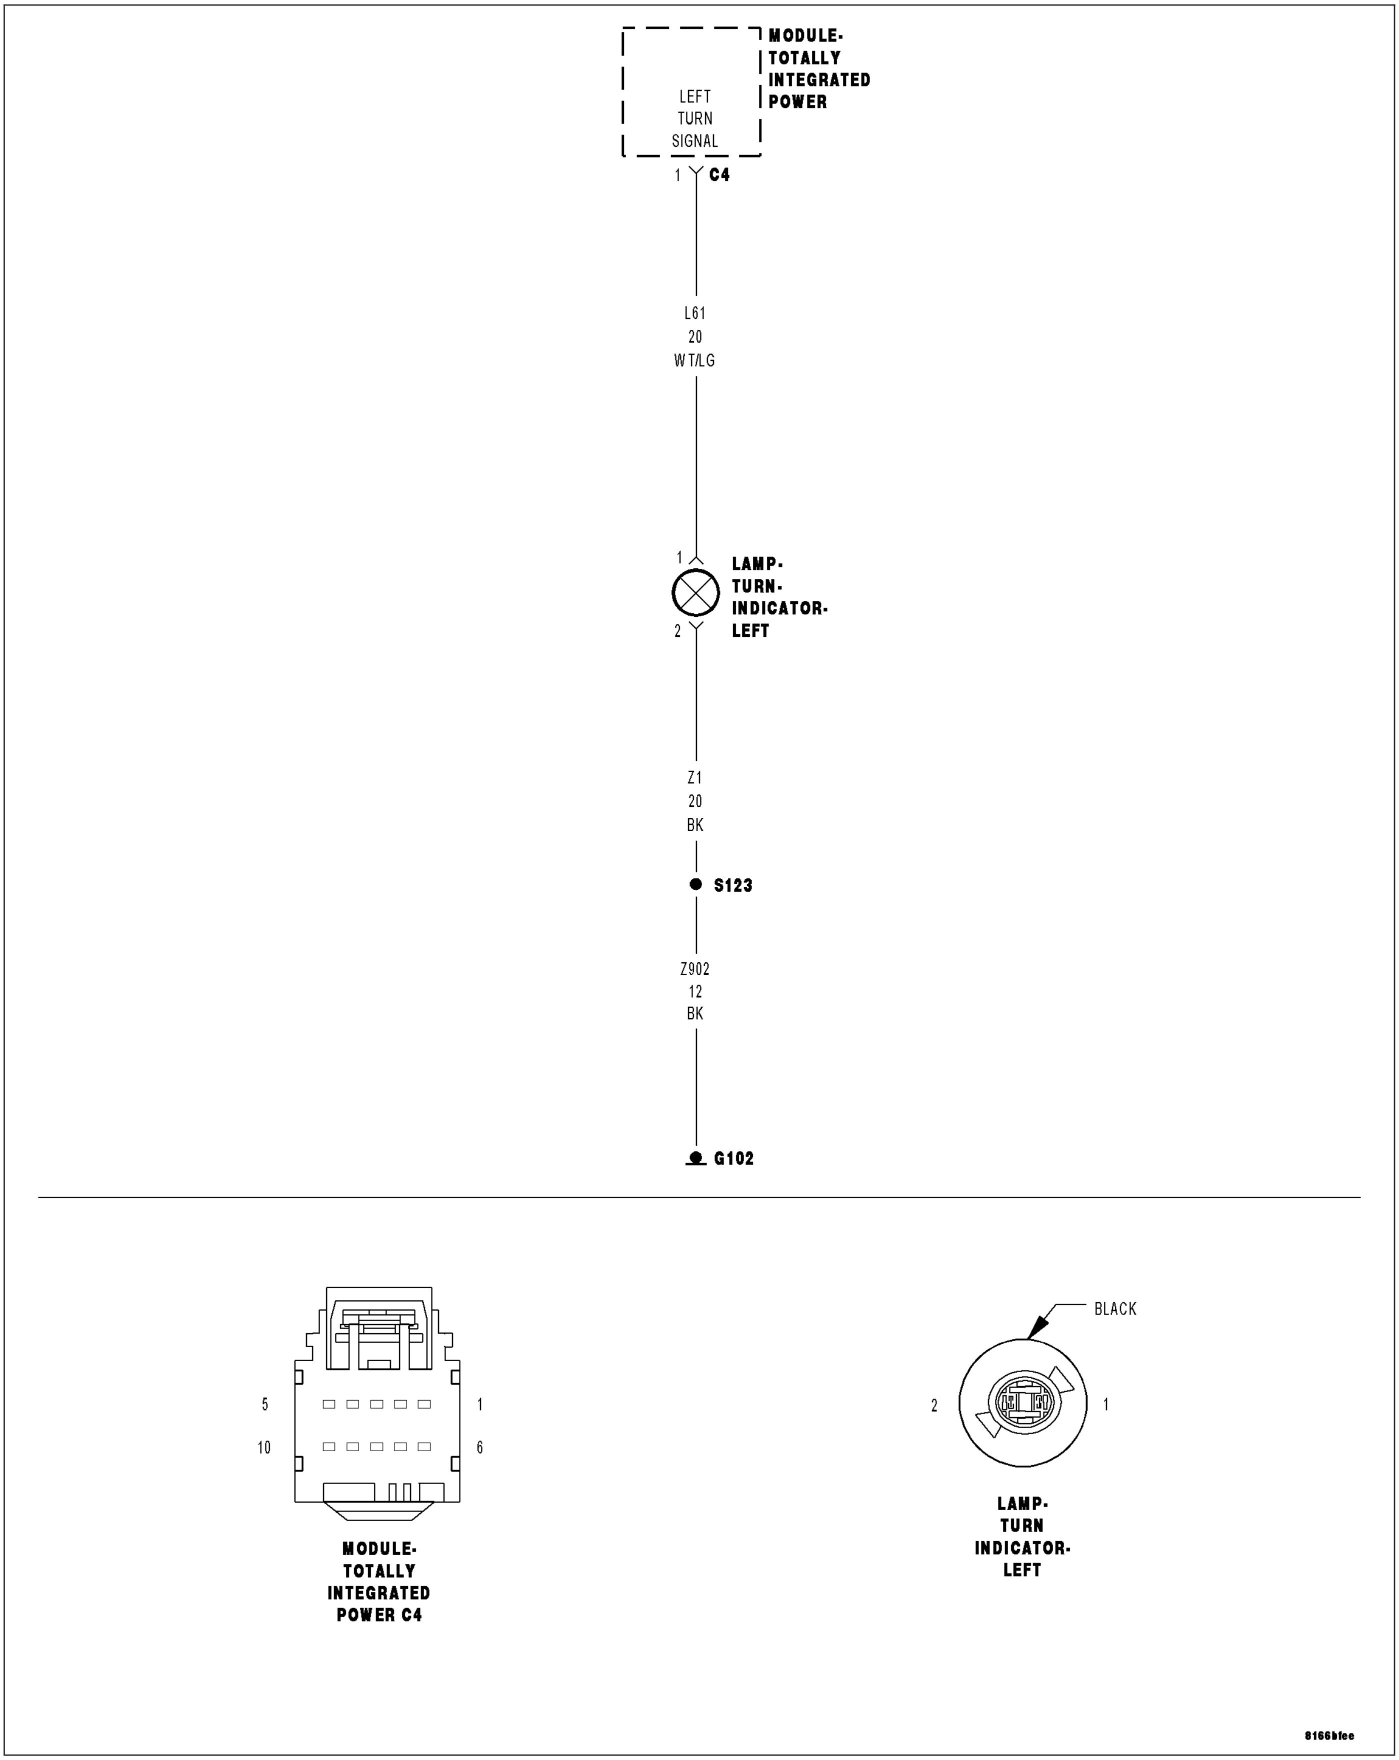
Disconnect the TIPM C4 harness connector.

Disconnect the Right Highbeam Lamp harness connector.

Turn the ignition on.

Measure for voltage on the (L34) High Beam Control circuit.

Is the voltage above 10.0 volts?



Yes >> Repair the (L34) High Beam Control circuit for a short to voltage condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Left Turn Signals on.

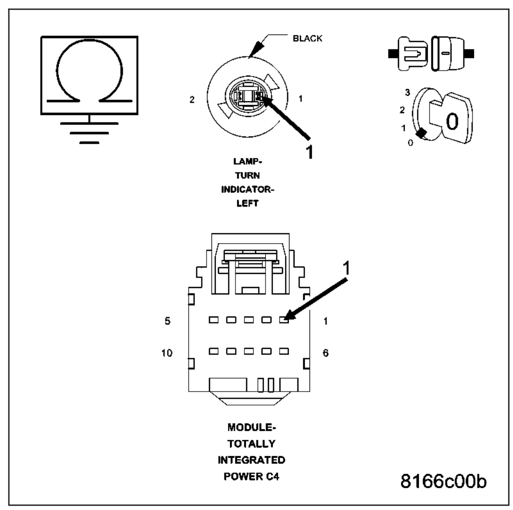
With the Scan Tool read the DTC information.

Does the Scan Tool read: B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT

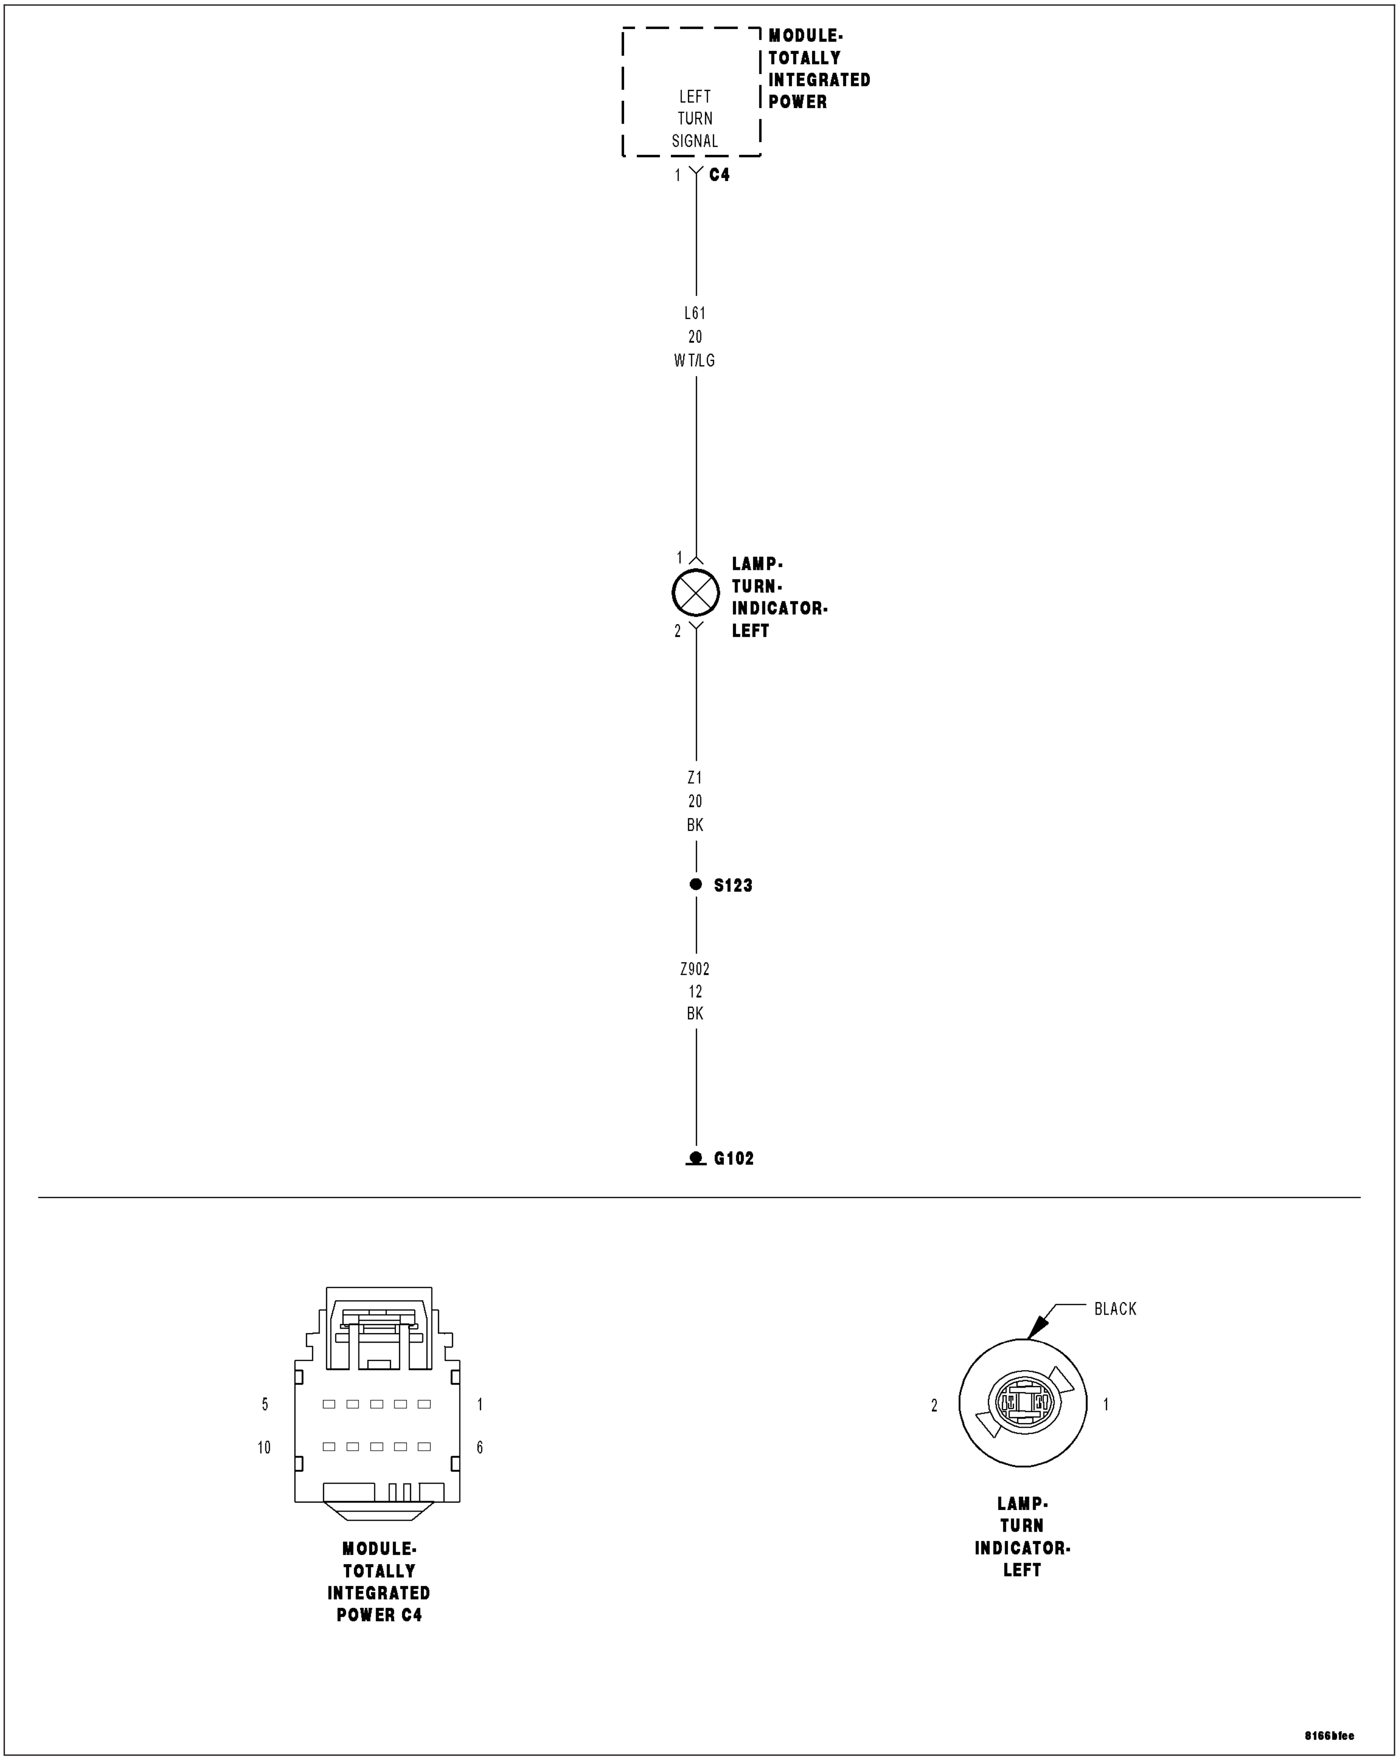
Turn the ignition off.

Disconnect the TIPM C2 connector.

Disconnect the Left Turn Signal Lamp harness connector.

Measure the resistance between ground and the (L61) Front Left Turn Signal Control circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (L61) Front Left Turn Signal Control circuit for a short to ground.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Front Control Module in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Totally Integrated Power Module detects a short to battery on the Control circuit.

Possible Causes
(L61) TURN SIGNAL CONTROL CIRCUIT OPEN
(L61) TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
FRONT LEFT TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

Clear all TIPM DTC's

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool read: B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. FRONT LEFT TURN SIGNAL BULB

Turn the ignition off.

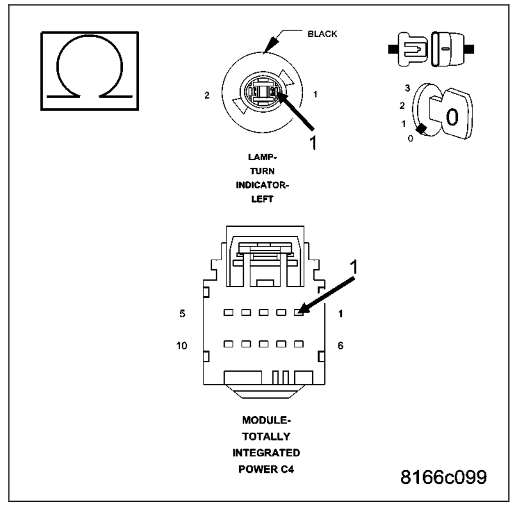
Inspect the Front Left Turn Signal Bulb Assembly.

Is the inoperative bulb OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



3. (L61) LEFT TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C4 connector.

Disconnect the Front Left Turn Signal Lamp harness connector.

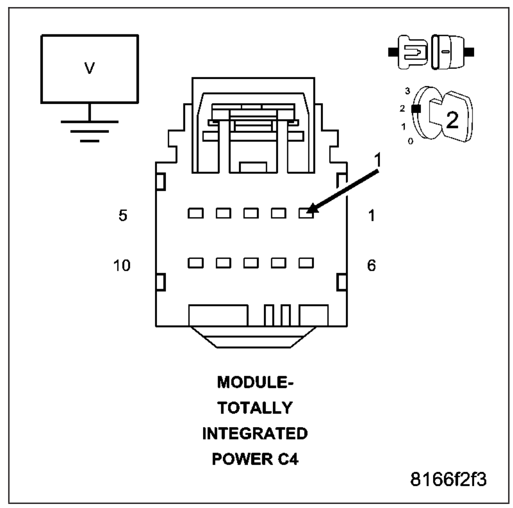
Measure the resistance of the (L61) Front Left Turn Signal Control circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (L61) Turn Signal Control circuit for an open.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4



4. L61 LEFT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE

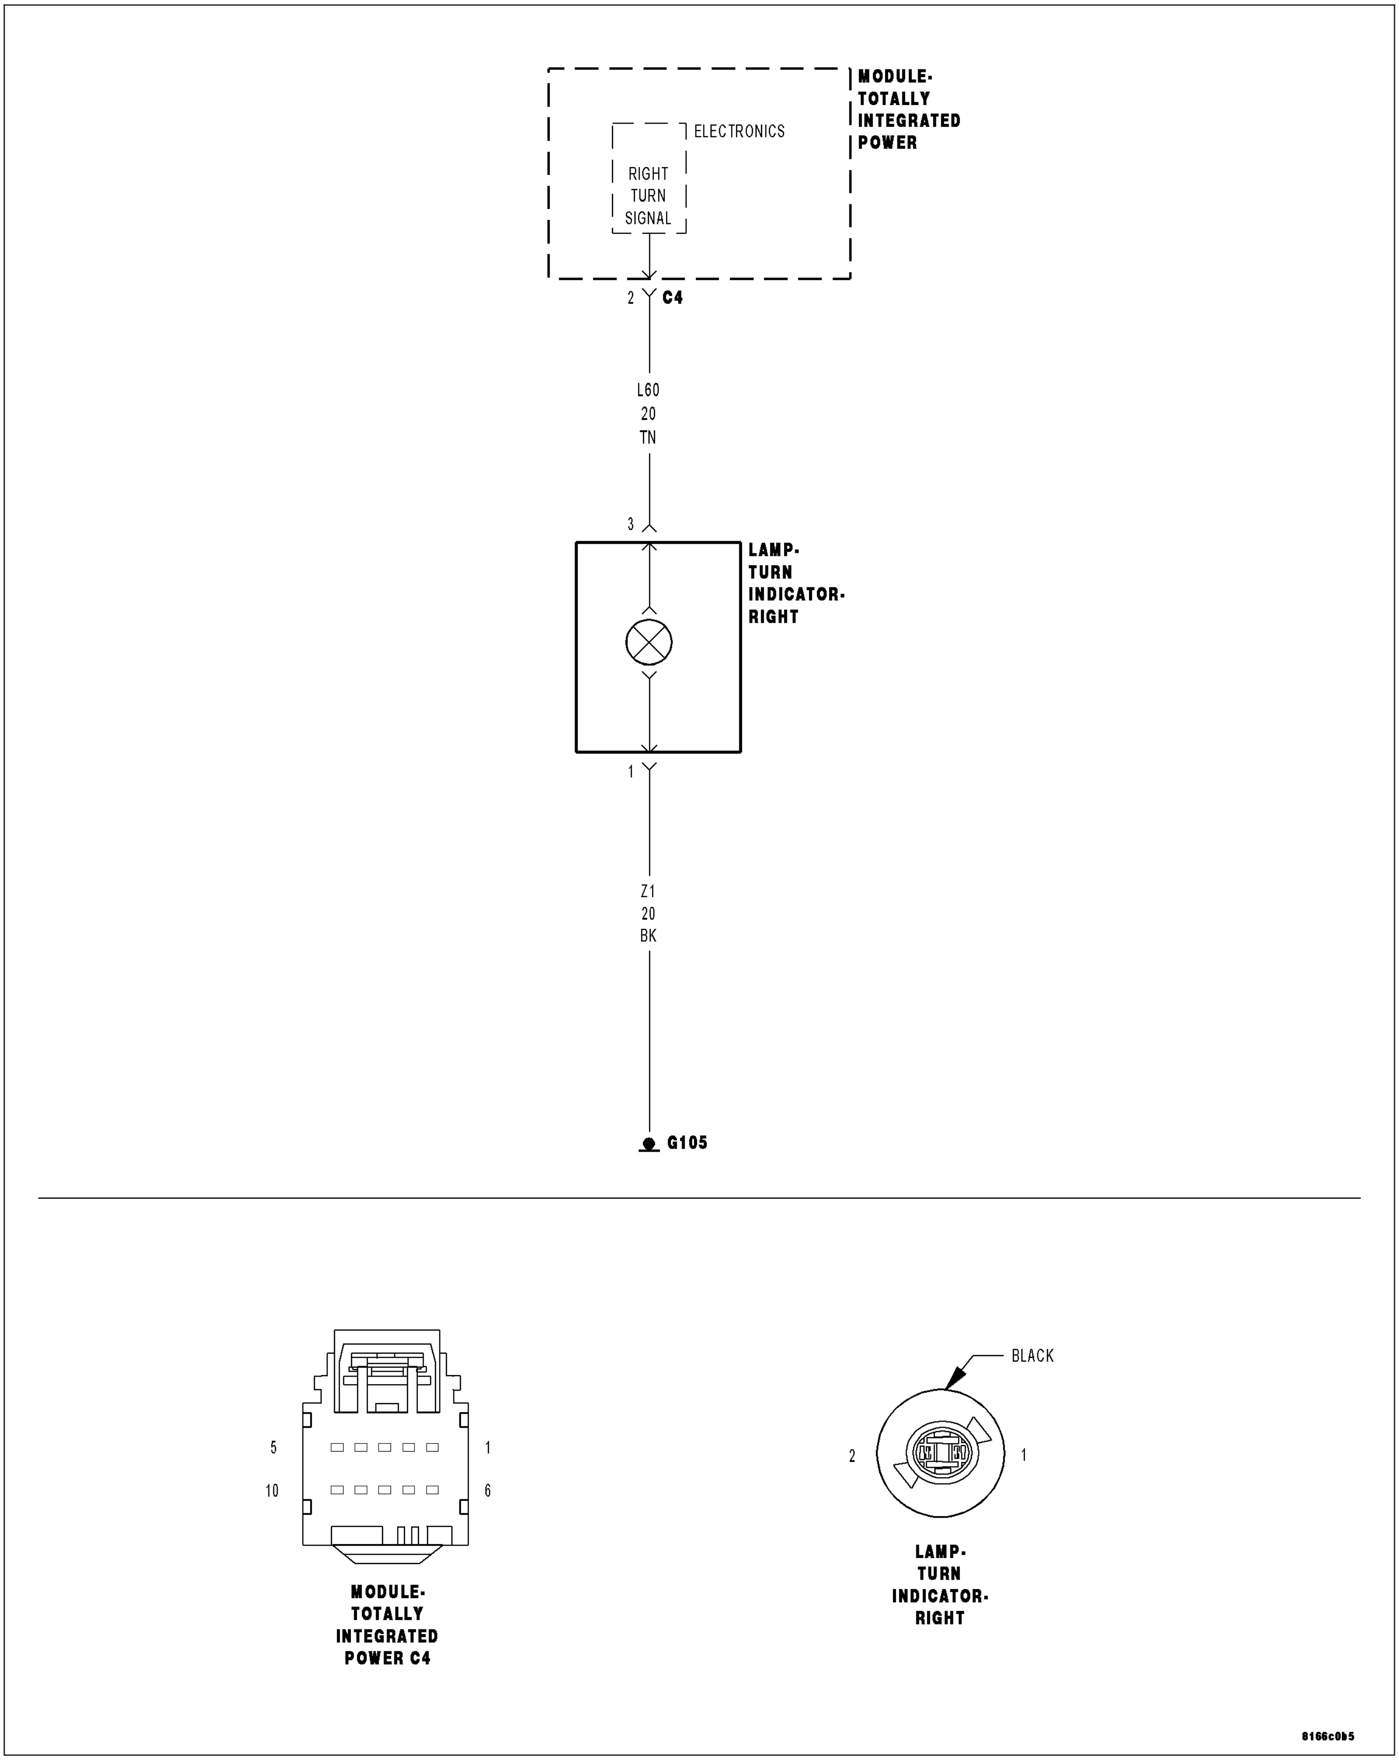
Turn the ignition off.

Disconnect the TIPM C4 connector.

Turn the ignition on.

Check for voltage on the (L61) Front Left Turn Signal Control circuit.

Is the voltage above 10.0 volts?



Yes >> Repair the (L61) Turn Signal Control circuit for a short to voltage.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Turn Signal activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Right Turn Signals on.

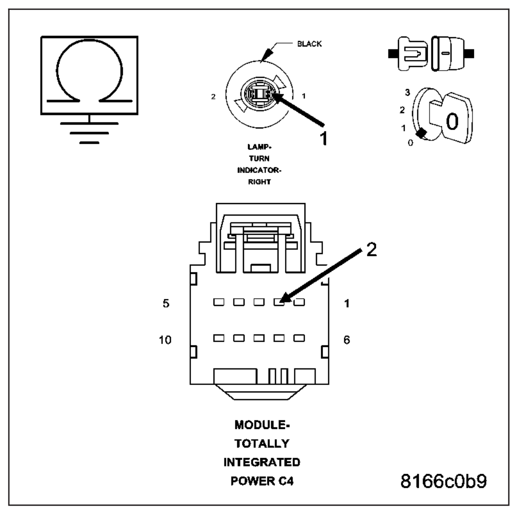
With the Scan Tool read the DTC information.

Does the Scan Tool read: B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT

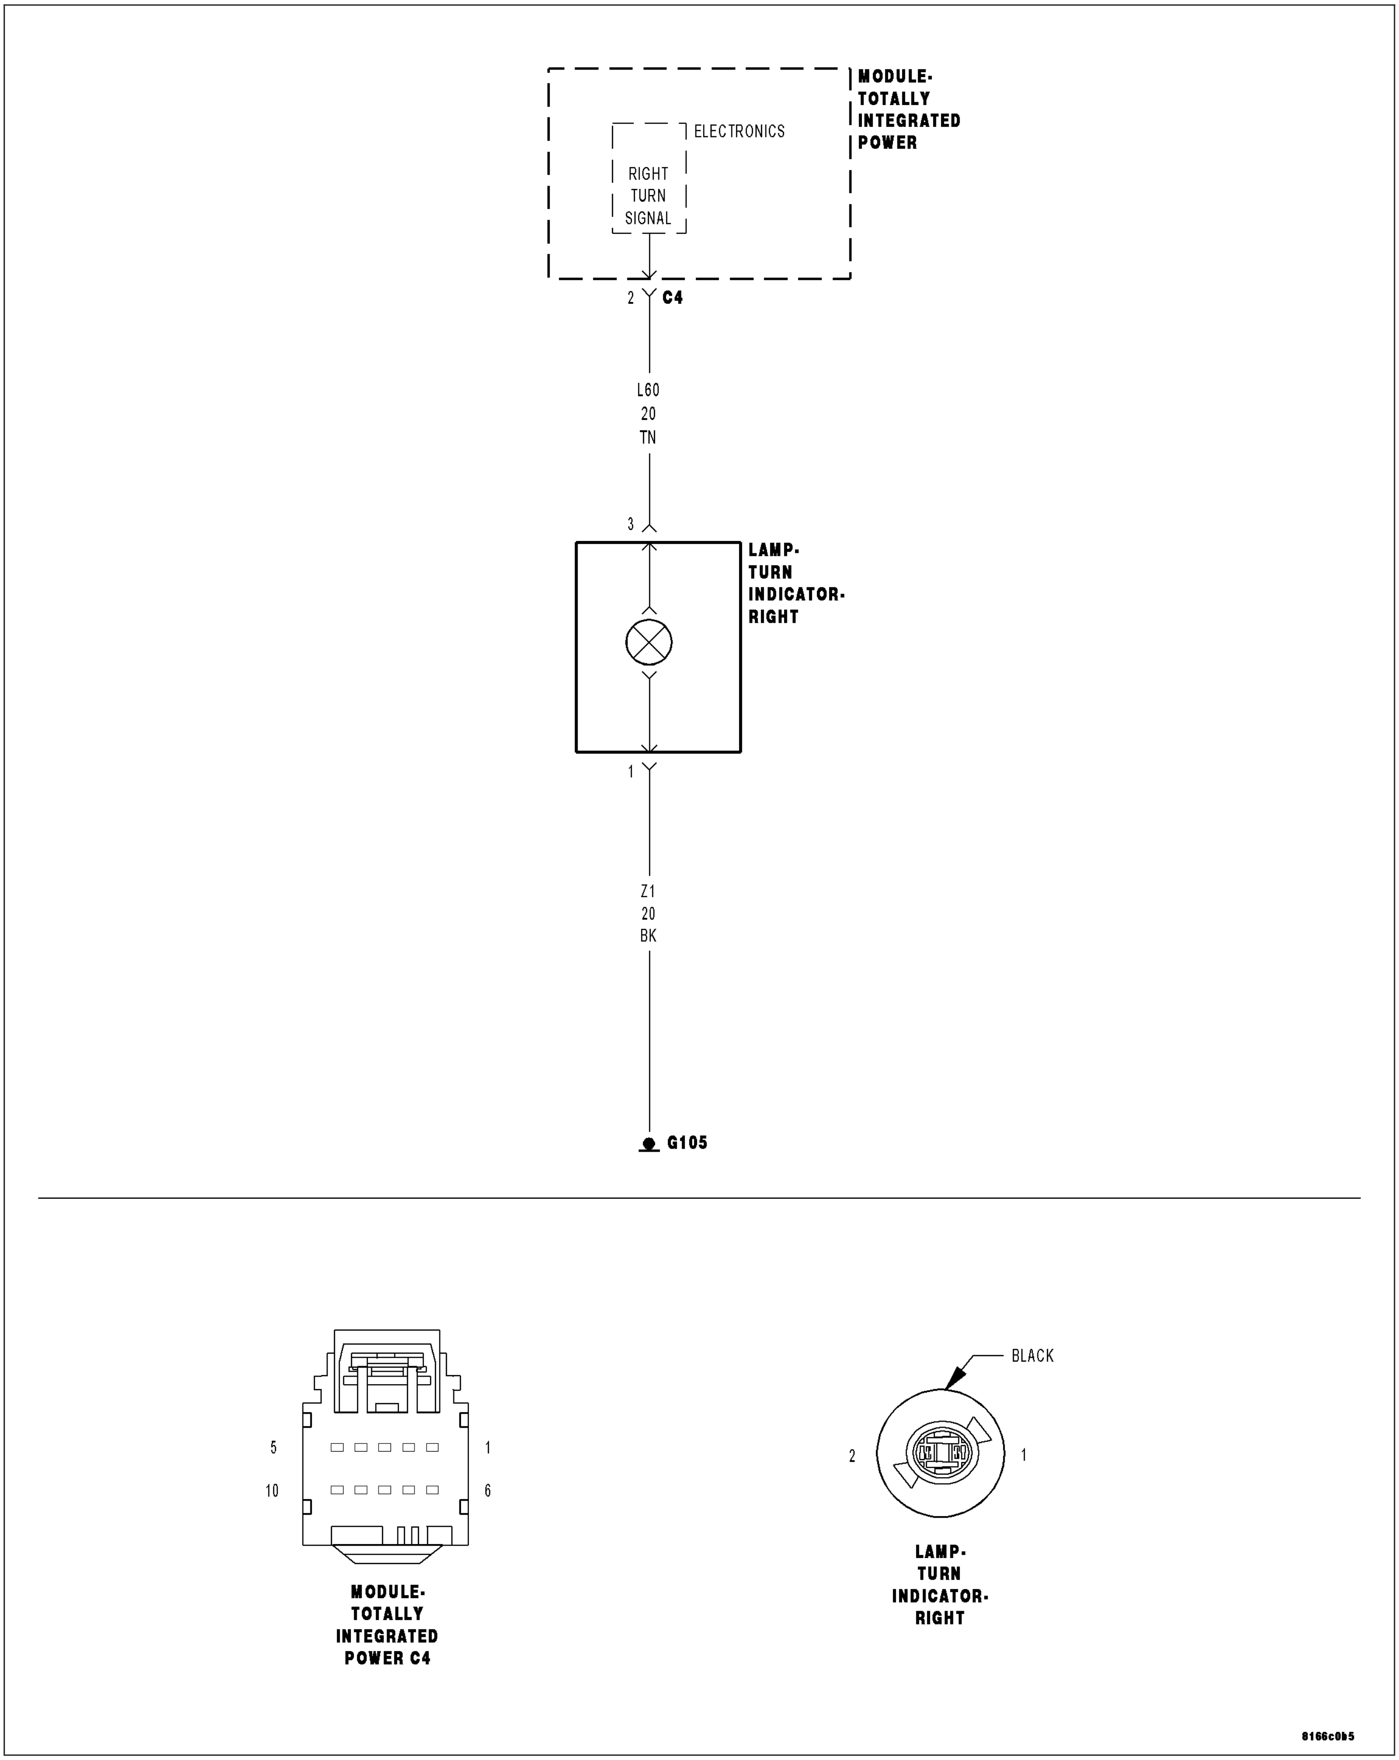
Turn the ignition off.

Disconnect the TIPM C4 harness connector.

Disconnect the Right Front Headlamp harness connector.

Measure the resistance between ground and the (L60) Front Turn Signal Control circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (L60) Front Right Turn Signal Control circuit for a short to ground.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Totally Integrated Power Module detects a short to battery on the Control circuit.

Possible Causes
(L60) TURN SIGNAL CONTROL CIRCUIT OPEN
(L60) TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
FRONT RIGHT TURN SIGNAL BULB
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

Clear all TIPM DTC's

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool read: B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH?

Yes >> Go To 2

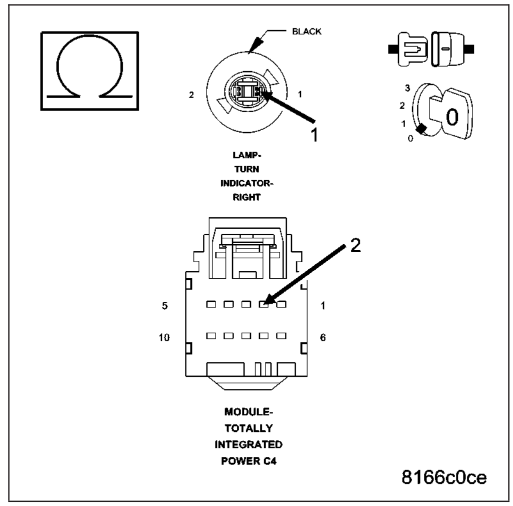
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. FRONT RIGHT TURN SIGNAL BULB

Turn the ignition off.

Inspect the Front Right Turn Signal Bulb Assembly.



Is the inoperative bulb OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb in accordance with the service information.

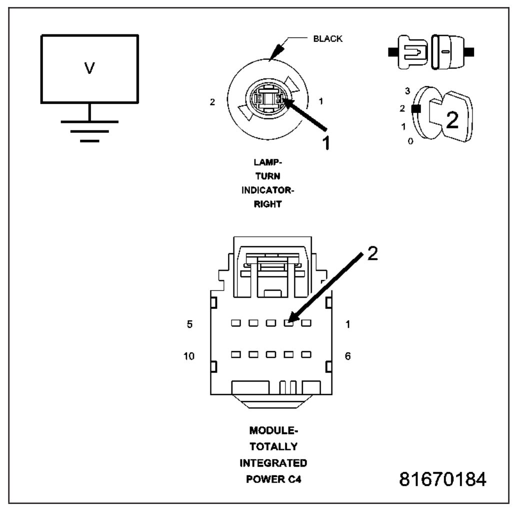
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L60) RIGHT TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C4 connector.

Disconnect the Front Right Turn Signal harness connector.



Measure the resistance of the (L60) Front Right Turn Signal Control circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (L60) Turn Signal Control circuit for an open.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

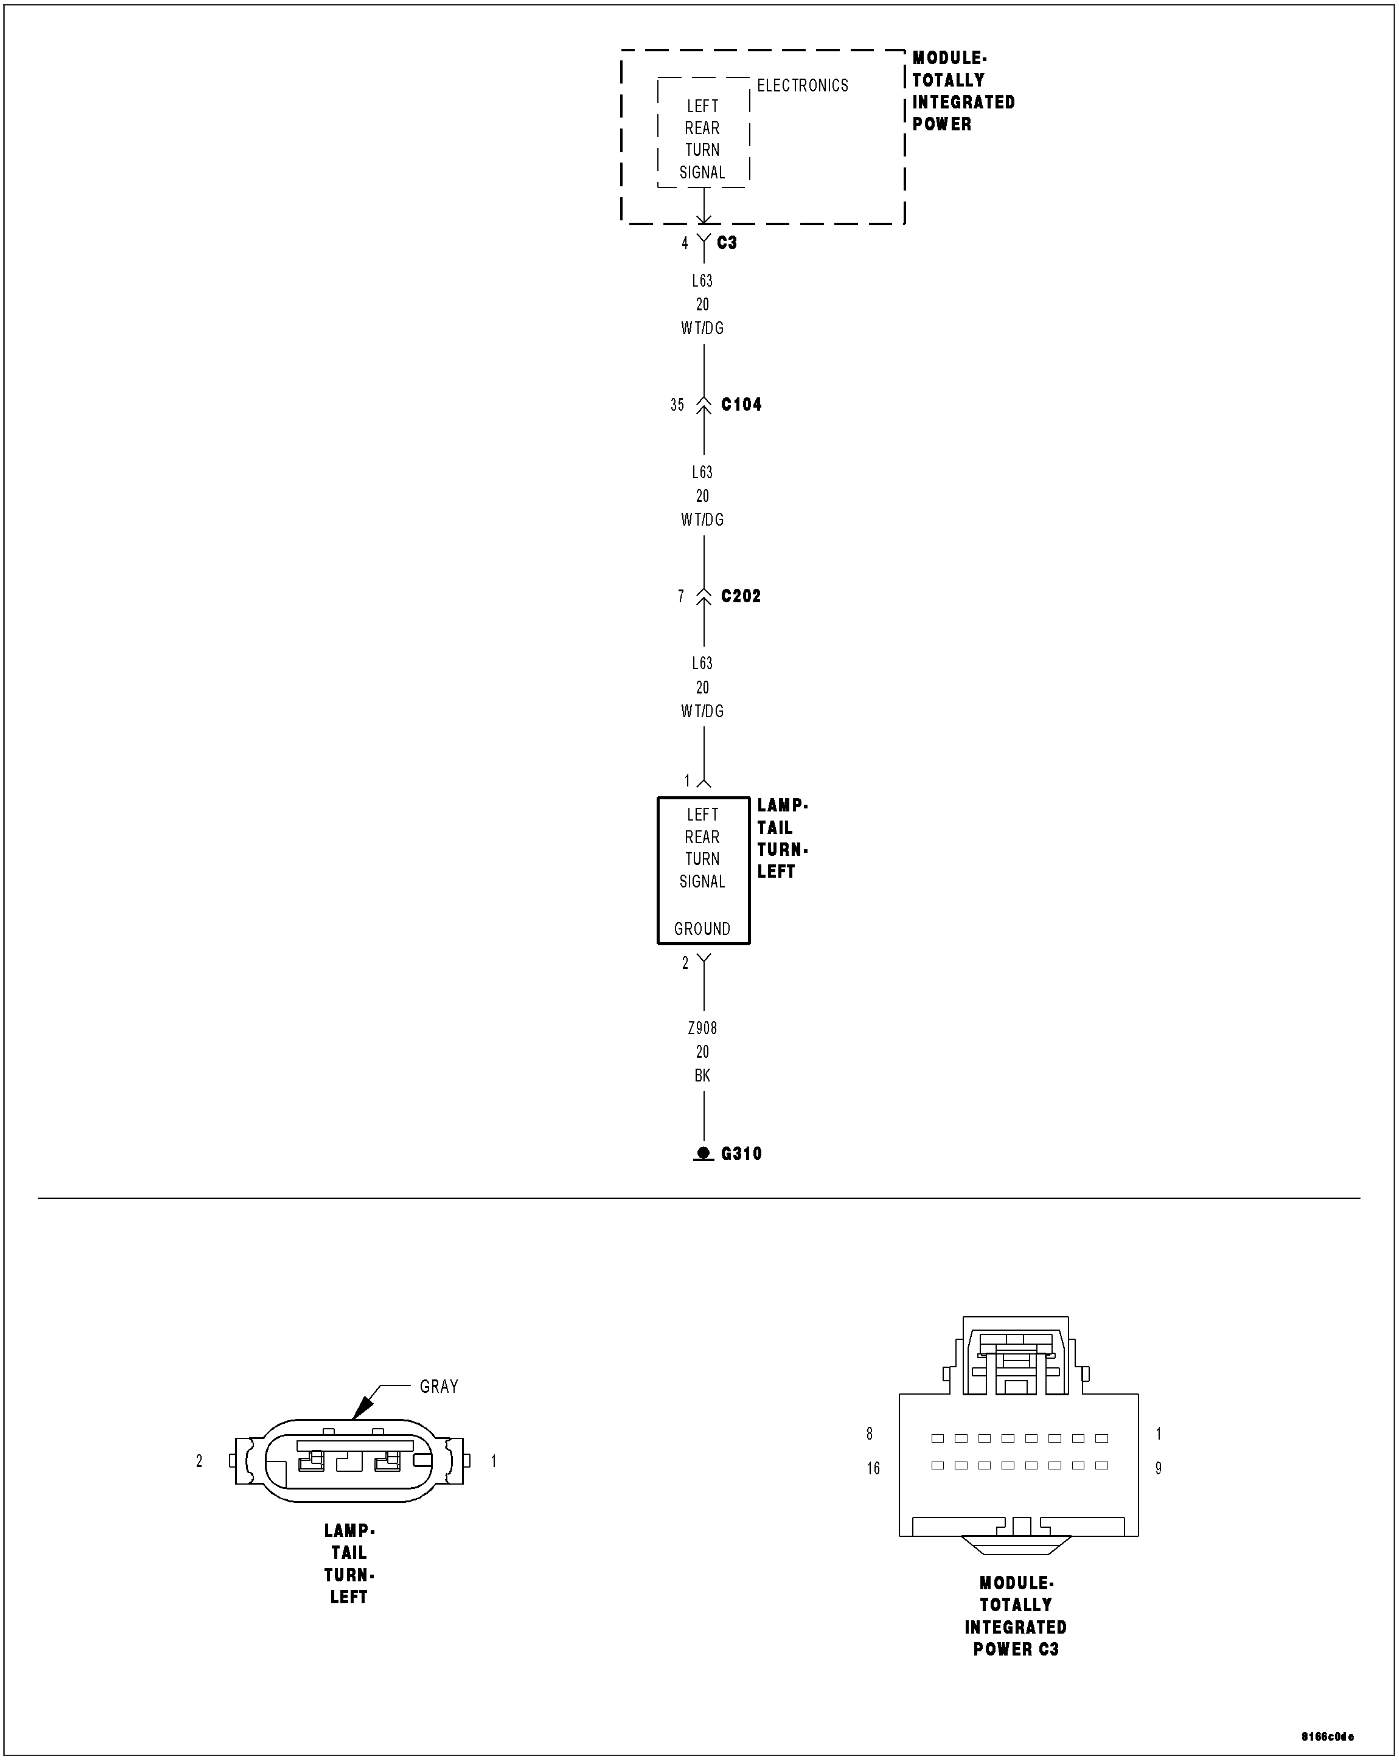
4. (L60) RIGHT TURN SIGNAL CONTROL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C4 connector.

Disconnect the Front Right Turn Signal harness connector.

Turn the ignition on.



Measure for voltage on the (L60) Front Right Turn Signal Control circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (L60) Turn Signal Control circuit for a short to voltage.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1643-REAR LEFT TURN CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Turn Signal activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L63) REAR LEFT TURN SIGNAL CONTROL CIRCUIT
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Left Turn Signals on.

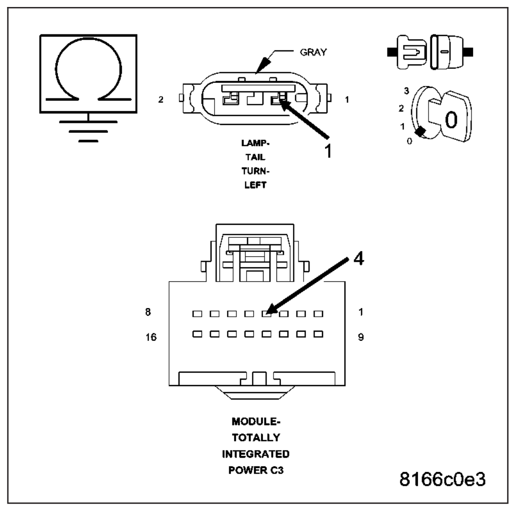
With the Scan Tool read the DTC information.

Does the Scan Tool read: B1643-REAR LEFT TURN CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L63) LEFT TURN SIGNAL CONTROL CIRCUIT

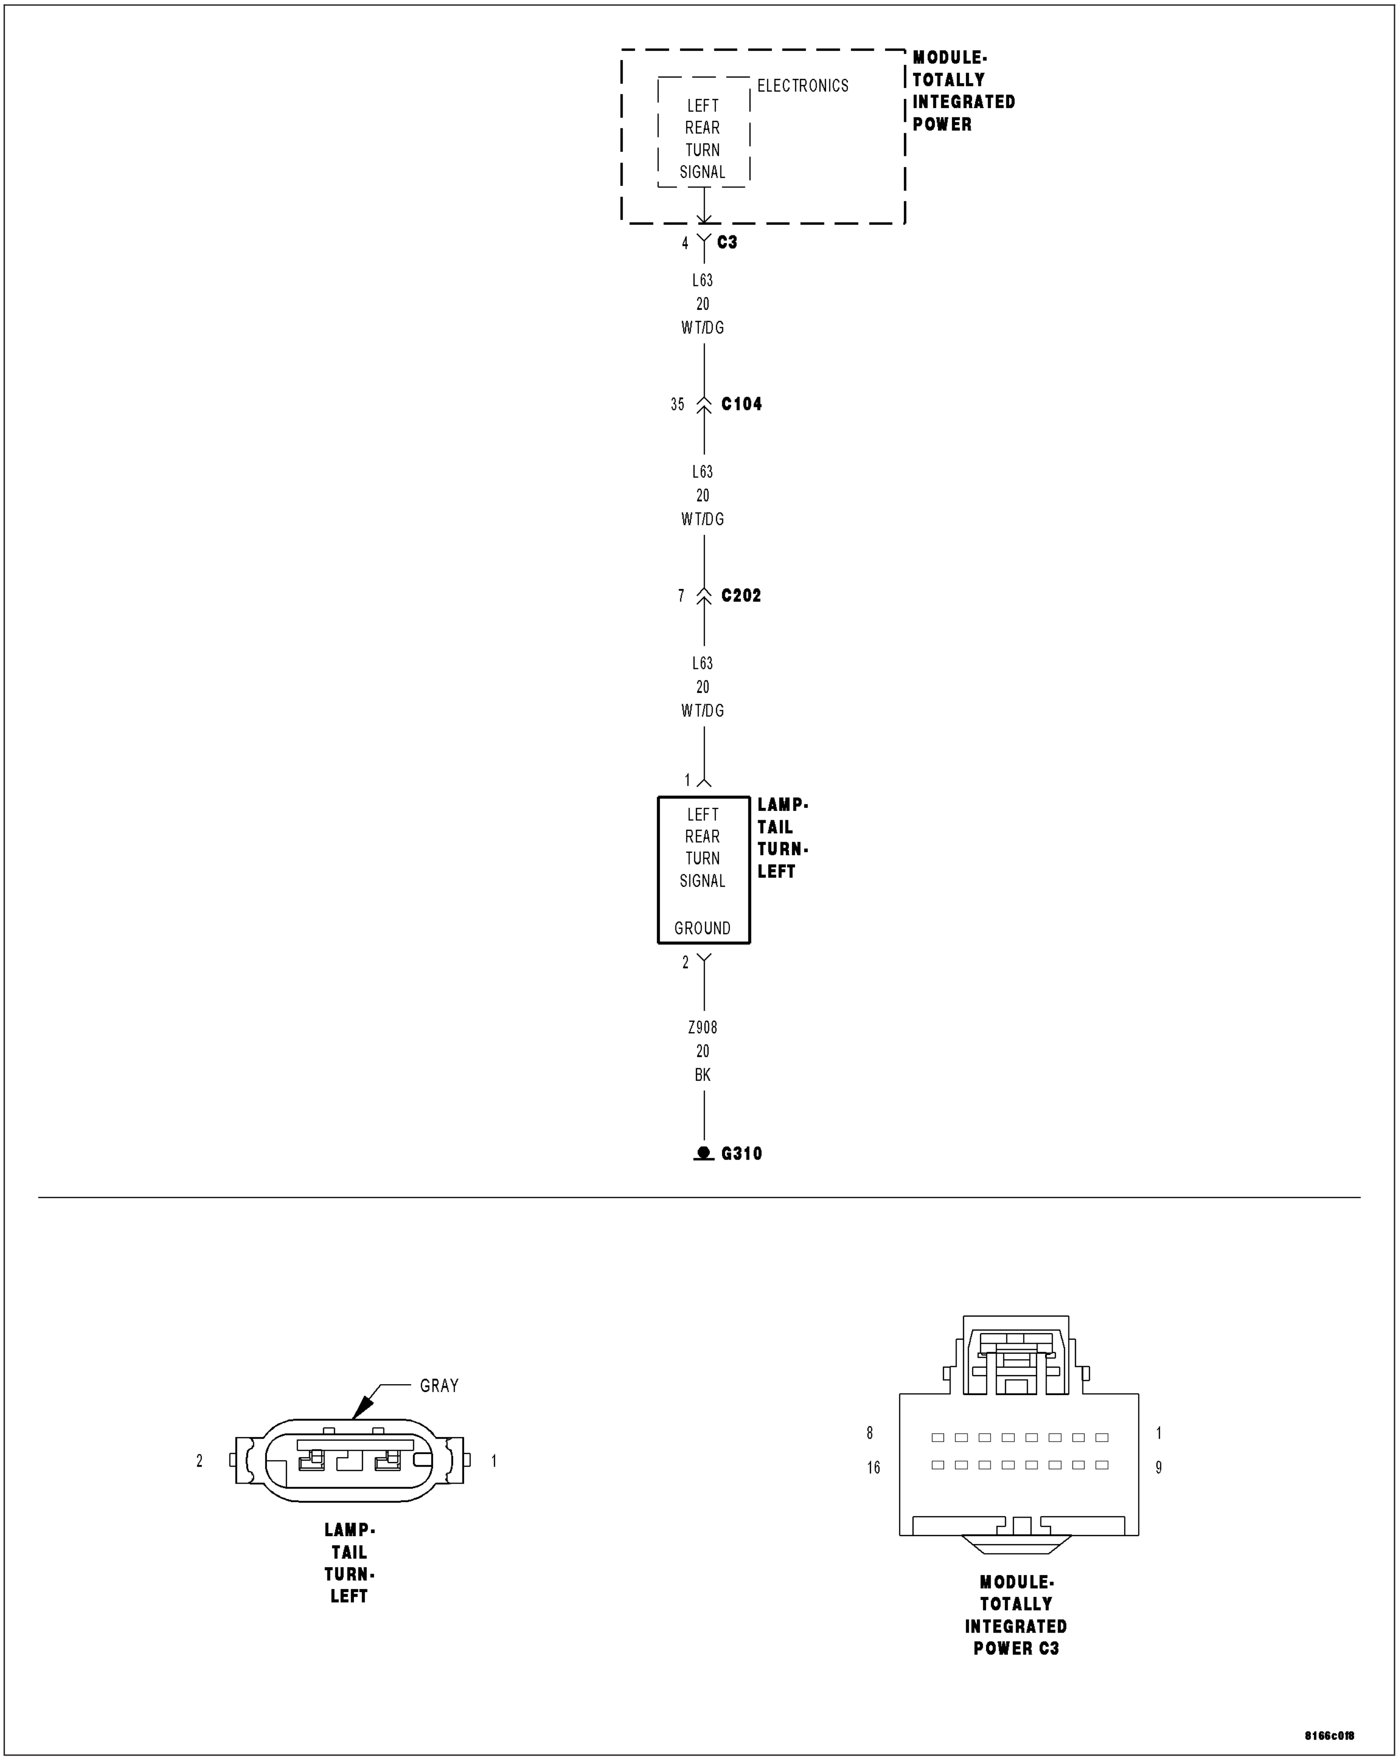
Turn the ignition off.

Disconnect the TIPM C3 connector.

Disconnect the Left Rear Tail Lamp connector.

Measure the resistance between ground and the (L63) Rear Left Rear Turn Signal Control circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (L63) Rear Left Turn Signal Control circuit for a short to ground.

Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the service information.

Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1644-REAR LEFT TURN CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Totally Integrated Power Module detects a short to battery on the Left Rear Turn Signal Control circuit.

Possible Causes
(L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT OPEN
(L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

Clear all TIPM DTC's

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool read: B1644-REAR LEFT TURN CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT REAR TURN SIGNAL BULB

Turn the ignition off.

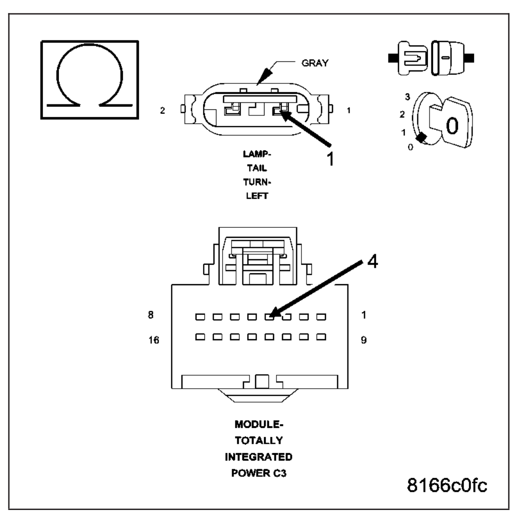
Inspect the Left Rear Turn Signal Bulb Assembly.

Is the inoperative bulb OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



3. (L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

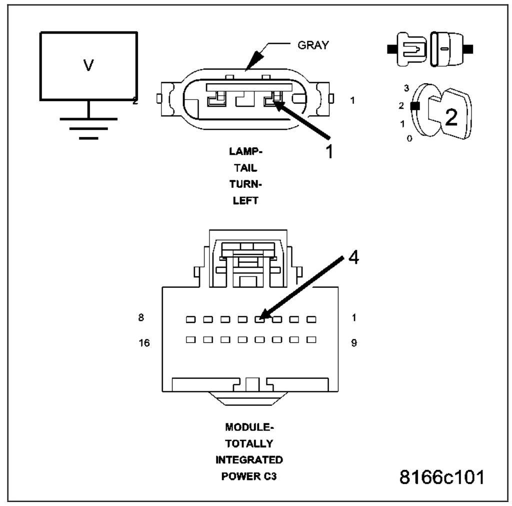
Disconnect the TIPM C3 harness connector.

Disconnect the Left Rear Tail Lamp harness connector.

Measure the resistance of the (L63) Left Rear Turn Signal Control circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (L63) Turn Signal Control circuit for an open.



Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

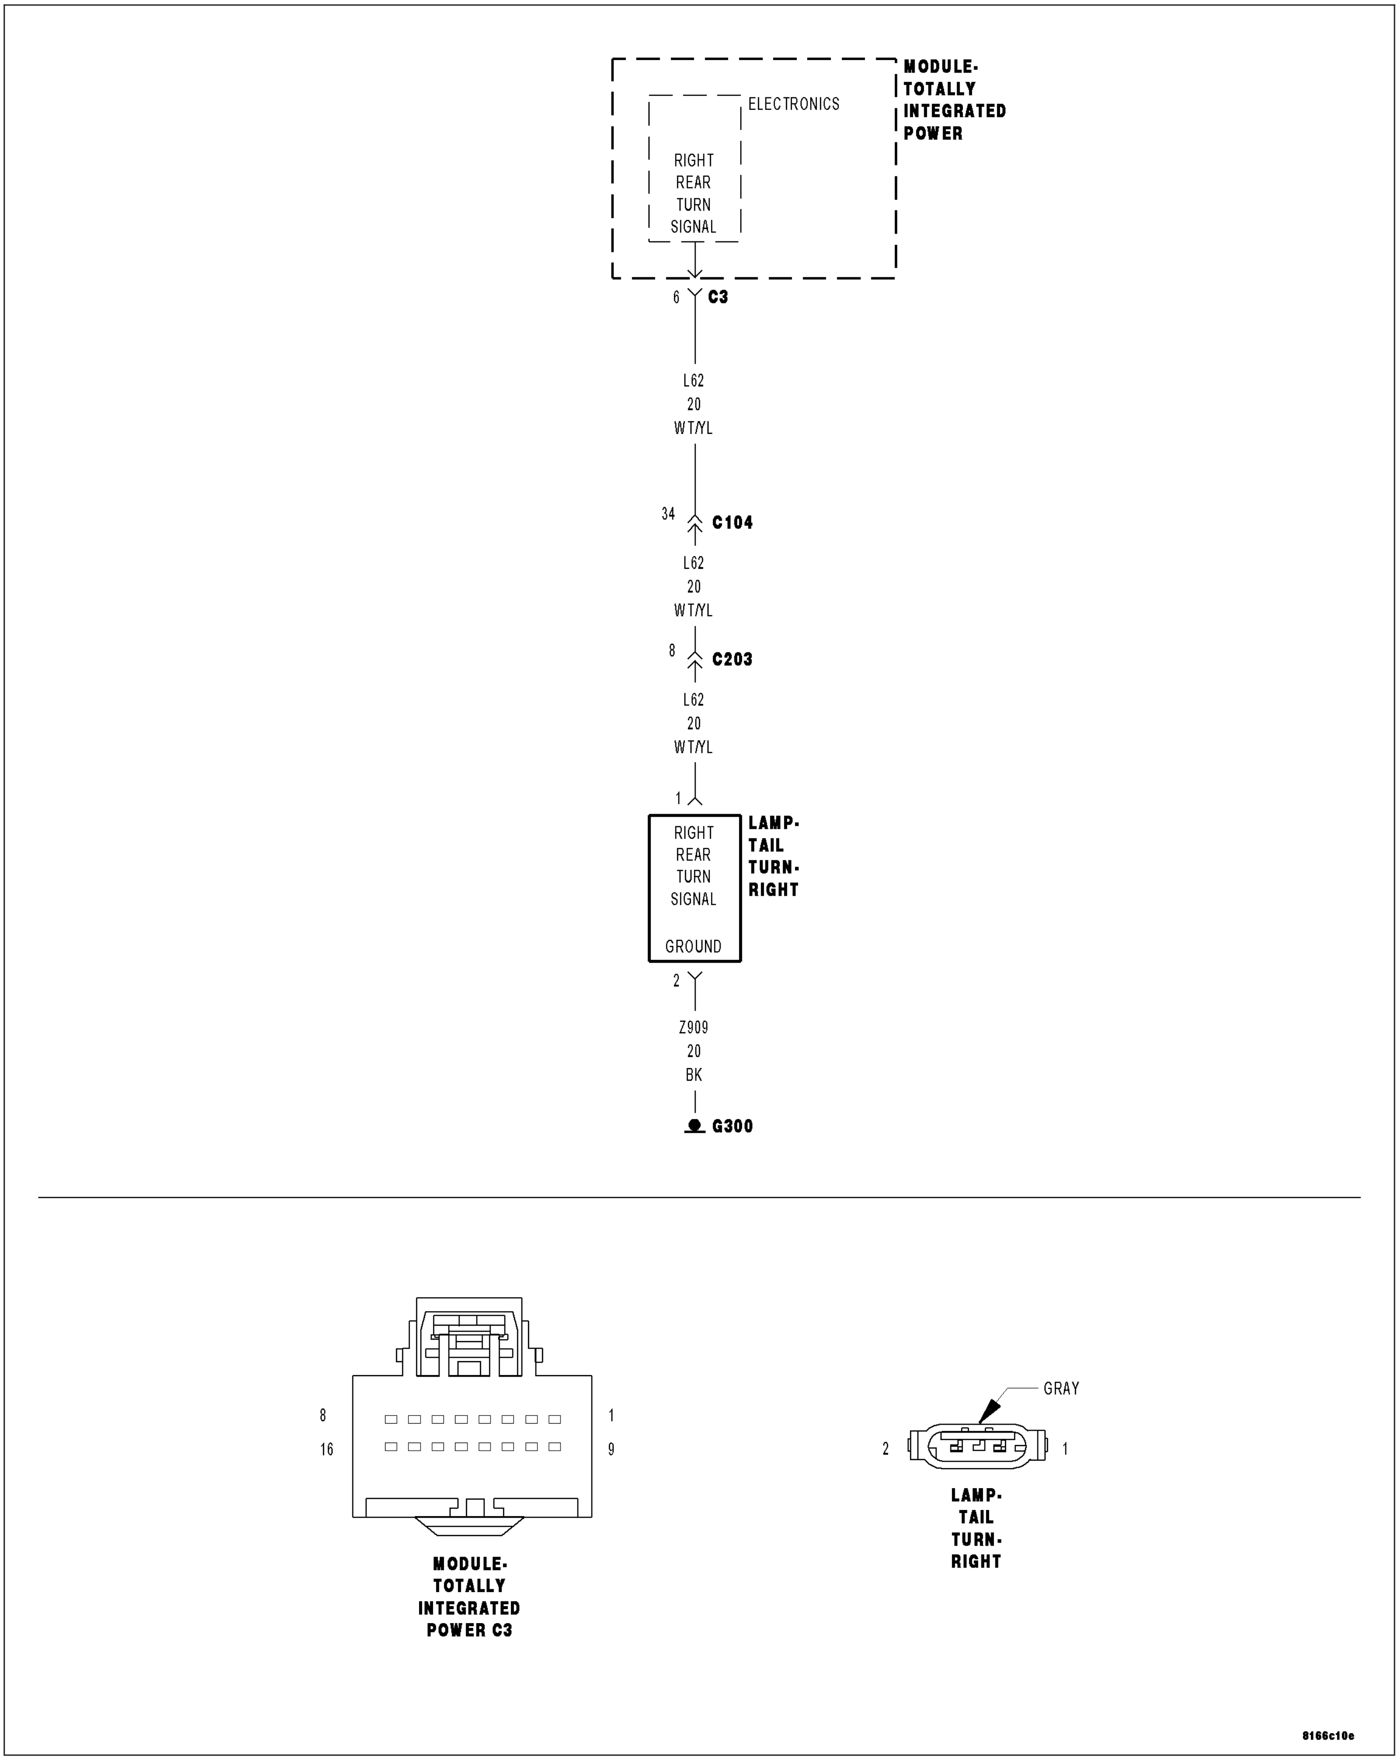
No >> Go To 4

4. (L63) LEFT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure for voltage on the (L63) Left Rear Turn Signal Control circuit.

Is there any voltage present?



Yes >> Repair short to voltage on the (L63) Left Rear Turn Signal Control circuit

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1647-REAR RIGHT TURN CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Turn Signal activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L62) REAR RIGHT TURN SIGNAL CONTROL CIRCUIT
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Right Turn Signals on.

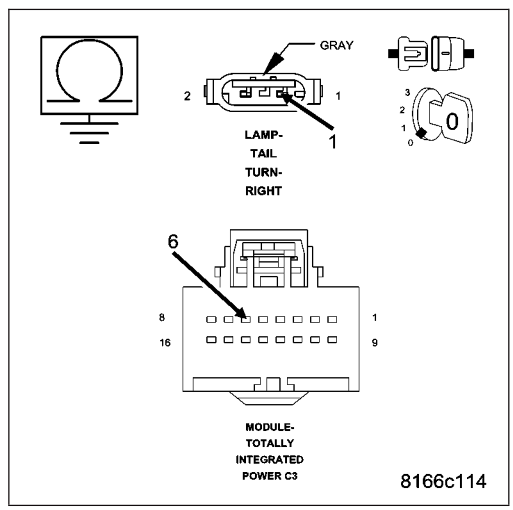
With the Scan Tool read the DTC information.

Does the Scan Tool read: B1647-REAR RIGHT TURN CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT

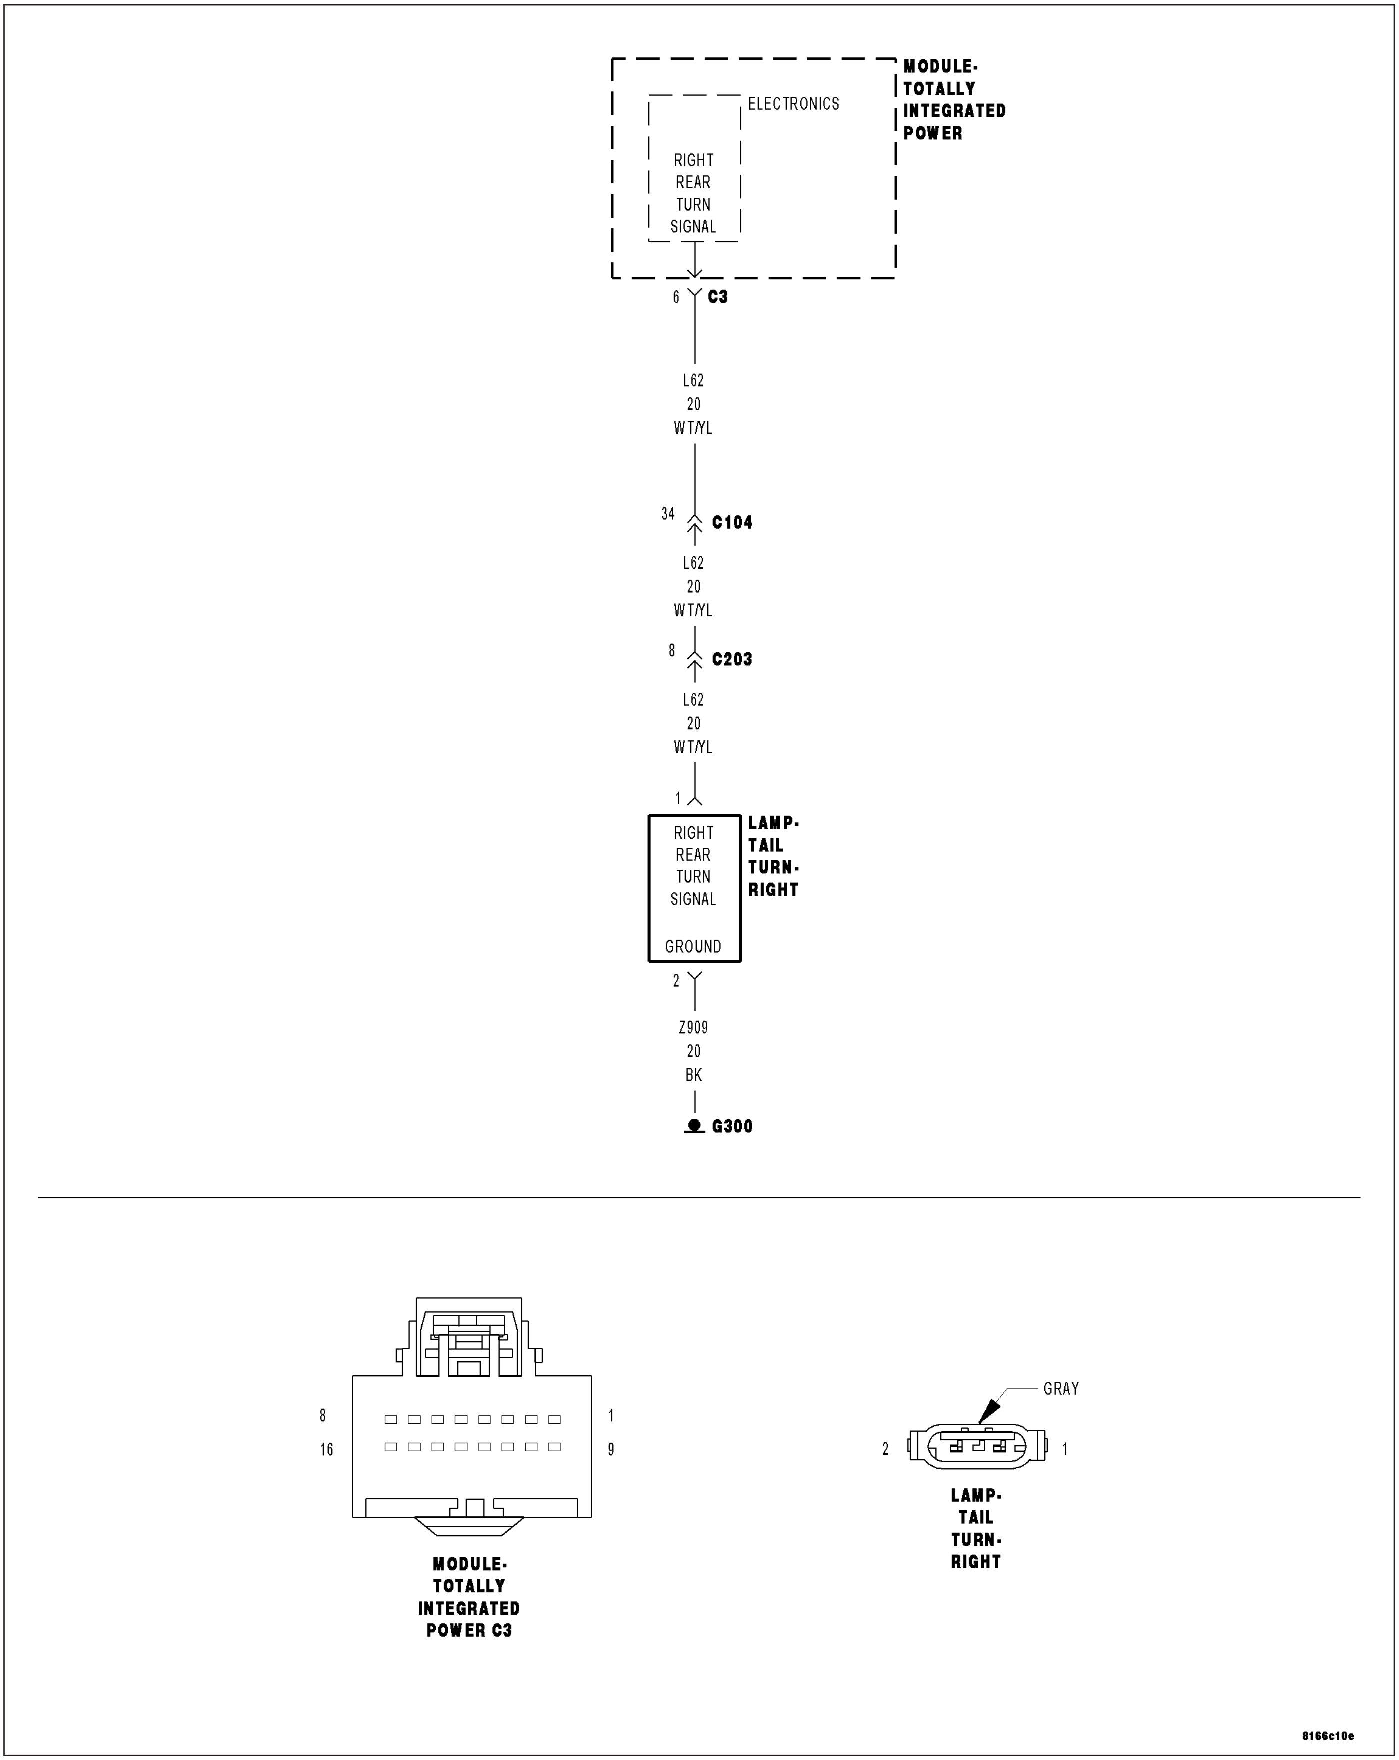
Turn the ignition off.

Disconnect theTIPM C3 connector.

Disconnect the Right Rear Tail Lamp harness connector.

Measure the resistance between ground and the (L62) Right Rear Turn Signal Control circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (L62) Right Rear Turn Signal Control circuit for a short to ground.

Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1648-REAR RIGHT TURN CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Totally Integrated Power Module detects a short to battery on the Control circuit.

Possible Causes
(L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT OPEN
(L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

Clear all TIPM DTC's

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

Does the scan tool read: B1648-REAR RIGHT TURN CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. RIGHT REAR TURN SIGNAL BULB

Turn the ignition off.

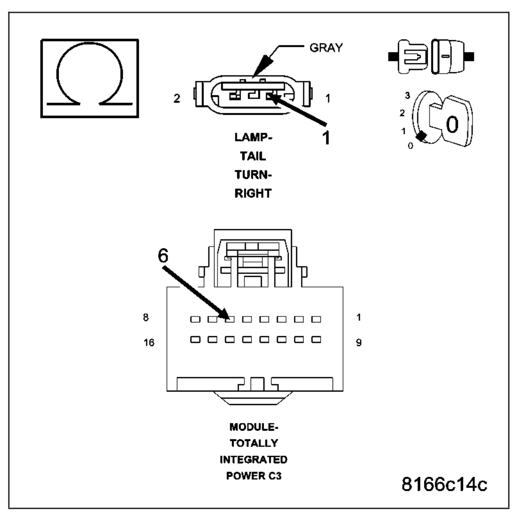
Inspect the Right Rear Turn Signal Bulb Assembly.

Is the inoperative bulb OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



3. (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT OPEN

Turn the ignition off.

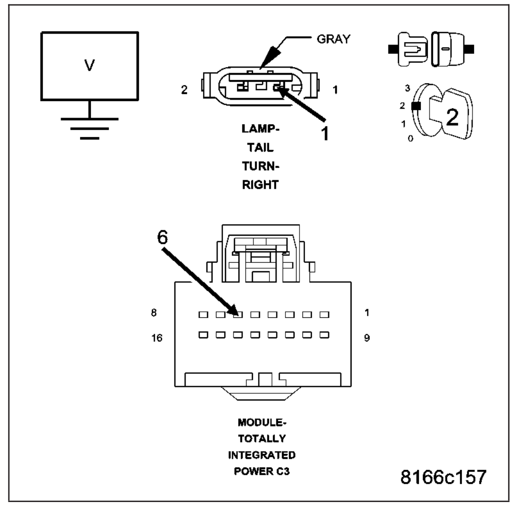
Disconnect the TIPM C3 harness connector.

Disconnect the Right Rear Tail Lamp harness connector.

Measure the resistance of the (L62) Right Rear Turn Signal Control circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (L62) Right Rear Turn Signal Control circuit for an open.



Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

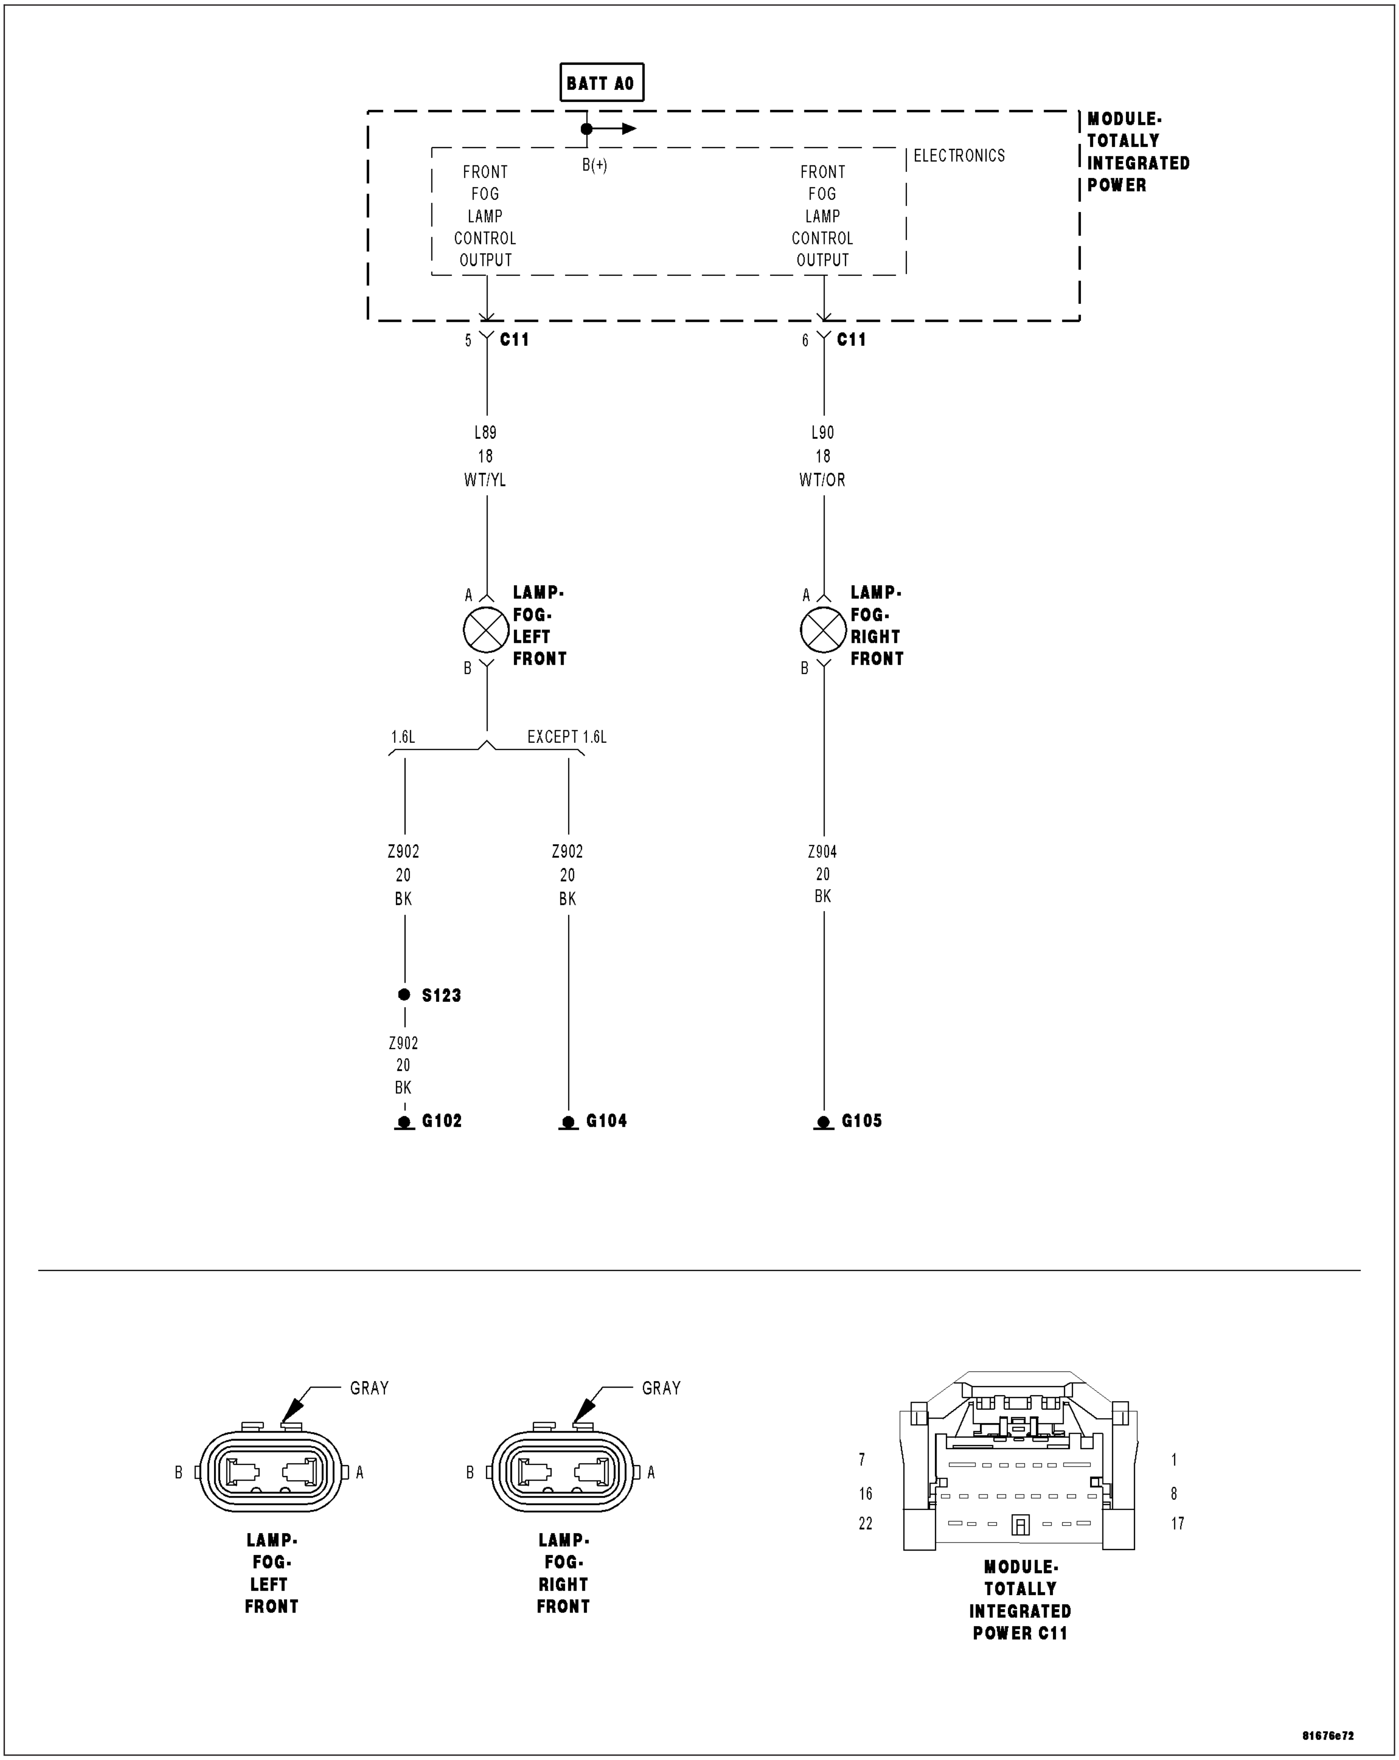
No >> Go To 4

4. (L62) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the (L62) Right Rear Turn Signal Control circuit for short to voltage.

Is there any voltage present?



Yes >> Repair short to voltage on the (L62) Right Rear Turn Signal Control circuit.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1659-FRONT FOG LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Front Fog Lamps activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L89)(L90) FRONT FOG LAMP CONTROL CIRCUIT SHORT TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Front Fog Lamps on.

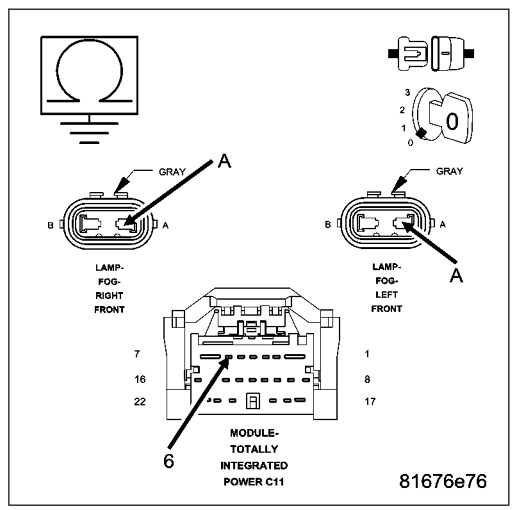
With the Scan Tool read the DTC information.

Does the Scan Tool read: B1659-FRONT FOG LAMP CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L89)(L90) FRONT FOG LAMP CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C11 harness connector.

Disconnect the Front Fog Lamp harness connector.

Measure the resistance between ground and the (L89)(L90) Front Fog Lamp Control circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (L89)(L90) Front Fog Lamp Control circuit for a short to ground condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B165C-PARK LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Parklamps activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L217) PARK LAMP CONTROL CIRCUIT SHORT TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Park Lamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B165C-PARK LAMP CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (L217) PARK LAMP CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Left and Right Park Lamp harness connectors.

Measure the resistance between ground and the (L217) Park Lamp Control circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (L217) Park Lamp Control circuit for a short to ground condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B165D-LEFT PARK LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Park Lamps are activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L217) PARK LAMP CONTROL CIRCUIT OPEN
(L217) PARK LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT AND/OR RIGHT PARK LAMP BULBS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Park Lamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B165D-PARK LAMP CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT AND RIGHT PARK LAMP BULBS

Turn the ignition off.

Inspect the Left and Right Park Lamp Bulb Assemblies.

Are the inoperative bulbs OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb(s) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L217) PARK LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Left and Right Park Lamp harness connectors.

Measure the resistance of the (L217) Park Lamp Control circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (L217) Park Lamp Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B165E-PARK LAMP CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Park Lamps Activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L217) PARK LAMP CONTROL CIRCUIT OPEN
LEFT AND/OR RIGHT PARK LAMP BULBS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all TIPM DTC's.
Turn the Stop Lamps on.
With the Scan Tool read the DTC information.

Does the Scan Tool read: B165E-PARK LAMP CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. PARK LAMP BULBS

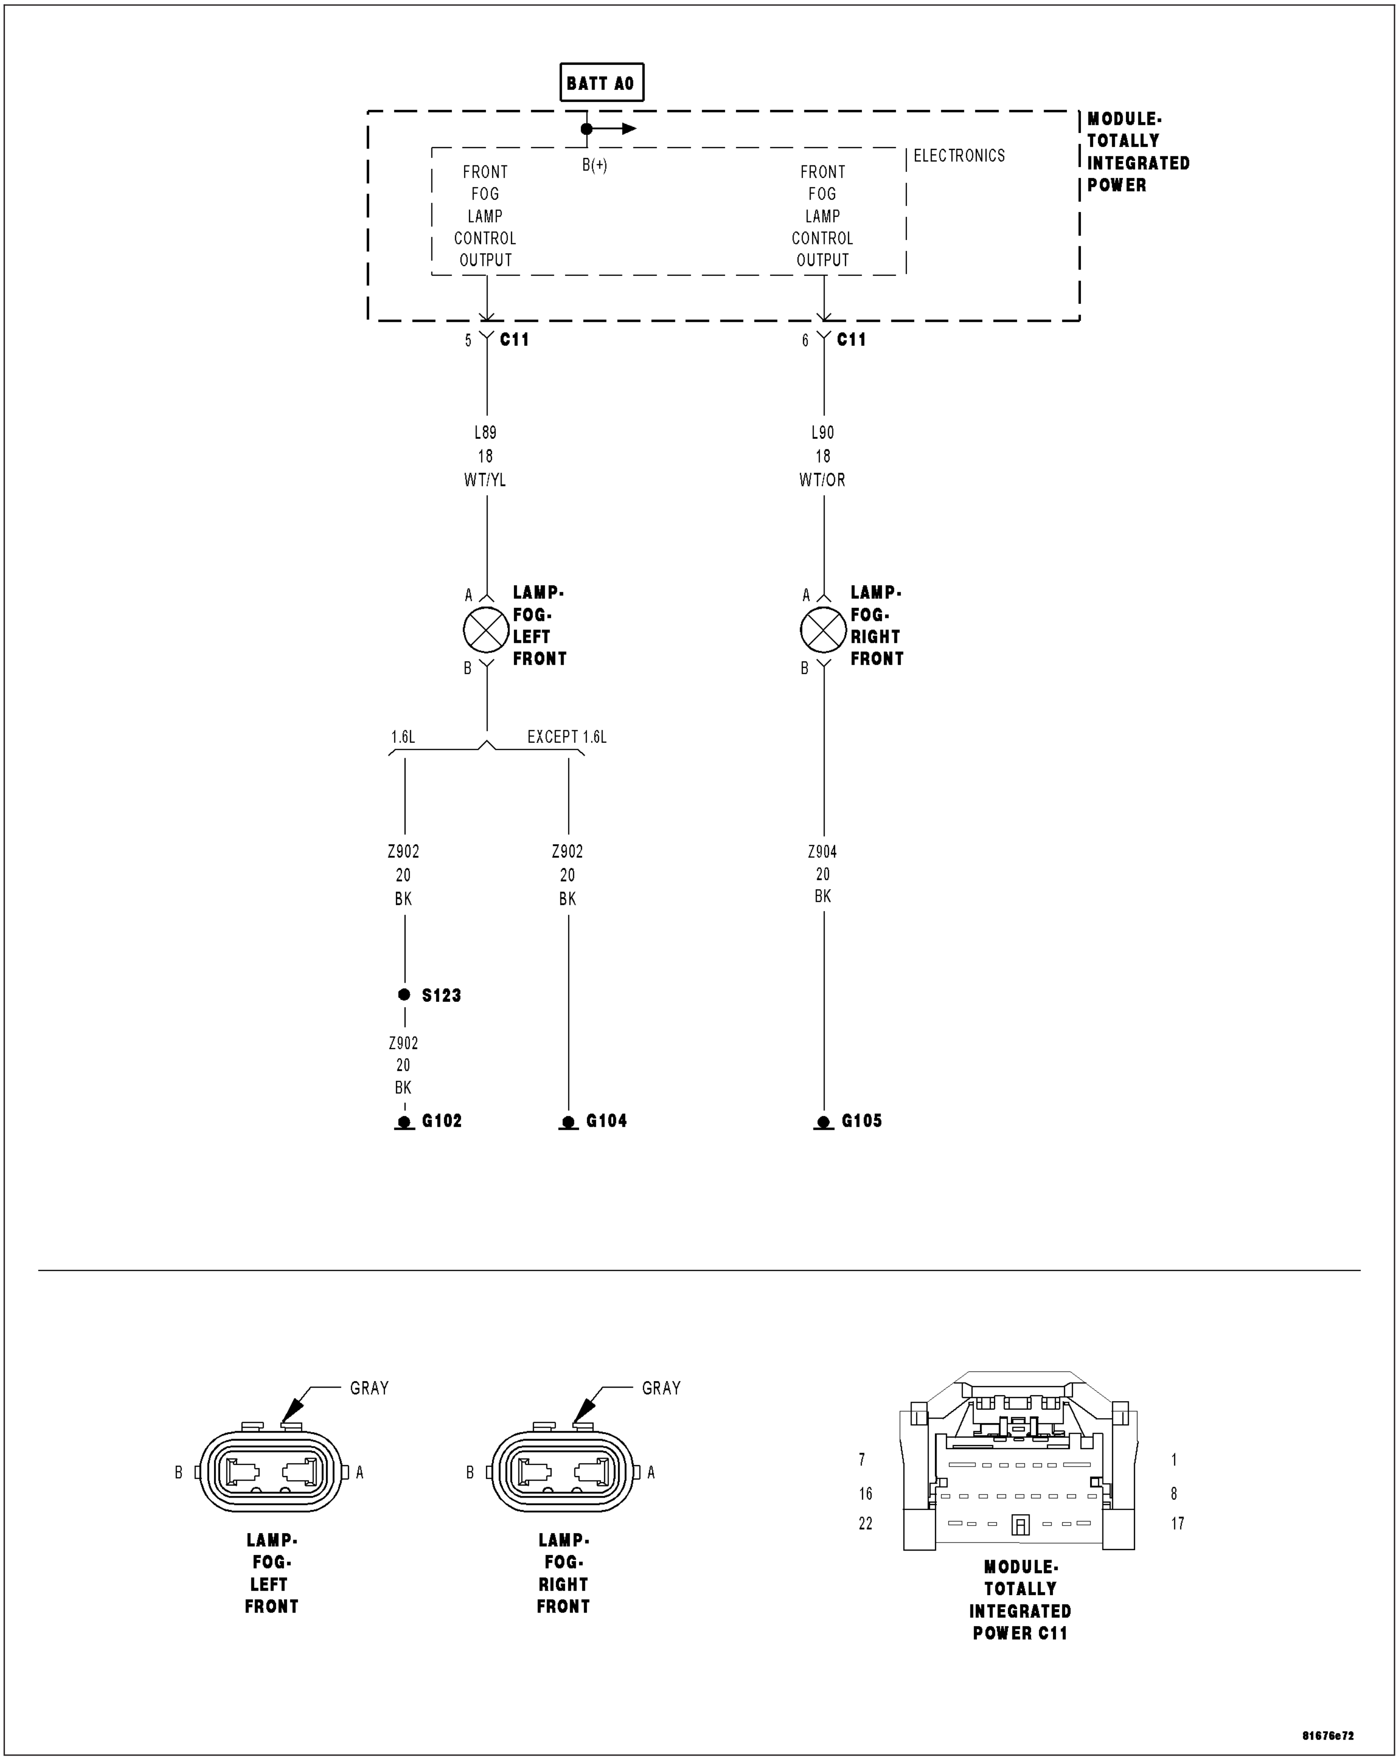
Turn the ignition off.
Inspect the Left and Right Park Lamp Bulb Assemblies.

Are the inoperative bulbs OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb or bulbs in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L217) PARK LAMP CONTROL CIRCUIT OPEN



Turn the ignition off.
Disconnect the TIPM C3 harness connector.
Disconnect the Left and Right Park Lamp harness connectors.
Measure the resistance of the (L217) Park Lamp Control circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (L217) Park Lamp Control circuit for an open condition.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1660-FRONT FOG LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Front Fog Lamps activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L89)(L90) FRONT FOG LAMP CONTROL CIRCUIT OPEN
(L89)(L90) FRONT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT AND/OR RIGHT FRONT FOG LAMP BULBS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Front Fog Lamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1660-FRONT FOG LAMP CONTROL CIRCUIT HIGH?

Yes >> Go To 2

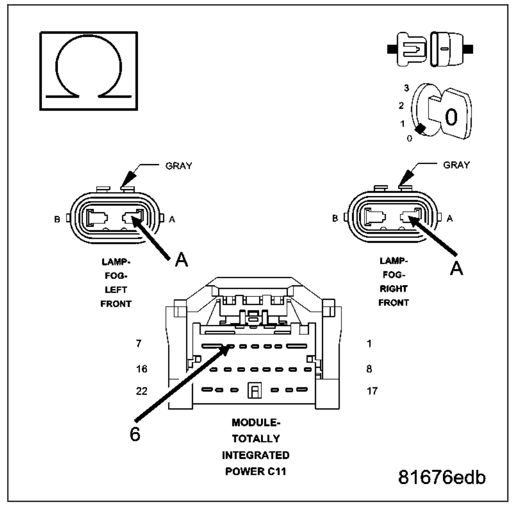
No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. FRONT FOG LAMP BULBS

Turn the ignition off.

Inspect the Left and Right Front Fog Lamp Bulb Assemblies.



Are the inoperative bulbs OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb(s) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

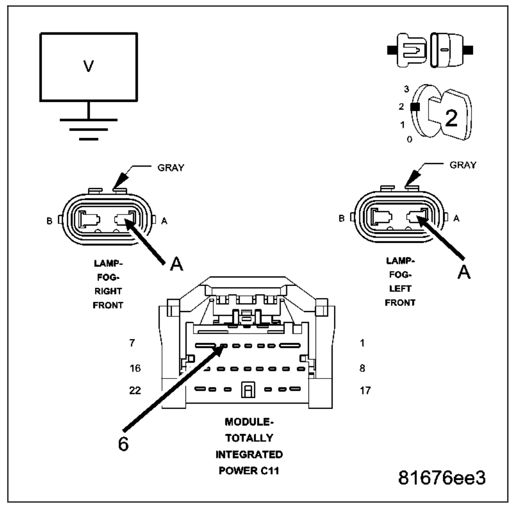
3. (L89)(L90) FRONT FOG LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C11 harness connector.

Disconnect the Left and Right Front Fog Lamp harness connectors.

Measure the resistance of the (L89)(L90) Front Fog Lamp Control circuit.



Is the resistance above 5.0 ohms?

Yes >> Repair the (L89)(L90) Front Fog Lamp Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (L89)(L90) FRONT FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

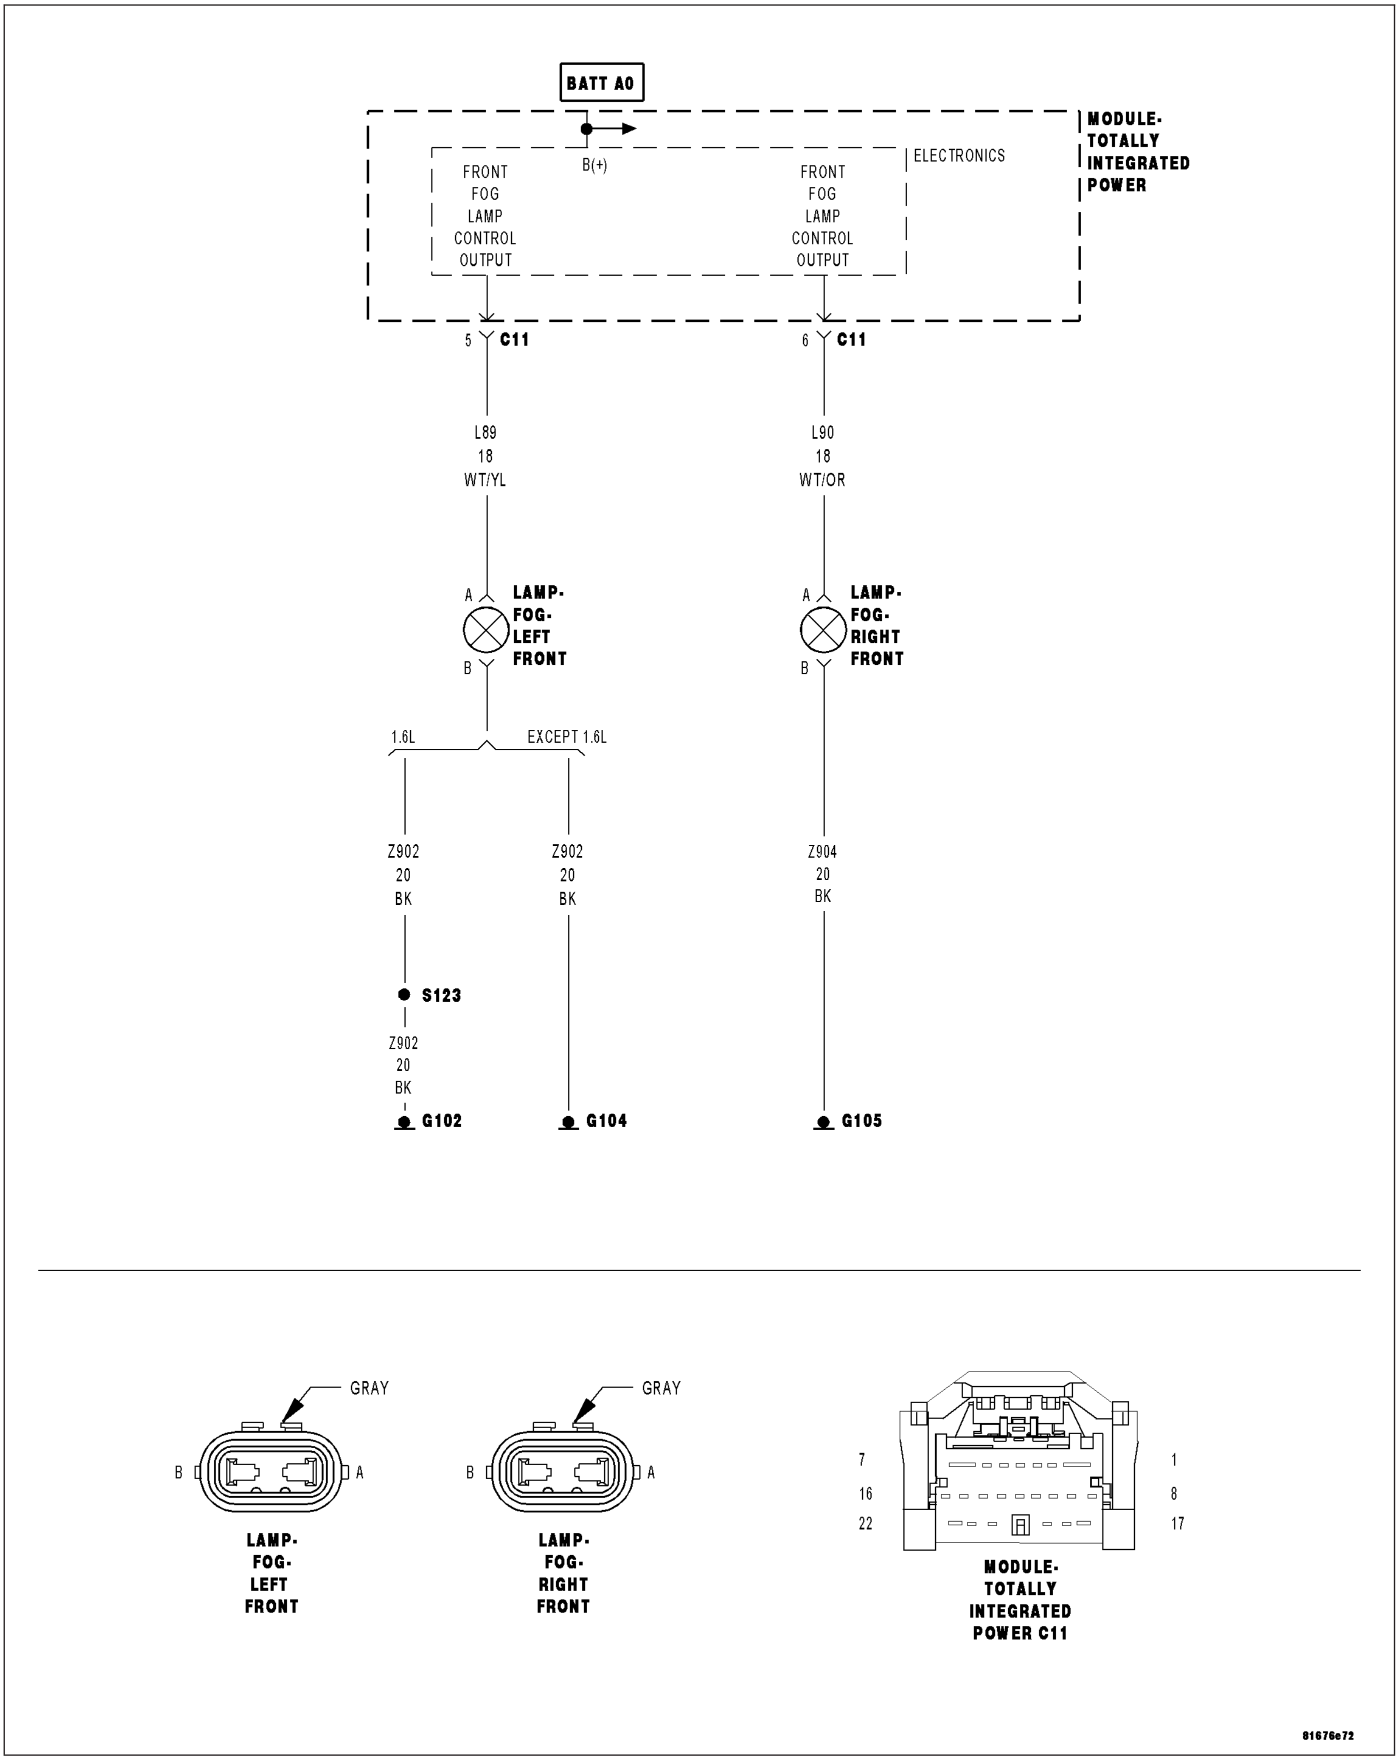
Disconnect the TIPM C11 harness connector.

Disconnect the Left and Right Front Fog Lamp harness connectors.

Turn the ignition on.

Measure for voltage on the (L89)(L90) Front Fog Lamp Control circuit.

Is the voltage above 10.0 volts?



Yes >> Repair the (L89)(L90) Front Fog Lamp Control circuit for a short to voltage condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1661-FRONT FOG LAMP CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Front fog Lamps Activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L89)(L90) FRONT FOG LAMP CONTROL CIRCUIT OPEN
LEFT AND/OR RIGHT FRONT FOG LAMP BULBS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all TIPM DTC's.
Turn the Front Fog Lamps on.
With the Scan Tool read the DTC information.

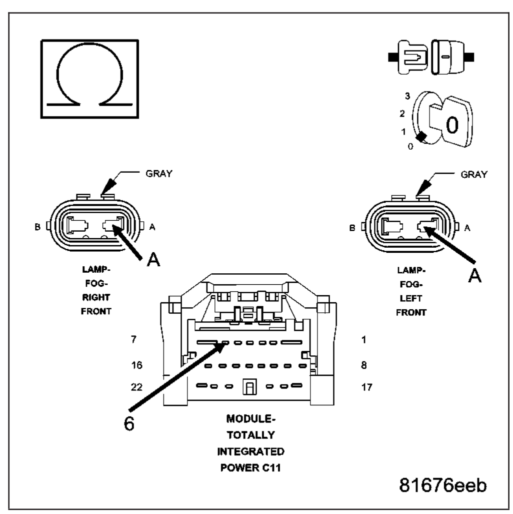
Does the Scan Tool read: B1661-FRONT FOG LAMP CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. FRONT FOG LAMP BULBS

Turn the ignition off.
Inspect the Left and Right Front Fog Lamp Bulb Assemblies.



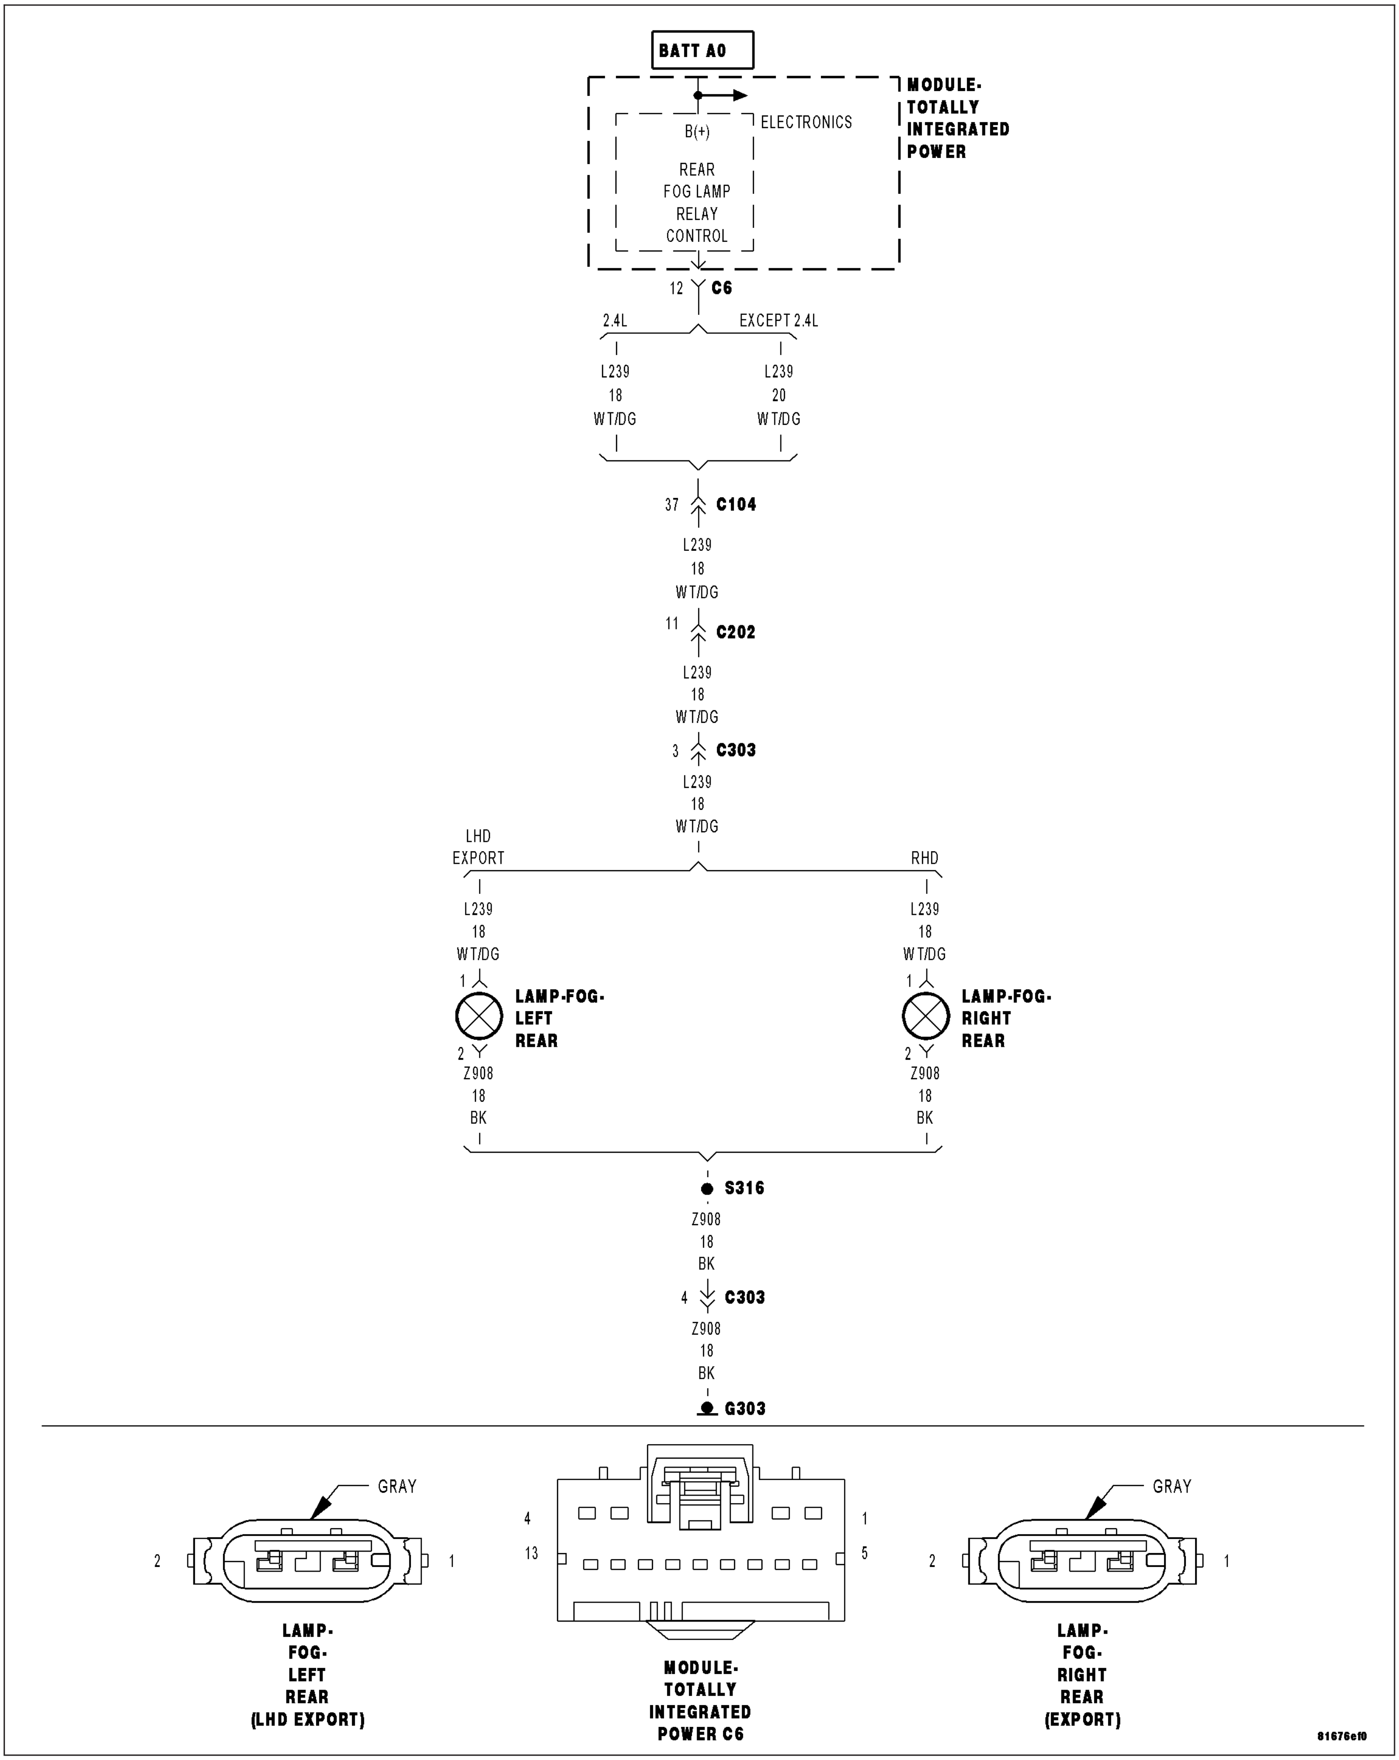
Are the inoperative bulbs OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb(s) in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L89)(L90) FRONT FOG LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.
Disconnect the TIPM C11 harness connector.
Disconnect the Left and Right Front Fog Lamp harness connectors.
Measure the resistance of the (L89)(L90) Front Fog Lamp Control circuit.



Is the resistance above 5.0 ohms?

Yes >> Repair the (L89)(L90) Front Fog Lamp Control circuit for an open condition.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1663-REAR FOG LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Rear Fog Lamps activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L239) REAR FOG LAMP CONTROL CIRCUIT SHORT TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Rear Fog Lamps on.

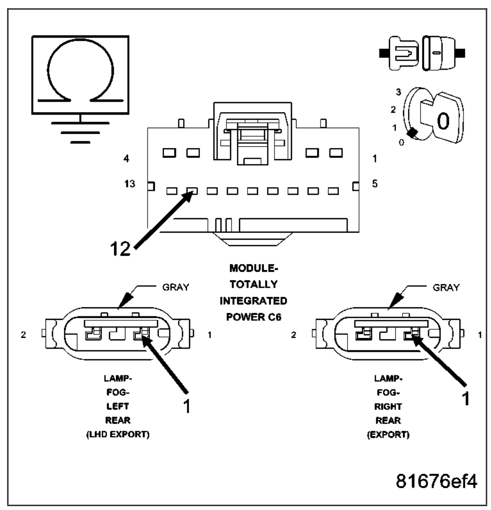
With the Scan Tool read the DTC information.

Does the Scan Tool read: B1663-REAR FOG LAMP CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L239) REAR FOG LAMP CONTROL CIRCUIT SHORT TO GROUND

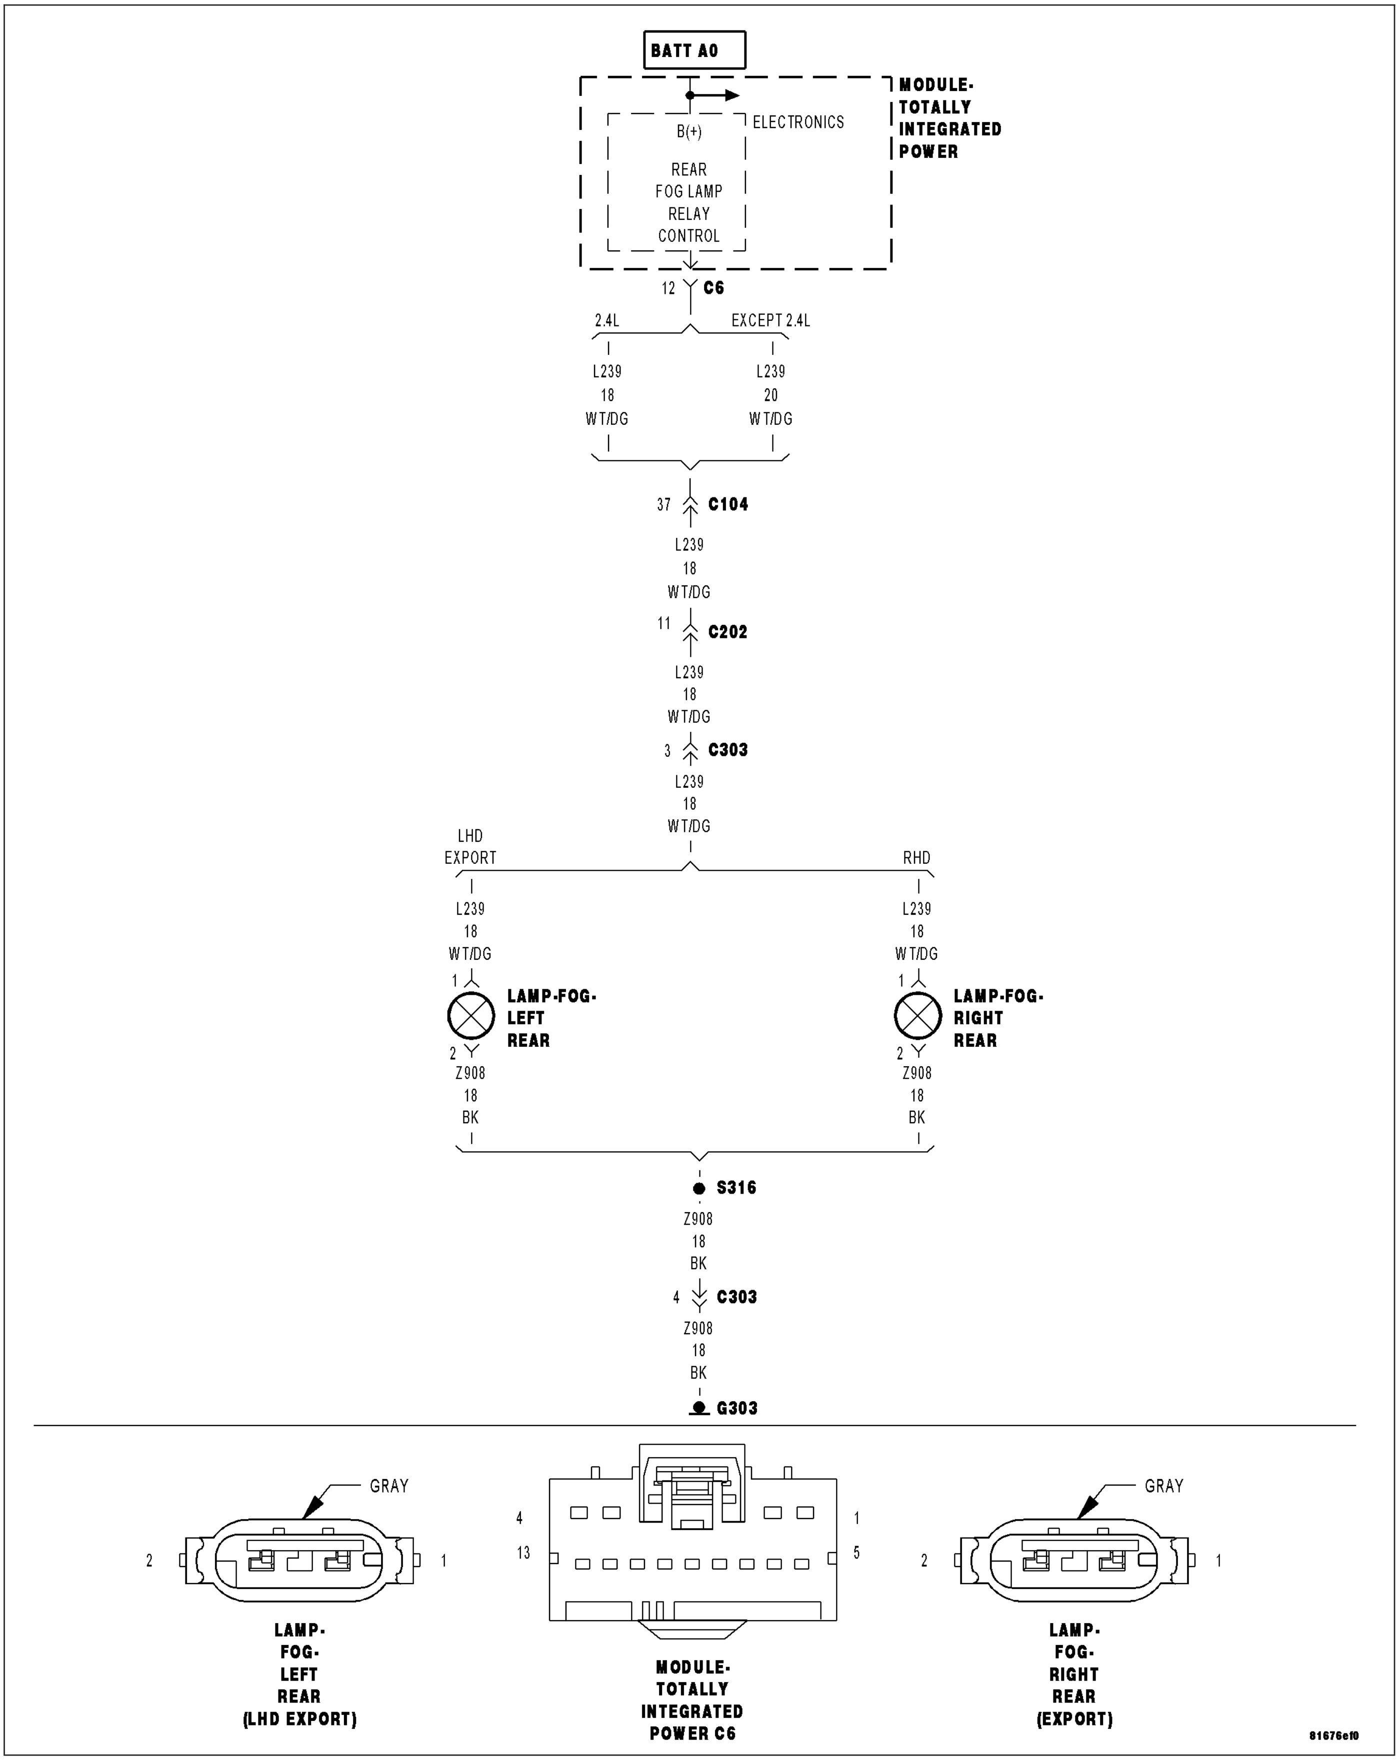
Turn the ignition off.

Disconnect the TIPM C6 harness connector.

Disconnect the Left and Right Fog Lamp harness connectors.

Measure the resistance between ground and the (L239) Right Low Beam Control circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (L39) Rear Fog Lamp Control circuit for a short to ground condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1664-REAR FOG LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Rear Fog Lamps activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L239) REAR FOG LAMP CONTROL CIRCUIT OPEN
(L239) REAR FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT AND/OR RIGHT REAR FOG LAMP BULBS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Rear Fog Lamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1664-REAR FOG LAMP CONTROL CIRCUIT HIGH?

Yes >> Go To 2

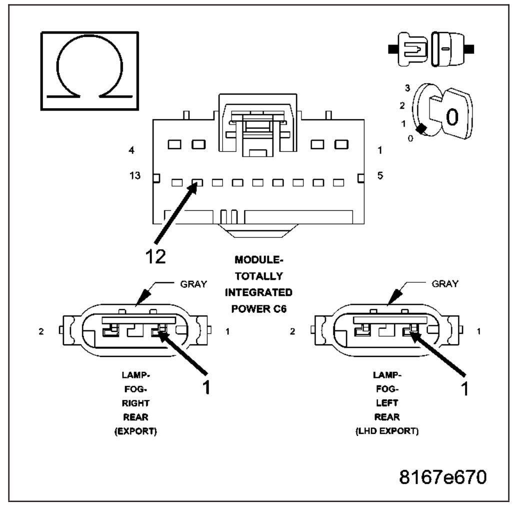
No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. LEFT AND RIGHT REAR FOG LAMP BULBS

Turn the ignition off.

Inspect the Left and Right Fog Lamp Bulb Assemblies.



Are the inoperative bulbs OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb(s) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L239) REAR FOG LAMP CONTROL CIRCUIT OPEN

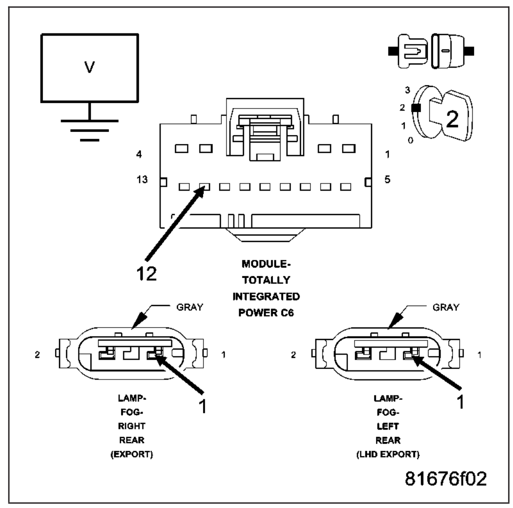
Turn the ignition off.

Disconnect the TIPM C6 harness connector.

Disconnect the Left and Right Rear Fog Lamp harness connectors.

Measure the resistance of the (L239) Rear Fog Lamp Control circuit.

Is the resistance above 5.0 ohms?



Yes >> Repair the (L239) Rear Fog Lamp Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

4. (L239) REAR FOG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

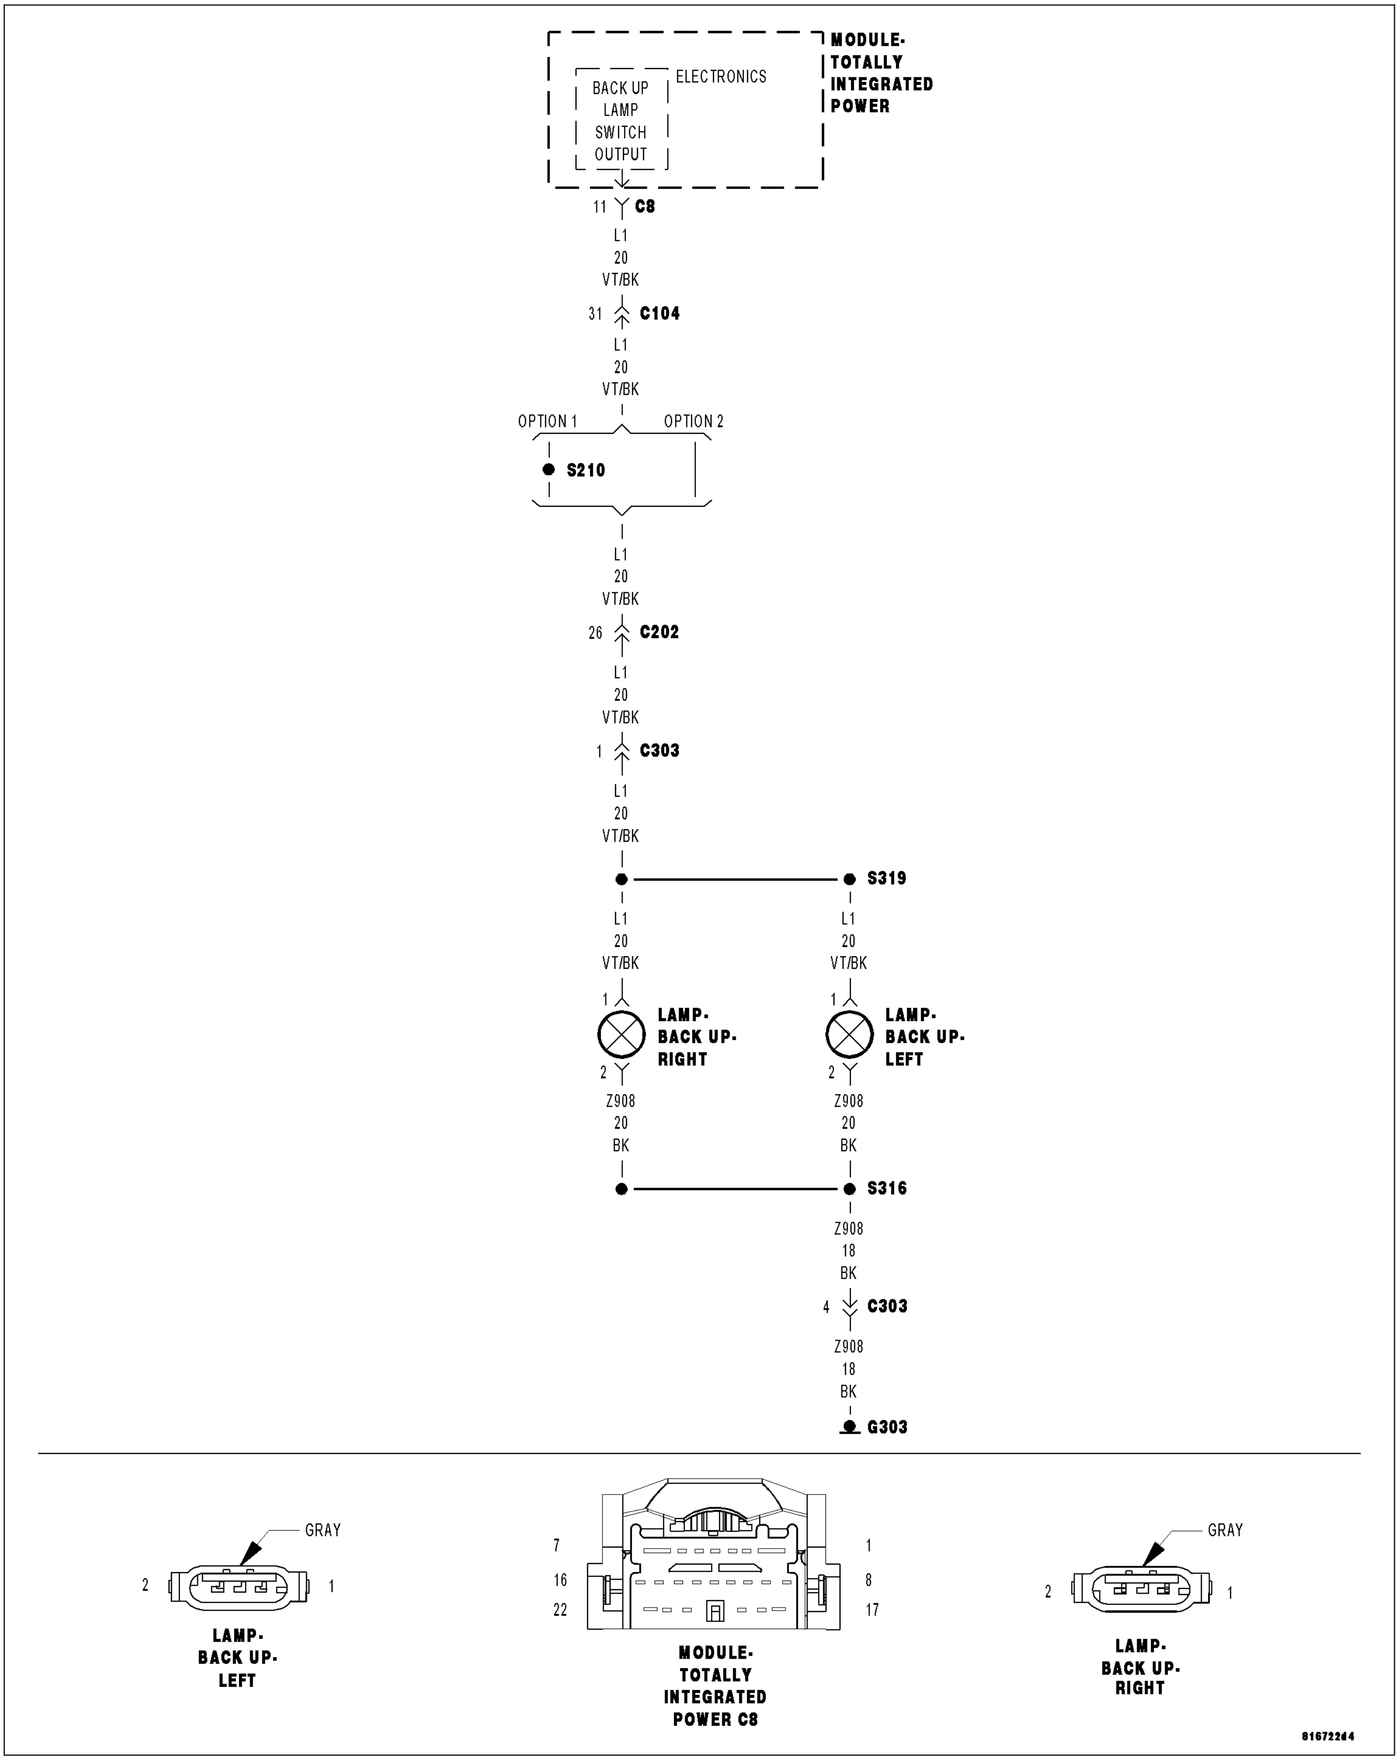
Disconnect the TIPM C6 harness connector.

Disconnect the Left and Right Rear Fog Lamp harness connectors.

Turn the ignition on.

Measure for voltage on the (L239) Rear Fog Lamp Control circuit.

Is the voltage above 10.0 volts?



Yes >> Repair the (L239) Rear Fog Lamp Control circuit for a short to voltage condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1667-REVERSE LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The TIPM Detects a Short to ground condition.

Possible Causes
(L1) BACK-UP LAMP FEED CIRCUIT SHORT TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

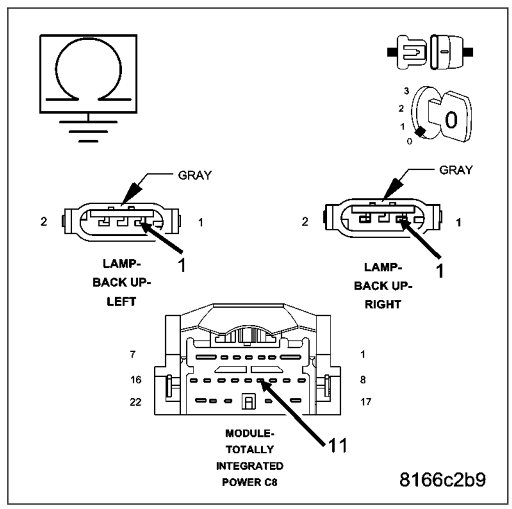
Shift the transmission into reverse.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1667-REVERSE LAMP CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.



Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

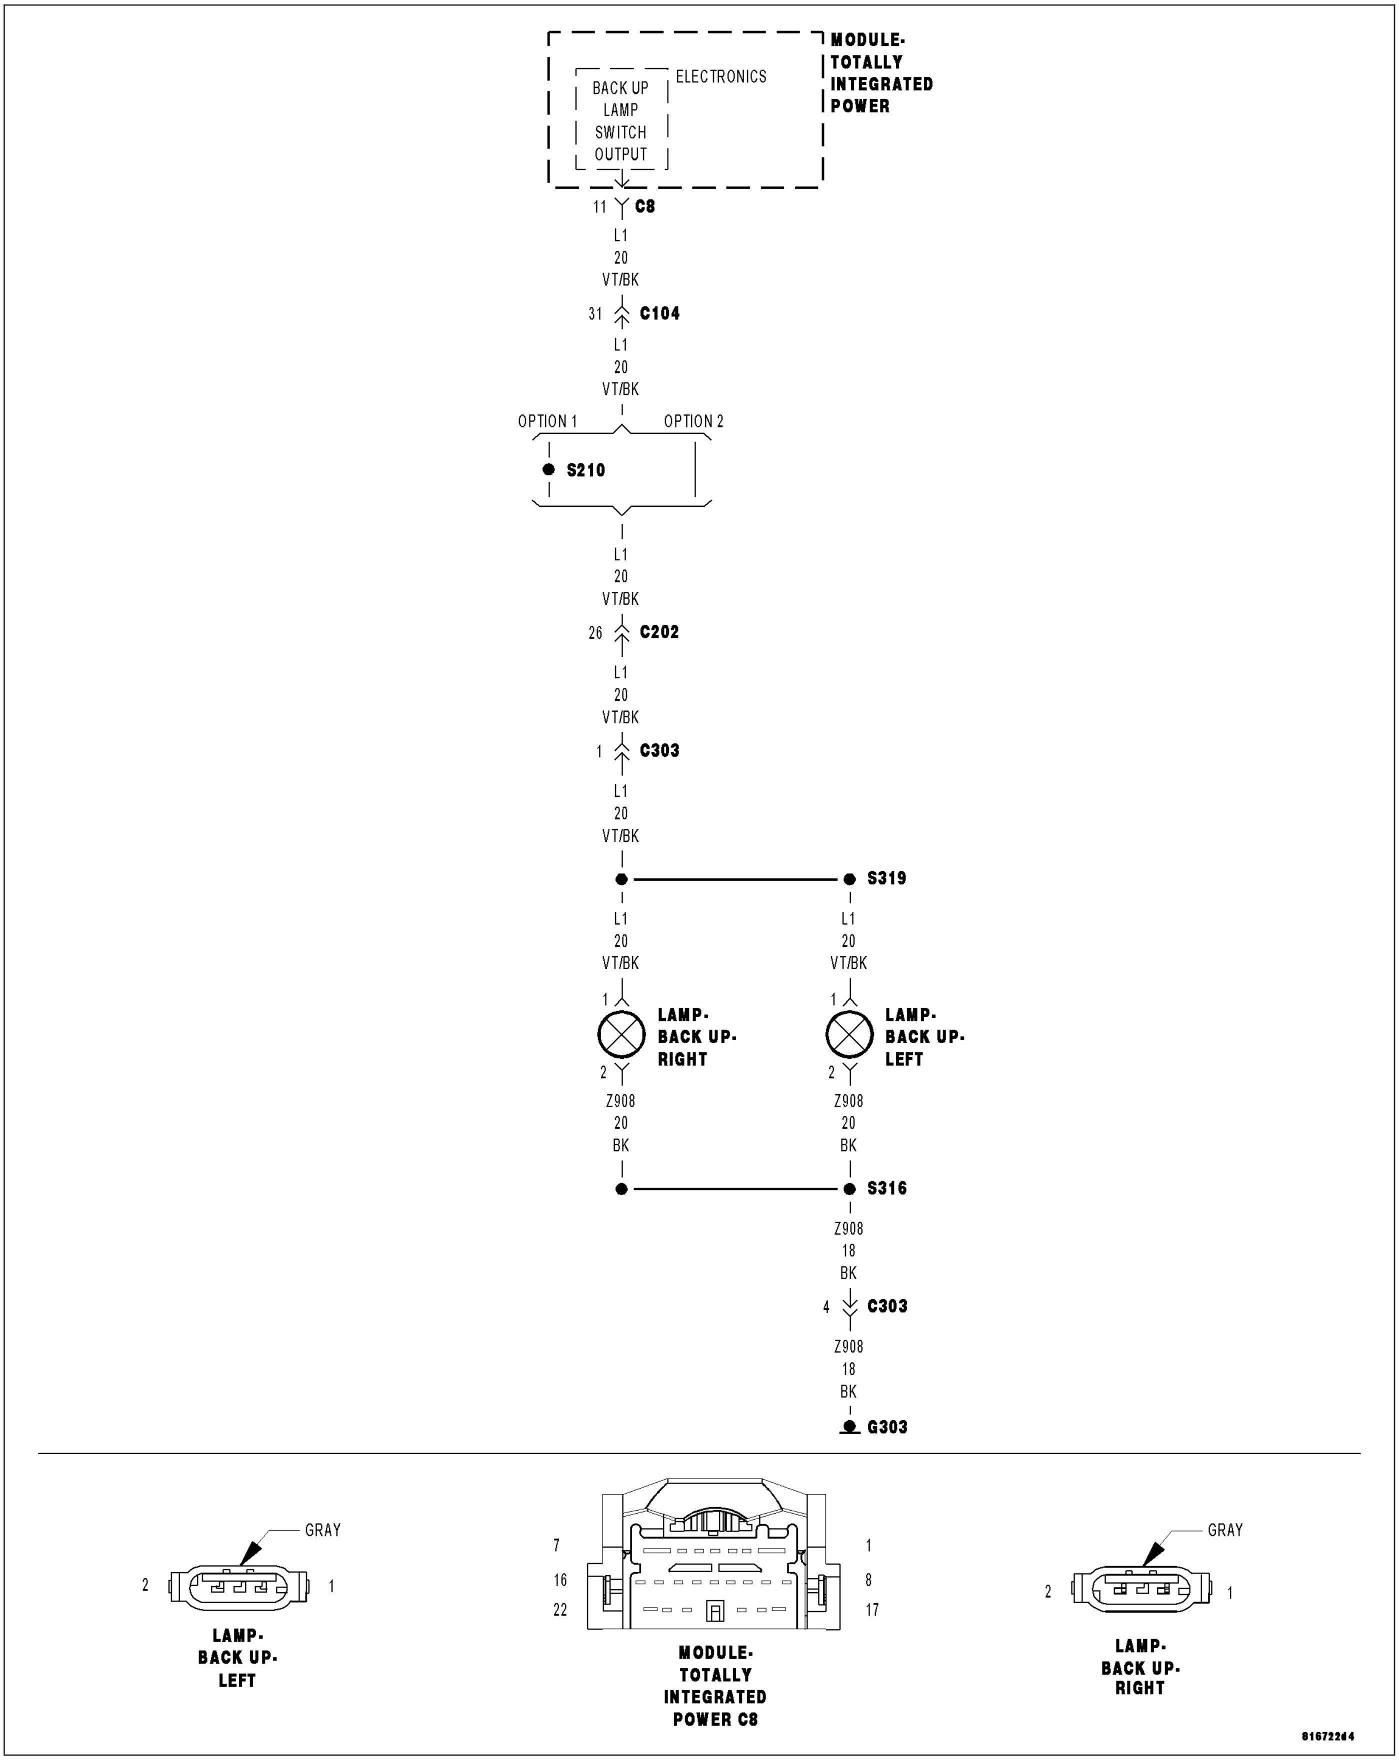
2. (L1) BACK-UP LAMP FEED CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C8 connector.

Measure the resistance between ground and the (L1) Back-up Lamp circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (L1) Back-up Lamp circuit for a short to ground.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1668-REVERSE LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The TIPM detects an open condition.

Possible Causes
(L1) BACK-UP LAMP FEED CIRCUIT SHORT TO VOLTAGE
TIPM

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

Clear all TIPM DTC's

Shift the transmission into reverse.

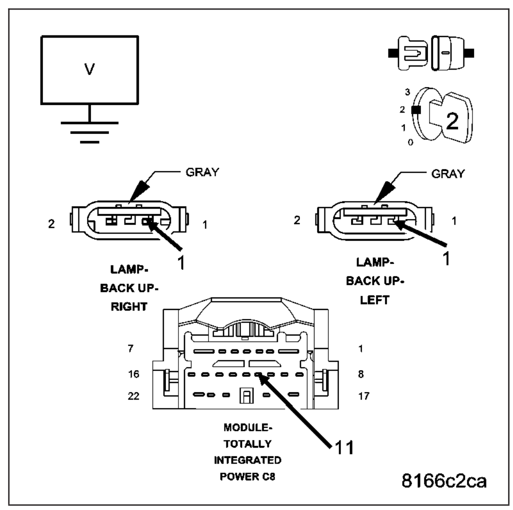
With the scan tool, read DTC's.

Does the scan tool read: B1668-REVERSE LAMP CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L1) BACK-UP LAMP FEED CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C8 harness connector.

Turn the ignition on.

Measure the voltage on the (L1) Back-up Lamp Feed circuit.

Is the voltage greater than 10.0 volts?

Yes >> Repair the (L1) Back-up Lamp Feed circuit for a short to voltage.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1669-REVERSE LAMP CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Reverse Lamps Activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L1) REVERSE LAMP CONTROL CIRCUIT OPEN
LEFT AND/OR RIGHT REVERSE LAMP BULBS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Reverse Lamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1669-REVERSE LAMP CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. REVERSE LAMP BULBS

Turn the ignition off.

Inspect the Left and Right Reverse Lamp Bulb Assemblies.

Are the inoperative bulbs OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb or bulbs in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L1) REVERSE LAMP CONTROL CIRCUIT OPEN

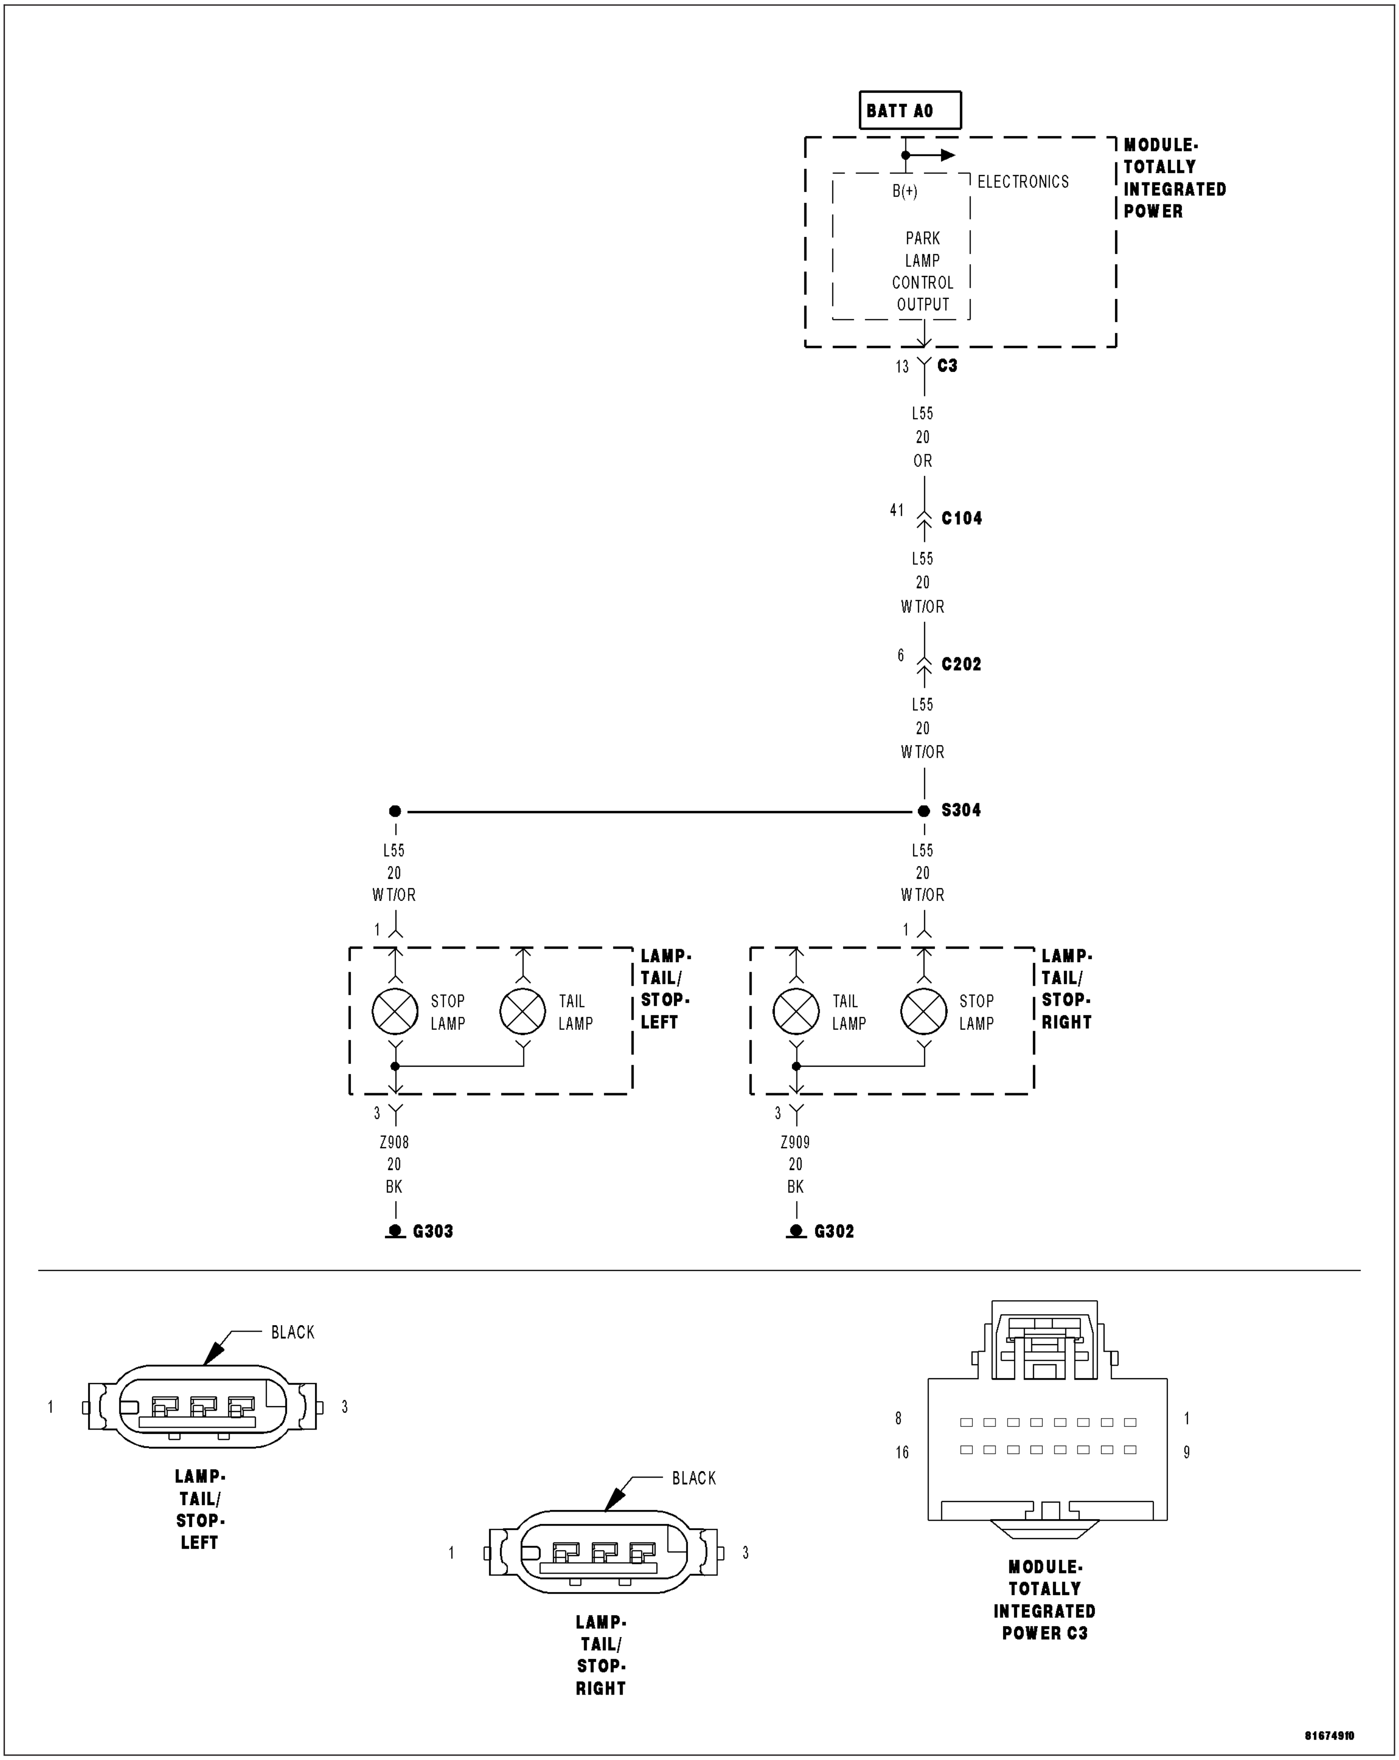
Turn the ignition off.

Disconnect the TIPM C8 harness connector.

Disconnect the Left and Right Reverse Lamp harness connectors.

Measure the resistance of the (L1) Reverse Lamp Control circuit.

Is the resistance above 5.0 ohms?



Yes >> Repair the (L1) Reverse Lamp Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1784-STOP LAMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Stop Lamps activated.
- **Set Condition:**
- When the TIPM detects a LOW condition.

Possible Causes
(L55) STOP LAMP CONTROL CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Stop Lamps on.

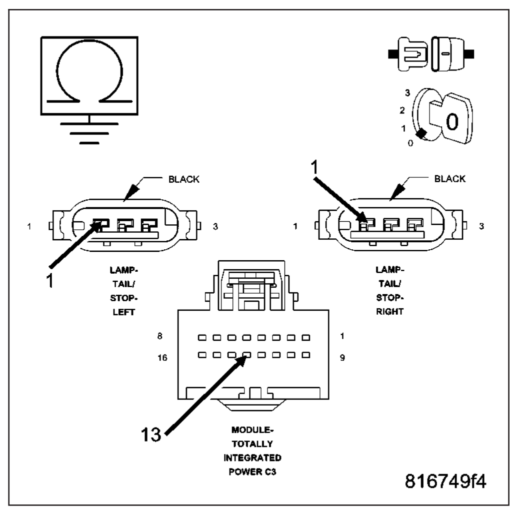
With the Scan Tool read the DTC information.

Does the Scan Tool read: B1784-STOP LAMP CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. (L55) STOP LAMP CONTROL CIRCUIT SHORTED TO GROUND

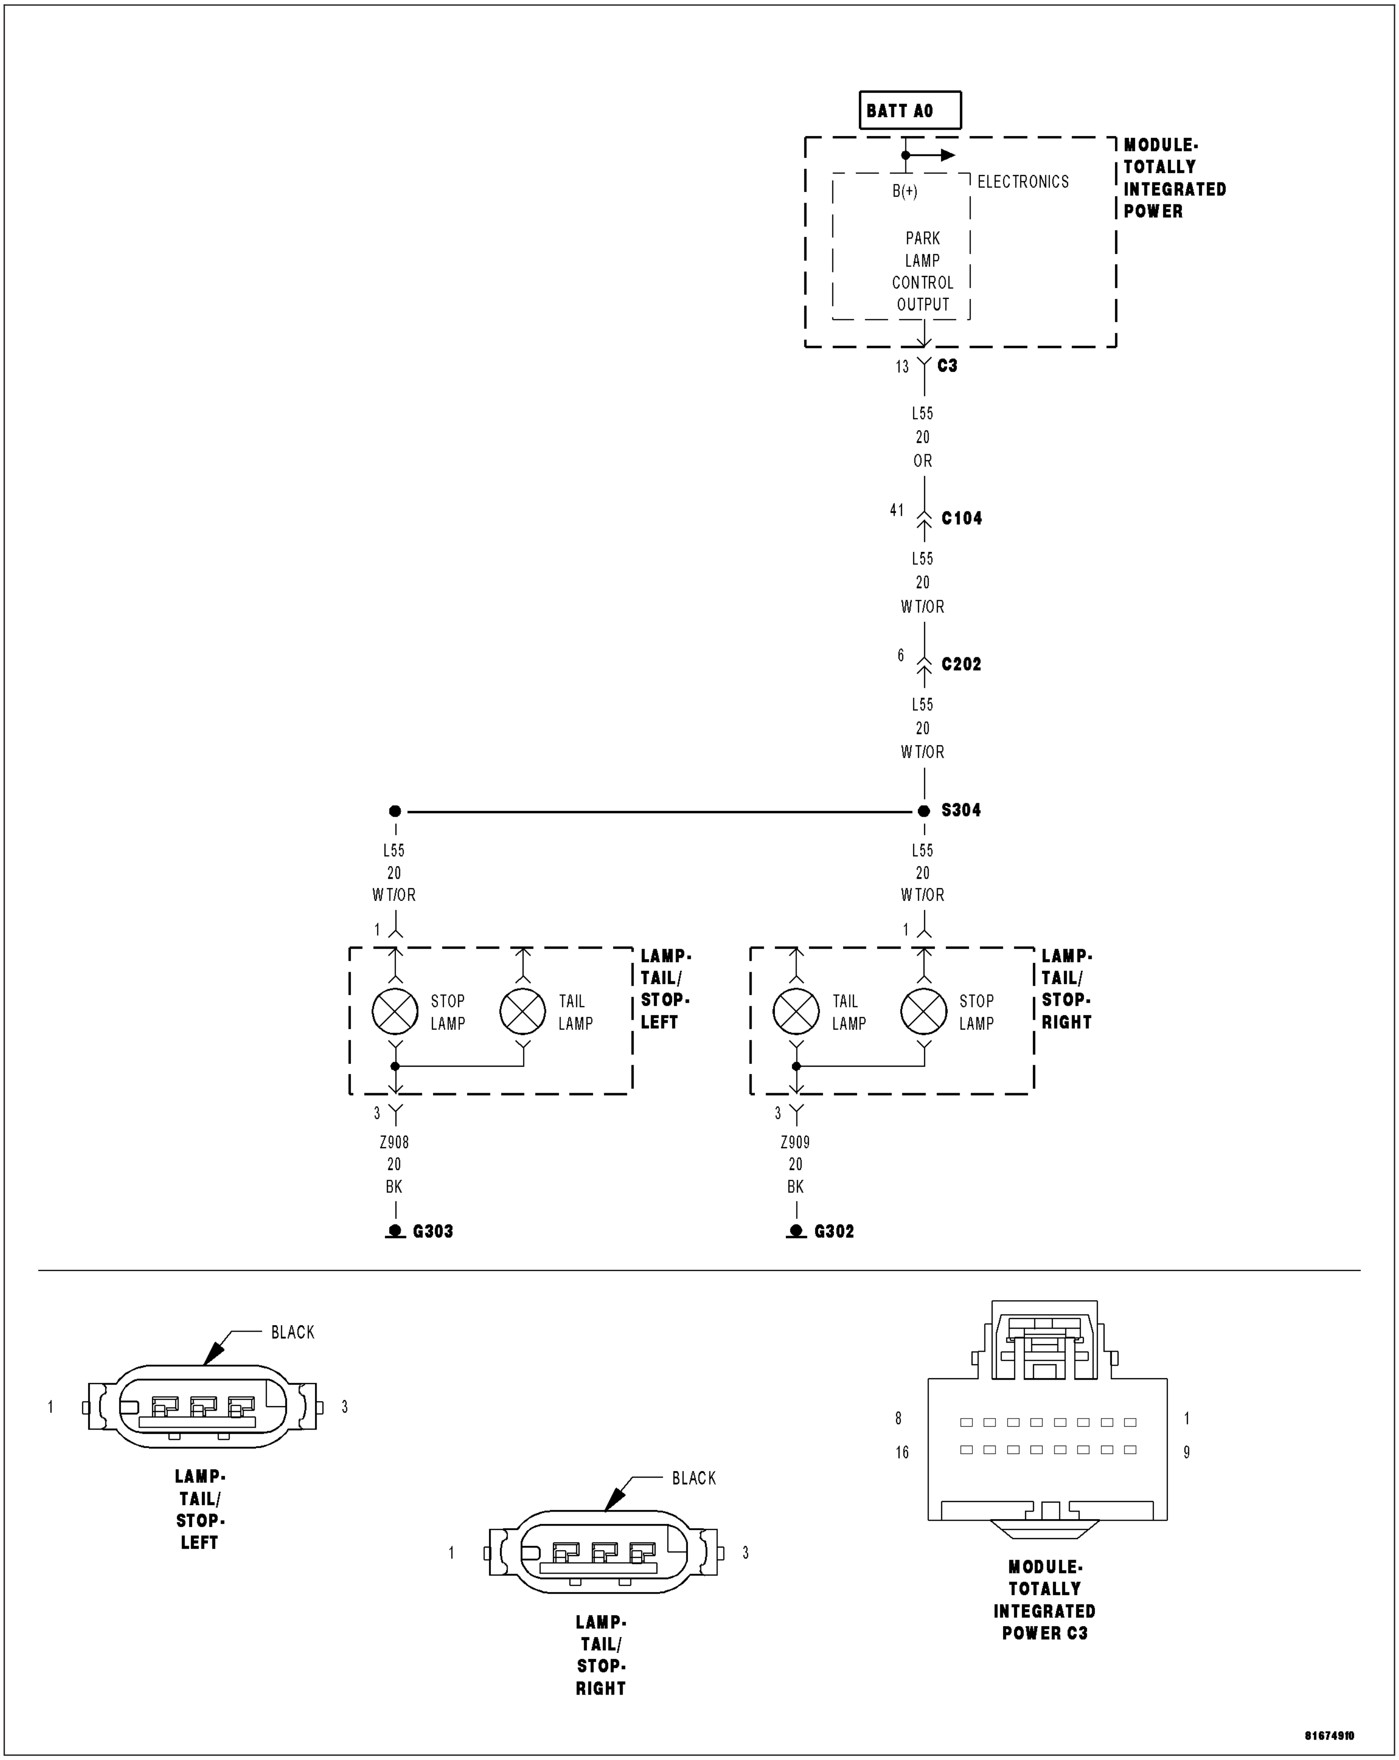
Turn the ignition off.

Disconnect the TIPM C3 connector.

Disconnect the Left and Right Rear Tail Lamp harness connectors.

Measure the resistance between ground and the (L55) Stop Lamp Control circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (L55) Stop Lamp Control circuit for a short to ground.

Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST-VER1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1785-STOP LAMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Stop Lamps Activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L55) STOP LAMP CONTROL CIRCUIT OPEN
(L55) STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
LEFT AND/OR RIGHT STOP LAMP BULBS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Stop Lamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1785-STOP LAMP CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. STOP LAMP BULBS

Turn the ignition off.

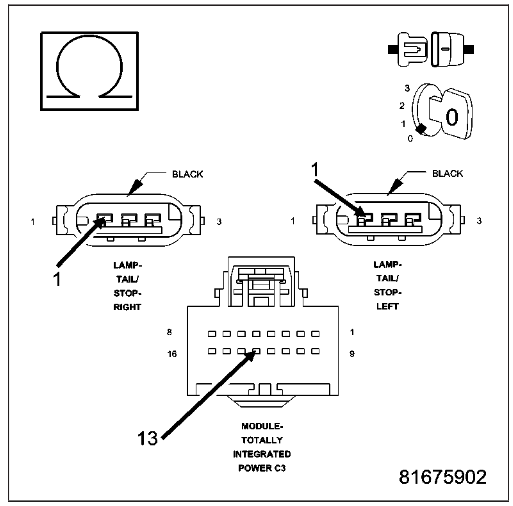
Inspect the Left and Right Stop Lamp Bulb Assemblies.

Are the inoperative bulbs OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb or bulbs in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



3. (L55) STOP LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Left and Right Stop Lamp harness connectors.

Measure the resistance of the (L55) Stop Lamp Control circuit.

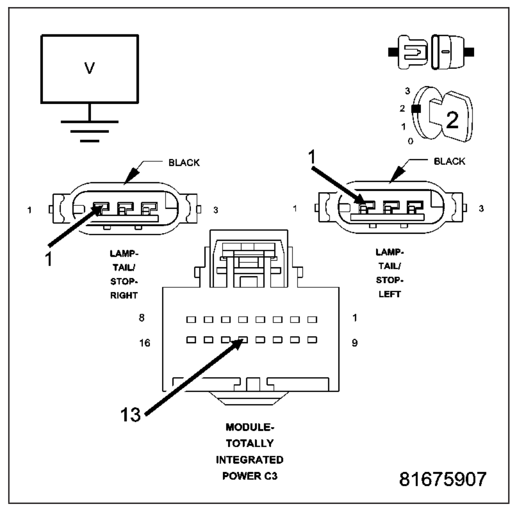
Is the resistance above 5.0 ohms?

Yes >> Repair the (L55) Stop Lamp Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (L55) STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

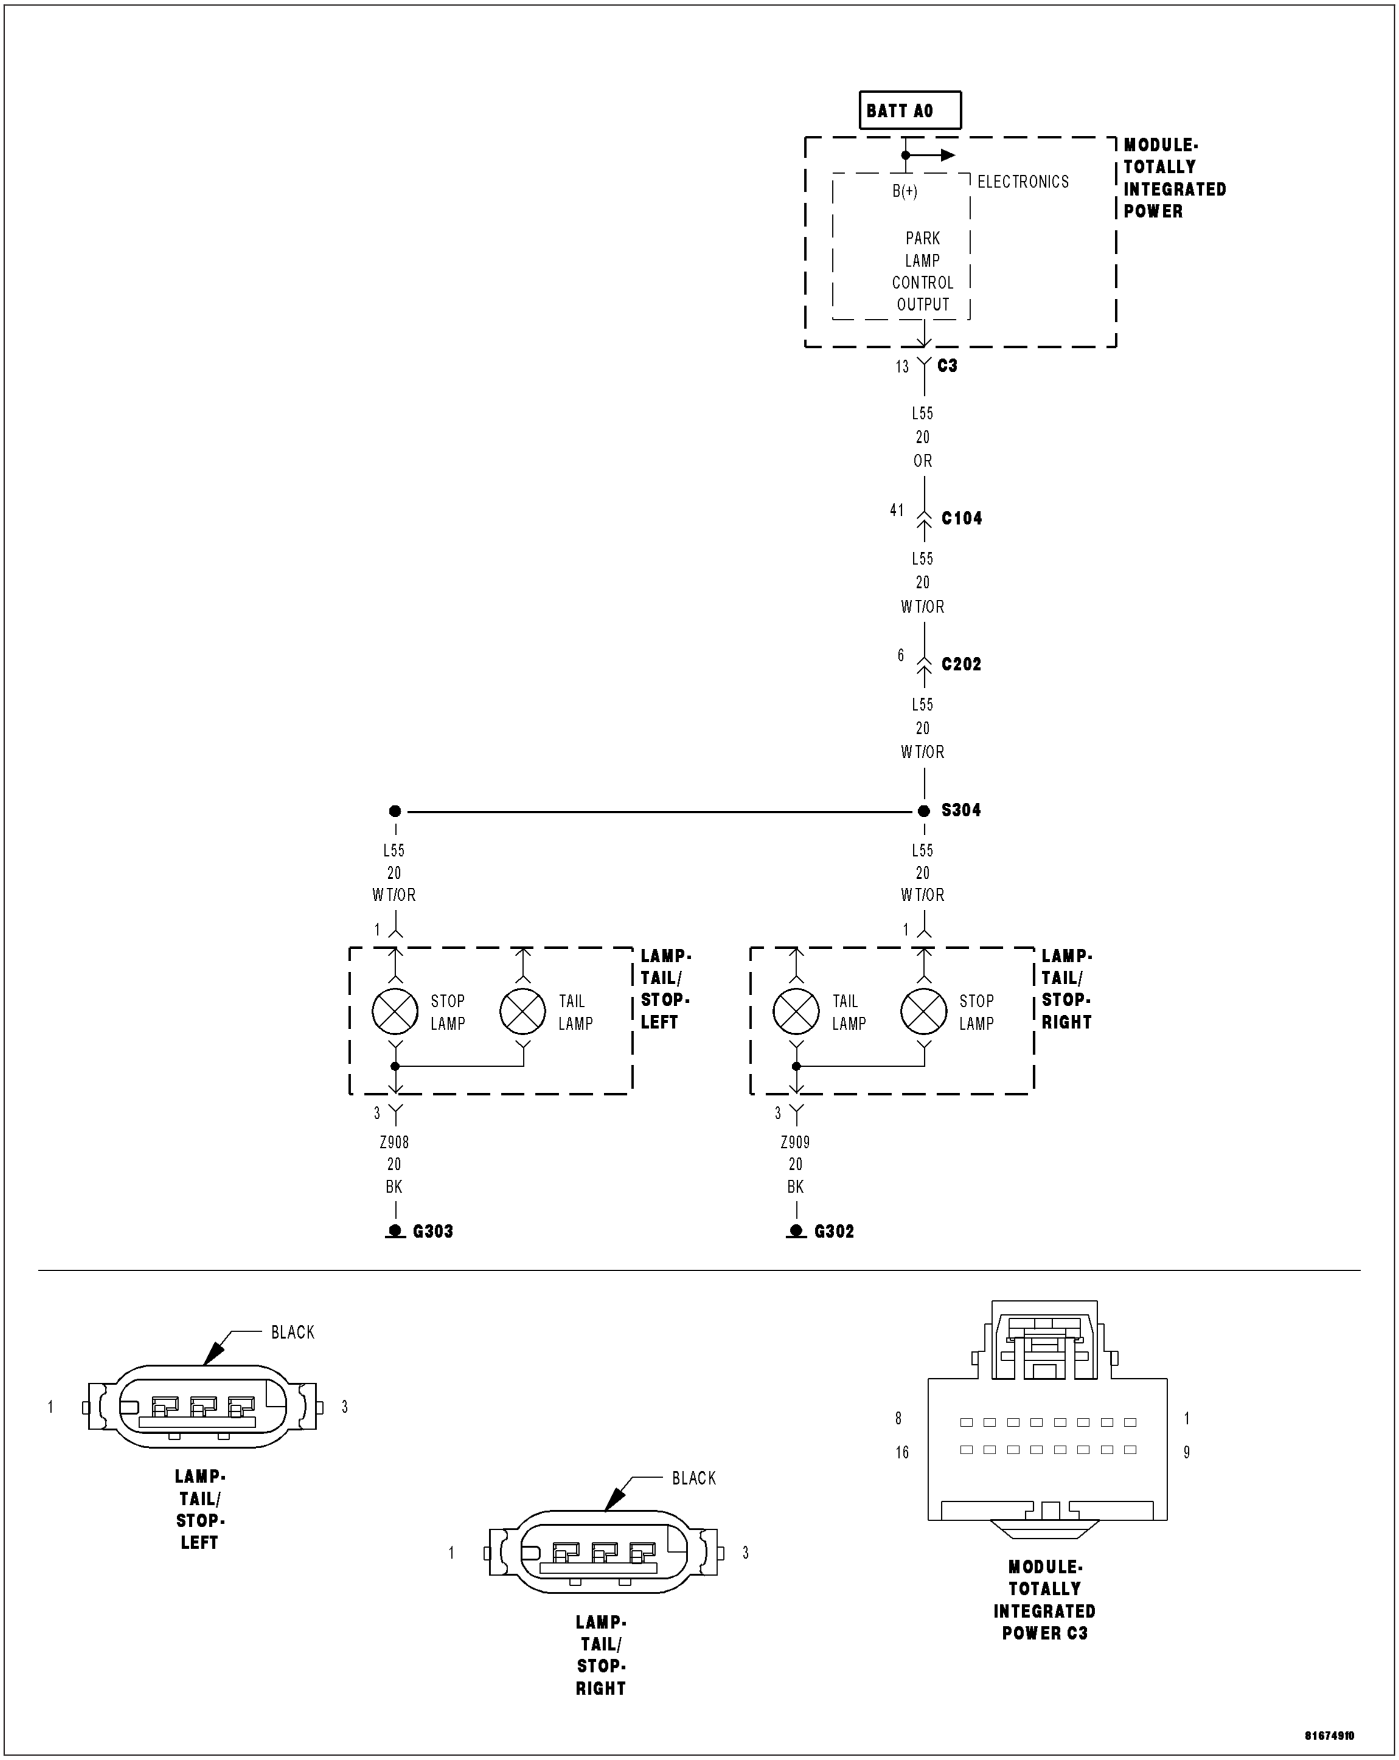
Disconnect the TIPM C3 harness connector.

Disconnect the Left and Right Stop Lamp harness connectors.

Turn the ignition on.

Measure for voltage on the (L55) Stop Lamp Control circuit.

Is the voltage above 10.0 volts?



Yes >> Repair the (L55) Stop Lamp Control circuit for a short to voltage condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1786-STOP LAMP CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Stop Lamps Activated.
- **Set Condition:**
- When the TIPM detects a HIGH condition.

Possible Causes
(L55) STOP LAMP CONTROL CIRCUIT OPEN
LEFT AND/OR RIGHT STOP LAMP BULBS
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all TIPM DTC's.

Turn the Stop Lamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1786-STOP LAMP CONTROL CIRCUIT OPEN?

Yes >> Go To 2

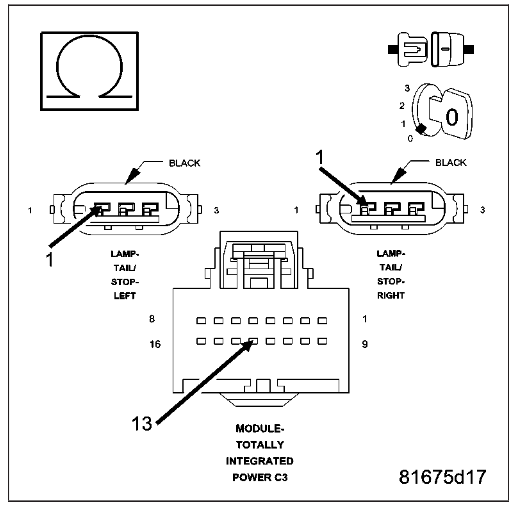
No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. STOP LAMP BULBS

Turn the ignition off.

Inspect the Left and Right Stop Lamp Bulb Assemblies.



Are the inoperative bulbs OK?

Yes >> Go To 3

No >> Replace the Inoperative bulb or bulbs in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. (L55) STOP LAMP CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C3 harness connector.

Disconnect the Left and Right Stop Lamp harness connectors.

Measure the resistance of the (L55) Stop Lamp Control circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (L55) Stop Lamp Control circuit for an open condition.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

LAMPS/LIGHTING - EXTERIOR - SERVICE INFORMATION

TABLE OF CONTENTS

LAMPS/LIGHTING - EXTERIOR - SERVICE INFORMATION

DIAGNOSIS AND TESTING

LAMPS/LIGHTING - EXTERIOR

BACKUP LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
BACKUP LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace backup lamp bulb as required.
	2. Ineffective ground circuit.	2. Test and repair backup lamp ground circuit as required.
	3. Ineffective feed circuit.	3. Test and repair open back-up lamp feed circuit as required.
	4. Ineffective switch.	4. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) as required.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. Check TIPM for DTC's.
BACKUP LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted back-up lamp feed circuit as required.
	2. Ineffective switch.	2. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) as required.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information.

BRAKE LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKE LAMP DOES NOT ILLUMINATE	1. Ineffective or missing fuse.	1. Test and replace brake lamp fuse as required.
	2. Ineffective or missing bulb.	2. Test and replace brake lamp bulb as required.
	3. Ineffective ground circuit.	3. Test and repair brake lamp ground circuit as required.
	4. Ineffective feed circuit.	4. Test and repair open brake lamp switch output circuit as required.
	5. Ineffective switch.	5. Test and replace brake lamp switch as required.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs. Refer to the appropriate diagnostic information. Check TIPM for DTC's.

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted brake lamp switch output circuit as required.
	2. Ineffective switch.	2. Test and replace brake lamp switch as required.

DAYTIME RUNNING LAMPS

NOTE: Before performing the following tests, determine whether the headlamp low and high beams operate. If the headlamp low and high beams are also inoperative, diagnose and repair that problem before attempting to repair the Daytime Running Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
DAYTIME RUNNING LAMPS WILL NOT ILLUMINATE	1. Incorrect TIPM programming.	1. Use a diagnostic scan tool to check and configure TIPM as required.
	2. Ineffective TIPM inputs or outputs.	2. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.

FRONT FOG LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace front fog lamp bulb as required.
	2. Ineffective ground circuit.	2. Test and repair front fog lamp ground circuit as required.
	3. Ineffective feed circuit.	3. Test and repair open front fog lamp feed circuit as required.
	4. Ineffective switch.	4. Test and replace headlamp switch as required. Check TIPM for DTC's.
	5. Ineffective instrument cluster inputs or outputs.	5. Use a diagnostic scan tool to test the instrument cluster inputs and outputs as required. Refer to the appropriate diagnostic information.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information. Check TIPM for DTC's.
	7. Ineffective CCN inputs or outputs.	7. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information. Check TIPM for DTC's
	7. Ineffective SCCM outputs.	Use diagnostic scan tool to diagnose LIN data bus. Refer to the appropriate diagnostic information. Check CCN for DTC's.

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted front fog lamp feed circuit as required.
	2. Ineffective switch.	2. Test and replace headlamp switch as required.
	3. Ineffective CCN inputs or outputs.	3. Use a diagnostic scan tool to test the instrument cluster inputs and outputs as required. Refer to the appropriate diagnostic information.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.
	5. Ineffective SCCM outputs.	5. Use diagnostic scan tool to diagnose LIN data bus. Refer to the appropriate diagnostic information. Check CCN for DTC's.

HAZARD WARNING LAMPS

NOTE: Before performing the following tests, confirm whether the left and right turn signals operate satisfactorily. If the turn signals are inoperative or operate improperly, diagnose and repair that problem before attempting to repair the Hazard Warning Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
HAZARD WARNING LAMPS DO NOT FLASH	1. Ineffective switch.	1. Test and replace Accessory Switch Bank Module (ASBM) as required.
	2. LIN bus down.	2. Use a diagnostic scan tool to test the ASBM inputs and outputs as required. Refer to the appropriate diagnostic information.
	3. Ineffective CCN inputs or outputs.	3. Use a diagnostic scan tool to test the CCN inputs and outputs as required. Refer to the appropriate diagnostic information.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.
HAZARD WARNING LAMPS DO NOT STOP FLASHING	1. Ineffective switch.	1. Test and replace ASBM as required.
	2. Ineffective CCN inputs or outputs.	2. Use a diagnostic scan tool to test the CCN inputs and outputs as required. Refer to the appropriate diagnostic information.
	3. Ineffective TIPM inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.

HEADLAMPS

NOTE: As part of the exterior lighting failsafe feature, upon ignition On all exterior park lamps and the headlamp low beams will illuminate regardless of the headlamp switch position if the CCN cannot detect an input from the headlamp switch, or if there is a loss of data bus communication.

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace headlamp bulb as required.
	2. Ineffective ground circuit.	2. Test and repair open headlamp ground circuit as required.
	3. Ineffective feed circuit.	3. Test and repair open headlamp low beam or high beam feed circuit as required.
	4. Ineffective switch.	4. Test and replace left multi-function switch as required.
	5. Ineffective TIPM inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information. Check for TIPM DTC's.
HEADLAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted headlamp low beam or high beam feed circuit as required.
	2 Ineffective switch.	2. Test and replace left multi-function switch as required.
	3. Ineffective CCN inputs or outputs.	3. Use a diagnostic scan tool to test the CCN inputs and outputs as required. Refer to the appropriate diagnostic information.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.
HEADLAMPS ILLUMINATE WITH IGNITION ON AND HEADLAMP SWITCH OFF (FAIL-SAFE OPERATION)	1. Ineffective circuits between headlamp switch and instrument cluster.	1. Test and repair left multi-function switch mux and return circuits as required.
	2. Loss of data bus communication.	2. Use a diagnostic scan tool to test the data bus. Refer to the appropriate diagnostic information.
	3. Ineffective switch.	3. Test and replace the left multi-function switch as required.
	4. Ineffective CCN inputs or outputs.	4. Use a diagnostic scan tool to test the CCN inputs and outputs as required. Refer to the appropriate diagnostic information.
HEADLAMPS WILL NOT SWITCH FROM HIGH TO LOW BEAMS, OR FROM LOW TO HIGH BEAMS	1. Ineffective circuits between left multi-function switch and CCN.	1. Test and repair wash/beam select mux and multi-function switch return circuits as required.
	2. Ineffective switch.	2. Test and replace the left multi-function switch as required.
	3. Ineffective CCN inputs or outputs.	3. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.

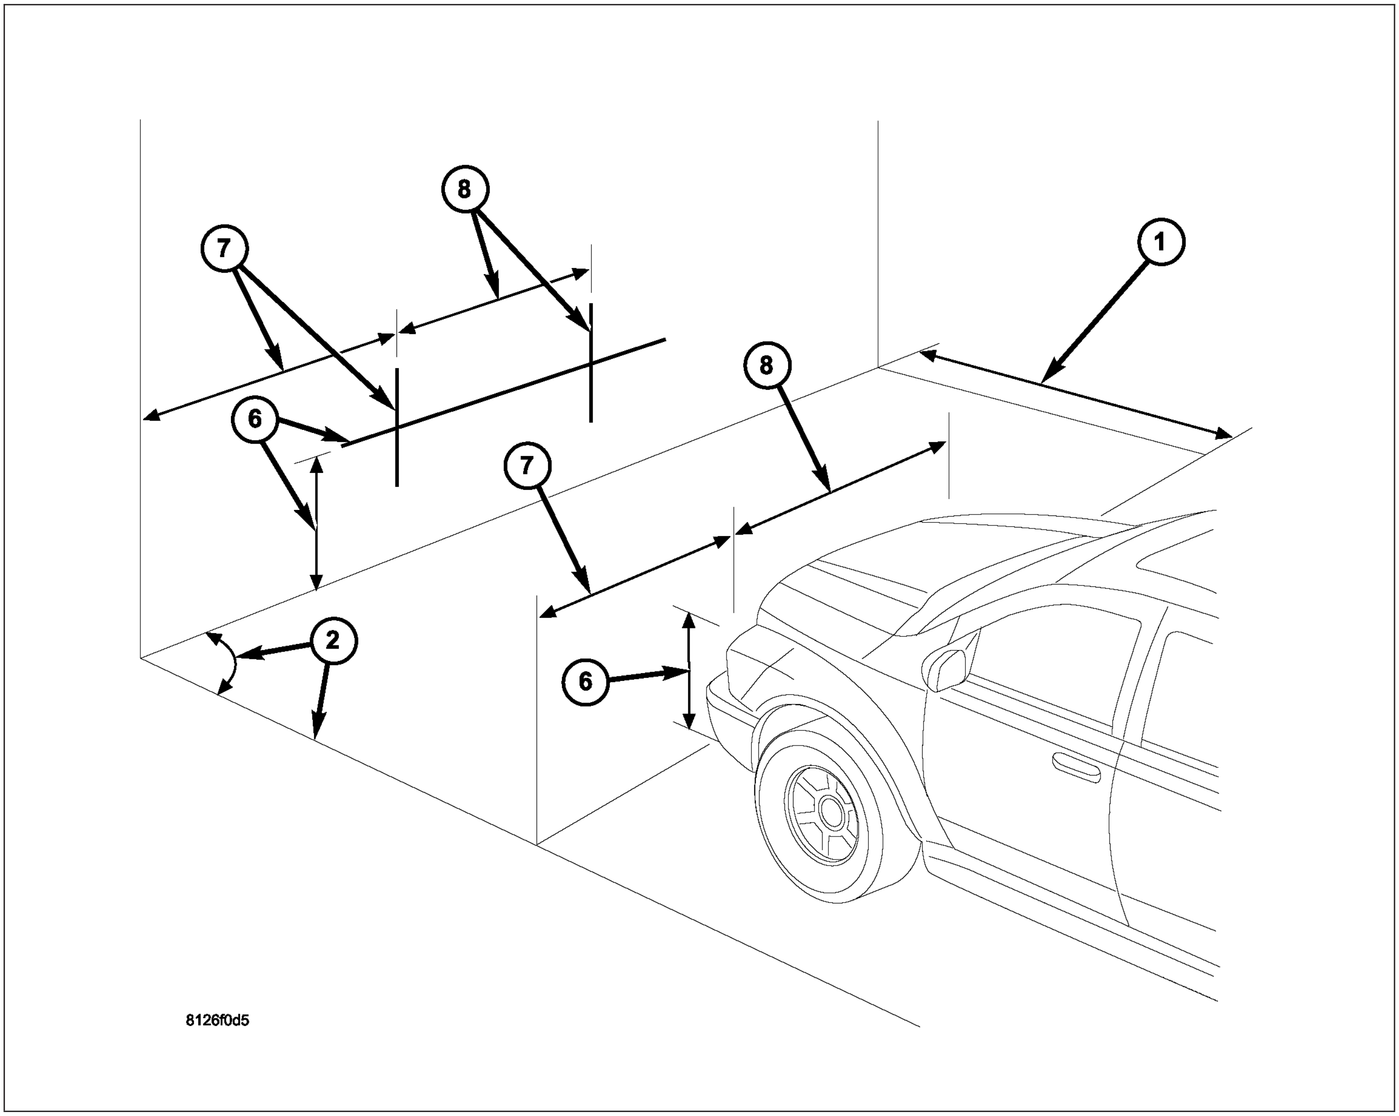
PARK LAMPS

NOTE: As part of the exterior lighting failsafe feature, upon ignition On all exterior park lamps and the headlamp low beams will illuminate regardless of the headlamp switch position if the instrument cluster cannot detect an input from the headlamp switch, or if there is a loss of data bus communication.

CONDITION	POSSIBLE CAUSES	CORRECTION
PARK LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace park lamp bulb as required.
	2. Ineffective ground circuit.	2. Test and repair open park lamp ground circuit as required.
	3. Ineffective feed circuit.	3. Test and repair open park lamp feed circuit as required.
	4. Ineffective switch.	4. Test and replace left multi-function switch as required.
	5. Ineffective CCN inputs or outputs.	5. Use a diagnostic scan tool to test the CCN inputs and outputs as required. Refer to the appropriate diagnostic information.
	6. Ineffective TIPM inputs or outputs.	6. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.
	7. Ineffective SCCM inputs or outputs.	7. Use diagnostic scan tool to diagnose LIN data bus. Refer to the appropriate diagnostic information. Check CCN for DTC’s.
PARK LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted park lamp feed circuit as required.
	2. Ineffective switch.	2. Test and replace left multi-function switch as required.
	3. Ineffective CCN inputs or outputs.	3. Use a diagnostic scan tool to test the CCN inputs and outputs as required. Refer to the appropriate diagnostic information.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.
	5. Ineffective SCCM inputs or outputs.	5. Use diagnostic scan tool to diagnose LIN data bus. Refer to the appropriate diagnostic information. Check CCN for DTC’s.

TURN SIGNAL LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE TURN SIGNAL LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace turn signal bulb as required.
	2. Ineffective ground circuit.	2. Test and repair open ground circuit as required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit as required.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.
	5. Ineffective CCN inputs or outputs.	5. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.
	6. Ineffective SCCM inputs or outputs.	6. Use diagnostic scan tool to diagnose LIN data bus. Refer to the appropriate diagnostic information. Check CCN for DTC's.
ALL RIGHT SIDE AND/OR ALL LEFT SIDE TURN SIGNAL LAMPS DO NOT FLASH	1. Ineffective switch.	1. Test and replace left multi-function switch or SCCM as required.
	2. Ineffective feed circuit.	2. Test and repair open right or left turn signal feed circuit as required.
	3. Ineffective CCN inputs or outputs.	3. Use a diagnostic scan tool to test the CCN inputs and outputs as required. Refer to the appropriate diagnostic information.
	4. Ineffective TIPM inputs or outputs.	4. Use a diagnostic scan tool to test the TIPM inputs and outputs as required. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNALS FLASH TOO RAPIDLY (MORE THAN 100 FLASHES PER MINUTE)	1. Ineffective or missing bulb.	1. Test and replace faulty bulb as required.
	2. Ineffective ground circuit.	2. Test and repair open ground circuit as required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit as required.



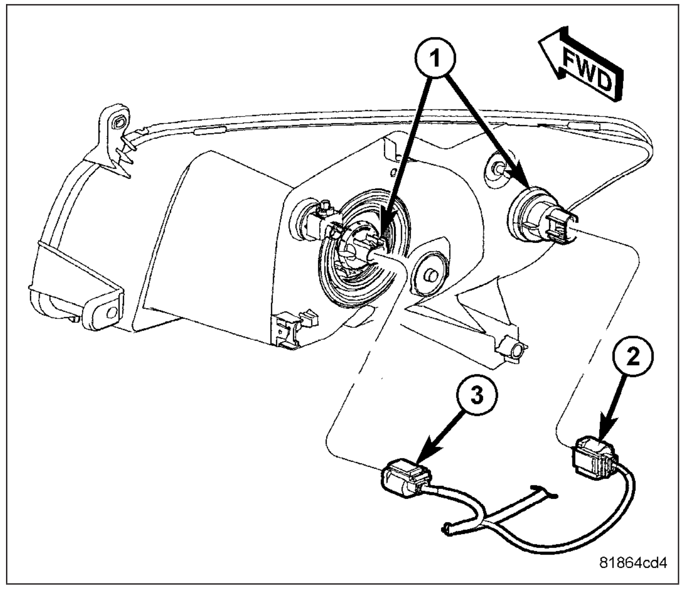
STANDARD PROCEDURE

FRONT LAMP AIMING

VEHICLE PREPARATION FOR LAMP ALIGNMENT

1. Check for and correct any burnt out bulbs.
2. Repair or replace any ineffective, worn or damaged body or suspension components that could hinder proper lamp alignment.
3. Verify proper tire inflation pressures.
4. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
5. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.
6. The fuel tank should be FULL. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.
7. Verify correct vehicle suspension height.

ALIGNMENT SCREEN PREPARATION

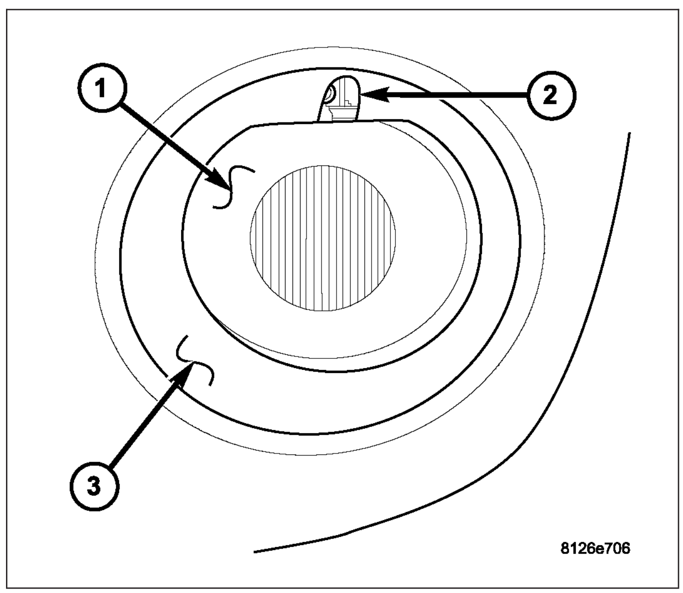


1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.
2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.
3. Position the vehicle so that the side of the vehicle is parallel to the vertical zero reference, and so that the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.
4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.
6. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the first lamp.

8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the second lamp.

HEADLAMP ALIGNMENT

NOTE: Due to the linear nature of the headlamp cutoff, a properly aimed low beam headlamp will project the top edge of the high intensity pattern on the alignment screen from the horizontal line to 50 millimeters (2 inches) below the horizontal line. No horizontal (right/left) adjustment is required for this headlamp beam pattern. The high beam pattern will be correct when the low beams are properly aimed.



1. Turn the headlamps ON and select the LOW beams.
2. Rotate the headlamp vertical adjustment screw which is located just inboard of the headlamp bulb (1) to adjust each lamp beam height as required.

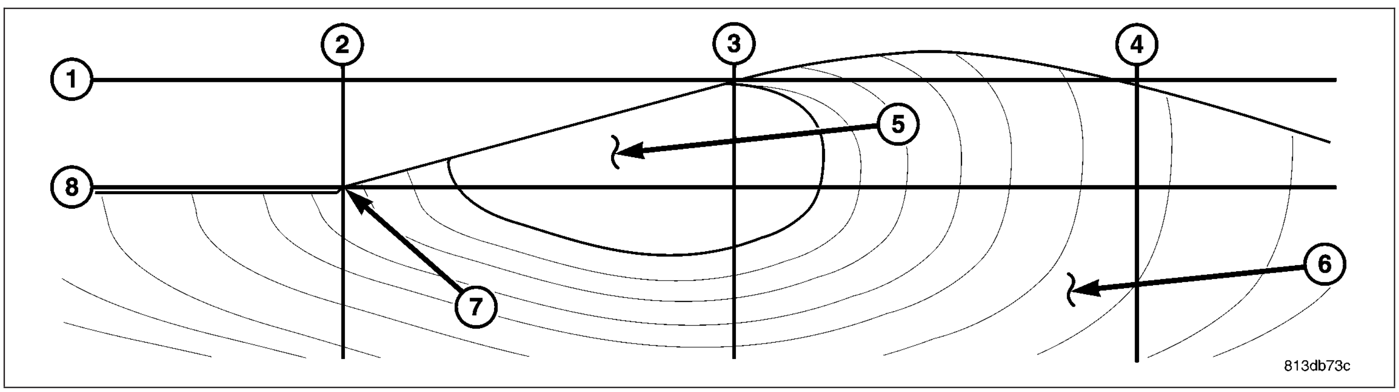
FOG LAMP ALIGNMENT

NOTE: A properly aimed front fog lamp will project a pattern on the alignment screen 100 millimeters (4 inches) below the fog lamp centerline and straight ahead of the lamp.

1. Turn the fog lamps ON.
2. Rotate the fog lamp vertical adjustment screw (2) on each lamp to adjust the beam height as required.

FRONT LAMP AIMING - EXPORT

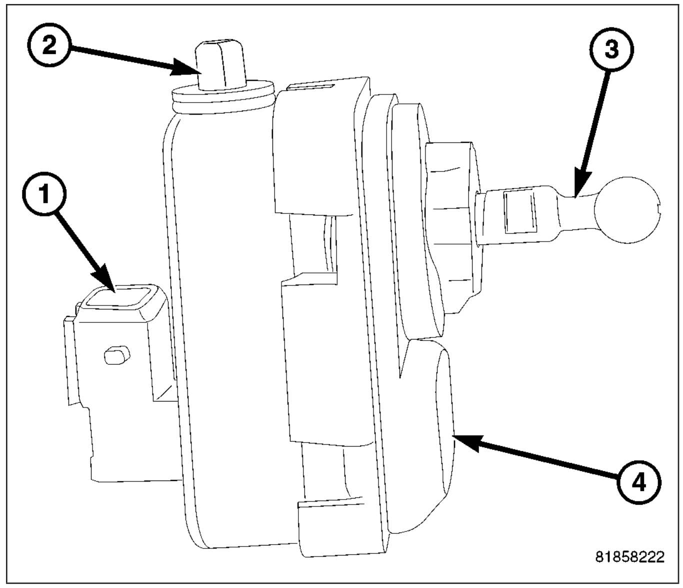
VEHICLE PREPARATION FOR FRONT LAMP UNIT ALIGNMENT



1. Verify headlamp dimmer switch and high beam indicator operation.
2. Verify that the headlamp leveling switch is in the “0” position.
3. Inspect and correct damaged or defective components that could interfere with proper headlamp alignment.
4. Verify proper tire inflation.

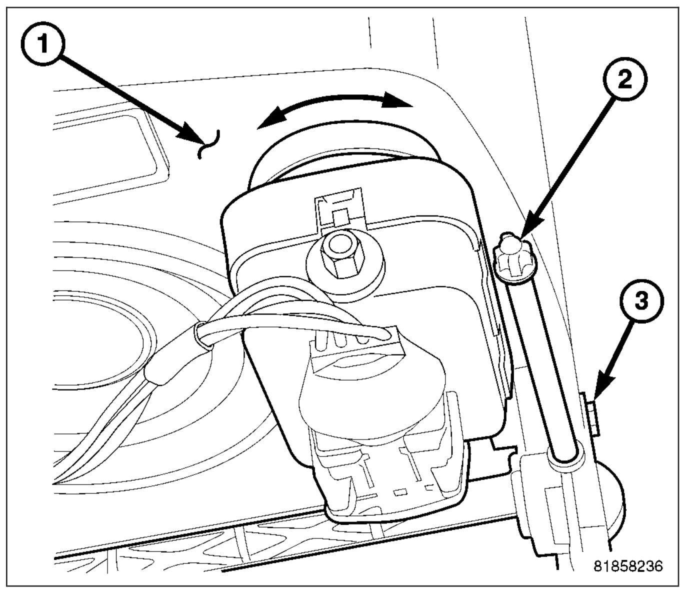
5. Clean headlamp lenses.
6. Verify that luggage area is loaded as the vehicle is routinely used.
7. Fuel tank should be FULL. Add 2.94 kg (6.5 lbs.) of weight over the fuel tank for each estimated gallon of missing fuel.

ALIGNMENT SCREEN PREPARATION



1. Position vehicle on a level surface perpendicular to a flat wall 10 meters (32.8 ft.) away from front of headlamp lens.
2. Place 75 kg in the driver's seat to simulate the ride height of the vehicle when driven.
3. If necessary, tape a line on the floor 10 meters (32.8 ft.) away from and parallel to the wall.
4. From the floor up 1.27 meters (5 ft.), tape a vertical line on the wall at the centerline of the vehicle. Sight along the centerline of the vehicle (from rear of vehicle forward) to verify accuracy of the line placement.
5. Rock vehicle side-to-side three times and allow suspension to stabilize.
6. Jounce front suspension three times by pushing downward on front bumper and releasing.
7. Measure the distance from the center of headlamp low beam dot on the lens to the floor. Transfer measurement to the alignment screen (with tape). Use this line for up/down adjustment reference.
8. Place a tape line 100 mm (4 inches) below and parallel to the center of headlamp line.
9. Measure distance from the centerline of the vehicle to the center of each headlamp being aligned. Transfer measurements to screen (with tape) to each side of vehicle centerline. Use these lines for left/right adjustment reference.

FRONT LAMP UNIT ALIGNMENT



With the horizontal centerline of the headlamp (1) transferred on the wall, measure down 76 mm (3 in). This line (6) will be the vertical aiming mark. Using the intersecting point (5) of the horizontal centerline (6) and the vertical centerline (2) for the left headlamp, adjust the headlamp unit horizontally and vertically so (5) is the intersecting point at lines (6 and 2). For the right headlamp unit, cover up the left headlamp and follow the same procedure but intersecting at (6 and 4).

1. Turn the headlamps On and select the Low beams.
2. The vertical alignment screw (2) is located on the top of the headlamp leveling motor (4).

3. The horizontal alignment screw (2) is located next to and inboard of the headlamp leveling motor.

A properly aimed low beam headlamp will project a high intensity light pattern on the screen with the horizontal cut-off line aligned with the tape line 100 mm (3.94 in.) below the headlamp centerline. The intersection of the horizontal and 15 degree cut-off lines in the projected pattern should align to the intersection of the headlamp centerline vertical tape line and the tape line 100 mm (3.94 in.) below the headlamp horizontal centerline. The high beams on a vehicle with aero headlamps cannot be aligned. The high beam pattern should be correct when the low beams are aligned properly.

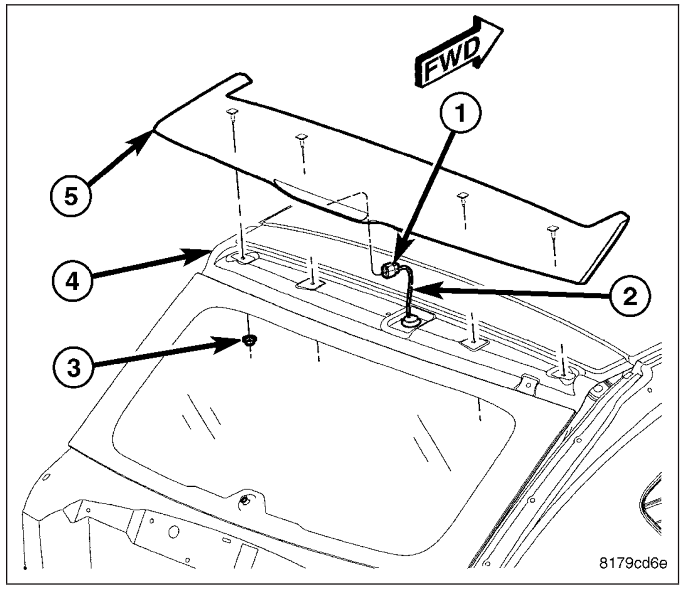
SPECIFICATIONS

EXTERIOR LAMPS

CAUTION: Do not use bulbs that have a higher candle power than the bulb listed in the chart below. Damage to lamp can result. Do not touch halogen bulbs with fingers or other oily surfaces. Bulb life will be reduced.

BULB APPLICATION TABLE

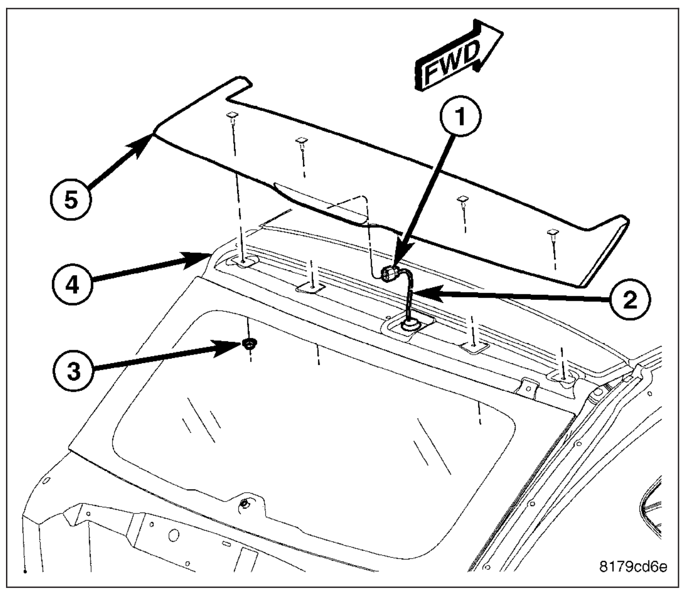
LAMP	BULB
Back-Up Lamp	921 W16W
Front Fog Lamp	9145
Front Park/Turn Signal/Side Marker Lamp	3157AK
Headlamp Low Beam/High Beam	H13
License Lamp	W5W
Rear Tail/Stop Lamp	3157
Rear Turn Signal	3757AK



BULB APPLICATION TABLE - EXPORT

LAMP	BULB
Front Position Lamp	W5W
Headlamp Low Beam/High Beam	H4
Rear Fog Lamp	3157

CENTER HIGH MOUNTED STOP LAMP



REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the rear spoiler (Refer to 23 - BODY/LIFT-GATE - SPOILER - REMOVAL)
3. With spoiler on bench, remove the two screws to the CHMSL.
4. Remove CHMSL from spoiler.

INSTALLATION

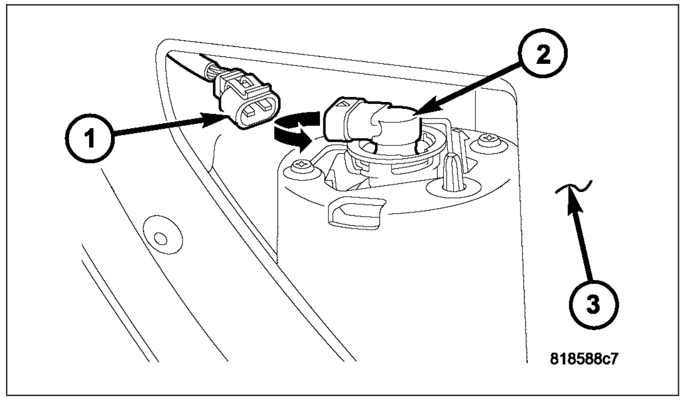
1. Place CHMSL onto rear spoiler.
2. Install the two mounting screws to the CHMSL.
3. Install the rear spoiler (Refer to 23 - BODY/LIFT-GATE - SPOILER - INSTALLATION).
4. Connect the battery negative cable.

DAYTIME RUNNING LAMPS

DESCRIPTION

Vehicles built for use in Canada, and also available as an option on vehicles for sale in the U.S., are equipped with a Daytime Running Lamp (DRL) system. All the exterior lighting messages come from Steering Control Module (SCM) or left multi-function switch on Local Interconnect Network (LIN) data bus and goes to the Cab Compartment Node (CCN), then the CCN sends out a Controller Area Network (CAN) data bus message to the Totally Integrated Power Module (TIPM) for each lighting function according to the request from left multi-function switch. Then the TIPM will turn ON/OFF the requested output. The DRL function is controlled by TIPM. Daytime running lamps are High beam lamps at lower intensity.

OPERATION



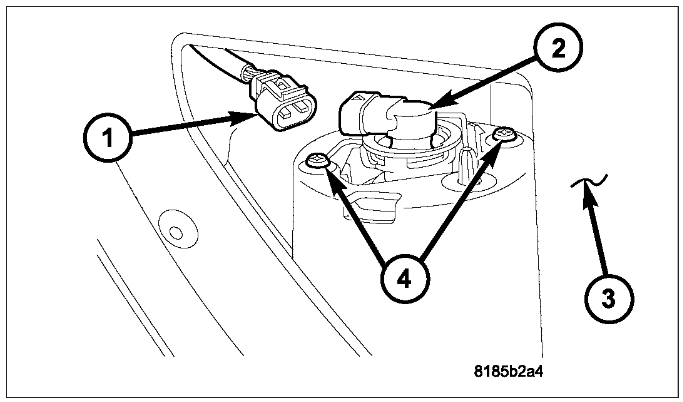
The Canadian cluster provides steady illumination of the front turn signal when the ignition switch is in the ON position. The Daytime Running Lamp (DRL) function may be inhibited by activating the turn signals, the hazard flashers, the headlamp switch, or park brake.

FOG LAMP

REMOVAL

BULB

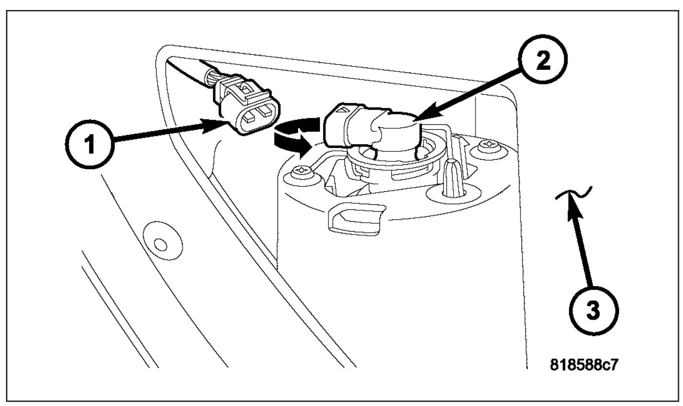
1. Disconnect and isolate the battery negative cable.
2. Reach up through the lower fascia (3) cutout.
3. Disconnect the fog lamp connector (1).
4. Twist the bulb (2) counterclockwise to remove from lamp unit.



UNIT

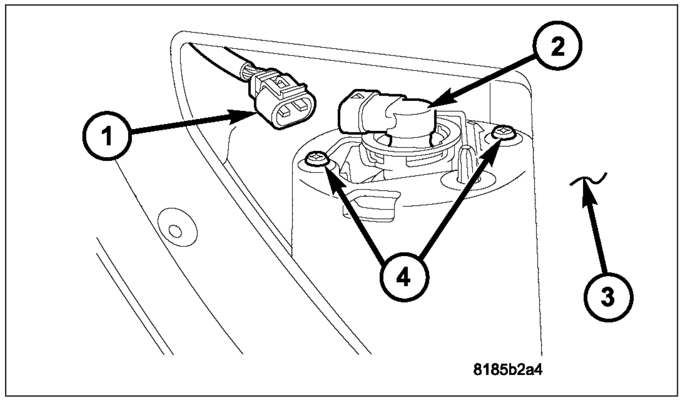
1. Disconnect and isolate the battery negative cable.
2. Reach up through the lower fascia (3) cutout.
3. Disconnect electrical connector from fog lamp (1).

NOTE: It may be necessary to twist out the fog lamp bulb (2) to release fog lamp unit from fascia.



4. Remove screws attaching fog lamp to fascia (4).
5. Push fog lamp forward to remove from fascia.

INSTALLATION



BULB

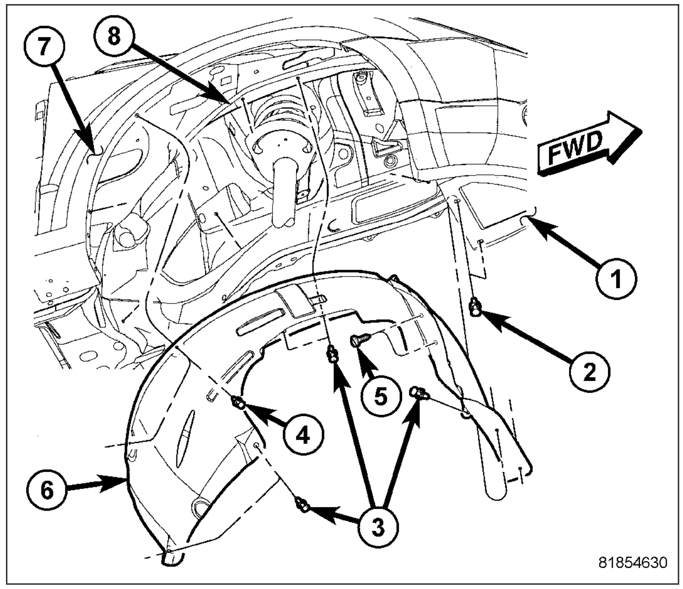
1. Reach up through the lower fascia (3) cutout.
2. Place bulb (2) into lamp unit and twist clockwise until stops, approximately 90 degrees.
3. Connect the fog lamp bulb electrical connector (1).
4. Connect the battery negative cable.

UNIT

CAUTION: Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result.

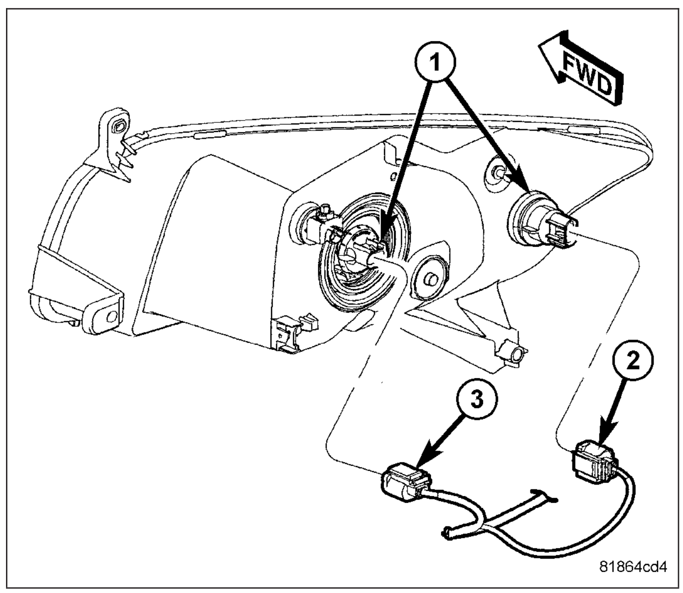
1. Place fog lamp into fascia opening and push rearward to position into fascia.
2. Reach up through the lower fascia (3) cutout.
3. Install two screws attaching fog lamp to fascia (4).

NOTE: It may be necessary to install the fog lamp bulb (2) if it was removed to access the fog lamp unit.



4. Connect electrical connector to fog lamp (1).
5. Connect the battery negative cable.

FRONT LAMP UNIT

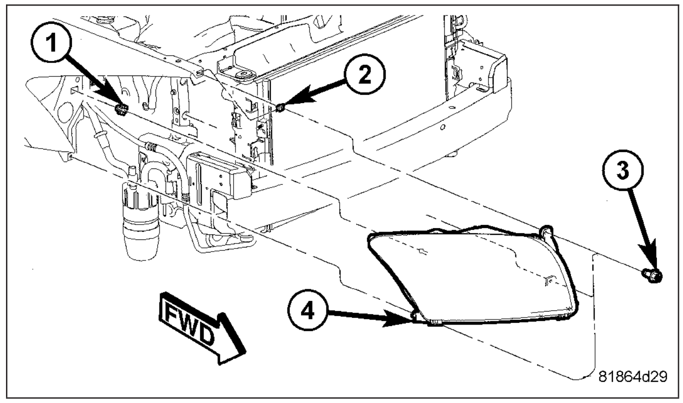


REMOVAL

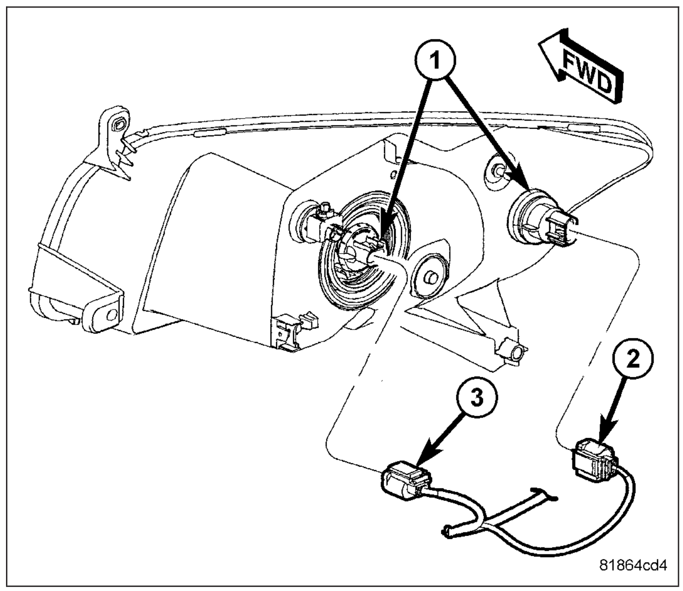
BULBS

1. Disconnect and isolate the battery negative cable.
2. Hoist vehicle.
3. Working in the appropriate wheel well, loosen up the front of the splash shield, but don't fully remove it.

4. Looking up through the front wheel well, locate the bulb (1) in which needs replacing. The headlamp bulb is the inboard bulb and the park/turn signal bulb is the outboard bulb.
5. Disconnect the bulb electrical connector (2 or 3).



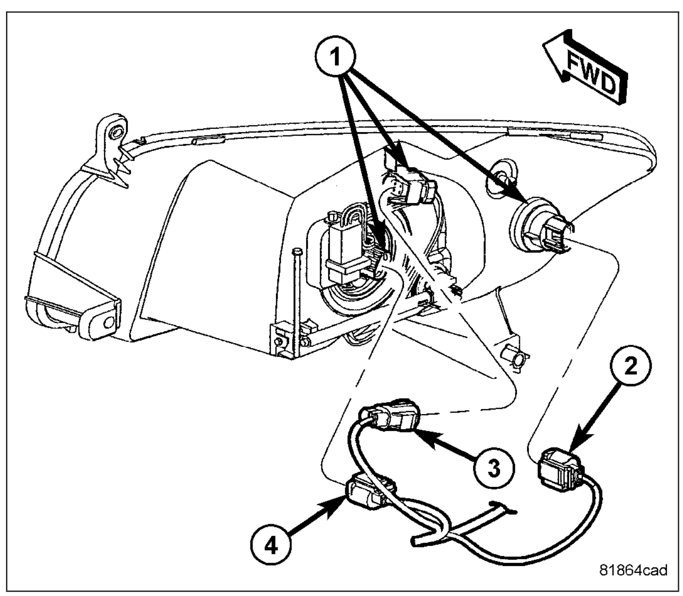
NOTE: EXPORT ONLY - If removing/replacing the headlamp bulb on export vehicles there is a rubber cover over the rear of the lamp housing that must be removed to access the bulb. Then a spring clip must be removed and the bulb pulled straight rearward.



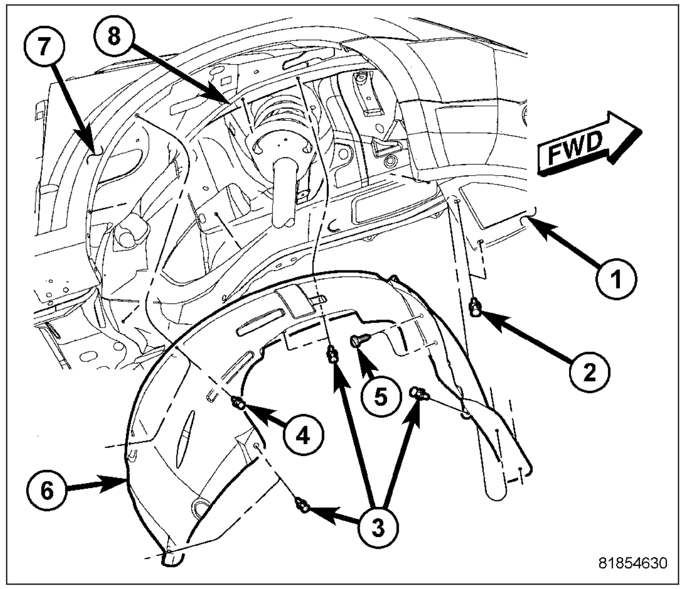
6. Grasp the bulb (1), twist 1/4 turn counterclockwise and pull straight out of front lamp unit.

UNIT

DOMESTIC

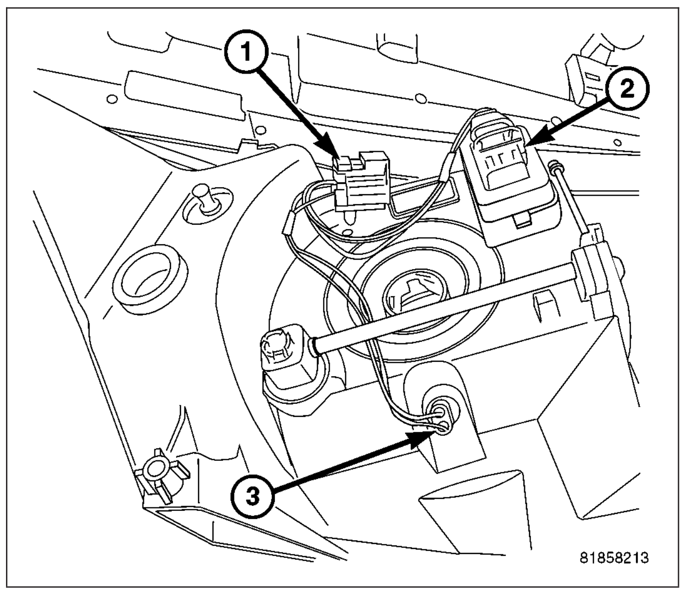


1. Open hood.
2. Disconnect and isolate the battery negative cable.
3. Loosen the fascia on the side you're taking the front lamp unit out on (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL). The fasteners along the radiator closure panel, the splash shield to fascia screws, and the bolt holding the fascia to the fender at the wheel well opening.
4. Remove the three screws (3) to the front lamp unit (4) to body.
5. Pull the front lamp unit (4) straight back to unsnap the ball and socket pivots from the retainer (1).
6. Maneuver the front lamp unit out of its mounting pocket, enough to expose the individual lamp (1) electrical connectors (2 and 3).
7. Disconnect the two electrical connectors (2 and 3).



EXPORT

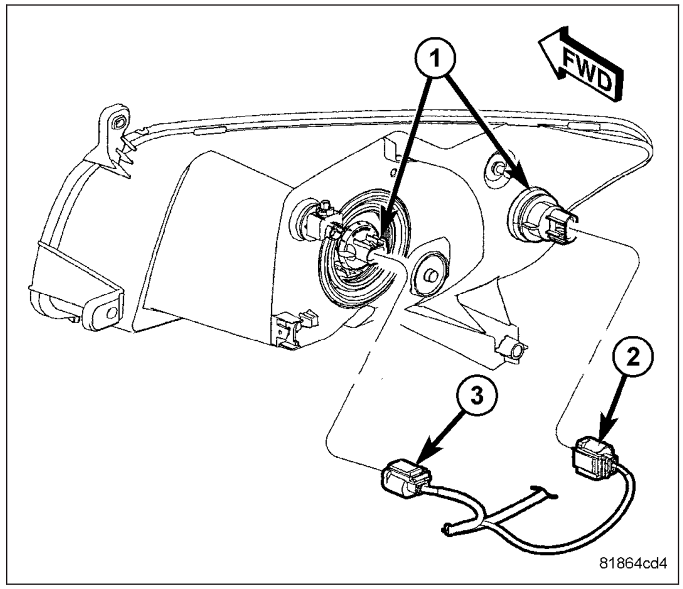
1. Use the Domestic Removal procedure to remove the BUX front lamp unit. Refer to Step 1.
2. For BUX markets, there are three electrical connectors (2, 3, and 4) to disconnect.



FRONT POSITION LAMP - EXPORT

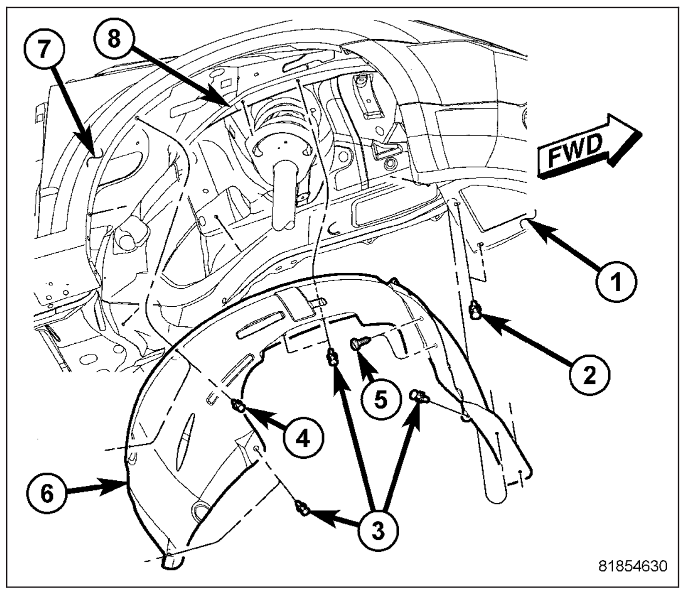
1. Disconnect and isolate the battery negative cable.
2. Hoist vehicle.
3. Working in the appropriate wheel well, loosen up the front of the splash shield, but don't fully remove it (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL).

4. Looking up through the front wheel well, locate the front position lamp (3).
5. Grasp the front position lamp (3) twist 1/4 turn counterclockwise, and pull straight out of front lamp unit.
6. Pull bulb straight from its socket.



INSTALLATION

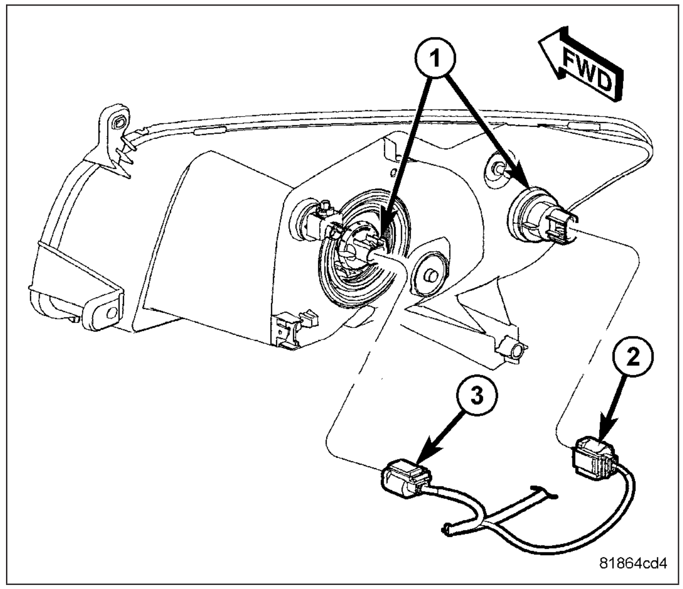
BULBS



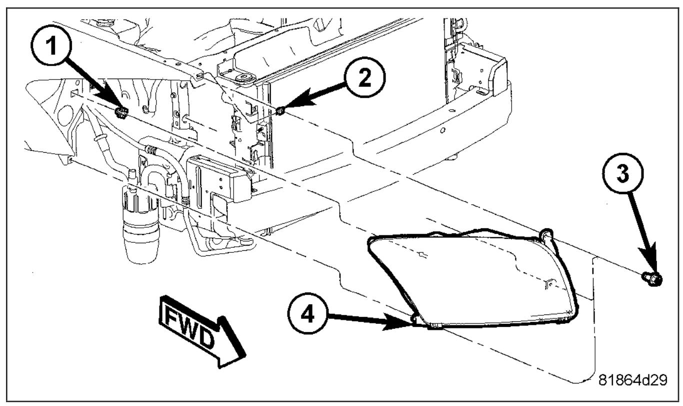
1. Reaching up through wheel well, install the headlamp or park/turn signal bulb (1) in the front lamp unit, locking it into place by twisting a 1/4 turn clockwise.

NOTE: EXPORT ONLY - If installing/replacing the headlamp bulb on export vehicles push the bulb straight in unit and then install the spring clip. Install the rubber cover over the rear of the lamp housing, over the headlamp bulb.

2. Connect the bulb electrical connector (2 or 3).



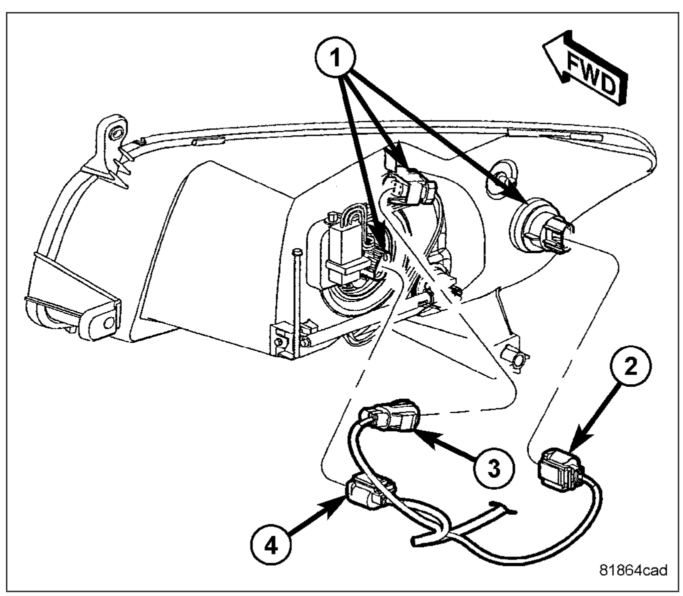
3. Install the front of the splash shield (6) removed to gain access to the front lamp unit bulbs (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - INSTALLATION).
4. Lower vehicle from hoist.
5. Connect the battery negative cable.



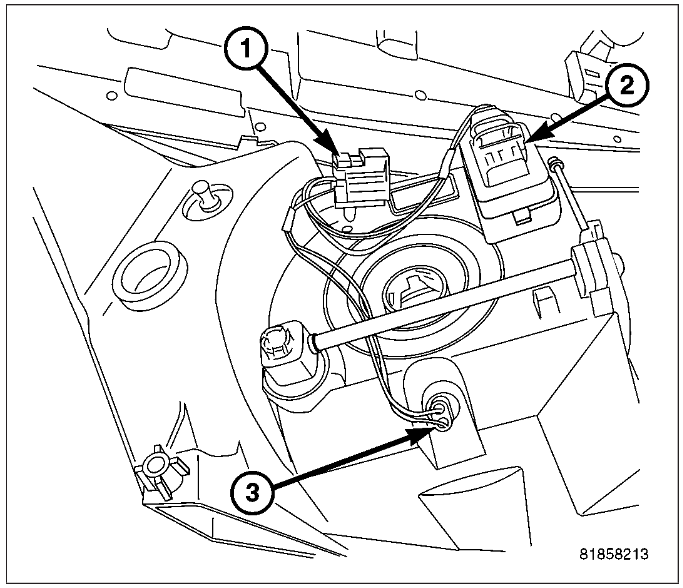
UNIT

DOMESTIC

1. Position the front lamp unit in its mounting location.
2. Connect the two front lamp unit electrical connectors (2 and 3).

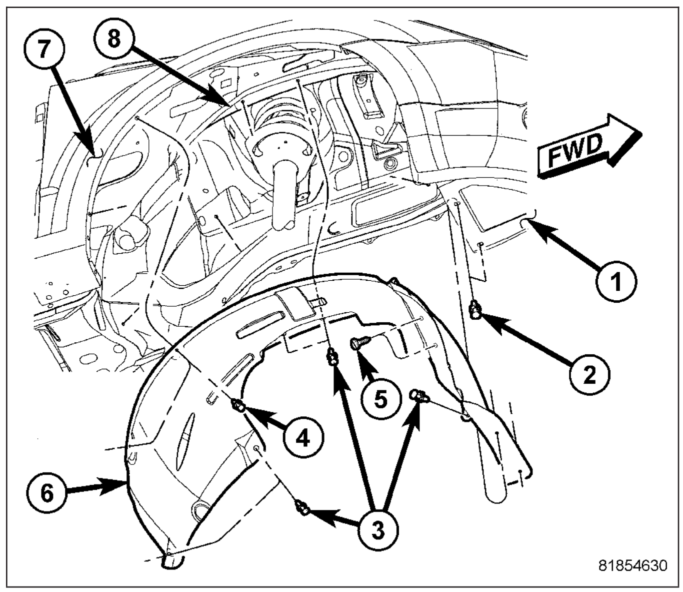


3. Align the ball and socket (1) up and then with a firm push, snap the front lamp unit into place.
4. Install the three screws (3) to the front lamp unit.
5. Install the fascia that was loosened on the repair side. One bolt holding the fascia to the fender at the wheel well opening, the splash shield to fascia screws, and the fasteners along the radiator closure panel (Refer to 13 - FRAME & BUMPERS/ BUMPERS/FRONT FASCIA - INSTALLATION).
6. Connect battery negative cable.



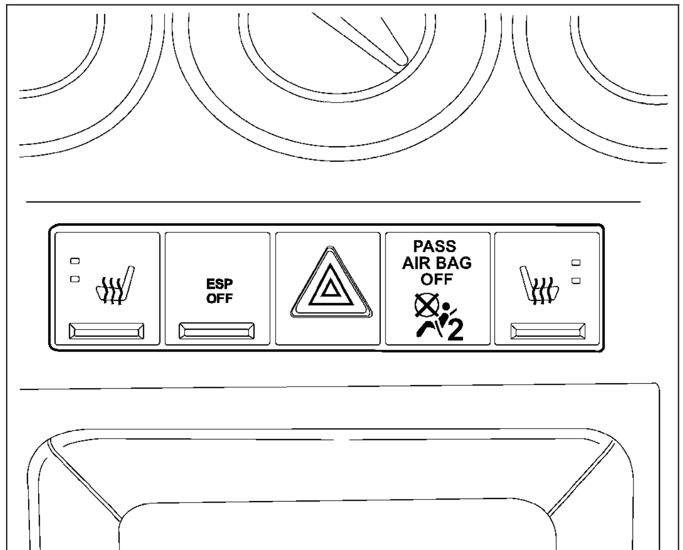
EXPORT

1. On BUX models, there are three electrical connectors (2, 3, and 4) to be connected.
2. Install the export front lamp unit the same way as the domestic unit Step 1.



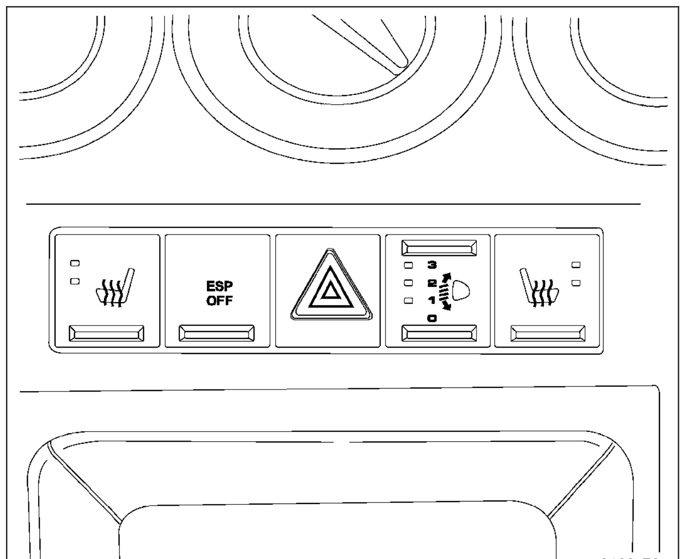
FRONT POSITION LAMP - EXPORT

1. Install the bulb in its socket (3).
2. Reaching up through wheel well, install front position lamp (3) in the front lamp unit, locking it into place by twisting a 1/4 turn.



3. Install the front of the splash shield removed to gain access to the front position lamp (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - INSTALLATION).
4. Connect the battery negative cable.

HAZARD SWITCH



DESCRIPTION

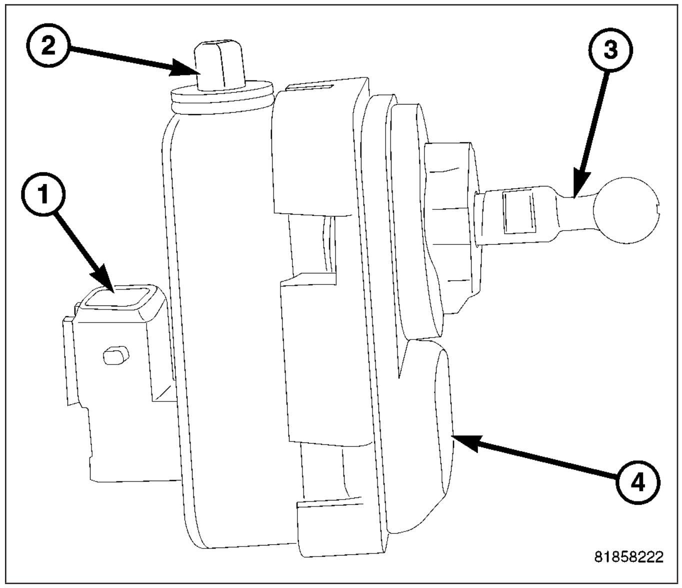
The hazard switch is located in the Accessory Switch Bank Module (ASBM) just below the heater a/c controls, in the instrument panel center stack. This switch is the control for the hazard warning lighting. The only visible component of the switch is the control push button that is located just to the left of the Passenger Airbag Disabled Light (PADL) indicator.

8183b99b

On BUX models, the hazard switch is located to the left of the Headlamp Leveling Switch, in the ASBM. The hazard switch cannot be adjusted or repaired. If the switch is ineffective or damaged, the entire ASBM must be replaced (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/ACCESSORY SWITCH BANK MODULE - REMOVAL).

8182c70c

OPERATION



The hazard switch features a push-push type latching push button. When the push button is in its latched (lowered) position the switch contacts are open, and when the push button is in its unlatched (raised) position the switch contacts are closed.

The hazard switch receives a ground on one terminal and provides a ground signal output to the Totally Integrated Power Module (TIPM)) whenever the switch contacts are closed. The TIPM responds to this input by controlling a battery voltage output and the flash rate for each of the right and left turn signal lamps, then sends an electronic hazard switch status message over the Controller Area Network (CAN) data bus to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher.

The hazard switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

HEADLAMP LEVELING MOTOR - EXPORT

DESCRIPTION

The headlamp leveling motor (4) is located on the rear upper surface of each front lamp unit on vehicles equipped with the headlamp leveling system, which is available only in certain markets where it is required equipment. There is a plunger (3) that moves the headlamp, an adjustment screw (2) that allows for baseline adjustment, and a connector (1) for connection to the vehicles electrical system.

Within the motor housing is a 12-volt Direct Current (DC) servo motor, an electronic controller board that includes the motor logic circuits, and an integral screw-drive transmission. The motor cannot be repaired and, if ineffective or damaged, the entire motor unit must be replaced.

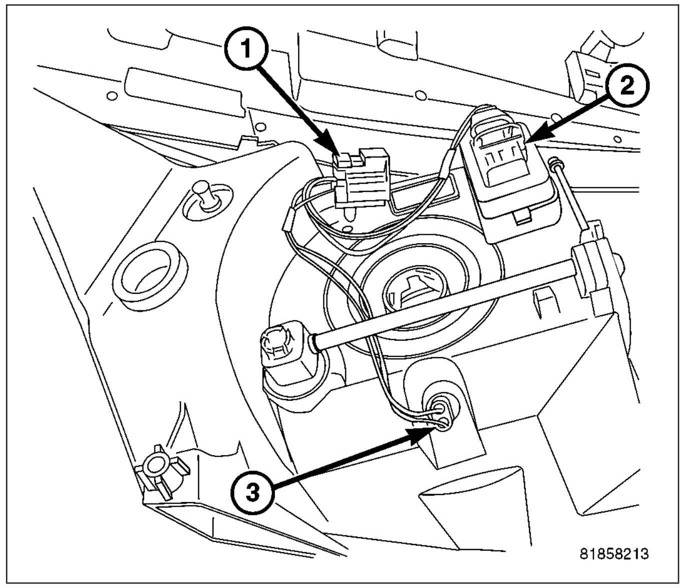
The Headlamp Leveling System allows the driver to adjust the headlamp beam pattern from the interior of the vehicle to compensate for passenger or cargo load. Only the vertical axis of the headlamp beam can be adjusted.

A headlamp leveling switch is located on the instrument panel Accessory Switch Bank Module (ASBM), and controls the headlamp leveling motors found on the headlamp unit. The headlamp leveling switch has four settings 0-3, 0 being the highest, 3 being the lowest headlight beam vertical setting.

When performing a headlamp beam pattern alignment on a vehicle equipped with headlamp leveling, be certain the headlamp leveling switch is in the “0” position before starting. Failure to do so will result in an incorrect headlamp unit alignment.

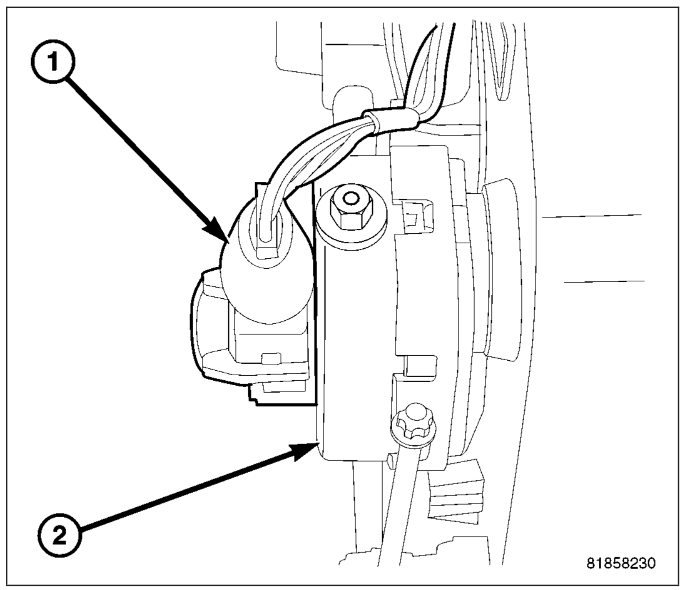
OPERATION

With the push button of the headlamp leveling switch control, voltage is adjusted at the headlamp leveling switch (rheostat). This signals the headlamp leveling motors to adjust the vertical headlamp beam pattern accordingly. Headlamps must be ON, and ignition in the ON or RUN position, in order for the leveling system to function.



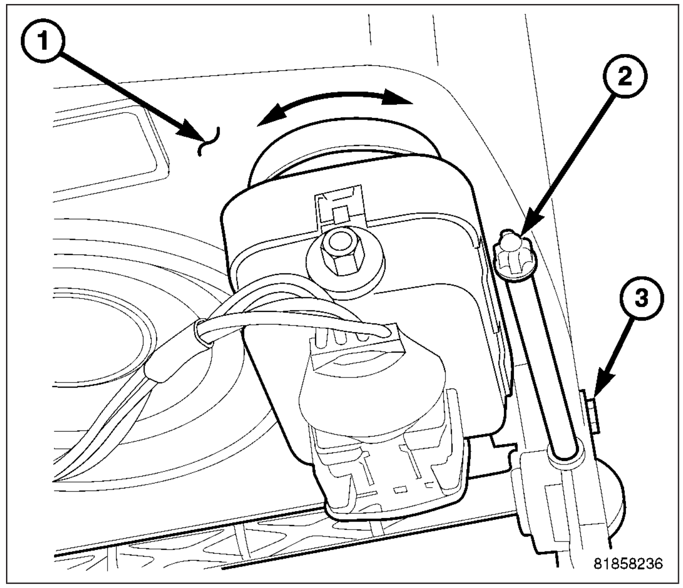
The controller board and logic circuitry of the headlamp leveling motor control motor operation based upon a voltage signal input received from the resistor multiplexed headlamp leveling switch in the Accessory Switch Bank Module (ASBM) on the instrument panel center stack. When the motor is energized it will extend or retract the motor push-rod through the integral screw-drive transmission. The ball on the end of the push-rod is snapped into a socket on the back of the reflector within the front lamp unit housing, which will cause the reflector to move as the push-rod is extended or retracted, changing the angle at which the light is projected from the headlamp low and high beam bulbs.

The headlamp leveling motors and switch have a path to ground at all times. The headlamp leveling components operate on battery voltage, but the system will only operate when the exterior lighting is turned ON.



Because of active electronic elements within the headlamp leveling motor, it cannot be tested using conventional diagnostic tools and procedures. If the headlamp leveling motor is believed to be ineffective, the hard wired headlamp leveling motor circuits and the leveling switch must be tested before considering motor replacement. Use a scan tool and the proper diagnostic information.

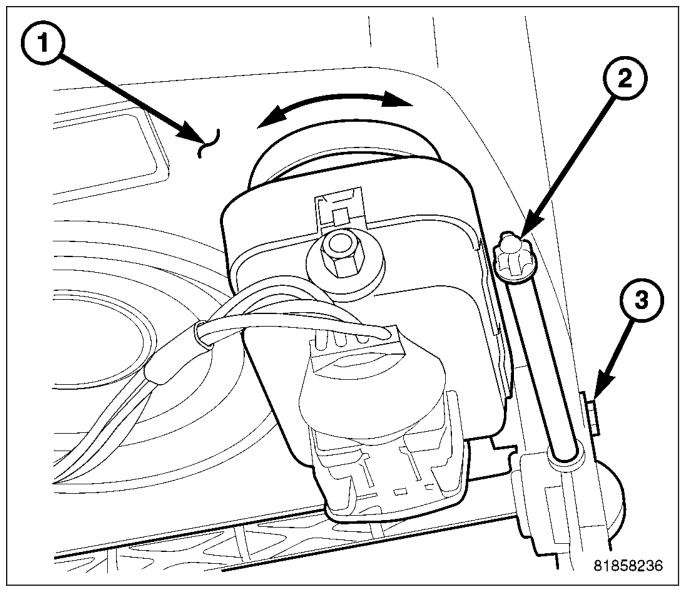
REMOVAL



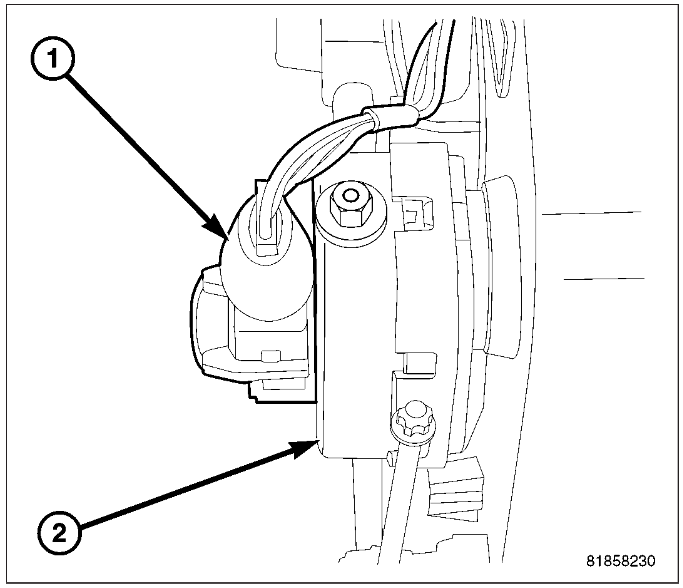
1. Remove Front Lamp Unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FRONT LAMP UNIT - REMOVAL).

2. Disconnect the headlamp leveling motor (2) electrical connector (1).

3. Remove the one screw (3) retaining the horizontal adjustment assembly (2) to allow the motor to swing far enough to remove.
4. Rotate leveling motor 1/4 turn counter-clockwise. This will free leveling motor housing from the headlamp unit (1).
5. Pull leveling motor straight from headlamp unit (1). Significant force will be required to unsnap motor control arm from lens reflector.

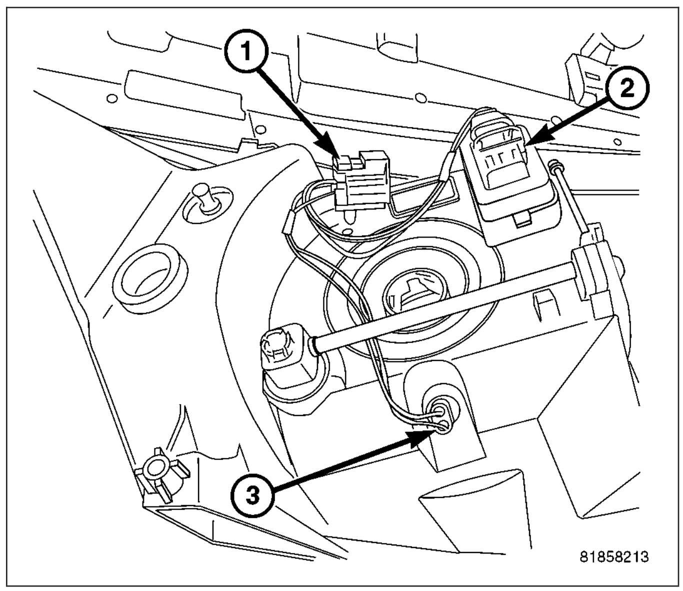


NOTE: The headlamp leveling motor control arm is snapped into the lens reflector mechanism very securely. Use a firm, steady pull to disengage motor arm from reflector.



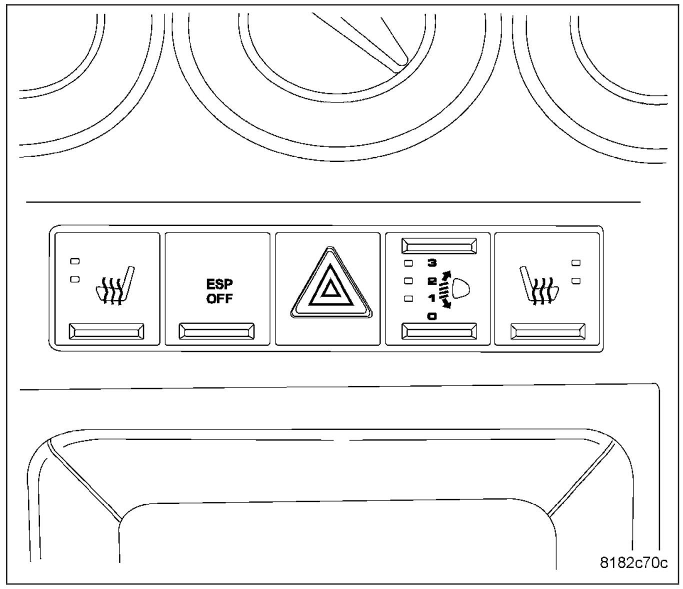
6. Remove leveling motor from front lamp unit.

INSTALLATION



1. While holding headlamp reflector assembly still, push leveling motor until control arm is fully seated into reflector mechanism. An audible “snap” will be heard.
2. Push and rotate leveling motor 1/4 turn clockwise to lock motor to the front lamp unit (1).

3. Connect headlamp leveling motor (2) electrical connector (1).



4. Install the front lamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FRONT LAMP UNIT - INSTALLATION).

HEADLAMP LEVELING SWITCH - EXPORT

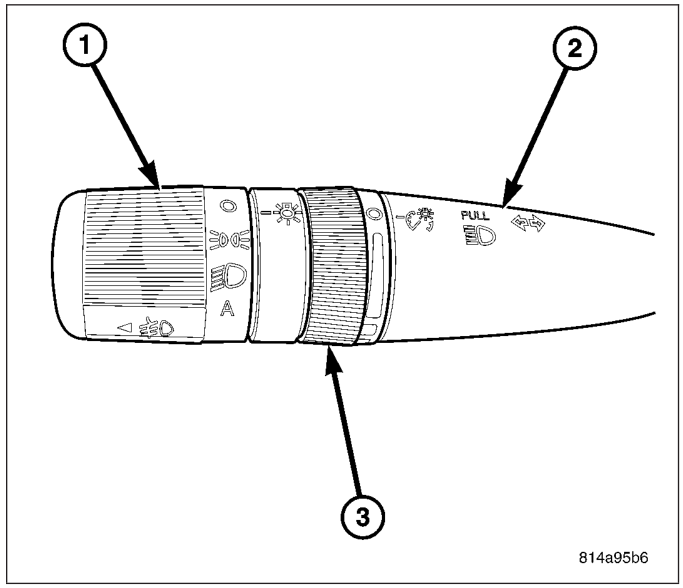
DESCRIPTION

The headlamp leveling switch is used only on vehicles manufactured for certain markets where the headlamp leveling system is required. The headlamp leveling switch is integral to the Accessory Switch Bank Module (ASBM) on the instrument panel center stack, just below the heater a/c controls and next to the hazard switch. The switch is marked with the numbers **0**, **1**, **2**, and **3**, which indicates each of the four switch detent positions. Each higher number represents a lower aiming position of the headlamp beam relative to the road surface.

The molded plastic ASBM housing encloses the switch mechanism and the leveling switch circuitry including the switch contacts and a series resistor configuration. The switch is connected to the vehicle electrical system through the instrument panel wire harness.

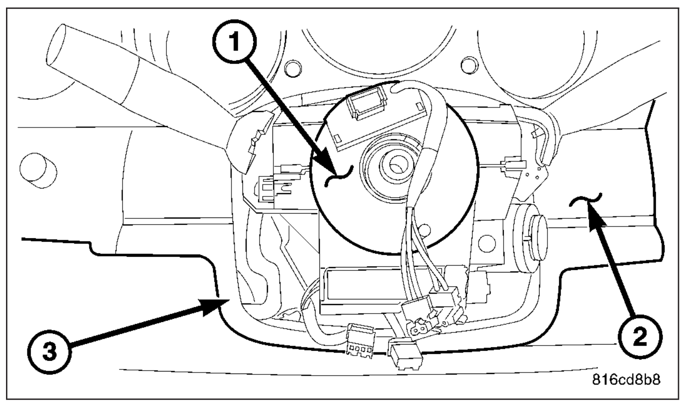
The headlamp leveling switch cannot be adjusted or repaired and, if ineffective or damaged, the entire ASBM unit must be replaced (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/ACCESSORY SWITCH BANK MODULE - REMOVAL).

OPERATION



The headlamp leveling switch receives battery voltage whenever the park lamp lamps are turned ON. The switch receives a path to ground at all times through the instrument panel wire harness. The only output from the switch is a voltage signal that it provides to the headlamp leveling motors on a headlamp adjust signal circuit. Each switch position selects a different tap on a series resistor within the switch to provide a different voltage signal to the leveling motors. The higher the switch position number, the higher the output voltage level.

The headlamp leveling switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.



LEFT MULTI-FUNCTION SWITCH

DESCRIPTION

The left (lighting) multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch is the primary control for the interior and exterior lighting systems. The only visible components of the switch are the control stalk (2), control knob (1) and control sleeve (3) that extend through the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connection, and the turn signal cancel actuator are concealed beneath the shrouds.

The switch housing and controls are attached to the Steering Column Control Module (SCCM) (1) by one retaining screw. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. A single integral interface connector connects the left multi-function switch directly to the SCCM (1).

The left multi-function switch provides the vehicle operator with a control interface for the following exterior lighting functions:

- **Front Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional front fog lamps.
- **Headlamps** - The left multi-function switch control knob provides detent switching for the headlamps.
- **Headlamp Beam Selection** - The left multi-function switch control stalk provides detent switching for selection of the headlamp high or low beams.
- **Headlamp Optical Horn** - The left multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Park Lamps** - The left multi-function switch control knob provides detent switching for the park lamps.
- **Rear Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional rear fog lamps. Rear fog lamps are optional only for vehicles manufactured for certain markets, where they are required.
- **Turn Signal Control** - The left multi-function switch control stalk provides both momentary non-detent switching and detent switching with automatic cancellation for both the left and right turn signal lamps.

The left multi-function switch also provides the vehicle operator with a control interface for the following interior lighting functions:

- **Interior Lamps Defeat** - The left multi-function switch control ring provides detent switching to defeat the illumination of all interior courtesy lamps when a door, the rear flip-up glass, or the liftgate are opened.

- **Interior Lamps On** - The left multi-function switch control ring provides detent switching to simultaneously illuminate all interior courtesy lamps.
- **Panel Lamps Dimming** - The left multi-function switch control ring provides simultaneous adjustable control of the illumination intensity of all instrument panel lighting at one of six available illumination intensity levels.
- **Parade Mode** - The left multi-function switch control ring provides detent switching for a parade mode that maximizes the illumination intensity of all instrument panel lighting for visibility when driving in daylight with the exterior lamps turned on.

The left multi-function switch cannot be adjusted or repaired. If any function of the switch is damaged or inoperative, the entire switch unit must be replaced.

OPERATION

The left (lighting) multi-function switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch then sends electronic switch status messages over the Local Interconnect Network (LIN) to the Cab Compartment Node (CCN) and then the CCN sends messages over the Controller Area Network (CAN) data bus to the Totally Integrated Power Module (TIPM) other electronic modules in the vehicle.

For lighting and wiper function it sends the messages over the LIN bus to the CCN and the CCN puts them out on the CAN bus to the other modules. The left switch has the microprocessor for all communication to the TIPM. The SCCM is composed of a clockspring and left lighting switch and a right wiper switch. The TIPM, controls the lighting and wiper functions.

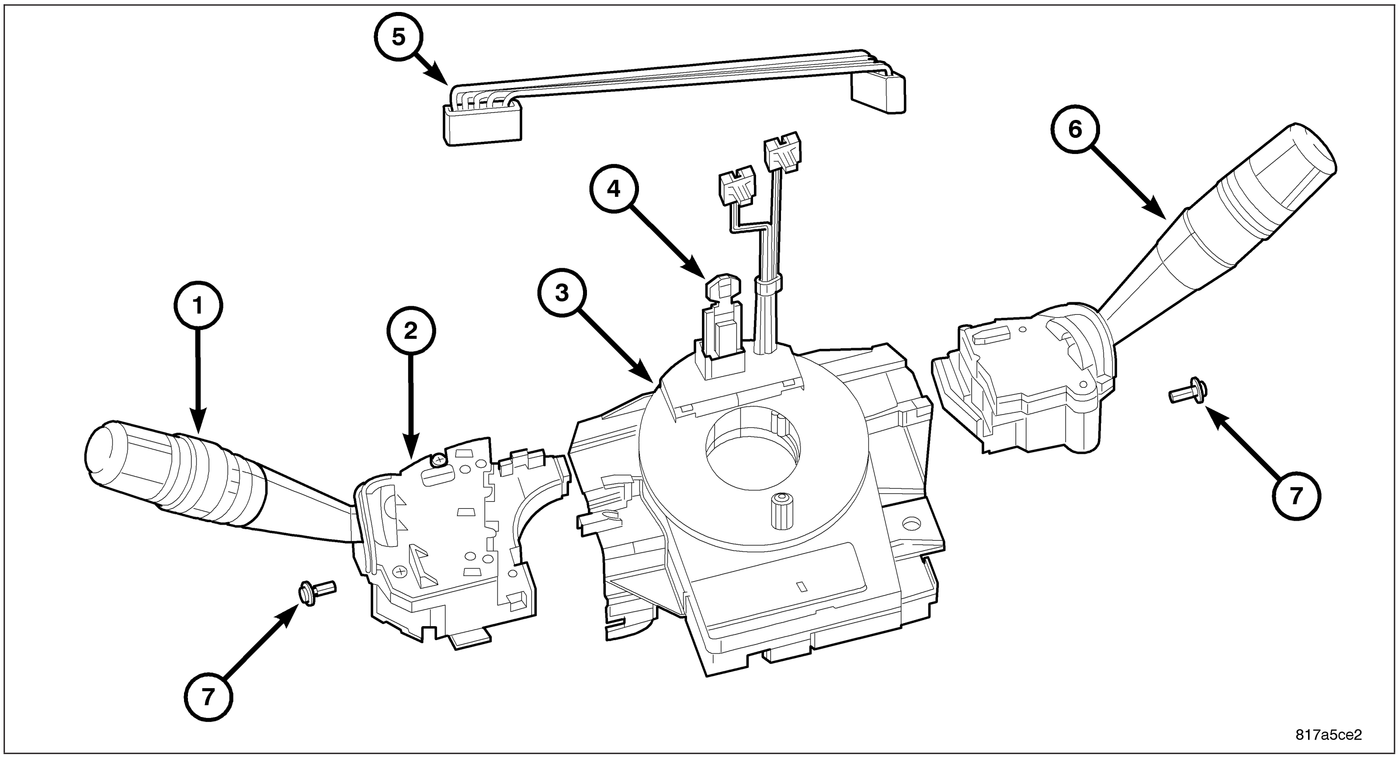
The left multi-function switch can be diagnosed using LIN based diagnostic tools and methods. However, the most reliable, efficient and accurate means to diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

EXTERIOR LIGHTING

Following are descriptions of how the left multi-function switch is operated to control the many exterior lighting functions and features it provides:

- **Front Fog Lamps** - The optional front fog lamps are requested when the left multi-function switch control knob is pulled outward to the front fog lamps detent position. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle. The switch control knob incorporates an internal cam mechanism that will only allow the front fog lamps to be selected while the headlamp On position is also selected, and will automatically move the control knob to the front fog lamps Off position when the control knob is rotated to deselect the headlamps.
- **Headlamps** - The headlamps are requested when the left multi-function switch control knob is rotated to the headlamps on detent position. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle.
- **Headlamp Beam Selection** - The headlamp beams are selected when the left multi-function switch control stalk is pushed forward. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle. Each time the control stalk is actuated in this manner, the headlamp beams are toggled from the current selection to the opposite selection.
- **Headlamp Optical Horn** - The headlamp optical horn is selected each time the left multi-function switch control stalk is pulled rearward to a momentary position just short of the beam selection detent position. The headlamp high beams will remain illuminated for as long as the control stalk is held in this momentary position and the previously selected beams will be restored when the control stalk is released. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle.
- **Park Lamps** - The headlamps are requested when the left multi-function switch control knob is rotated to the park lamps on detent position. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle.
- **Rear Fog Lamps** - The optional rear fog lamps are requested when the left multi-function switch control knob is pulled outward to the front fog lamps detent position and then rotated to the rear fog lamps detent position. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle. The switch control knob incorporates an internal cam mechanism that will only allow the rear fog lamps to be selected while the front fog lamps On

position is also selected, and will automatically move the control knob to the rear fog lamp Off position when the control knob is pushed in to deselect the front fog lamps.



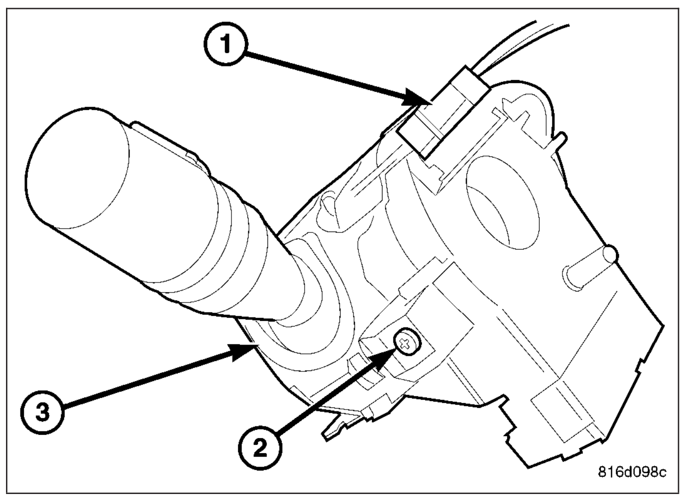
- **Turn Signal Control** - The turn signals are requested when the left multi-function switch control stalk is moved downward (left signal) or upward (right signal). The control stalk has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary “lane change” position in each direction that provides turn signals only until the control stalk is released. When the control stalk is moved to a detent turn signal switch position, a cancel actuator extends toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring, rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the left multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the two turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the left turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral Off position. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle.

INTERIOR LIGHTING

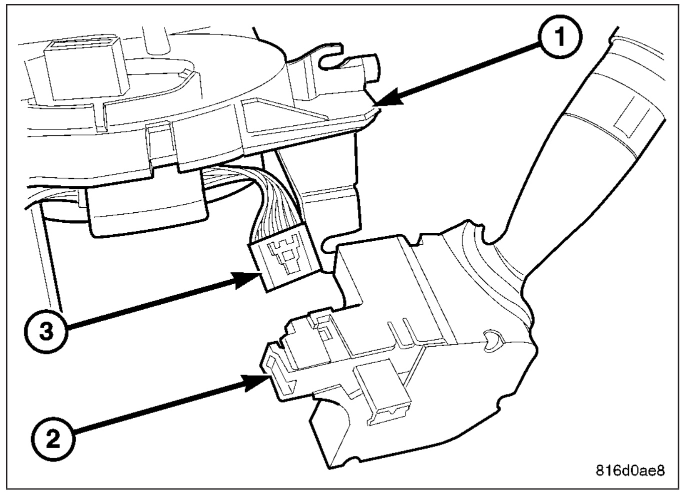
Following are descriptions of the how the left multi-function switch is operated to control the many interior lighting functions and features it provides:

- **Interior Lamps Defeat** - The interior lamps defeat feature is requested when the left multi-function switch control sleeve is rotated to the interior lamps defeat detent position. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle.
- **Interior Lamps On** - The interior lamps on feature is requested when the left multi-function switch control sleeve is rotated to the interior lamps On detent position. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle.
- **Panel Lamps Dimming** - The panel lamps dimming function is active only when the left multi-function switch control knob is in any exterior lighting On position. With the exterior lighting On, the panel lamps dimming level is requested when the left multi-function switch control sleeve is rotated to any one of five minor detent positions. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle.
- **Parade Mode** - The parade or funeral mode is active only when the left multi-function switch control knob is in any exterior lighting On position. With the exterior lighting On, the parade mode is requested when the left multi-function switch control sleeve is rotated to the parade mode detent position. The left multi-function switch sends an electronic switch status message over the LIN bus to the CCN, then over the CAN data bus to the other electronic modules in the vehicle.

REMOVAL



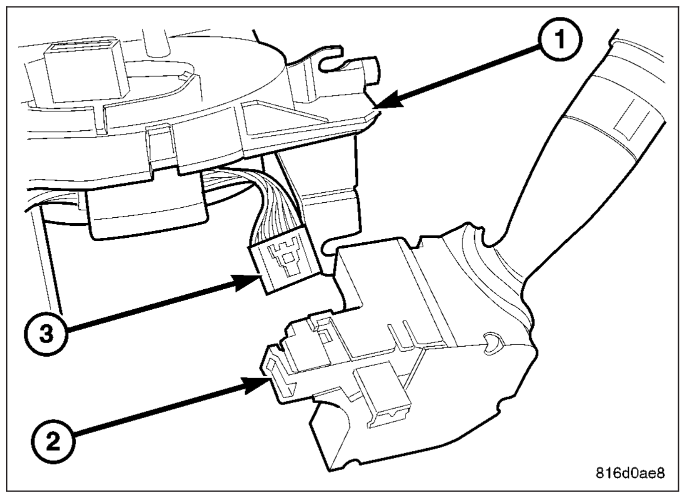
NOTE: It is not necessary to remove the Steering Column Control Module (SCCM) from the steering column to replace the left multi-function switch (2).



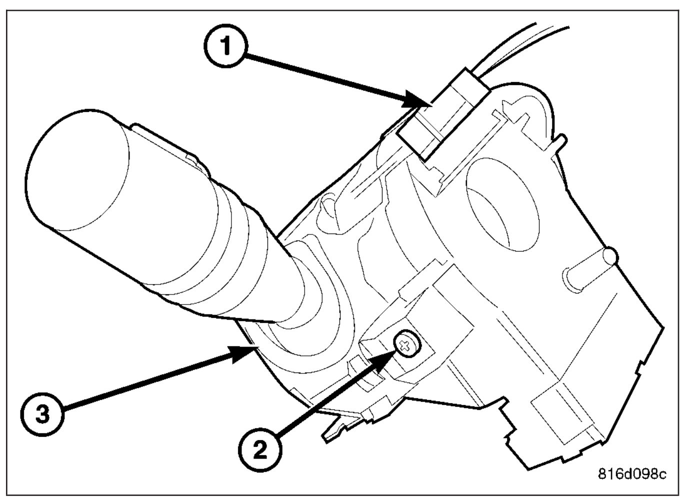
1. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the system reserve capacitor to discharge before servicing any airbag or steering column components.

2. Remove both the upper and lower shrouds from the steering column. (Refer to 19 - STEERING/ COLUMN/SHROUD - REMOVAL).
3. Remove the one screw (2) that secures the left multi-function switch (3) on the right side of the clockspring (1).



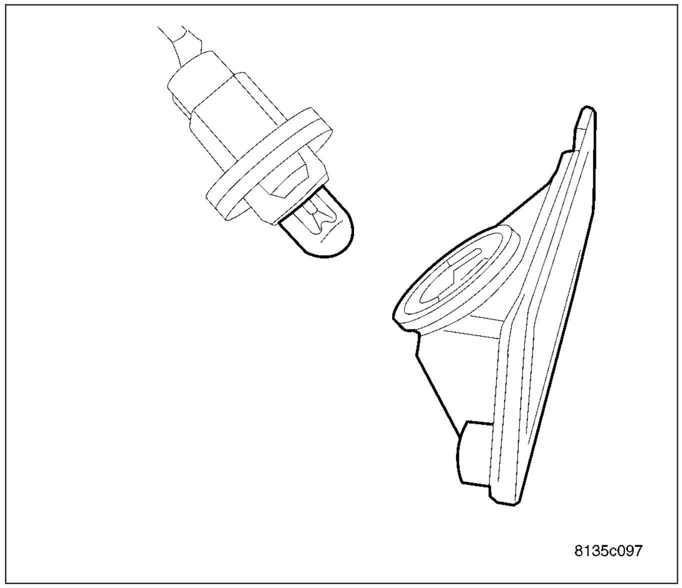
4. Pull the switch (2) straight away from the clockspring (1) far enough to access the electrical connector (3) to disconnect it.
5. Disconnect the instrument panel wiring harness from the back of the left multi-function switch.
6. Remove the switch (2) from the clockspring (1).



INSTALLATION

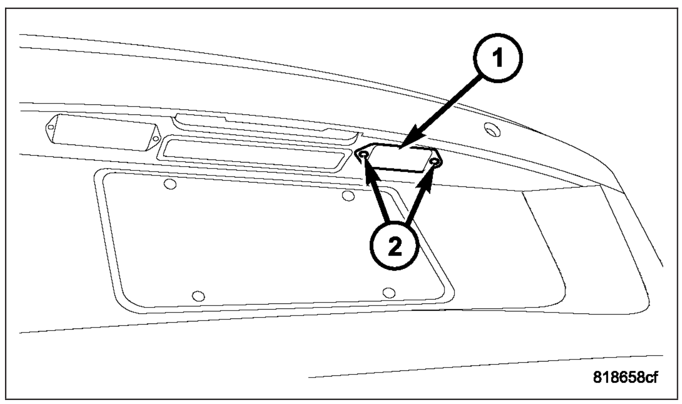
1. Position the left multi-function switch in the slot in the back of the clockspring (1) and connect the switch connector (3).
2. Connect the instrument panel wiring harness connector to the back of the left multi-function switch.

3. Align switch (3) with the clockspring (1) and slide toward steering column.
4. Install the screw (2) that secures the switch (3) to the clockspring (1).
5. Install the upper and lower shrouds onto the steering column. (Refer to 19 - STEERING/COLUMN/SHROUD - INSTALLATION).
6. Connect the battery negative cable.



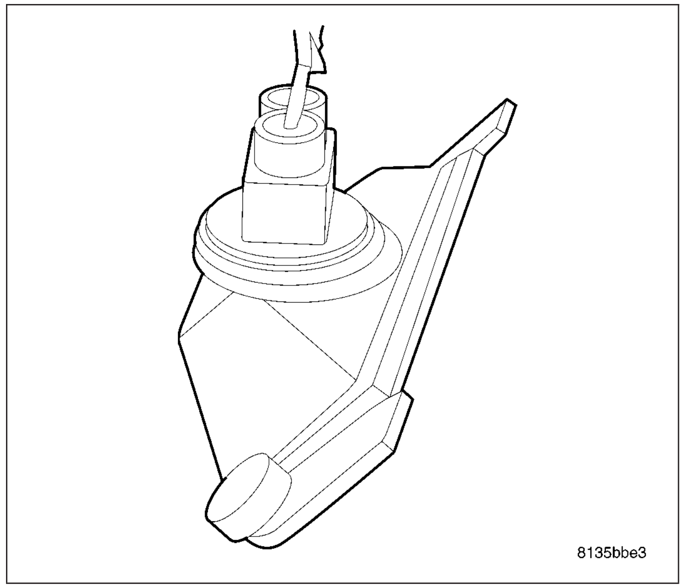
LICENSE PLATE LAMP

REMOVAL

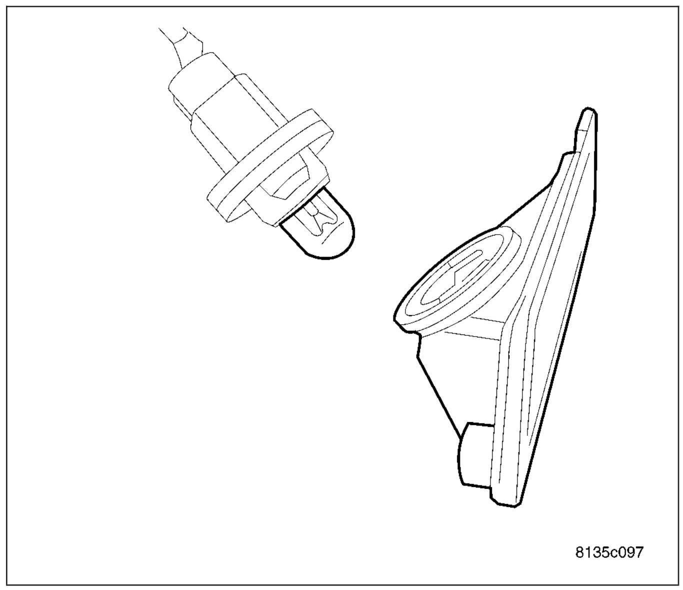


BULB

1. Remove the license plate lamp unit from the liftgate (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LICENSE PLATE LAMP - REMOVAL).
2. Pull bulb from socket.

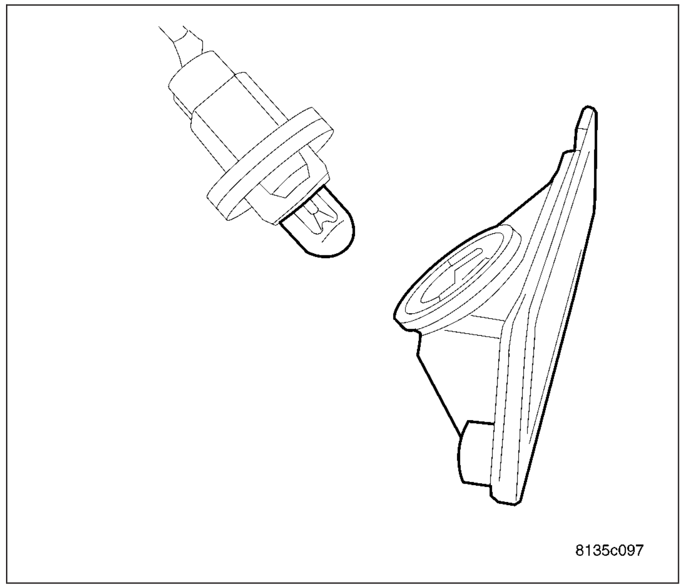


UNIT



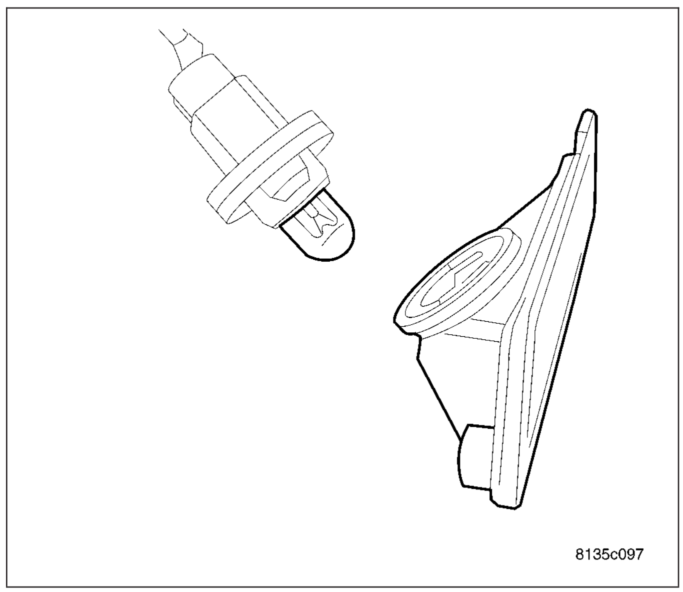
1. Using a trim stick or equivalent, gently pry on the side (2) of the license plate lamp unit (1) to release it from the liftgate.

2. Remove lamp (1) from liftgate.



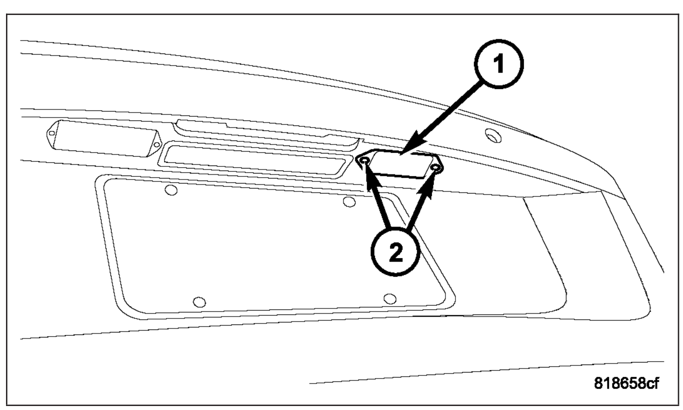
3. Twist the bulb socket 1/4 turn counter-clockwise and remove from license lamp unit.

INSTALLATION



BULB

1. Install bulb into socket.
2. Install the license plate lamp unit into the liftgate (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LICENSE PLATE LAMP - INSTALLATION).



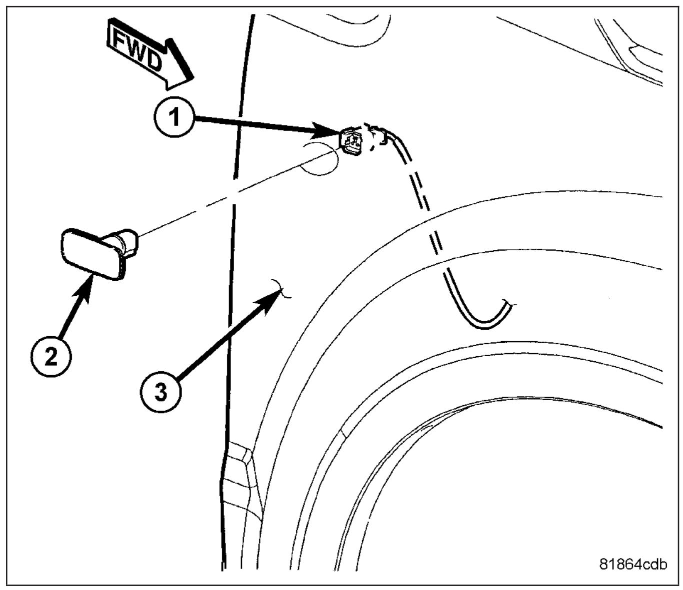
UNIT

1. Place bulb socket into license plate lamp unit.

2. Position lamp unit (1) into the liftgate opening and firmly push up and snap into place. Make sure both sides (2) are fully engaged.

SIDE REPEATER LAMP - EXPORT

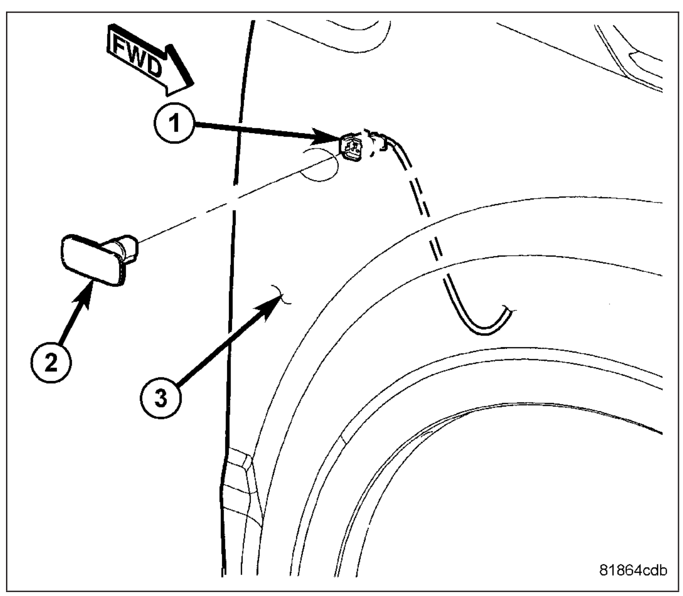
DIAGNOSIS AND TESTING



SIDE REPEATER LAMP

NOTE: The battery must be completely charged (12v) prior to testing. It may also be necessary to install a battery charger on the vehicles electrical system when performing this test.

1. Remove the side repeater lamp and check for a burned out condition. Replace lamp if necessary.
2. If lamp appears OK, reinstall the bulb in its socket and rotate the ignition switch to the ON position. Turn the appropriate turn signal lamp ON and check for lamp operation. If lamp is still inoperative proceed to Step 3.
3. Remove lamp and check for power (12v) and ground connections in lamp socket. If power and/or ground connections are not present, trace wire until open or short is found. Refer to Wiring Diagrams for a complete system schematic.

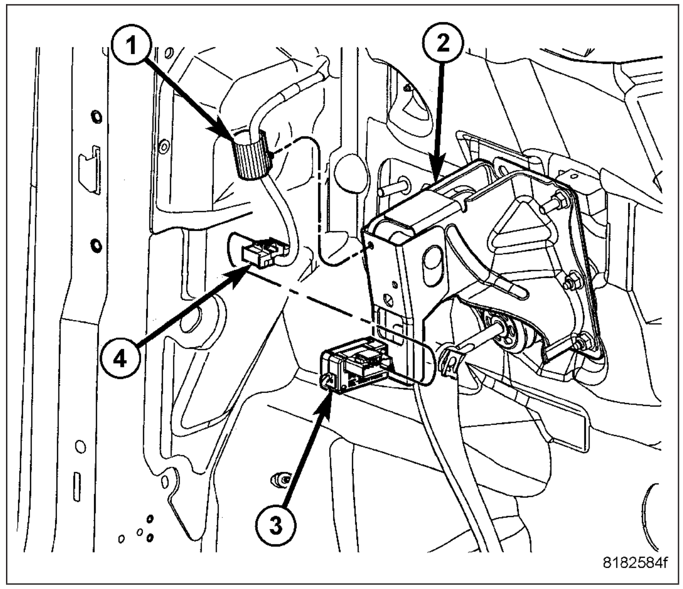


REMOVAL

1. Grasp the repeater lamp (2) from the side with a finger and pull towards the opposite end of the lamp. There is a spring clip that will allow the lamp to be released.
2. Disconnect the electrical connector (1).

INSTALLATION

1. Connect the repeater lamp electrical connector (1).
2. Position side repeater lamp (2) near hole in fender (3) and there is a large cut-out and a small cut-out in the fender. Place the large side in first, matching the tab on the lamp and then slide it that direction and release. This will lock the lamp into the fender.



SWITCH-STOP LAMP

DESCRIPTION

The stop lamp switch (3) is located under the instrument panel, at the brake pedal (2). It has three internal switches controlling various functions of the vehicle. It's main function is to control operation of the vehicle's brake lamps. Other functions include speed control deactivation, brake sense for the antilock brake system and brake sense for the brake transmission shift interlock.

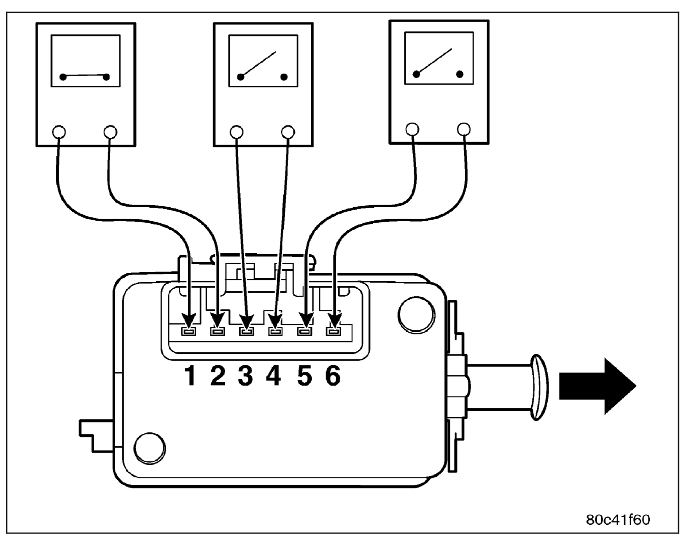
CAUTION: The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.

OPERATION

When the brake pedal is pressed, the plunger on the outside of the stop lamp switch extends outward. This action opens or closes the contacts of the three switches inside the stop lamp switch.

With the brake pedal pressed down (plunger extended), the switch for terminals 1 and 2 is closed completing the circuit. The switch for terminals 3 and 4 is open and so is the switch for 5 and 6.

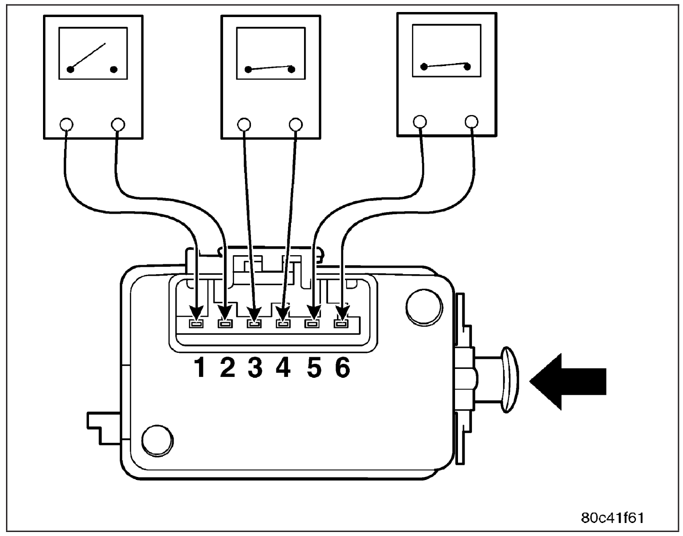
When the brake pedal is released (plunger pushed in), the three switches assume the opposite positions. The switch for terminals 1 and 2 is now open while the other two switches are now closed, completing their circuits.



DIAGNOSIS AND TESTING

STOP LAMP SWITCH

NOTE: Before proceeding with this diagnostic test, verify the adjustment lever on the back of the switch is in the adjusted position. If the lever is in the non-adjusted (diagonal) position it may have never been adjusted. For adjustment, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/STOP LAMP SWITCH - INSTALLATION).

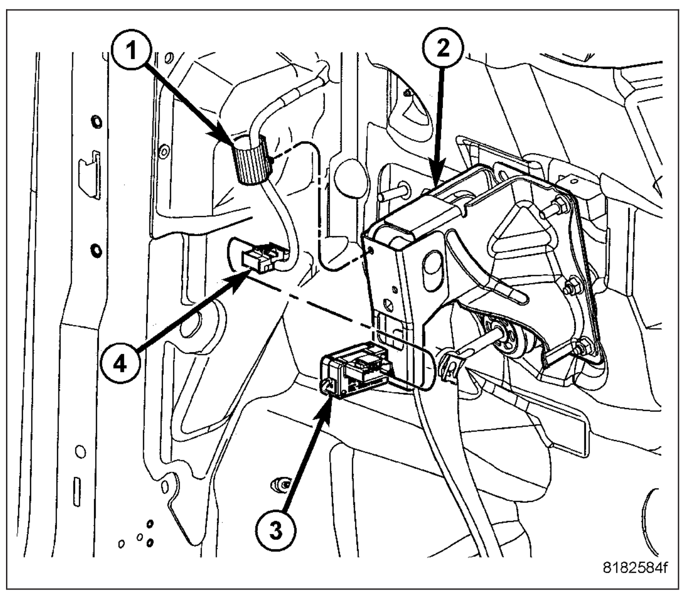


If the electrical circuit has been tested and the stop lamp switch is suspected of being damaged or inoperative, it can be tested using the following method.

1. Remove the switch from the vehicle. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ STOP LAMP SWITCH - REMOVAL).
2. With the switch in the released position (plunger extended), use an ohmmeter to test each of the

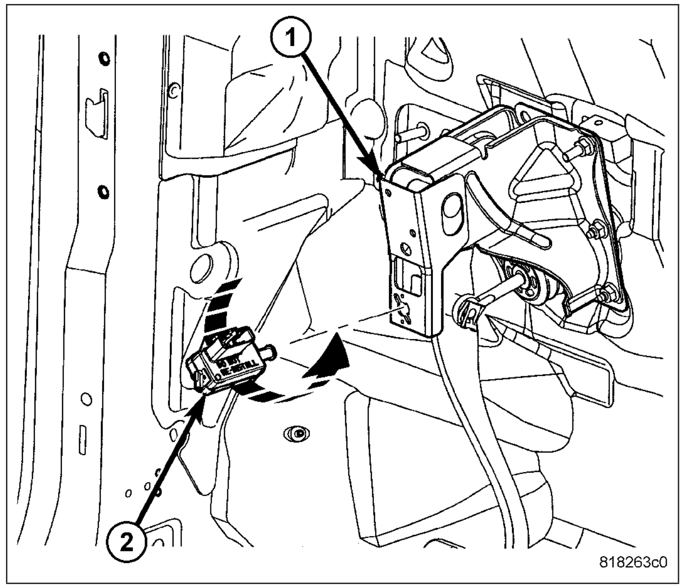
three internal switches as shown. You should achieve the results as listed in the figure.

3. Gently push the plunger on the stop lamp switch in until it stops.
4. With the switch in this depressed position (plunger pushed in), use an ohmmeter to test each of the three internal switches as shown. You should achieve the results as listed in the figure.



If you do not achieve the results as listed in both figures, the switch must be replaced. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/STOP LAMP SWITCH - INSTALLATION)

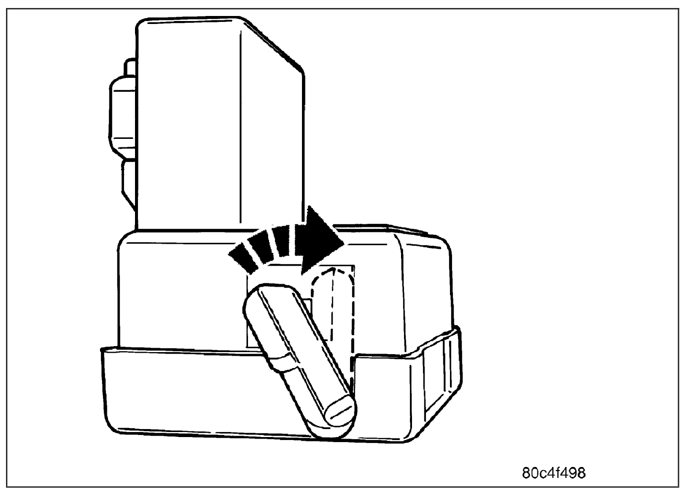
If the switch is found to be operating properly, it may be misadjusted. Do not reinstall the switch, replace it. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/STOP LAMP SWITCH - INSTALLATION)



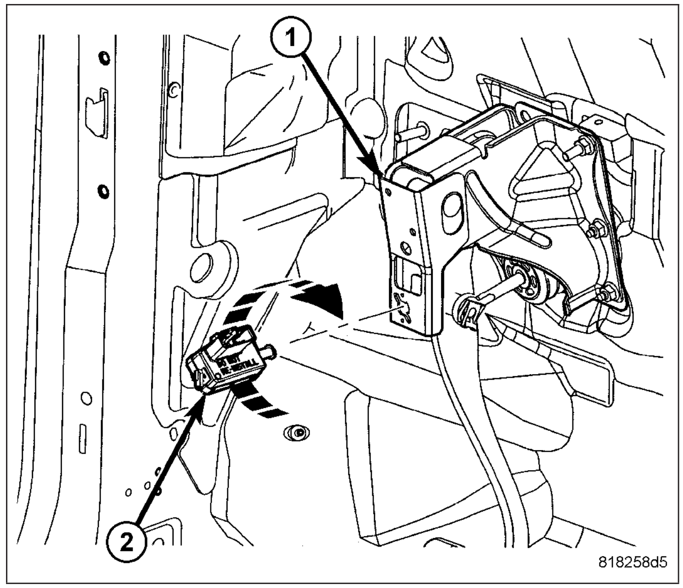
CAUTION: The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for any reason, a new switch must be installed and adjusted.

REMOVAL

1. Disconnect and isolate the battery negative cable from its post on the battery.
2. If equipped, remove the silencer pad below the steering column.
3. Disconnect the wiring harness connector (4) at the switch (3).

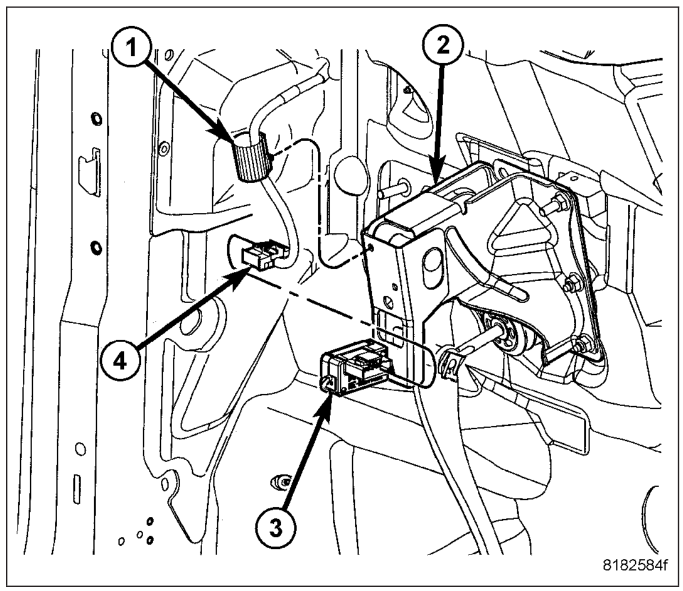


4. Remove the stop lamp switch (2) from the brake pedal bracket (1) by rotating the switch in a counterclockwise direction approximately 30 degrees, then pulling the switch rearward.
5. Discard the stop lamp switch. **It must not be reused.**



INSTALLATION

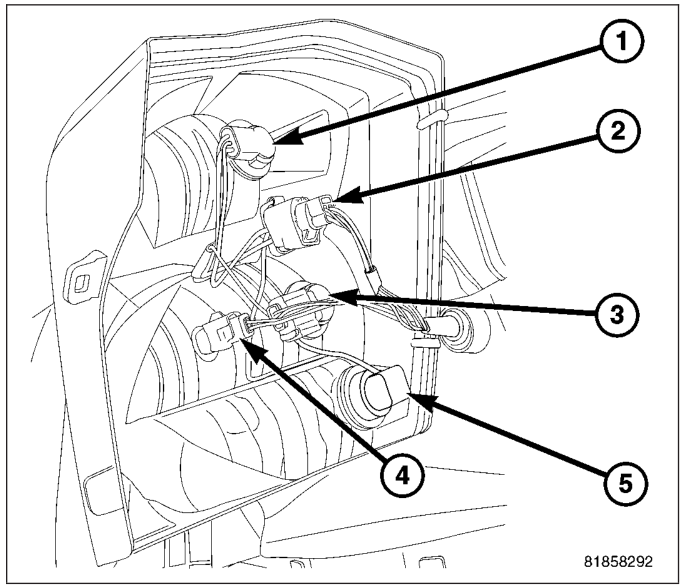
CAUTION: Do not reuse the original stop lamp switch. The switch can only be adjusted once. That is during initial installation of the switch. If the switch is not adjusted properly or has been removed for some service, a new switch must be installed and adjusted.



1. Obtain a NEW stop lamp switch. The adjustment lever on the NEW switch should be at a 45° angle from the wiring connector. **If the adjustment lever is parallel with the wiring connector, the switch has been pre-set and must be scrapped. DO NOT ATTEMPT TO RESET (OR RE-ADJUST) THE STOP LAMP SWITCH.**

2. Mount and adjust the NEW brake lamp switch (2) using the following steps:
   a. Install the switch in its bracket by aligning the index tab on the switch with the notch in the brake pedal bracket (1).
   b. When the switch body is fully seated in its bracket, rotate the switch clockwise approximately 30° to lock the switch into place.
   c. With the brake pedal in the fully released position, move the adjustment lever on the brake lamp switch from the 45° angled non-adjusted position, clockwise as shown, until it is parallel with the wiring connector. The brake lamp switch is now properly adjusted to the vehicle.

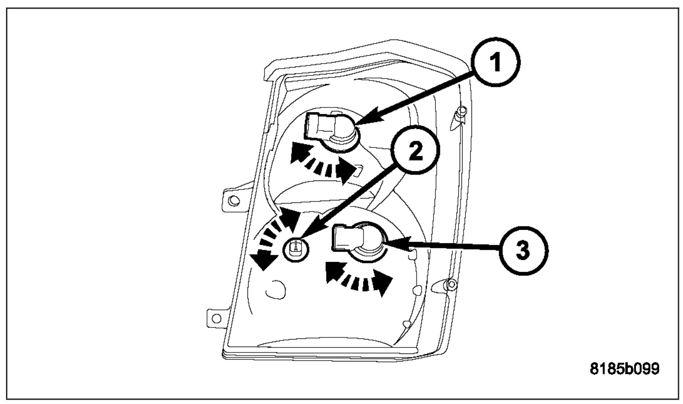
3. Connect the wiring harness connector (4) to the switch (3).
4. If equipped, install the silencer pad below the steering column.
5. Reconnect the battery negative terminal.
6. Check the stop lamps to verify they are operating properly and not staying on when the pedal is in the released position.
7. Road test the vehicle to ensure proper operation of the brakes (including ABS) and speed control (if equipped).



TAIL LAMP

REMOVAL

BULBS

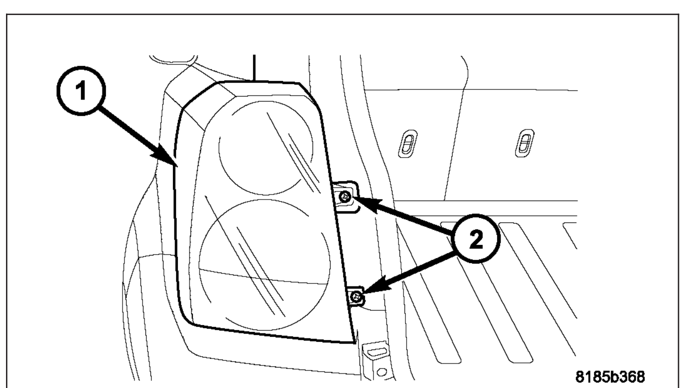


There are a total of four possible bulbs in the tail lamp unit:

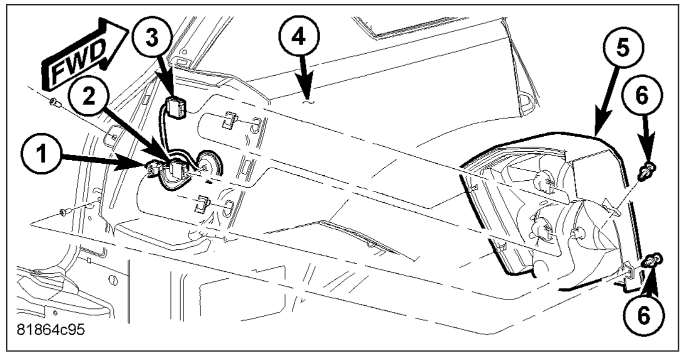
- Back-Up Lamp (4)
- Park/Brake Lamp (1)
- Rear Fog Lamp (5) - Export Only
- Turn Signal (3)

1. Remove the tail lamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP UNIT - REMOVAL).

NOTE: It is not necessary to completely remove the tail lamp unit. Once loosened from quarter panel, there should be enough room to service any of the bulbs.



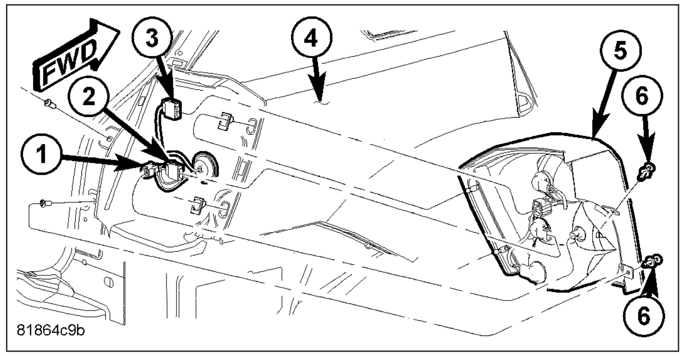
2. Disconnect the electrical connector.
3. Remove bulb socket from tail lamp unit by twisting a quarter turn counterclockwise.
4. Pull socket straight out of tail lamp unit.
5. Pull bulb from socket.



UNIT

DOMESTIC

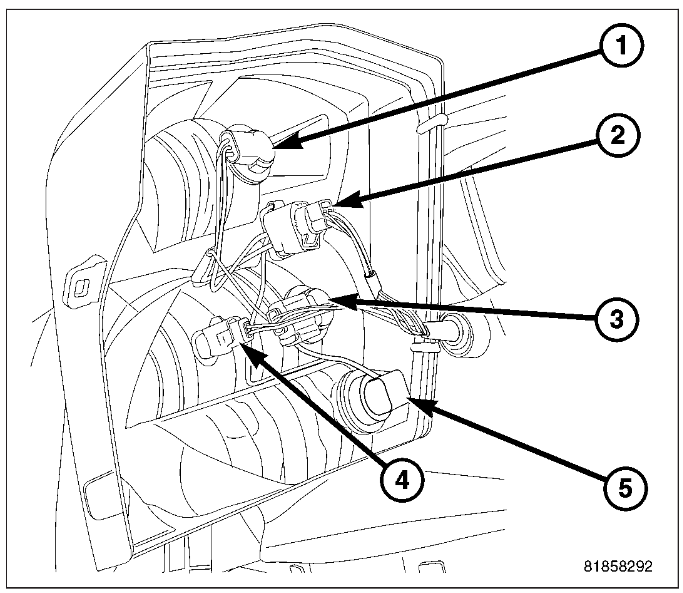
1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or equivalent, pry out the two push pins (2) retaining the tail lamp unit (1).



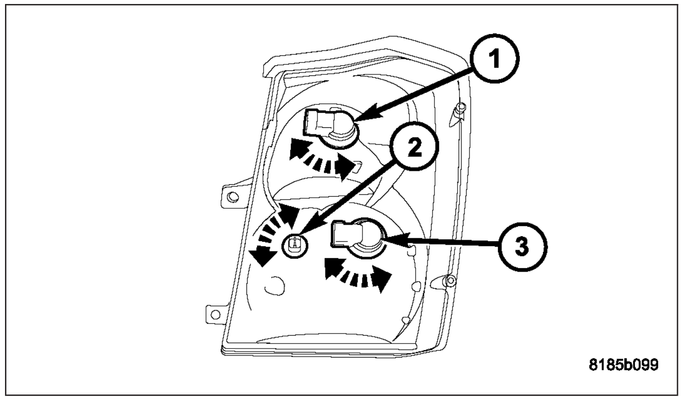
3. Pull straight back on the tail lamp unit (5) to release it from the quarter panel (4).
4. Disconnect the three electrical connectors (1, 2, and 3) to the tail lamp unit (5).
5. Remove the tail lamp unit (5) from the vehicle.
6. Remove the bulb sockets from the lamp unit by rotating the sockets counterclockwise, and then pull straight out of the unit.

EXPORT

The BUX tail lamp unit comes out the same way as the domestic, with the difference being the location of the electrical connectors (1, 2, and 3). They incorporate a rear fog lamp in the tail lamp assembly.



INSTALLATION

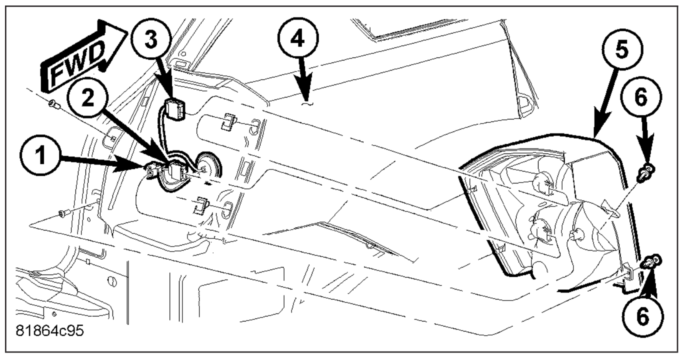


BULBS

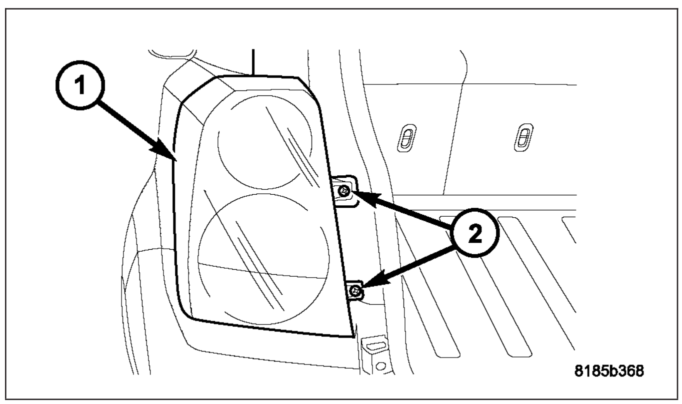
There are a total of four possible bulbs in the tail lamp unit:

- Back-Up Lamp (4)
- Park/Brake Lamp (1)
- Rear Fog Lamp (5) - Export Only
- Turn Signal (3)

1. Push bulb into the bulb socket.
2. Install bulb socket into tail lamp assembly. Rotate the socket clockwise until fully seated.
3. Install the tail lamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - INSTALLATION).



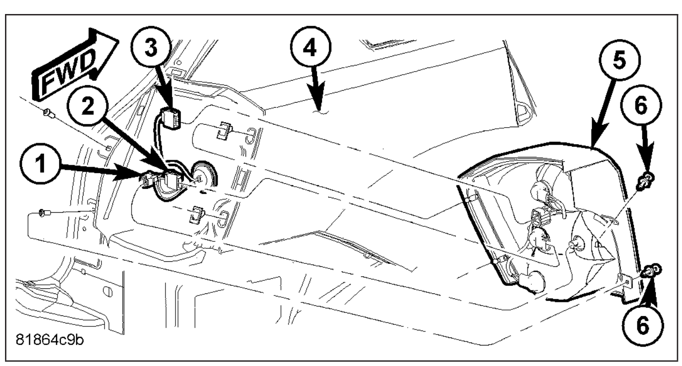
UNIT



DOMESTIC

If replacing the tail lamp unit (5) with a new one, transfer the bulb sockets to the new unit (5).

1. Position the tail lamp unit (5) near the quarter panel (4),
2. Connect the three electrical connectors (1, 2, and 3).
3. Align the ball and socket retainers in the quarter panel (4) and firmly push forward until the tail lamp (5) snaps into place.

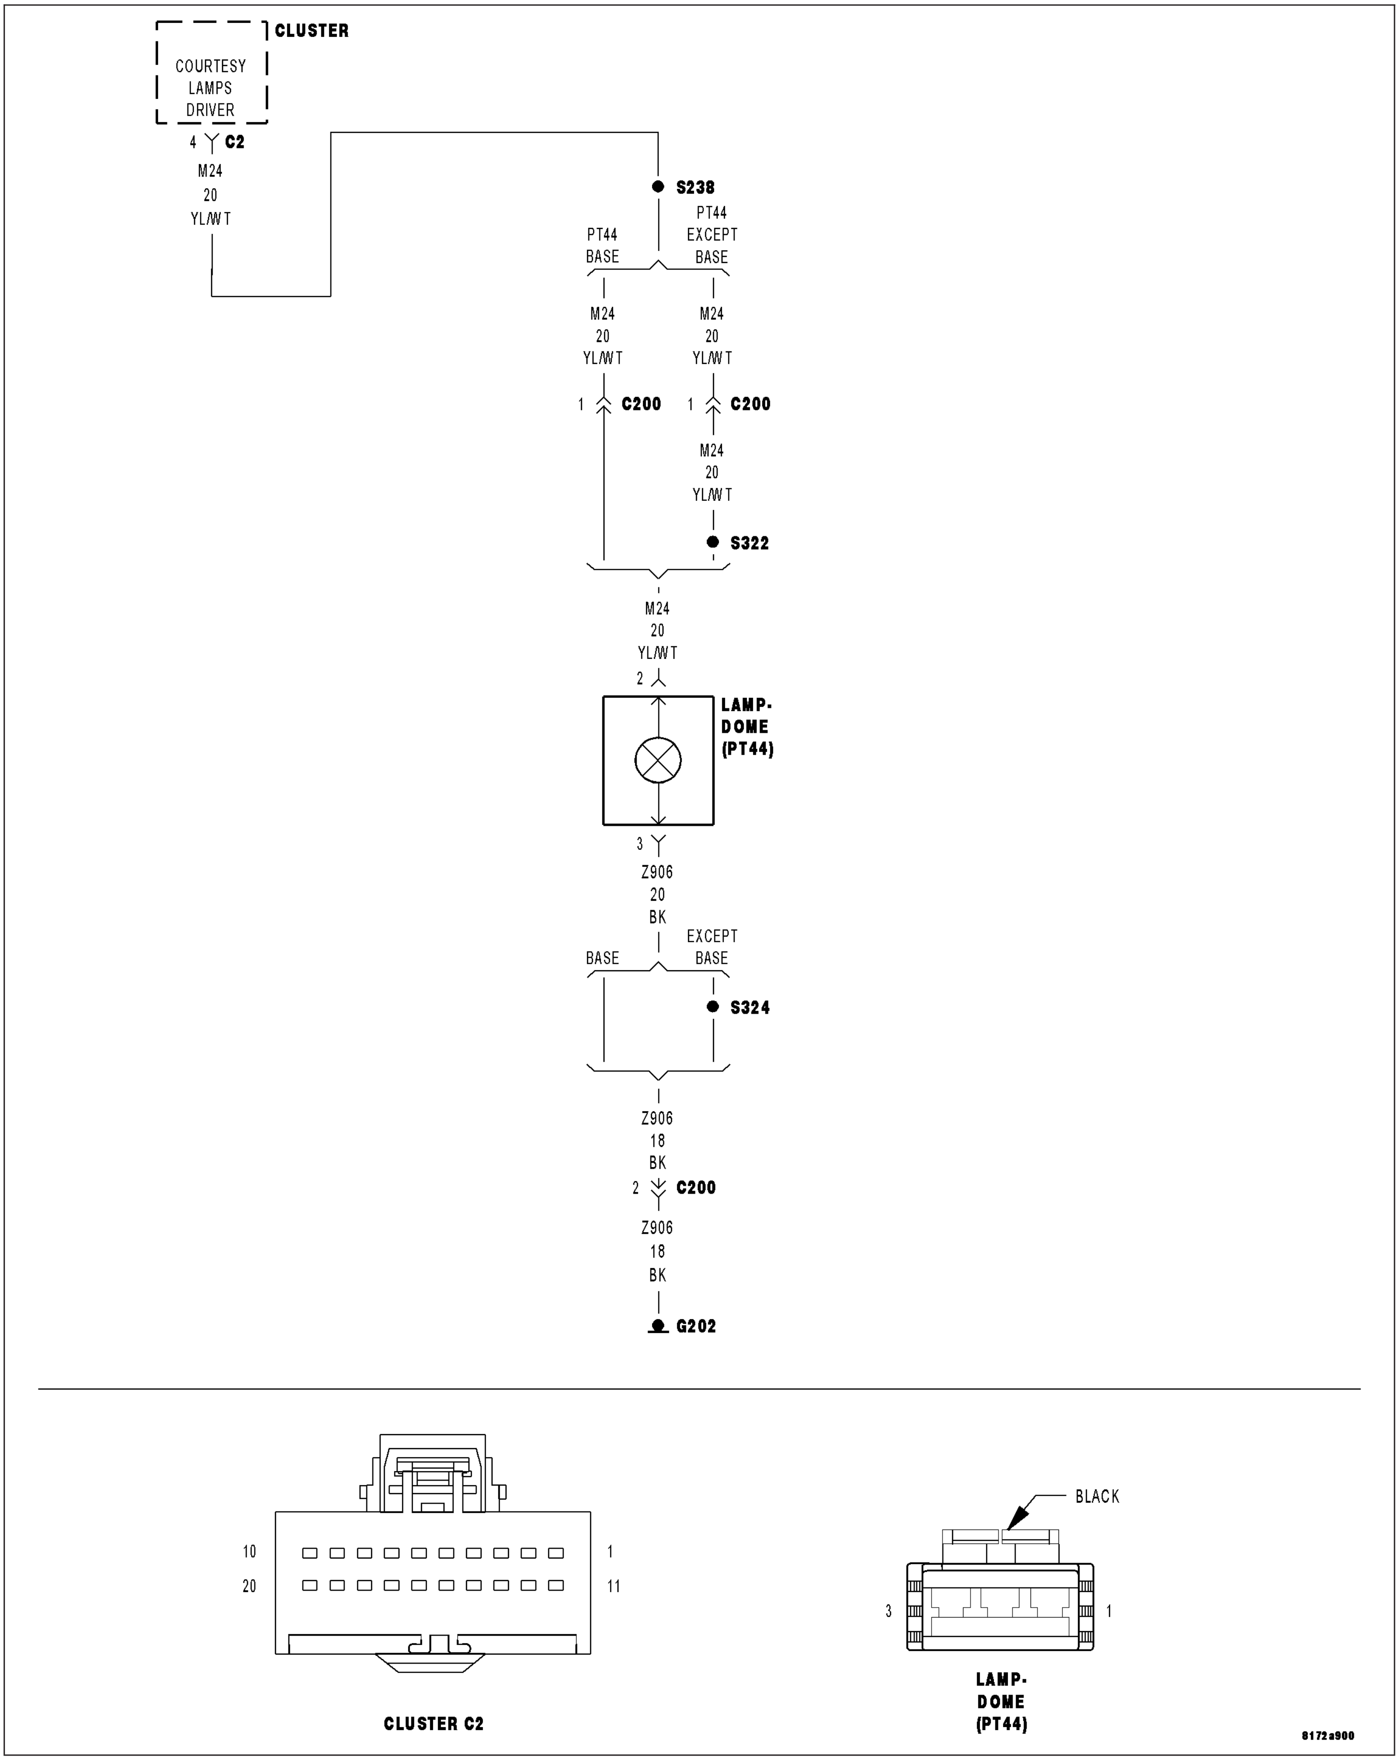


4. Install the push pin retainers (2) to the tail lamp unit (1).
5. Connect the battery negative cable.

EXPORT

If replacing the tail lamp unit (5) with a new one, transfer the bulb sockets to the new unit (5). Remember that there is a rear fog lamp bulb in the BUX tail lamp unit.

1. Install the tail lamp unit (5). Follow the same procedure as the domestic Step 1.



LAMPS/LIGHTING - INTERIOR

LAMPS/LIGHTING - INTERIOR

DIAGNOSIS AND TESTING

B161A-COURTESY/DOME LAMP CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Continuously
- **Set Condition:**
- When the Instrument Cluster detects a short to battery on the Control circuit.

Possible Causes
(M24) COURTESY LAMPS DRIVER CIRCUIT SHORT TO GROUND
(M24) COURTESY LAMPS DRIVER CIRCUIT OPEN
INSTRUMENT CLUSTER

Diagnostic Test

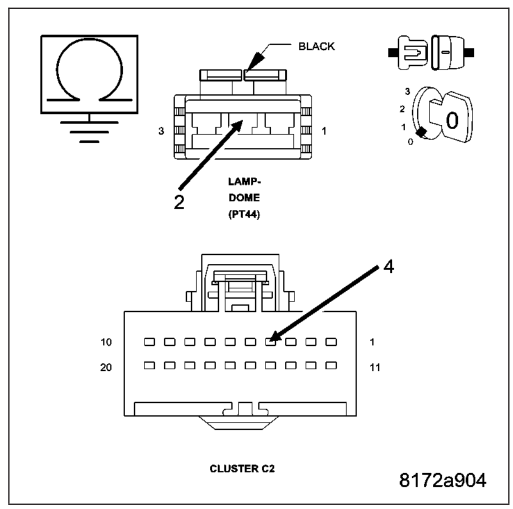
1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
Clear all Instrument Cluster DTC's
Turn the Courtesy Lamps on.
With the scan tool, read DTC's.

Does the scan tool read: B161A-COURTESY/DOME LAMP CONTROL CIRCUIT?

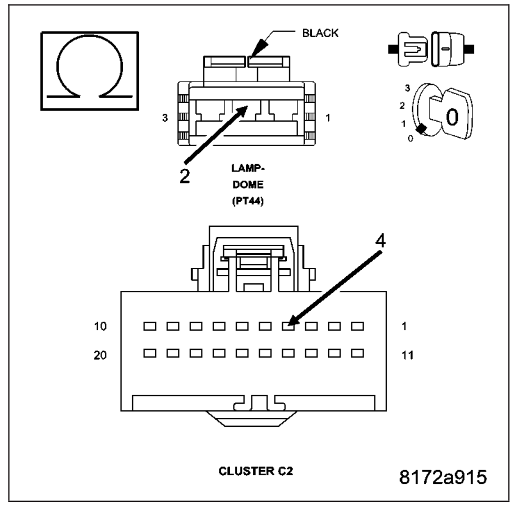
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



2. CHECK THE (M24) COURTESY LAMPS DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Disconnect the Instrument Cluster C2 harness connector.
Measure the resistance between the (M24) Courtesy Lamp Driver circuit and ground.



Is the resistance below 5.0 ohms?

Yes >> Repair the (M24) Courtesy Lamp Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE (M24) COURTESY LAMPS DRIVER CIRCUIT FOR AN OPEN

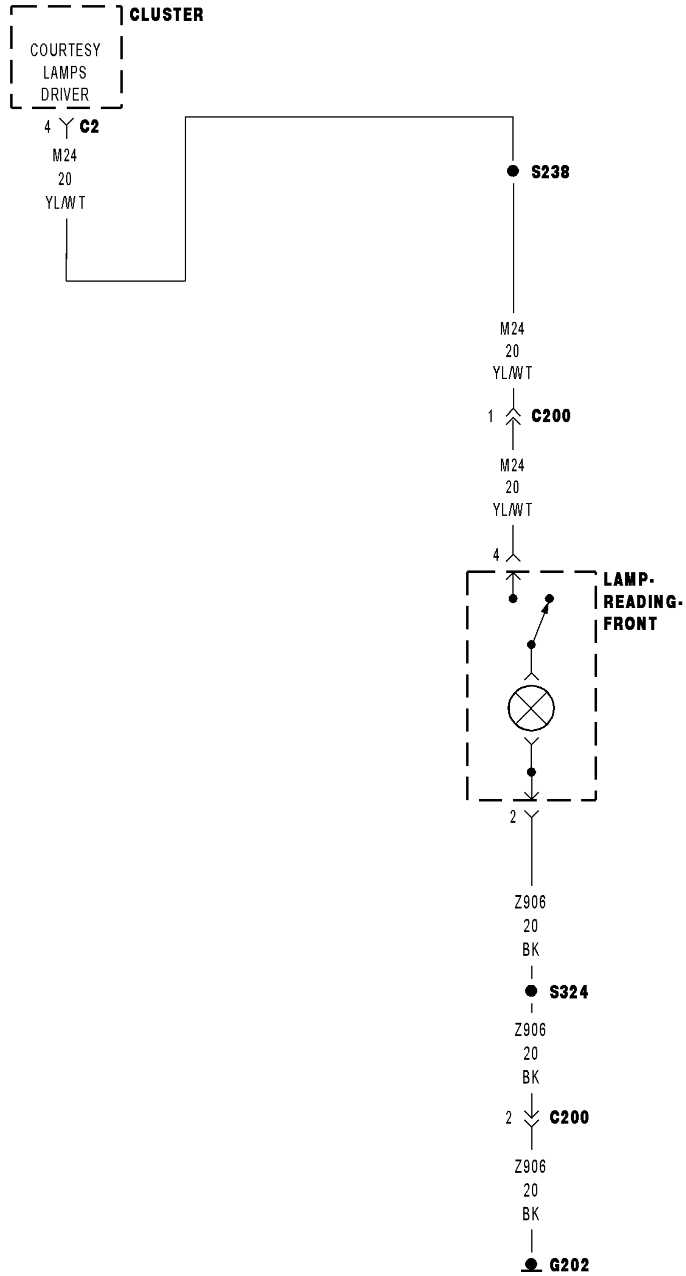
Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

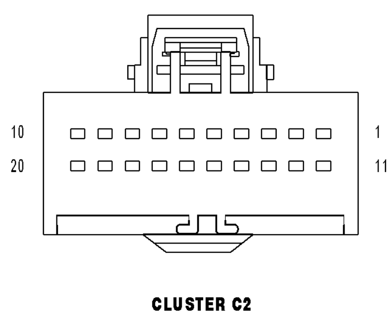
Turn the ignition on.

Measure the voltage of the (M24) Courtesy Lamp Driver circuit.

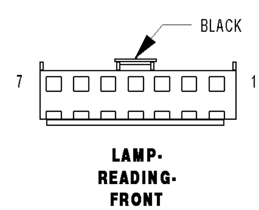
Is the voltage below 10.0 volts?



Yes >> Repair the (M24) Courtesy Lamp Driver circuit for an open.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



No >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B161E-READING LAMP CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Continuously
- **Set Condition:**
- When the Instrument Cluster detects a short to battery on the Control circuit.

Possible Causes
(M28) GLOVE BOX LAMP DRIVER CIRCUIT SHORT TO GROUND
(M28) GLOVE BOX LAMP DRIVER CIRCUIT OPEN
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

Clear all Instrument Cluster DTC's

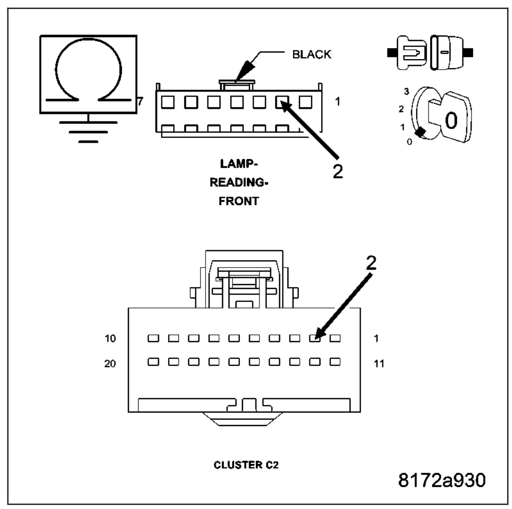
Turn the Courtesy Lamps on.

With the scan tool, read DTC's.

Does the scan tool read: B161E-READING LAMP CONTROL CIRCUIT?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE (M28) GLOVE BOX LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance between the (M28) Glove Box Lamp Driver circuit and ground.

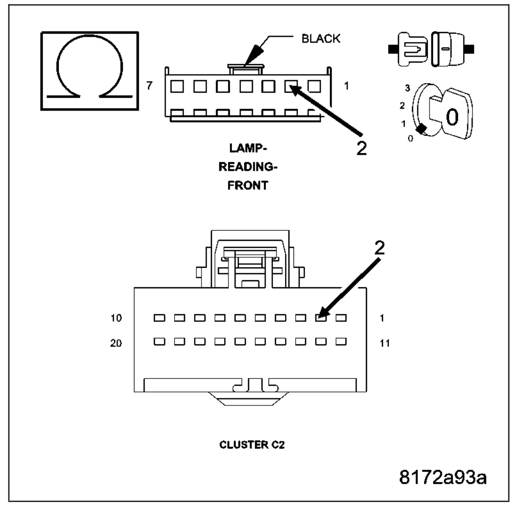
Is the resistance below 5.0 ohms?

Yes >> Repair the (M28) Glove Box Lamp Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE (M28) GLOVE BOX LAMP DRIVER CIRCUIT FOR AN OPEN



Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Activate the left and right vanity lamps (if equipped), the glove box lamp, and the left and right door handle lamps.

Turn the ignition on.

Measure the voltage of the (M28) Glove Box Lamp Driver circuit.

Is the voltage below 10.0 volts?

Yes >> Repair the (M28) Glove Box Lamp Driver circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

LAMPS/LIGHTING - INTERIOR - SERVICE INFORMATION

TABLE OF CONTENTS

LAMPS/LIGHTING - INTERIOR - SERVICE INFORMATION

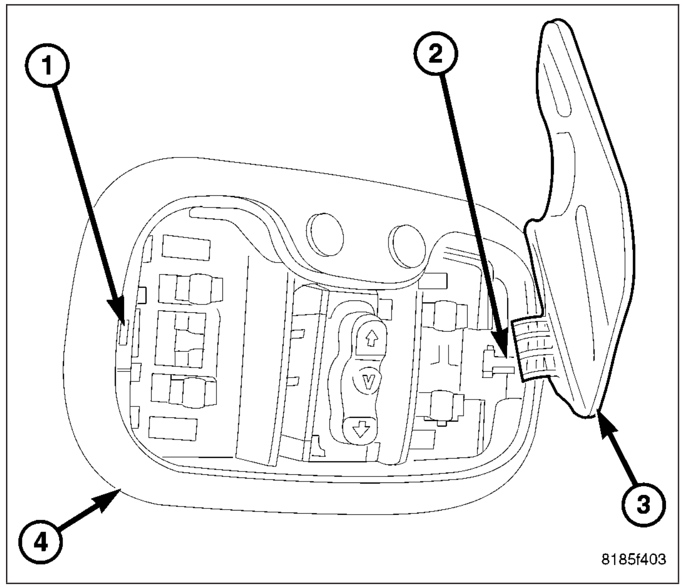
SPECIFICATIONS

INTERIOR LAMPS

CAUTION: Do not use bulbs that have a higher candle power than the bulb listed in the chart below. Damage to the lamp unit can result.

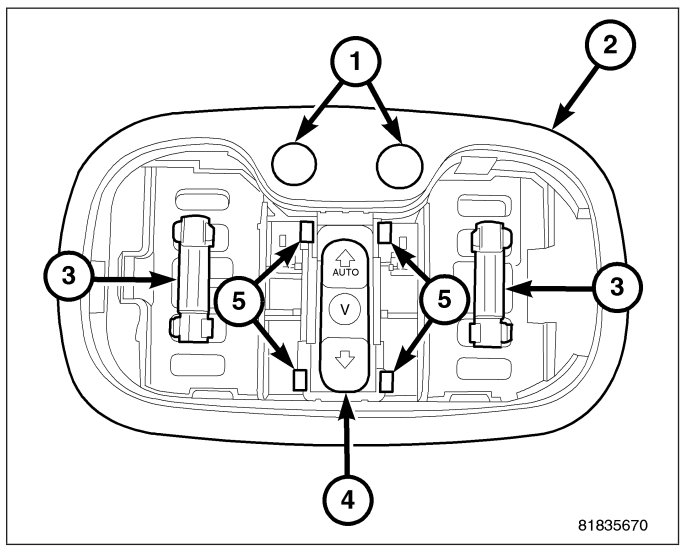
BULB APPLICATION TABLE

BULB	LAMP
Courtesy/Reading Lamp	T578
Dome Lamp	T578
Rear Cargo Lamp	8-A35LF



All the interior bulbs utilize a brass or glass wedge base. Bulbs with aluminum bases are not approved and should not be used.

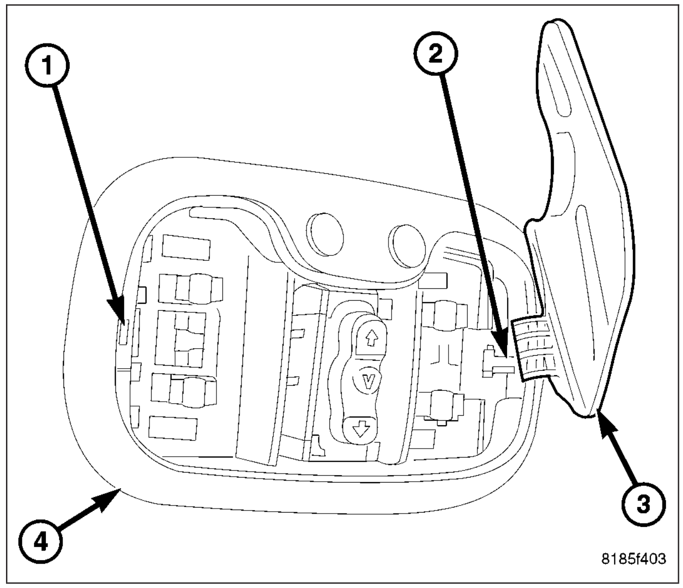
COURTESY/READING LAMP



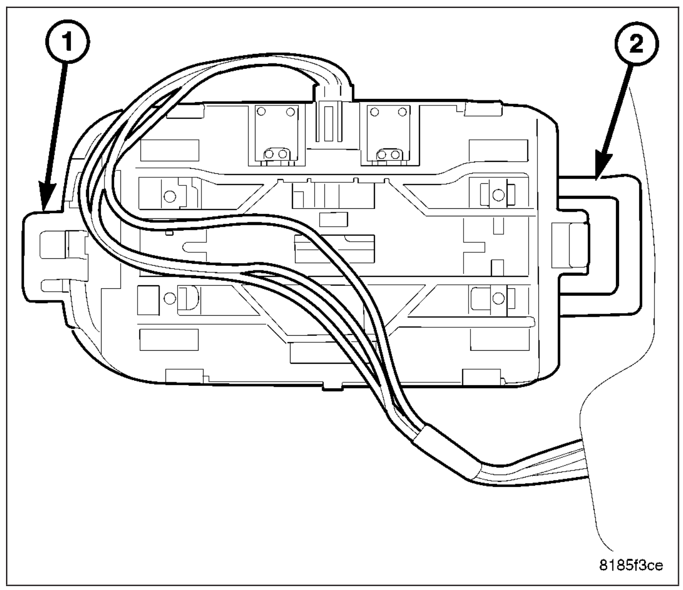
REMOVAL

BULB

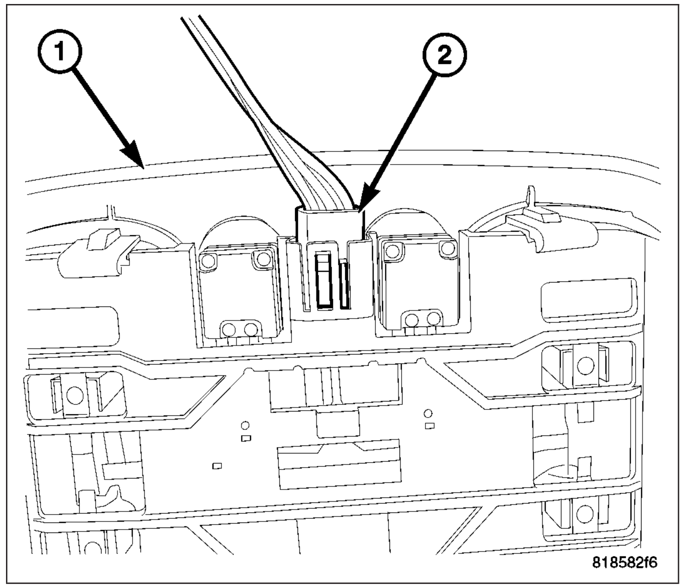
1. Insert a trim stick between the lamp bezel (4) and courtesy/reading lamp lens (3) on the left side of the courtesy/reading lamp at (1).
2. Carefully swing lamp lens (3) toward the right side of the vehicle so that the tab (2) on the lens can come out of the lamp unit (4).



3. Remove bulb (3) from lamp unit (2).

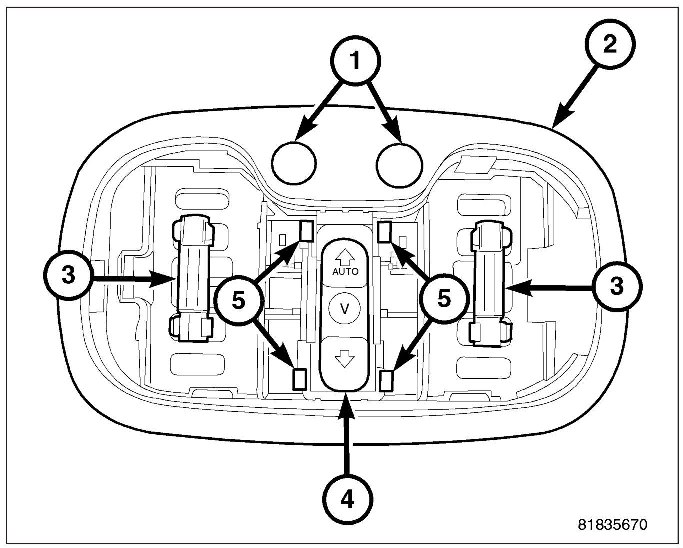


UNIT

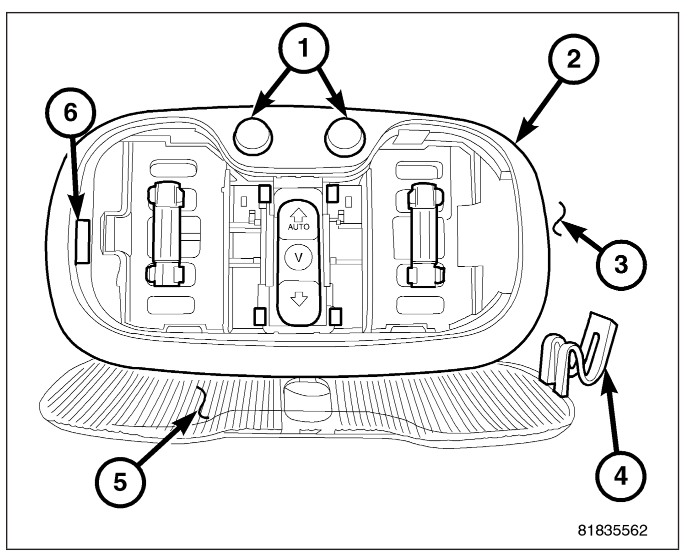


1. Insert a trim stick between the lamp bezel (4) and courtesy/reading lamp lens (3) on the left side of the courtesy/reading lamp at (1).
2. Carefully swing lamp lens (3) toward the right side of the vehicle so that the tab (2) on the lens can come out of the lamp unit (4).

3. As shown from the backside, once the tab (1) from the lens is out of the way, the right side will pull down from the headliner and then pull to the right to release the unit retaining tab (2).

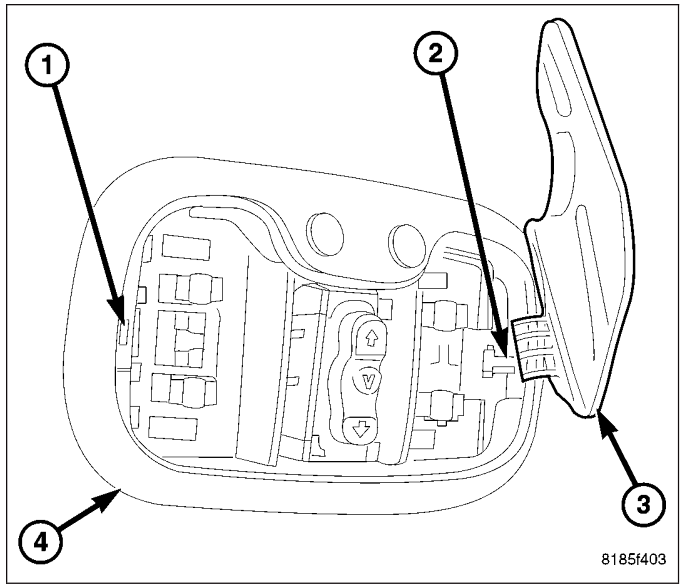


4. Disconnect the courtesy/reading lamp unit (1) electrical connector (2).



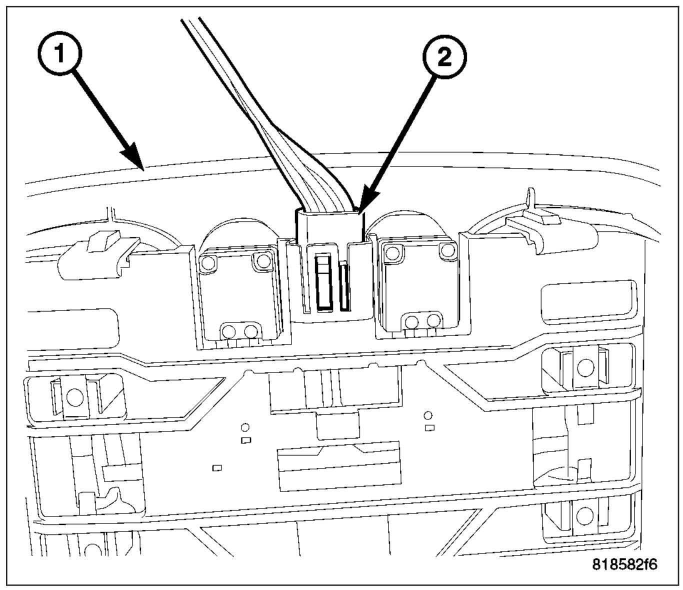
INSTALLATION

BULB

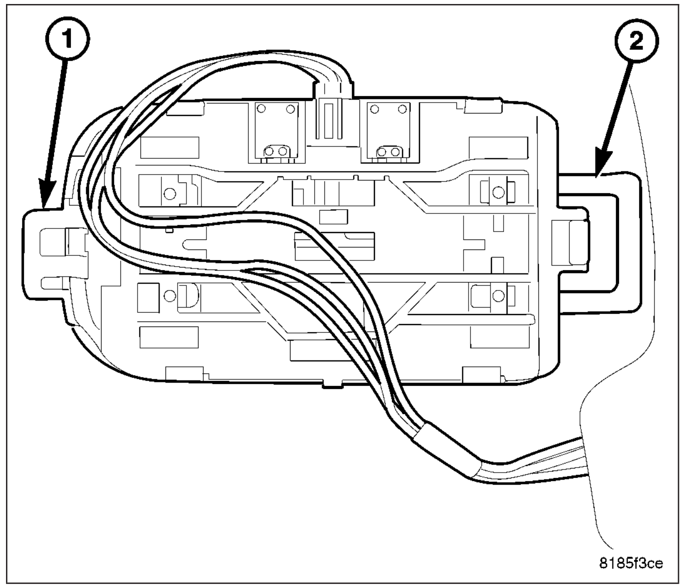


1. Position bulb (3) in holder and firmly press into place.

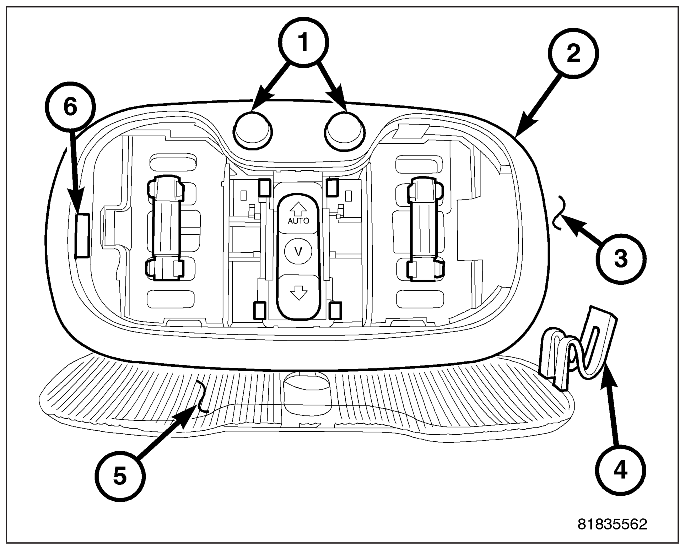
NOTE: When installing the lens (5), make sure that the tab on the lens (4) is inserted on the right side of the courtesy/reading lamp unit first.



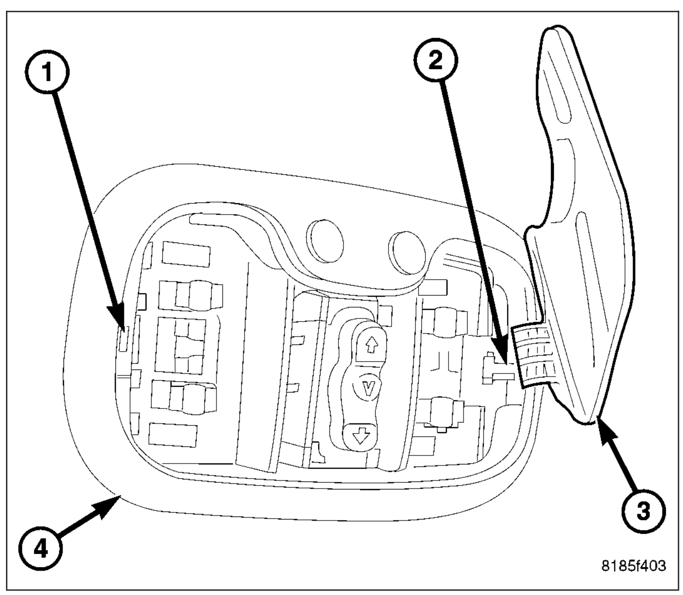
2. Once the right side tab (2) is in the headliner, roll up the left side of the lens (3) until it snaps into place at (1).



UNIT



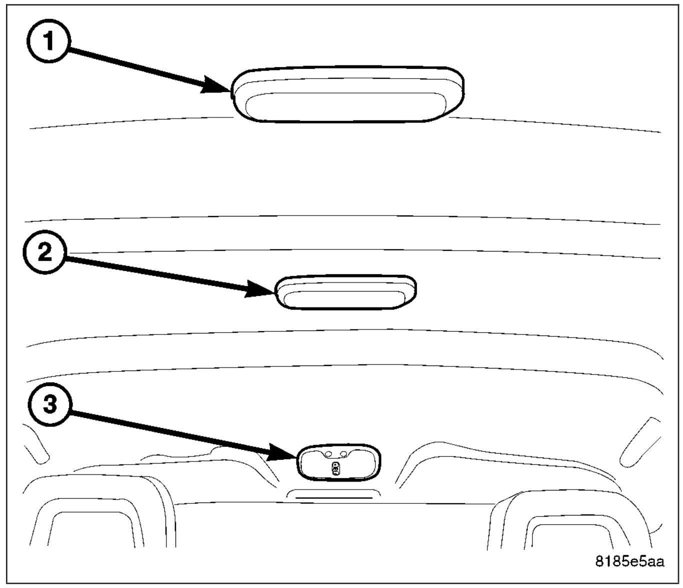
1. Connect the courtesy/reading lamp (1) electrical connector (2).



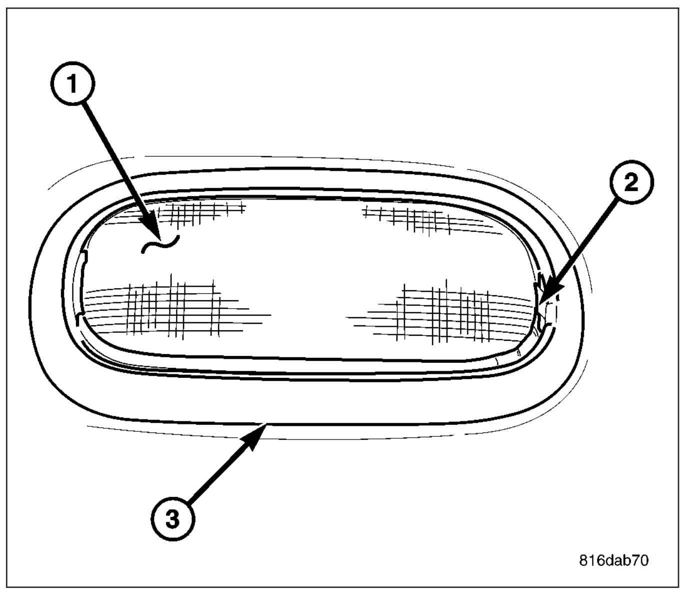
2. As shown from the backside, insert the unit tab (2) up into the headliner to the left first of all. Then push up the right side up into the headliner. The lens tab (1) will hold up the right side of the courtesy/reading lamp unit.

NOTE: When installing the lens (5), make sure that the tab on the lens (4) is inserted on the right side of the courtesy/reading lamp unit first.

3. Once the right side tab (2) is in the headliner, roll up the left side of the lens (3) until it snaps into place at (1).



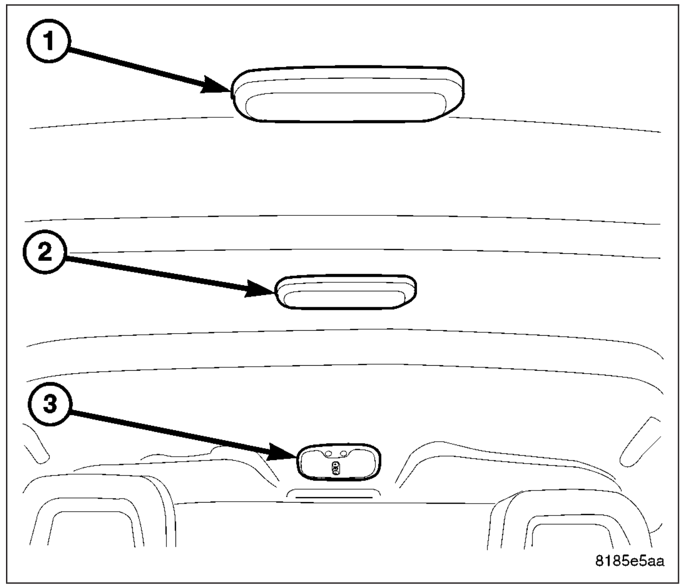
DOME LAMP



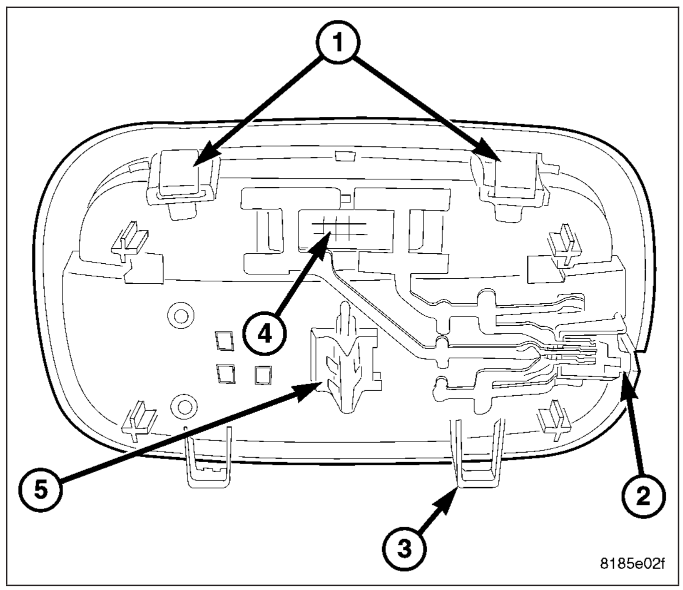
REMOVAL

BULB

1. On lower line vehicles, there will be two overhead lamps located at (1 and 2). (1) is the Cargo Lamp, and (2) is the Dome Lamp.

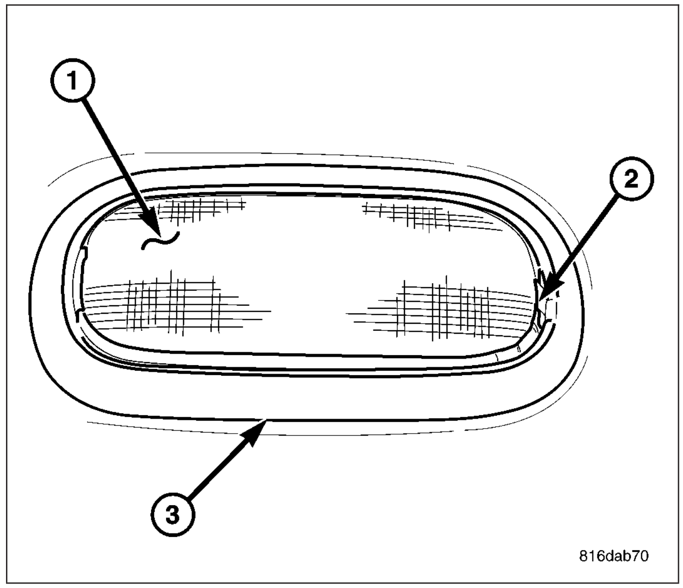


2. Insert a trim stick or equivalent between the lamp unit (3) and the lens (1) at this position (2).
3. Carefully remove the lamp lens (1).
4. Remove lamp from lamp unit.



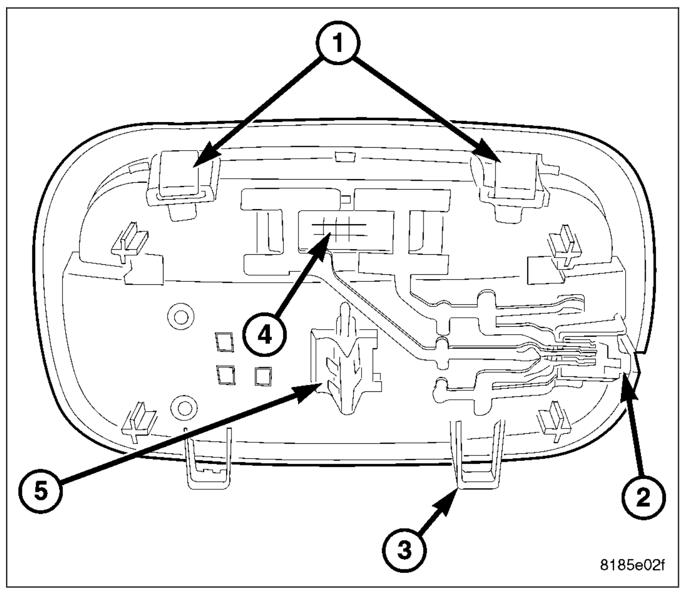
UNIT

1. On lower line vehicles, there will be two overhead lamps located at (1 and 2). (1) is the Cargo Lamp, and (2) is the Dome Lamp.



2. From the front of the dome lamp, insert a trim stick between the dome lamp unit bezel (3) and the headliner and gently pry down to release the clip (5) holding the unit to the roof panel , and the two clips (1) holding it to the headliner.
3. Pull the dome lamp forward to release the two tabs (3) from the headliner.
4. Disconnect the wire connector (2).
5. Remove the dome lamp unit from vehicle.

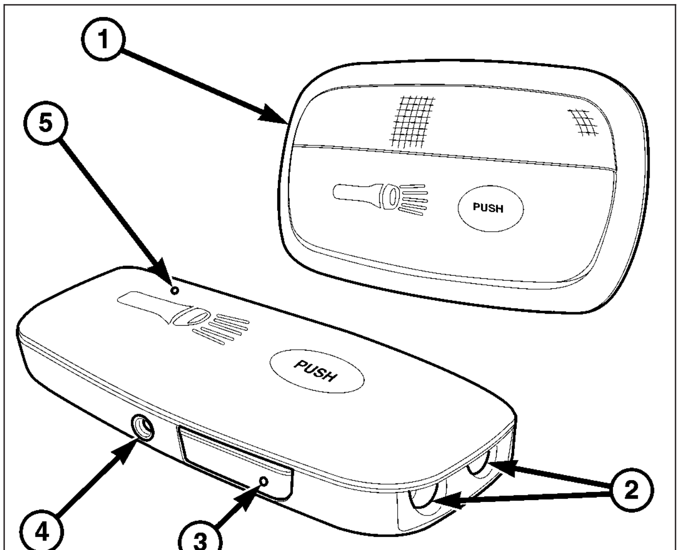
INSTALLATION



BULB

1. Push lamp in lamp unit (3) and snap into place.
2. Position lens (1) on lamp unit (3) and snap into place.

UNIT

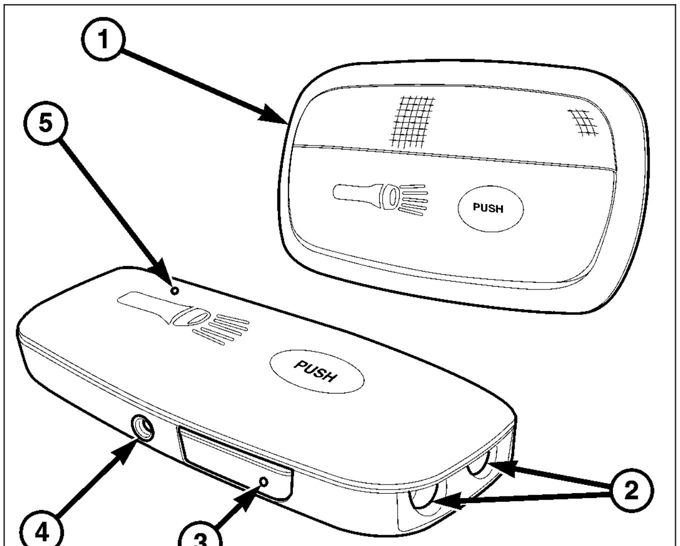


1. Connect electrical connector (2).
2. Place lamp into position, insert the unit into headliner opening, place the two tabs (3) towards the rear of the vehicle.
3. Push up on the front of the dome lamp until the three clips are fully engaged. The two front clips (1) to the headliner and the one clip (5) to the roof panel.

REAR CARGO LAMP

DESCRIPTION

An optional dual-purpose cargo lamp (1) is removable and rechargeable on some models. If equipped with this option, there is flashlight (5) that can be removed. When the flashlight is snapped out of its bezel, it can be used in emergencies or other situations. The recharge indicator (4) reminds you that the flashlight batteries are getting low and need to be recharged by reinstalling the flashlight into the cargo lamp. The flashlight uses two Light Emitting Diodes (LED's) (2) for illumination and is powered by rechargeable lithium batteries integral to the flashlight unit. The cargo lamp is still functional with or without the flashlight installed

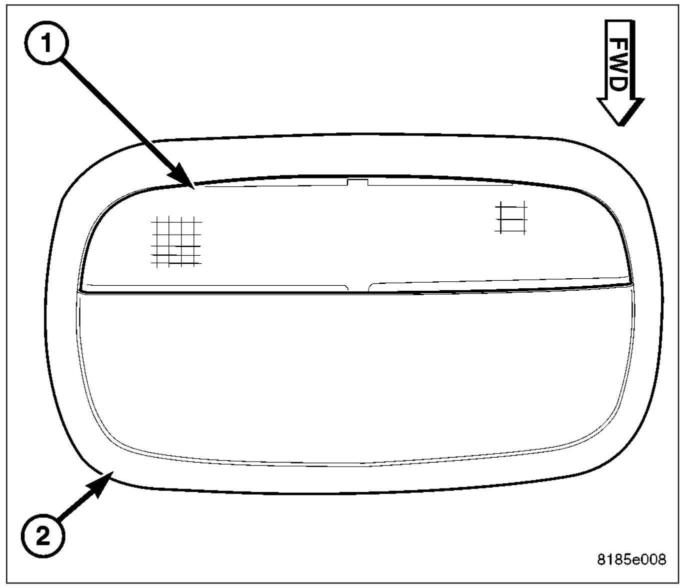


8185e221

OPERATION

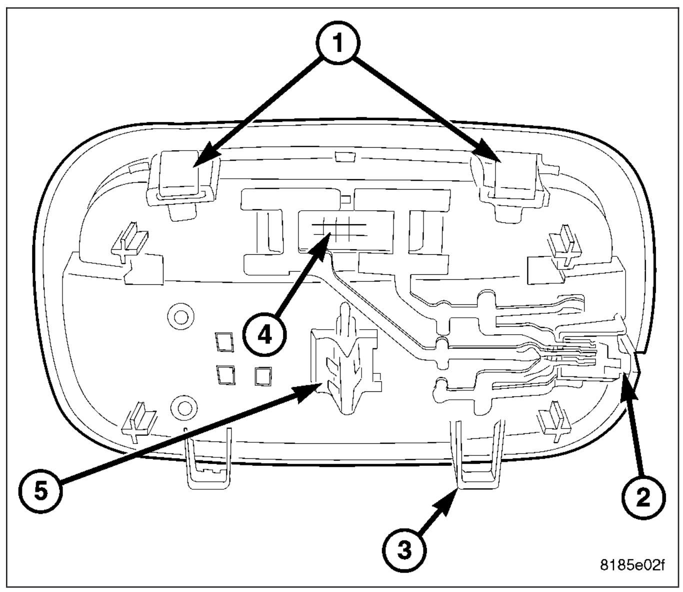
Some models will be equipped with the optional Removable/Rechargeable Cargo Lamp (1). This is a flashlight (5) that is removed from the rear cargo lamp with the simple push on the flashlight on the left side, and then is pulled down to release it from the cargo lamp. The flashlight is turned on by the momentary contact switch (3). The flashlight uses Light Emitting Diodes (LED's) (2) that are not serviceable and if inoperative, must be replaced with a new flashlight.

The rear cargo lamp has B+ battery power to it when any of the doors or liftgate is opened, assuming that the thumbwheel on the left switch stalk is in the on position. The flashlight has two contacts that apply B+ battery power and ground when the ignition switch is in the Run/Start position, regardless of the position of the interior lamp thumbwheel.



8185e221

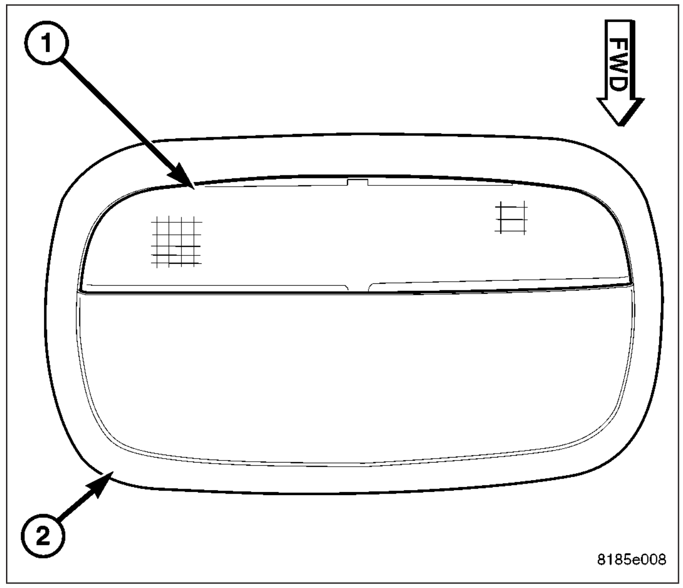
REMOVAL



BULB

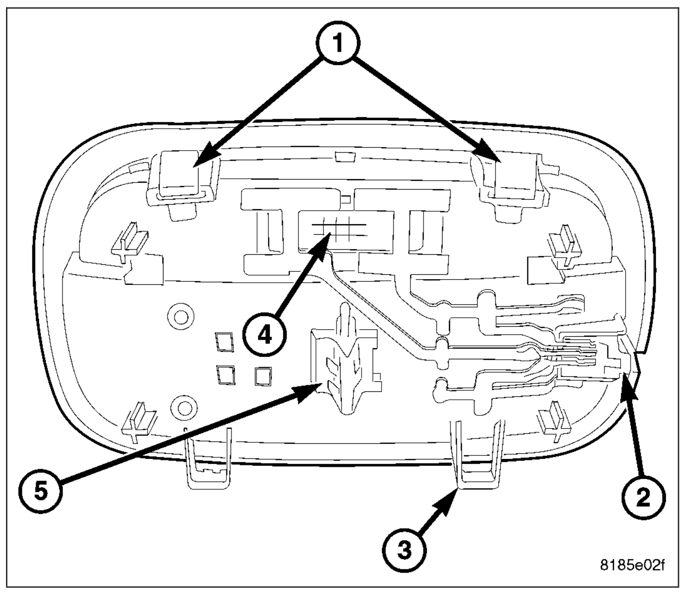
1. Open liftgate.
2. Using a trim stick or equivalent, gently pry between the lens (1) and the cargo lamp unit (2).
3. Pull bulb from unit.

UNIT



1. Open liftgate.
2. Peel down the rear of the headliner and disconnect the wire connector (2).
3. From the front of the rear cargo lamp unit, insert a trim stick between the cargo lamp unit bezel (3) and the headliner and gently pry down to release the clip (5) holding the unit to the roof panel , and the two clips (1) holding it to the headliner.
4. Pull the rear cargo lamp forward to release the two tabs (3) from the headliner.
5. Remove the rear cargo lamp unit from vehicle.

INSTALLATION

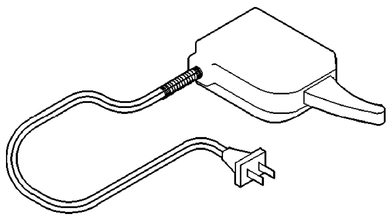


BULB

1. Push bulb into unit until seated.
2. Snap lens (1) onto lamp unit (2).

UNIT

1. Place lamp into position, insert the unit into headliner opening, place the two tabs (3) towards the rear of the vehicle.
2. Push up on the front of the rear cargo lamp until the three clips are fully engaged. The two front clips (1) to the headliner and the one clip (5) to the roof panel.
3. Peel down the rear of headliner and connect electrical connector (2).

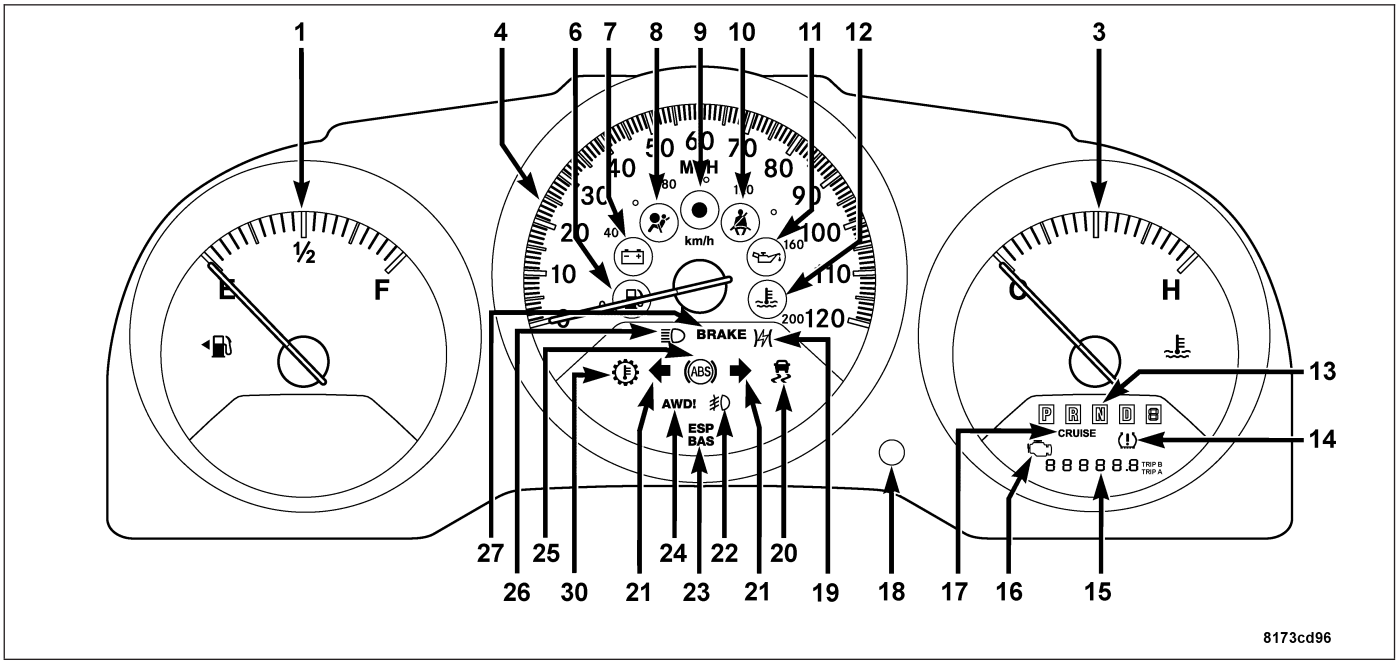


MESSAGE SYSTEMS

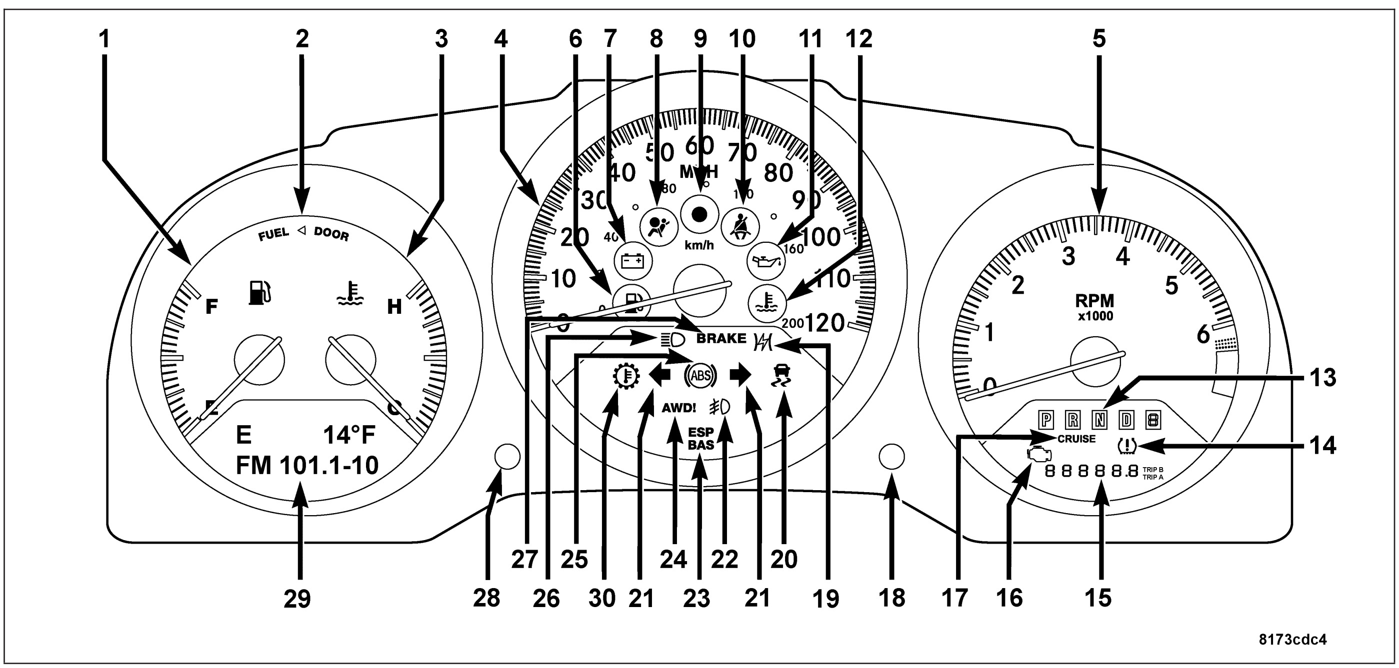
TABLE OF CONTENTS

MESSAGE CENTER

SPECIAL TOOLS



ELECTRONIC VEHICLE INFORMATION CENTER



DEGAUSSING TOOL 6029

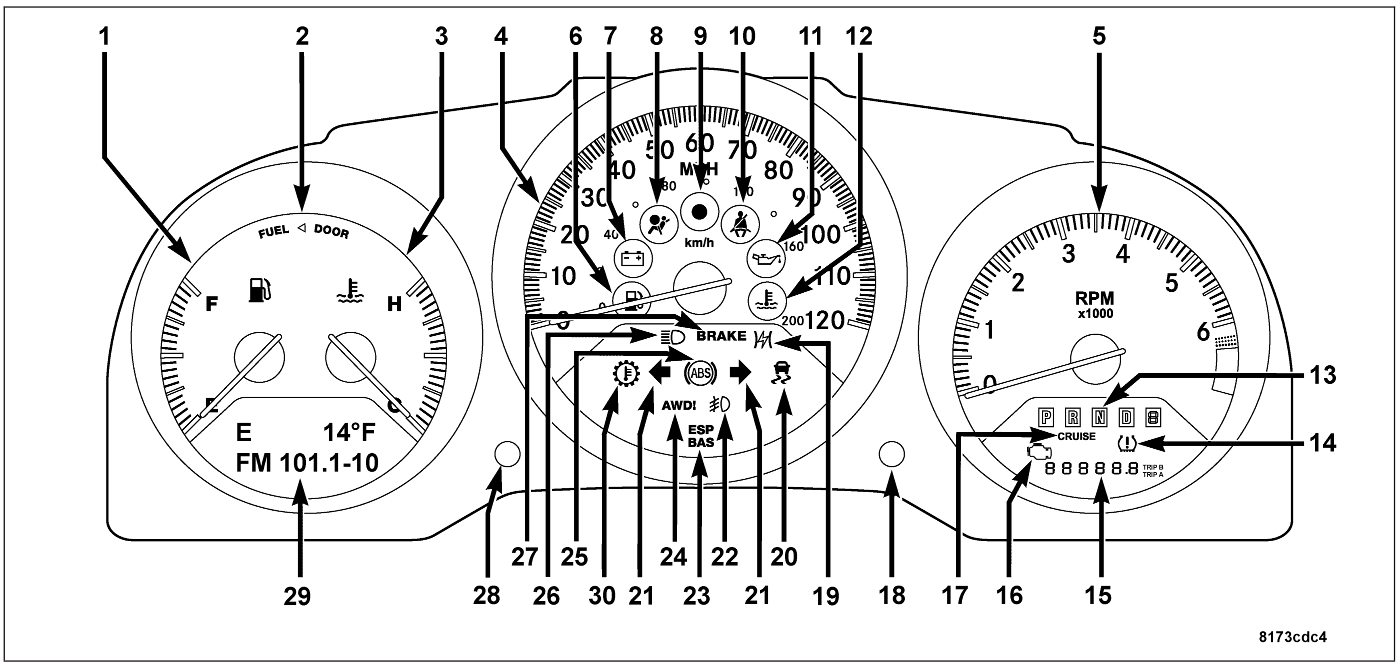
ELECTRONIC VEHICLE INFORMATION CENTER

DESCRIPTION

The base instrument cluster can be identified by the single **TRIP SHAFT** button (18) located to the left of the Temperature Gauge (3). The odometer display (15) doubles as the outside air temperature display when selected by toggling through the odometer menu using the **TRIP SHAFT** button.

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display (29). The display is located in the lower left part of the instrument cluster below the fuel and engine temperature gauges (1 and 3). This system conveniently allows the driver to select a variety of useful information by pressing the **STEP** button (28) to the right of the EVIC display. The EVIC displays information related to the following:

- System Status
- Vehicle information warning message displays
- Personal Settings (customer programmable features)
- Compass display



- Outside temperature display
- Trip computer functions
- UConnect™ hands-free communication system displays - If Equipped
- Navigation system screens - If Equipped
- Audio mode display

The EVIC system is comprised of several different components. Those components are:

- Instrument Cluster
- EVIC **STEP** Button
- Ambient Temperature Sensor
- Remote Compass Module (RCM)
- Controller Area Network (CAN) Data Bus
- Local Interface Network (LIN) Data Bus

The EVIC display and **STEP** button are part of the Instrument Cluster assembly and cannot be serviced as separate components. If the display or button are inoperative the complete Instrument Cluster assembly must be replaced, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

OPERATION

The Electronic Vehicle Information Center (EVIC) uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the On position. When the ignition switch is turned to the On position, the EVIC display (29) will return to the last function being displayed before the ignition was turned to the Off position.

The EVIC system is comprised of several different components that communicate over the Controller Area Network (CAN) and Local Interface Network (LIN) Data Buses. If the system is inoperative a scan tool and the appropriate diagnostic information must be used to diagnose the system and related data buses.

The instrument cluster **STEP** button (28) is used to operate the different functions of the EVIC system. Pressing and releasing the **STEP** button will scroll through the following displays:

- Compass/Temperature/Audio
- Average Fuel Economy
- Distance to Empty
- Elapsed Time
- Personal Settings

Once a particular system is displayed, short and long presses of the **STEP** button will move the EVIC through the system menu. Pressing and holding the **STEP** button once will clear the resettable function currently being dis-

played. Reset will only occur if a resettable function is currently being displayed. To reset all resettable functions, press and release the **STEP** button a second time within 3 seconds of resetting the currently displayed function (Reset ALL will be displayed during this 3 second window).

EVIC DISPLAY MODES

SYSTEM STATUS MODE

System display mode displays warnings and user interaction messages on the EVIC display (29). The driver can scroll to view multiple messages by using the **STEP** button.

When the appropriate conditions exist, the EVIC displays the following messages:

- Turn Signal On (with a continuous warning chime)
- Left Front Turn Signal Lamp Out (with a single chime)
- Left Rear Turn Signal Lamp Out (with a single chime)
- Right Front Turn Signal Lamp Out (with a single chime)
- Right Rear Turn Signal Lamp Out (with a single chime)
- Personal Settings Not Available – Vehicle Not in Park (automatic transmissions) or vehicle in motion (manual transmissions)
- Left/Right Front Door Ajar (one or more, with a single chime if speed is above 1 mph (1.6 km/h))
- Left/Right Rear Door Ajar (one or more, with a single chime if speed is above 1 mph (1.6 km/h))
- Door(s) Ajar (with a single chime if vehicle is in motion)
- Trunk Ajar (with a single chime)
- Headlamps On/Lights On With Key Out Of Ignition.

COMPASS/TEMPERATURE/AUDIO

Compass heading and outside temperature are displayed at the top of the EVIC display screen. On the lower half of the screen the audio mode is displayed along with the odometer. One of eight compass headings to indicate the direction the vehicle is facing (N, S, E, W, NE, NW, SE, SW) and to select one of 15 compass variance settings. Outside temperature is displayed in °C (degrees Celsius) or °F (degrees Fahrenheit). Audio mode can display any one of 12 radio station preset frequencies, CD disc number, CD track number, tape, and one of 200 Satellite Radio Channels - if equipped.

For additional information regarding the compass, refer to Personal Settings (Customer Programmable Features) in this section.

AVERAGE FUEL ECONOMY

Shows the average fuel economy since the last reset. When the fuel economy is reset, the display will read “RESET” or show dashes for two seconds. Then, the history information will be erased, and the averaging will continue from where it was before the reset.

DISTANCE TO EMPTY (DTE)

NOTE: Significant changes in driving style or vehicle loading will greatly affect the actual drivable distance of the vehicle, regardless of the DTE displayed value.

Shows the estimated distance that can be travelled with the fuel remaining in the tank. This estimated distance is determined by a weighted average of the instantaneous and average fuel economy, according to the current fuel tank level. This is not resettable.When the DTE value is less than 30 miles (48 kilometers) estimated driving distance, the DTE display will change to a text display of ″LOW FUEL″. This display will continue until the vehicle runs out of fuel. Adding a significant amount of fuel to the vehicle will turn off the ″LOW FUEL″ text and a new DTE value will be displayed, based on the current values in the DTE calculation and the current fuel tank level.

ELAPSED TIME

Shows the total elapsed time of travel since the last reset when the ignition switch is in the ACC position. Elapsed time will increment when the ignition switch is in the ON or START position.

HANDS FREE TELEPHONE MODE - IF EQUIPPED

Provides the following information and features for the optional hands-free communications system:

- Phone status: idle, voice mail, roaming, battery strength and signal strength in increments of 20 percent
- Call status: Incoming call, connecting, connected, air time in minutes and seconds, call ended, busy, call failed, roaming and no phone connection
- Caller ID phone number display

PERSONAL SETTINGS MODE (CUSTOMER PROGRAMMABLE FEATURES)

Allows the driver to set and recall features when the transmission is in Park by pressing and releasing the **STEP** button until Personal Settings is displayed in the EVIC. The following personal settings can be set and recalled:

- Language: English, Spanish and French (domestic markets) German and Italian (export markets)
- Lock doors automatically at 15 mph (24 km/h), On or Off
- Unlock door automatically on exit, On or Off
- Remote Keyless Entry unlock driver door on first press or unlock all doors on first press
- Sound horn with Remote Keyless Entry Lock, On or Off
- Turn headlamps on with Remote Keyless Entry Lock, On or Off
- Delay turning headlamps off for 0, 30, 60 or 90 seconds
- Key-Off Power Delay (delay power off to accessories until exit off, 45-seconds maximum, 5-minute maximum, 10-minute maximum)
- Illuminated Approach - Turn headlamps on with Remote Keyless Entry Unlock, Off or 30, 60 or 90 seconds
- Display units in English or Metric
- Compass Variance Setting 1 through 15
- Calibrate Compass Yes/No

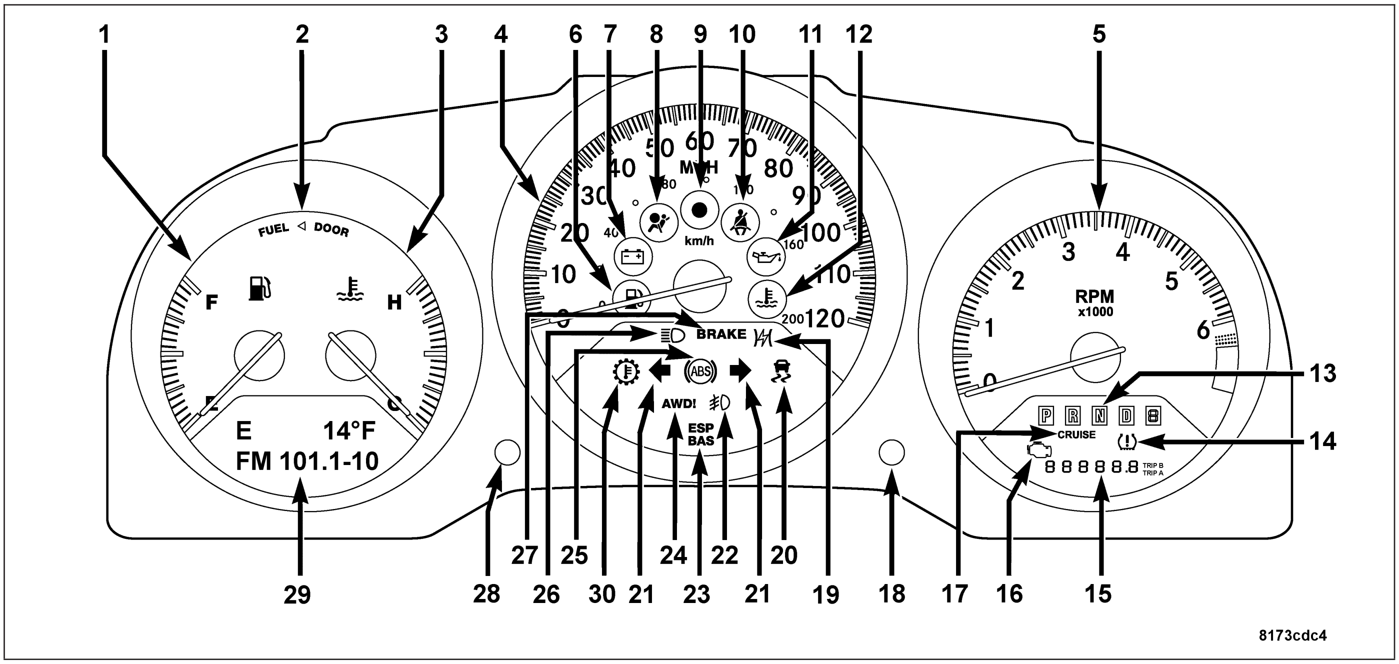
DIAGNOSIS AND TESTING

ELECTRONIC VEHICLE INFORMATION CENTER

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not place any electronic devices (cell phones, laptop computers, PDA's, portable DVD players, etc), on or near the instrument panel as the Remote Compass Module (RCM) performance may be effected. Do not use magnetic tools when servicing the RCM.

The Electronic Vehicle Information Center (EVIC) data is obtained from several components on the Controller Area Network (CAN) and Local Interface Network (LIN) Data Bus circuits. The EVIC will not function properly if the bus messages from any of these components is not received. If no EVIC data is displayed or the display indicates dashes ″– –″, check the CAN Data Bus circuit communications, the Instrument Cluster functions, the Remote Compass Module (RCM) and the Totally Integrated Power Module (TIPM).

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the EVIC,the RCM, the CAN Data Bus and Local Interface Network (LIN) Data Bus circuits. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.



STANDARD PROCEDURE

COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not place any electronic devices (cell phones, laptop computers, PDA's, portable DVD players, etc), on or near the instrument panel as the Remote Compass Module (RCM) performance may be effected. Do not use magnetic tools when servicing the RCM.

The electronic compass unit features a continuous self-calibrating feature. This feature automatically updates the compass calibration as the vehicle is driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or

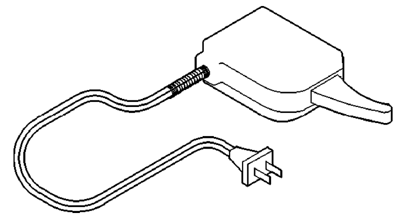
the Electronic Vehicle Information Center (EVIC) displays “CAL”, perform the following calibration procedure. Also, any time a new RCM is installed, it must be calibrated using this procedure.

Calibrate the compass manually as follows:

NOTE: Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

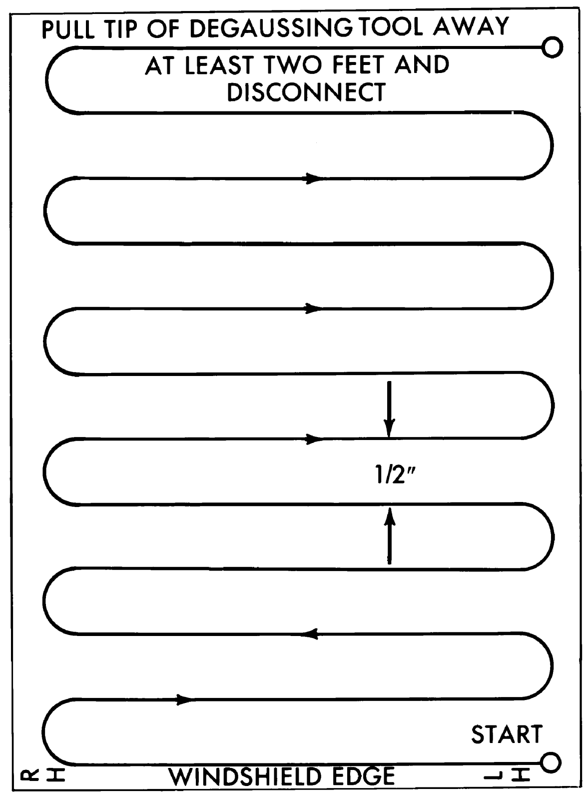
1. Start the engine but leave the vehicle in “PARK”.
2. Continue to depress and release the **STEP** button (28) until the “Personal Settings” menu is displayed.
3. Once in the “Personal Settings” menu depress and release the **STEP** button (28) several times until “Calibrate Compass (Yes)” is displayed.
4. A long (longer than two seconds) **STEP** button press will place the compass in calibration mode. The “Cal” indicator will change from flashing to on continuously in the EVIC display (29) to indicate that the compass is now in the calibration mode and that the vehicle can now be driven to calibrate. (A short **STEP** button press from the ″Calibrate Compass (Yes)″ screen will exit the EVIC Customer Programmable features, and return it to its normal operating mode).
5. To complete the compass calibration, drive the vehicle in one or more complete 360 degree circles under 5 mph (8 km/h) in an area free of large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines, until the “CAL” indicator turns off. The compass will now function normally.

NOTE: If the compass display indicates an inaccurate compass heading or the display is locked up, the RCM may be inoperative or the vehicle may need to be demagnetized. Perform the Compass Demagnetizing Procedure prior to performing any system diagnosis, (Refer to 8 - ELECTRICAL/MESSAGE CENTER/ELECT VEHICLE INFORMATION CENTER - STANDARD PROCEDURE - COMPASS DEMAGNETIZING).



NOTE: If the compass display indicates dashes ″– –″ the RCM may be inoperative or the vehicle may need to be demagnetized. Perform the Compass Demagnetizing Procedure prior to performing any system diagnosis, (Refer to 8 - ELECTRICAL/MESSAGE CENTER/ELECT VEHICLE INFORMATION CENTER - STANDARD PROCEDURE - COMPASS DEMAGNETIZING).

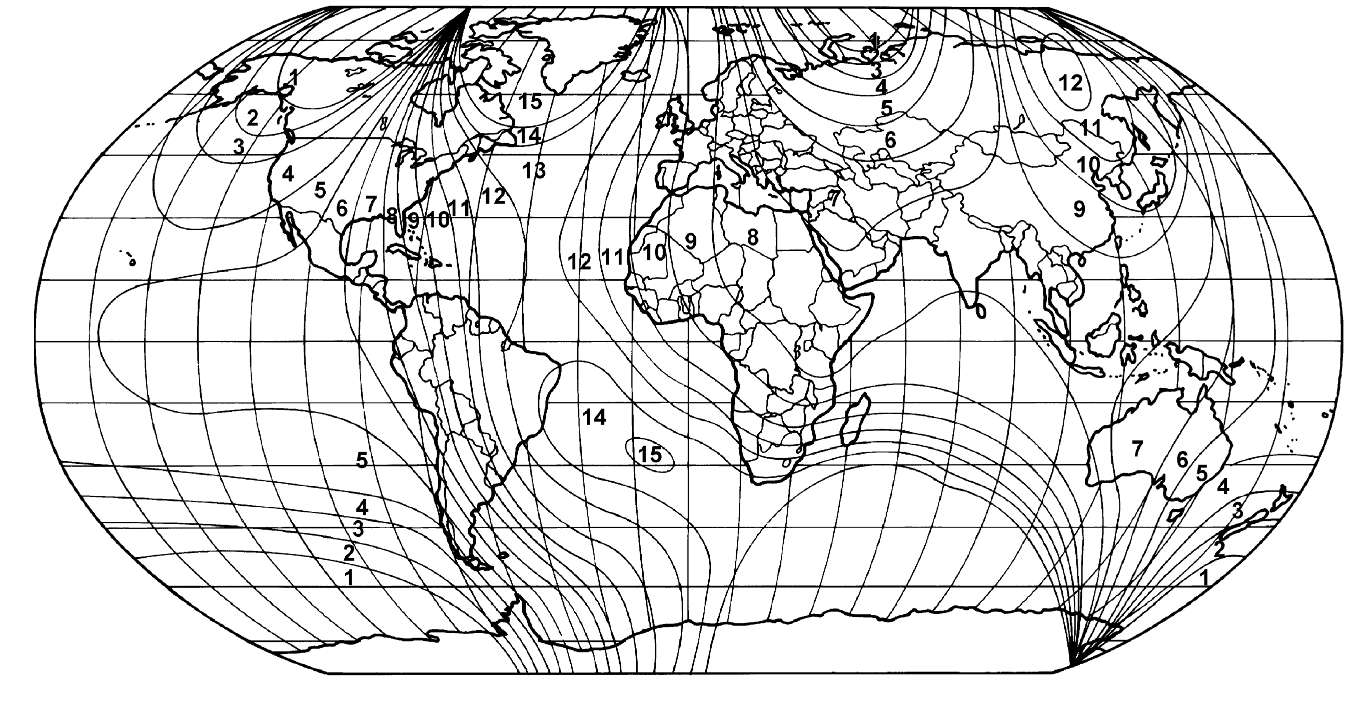
NOTE: If the “CAL” message remains in the display or if the compass heading is inaccurate following the calibration procedure and there are no internal compass faults, either there is excessive magnetism near the compass, or the unit is inoperative. Repeat the calibration procedure at least one more time prior to performing any system diagnosis.



NOTE: If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the calibration procedure in another location.

COMPASS DEMAGNETIZING

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the roof panel above the overhead console. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

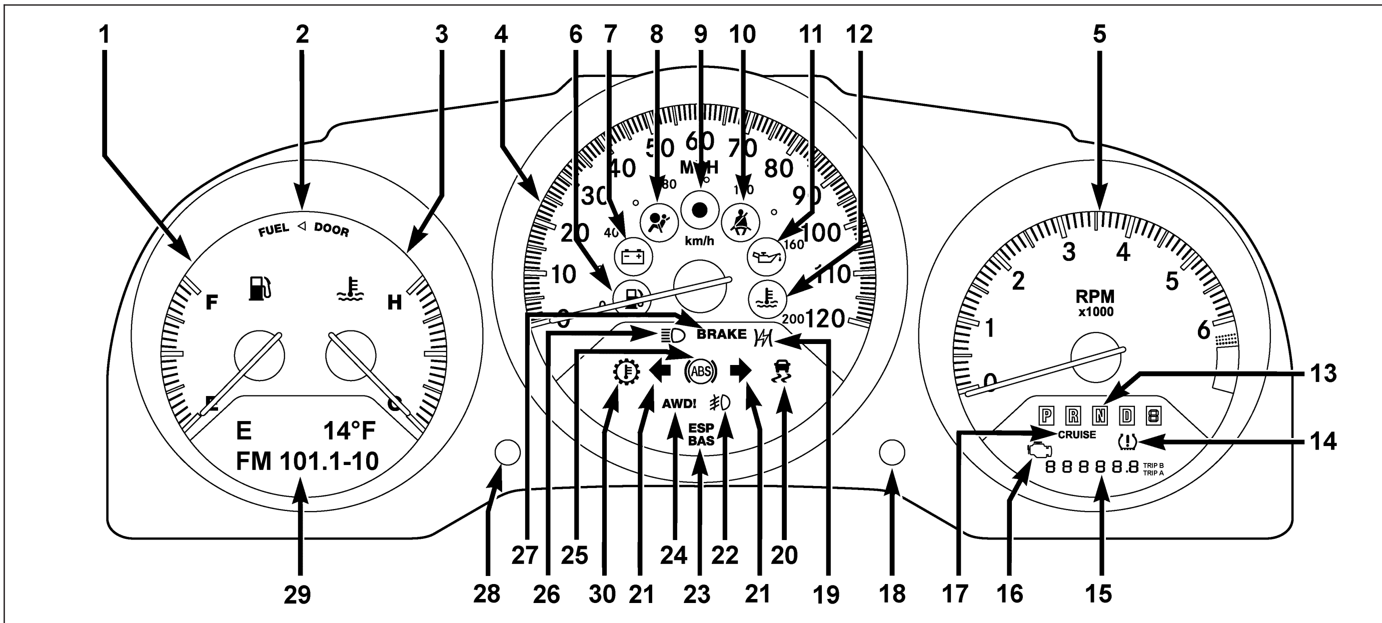


To demagnetize the roof panel proceed as follows:

J908E-27

1. Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.
2. Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from front to rear, on the center line of the roof at the windshield header. The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.
3. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.
4. Slowly approach the center line of the roof panel at the windshield header, with the degaussing tool connected.
5. Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) back from the windshield header.
6. With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.
7. Calibrate the compass, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - STANDARD PROCEDURE - COMPASS CALIBRATION) and adjust the compass variance, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - STANDARD PROCEDURE - COMPASS VARIATION ADJUSTMENT).

COMPASS VARIANCE ADJUSTMENT



80a13863

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give inaccurate readings. To optimize compass accuracy, the compass variance should be properly set according to the compass variance map zone for the region that the vehicle is in.

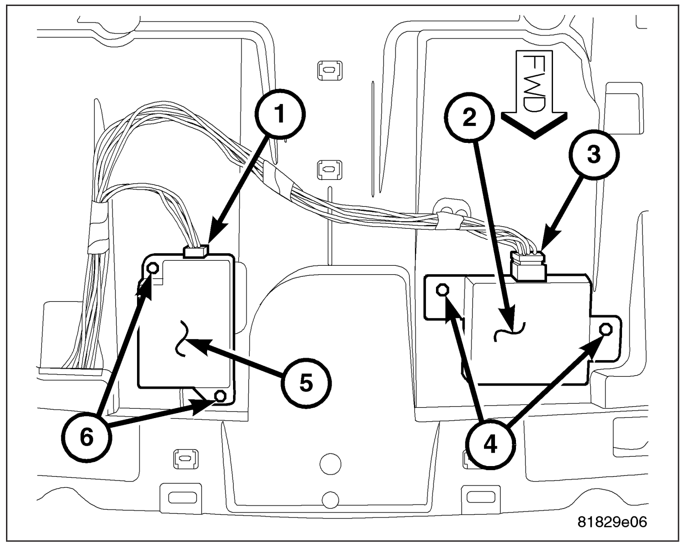
To set the compass variance:

1. Using the Variance Settings map, find your geographic location and note the zone number.

8173cdc4

2. Turn the ignition switch to the On position.
3. Continue to depress and release the **STEP** button (28) until the “Personal Settings” menu is displayed.

4. Once in the “Personal Settings” menu depress and release the **STEP** button (28) several times until “Compass Variance” is displayed. The “Compass Variance” message and the current variance zone number will be displayed. The default variance zone is 8.

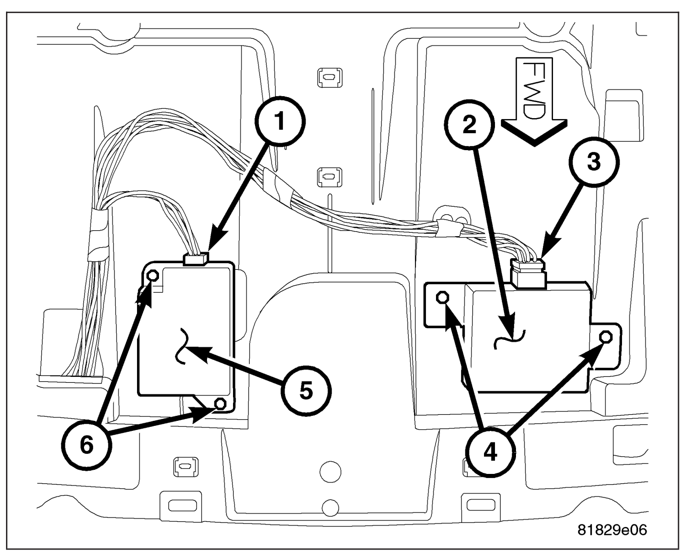


NOTE: During programming, the Zone value will wrap around from Zone 15 to Zone 1.

5. To change the zone, press and hold (longer than two seconds) the **STEP** button to increment the variance one step. Repeat as necessary, with individual long (longer than two seconds) **STEP** button presses for each increment, until the desired variance is achieved.
6. To exit the Variance Programming, press the **STEP** button with a short (less than one second) button press.
7. Confirm that the correct directions are now indicated by the compass.

REMOVAL - REMOTE COMPASS MODULE

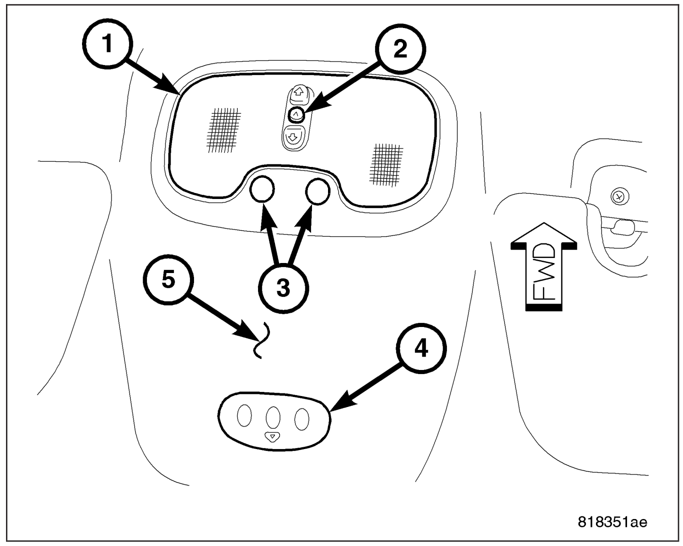
WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.



NOTE: RHD model shown in illustration. LHD model similar.

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel upper panel, (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - REMOVAL).
3. Remove the screws (6) securing the Remote Compass Module (RCM) (5) to the instrument panel.
4. Disconnect the RCM electrical connector (1) and remove the RCM from the vehicle.

INSTALLATION - REMOTE COMPASS MODULE



NOTE: RHD model shown in illustration. LHD model similar.

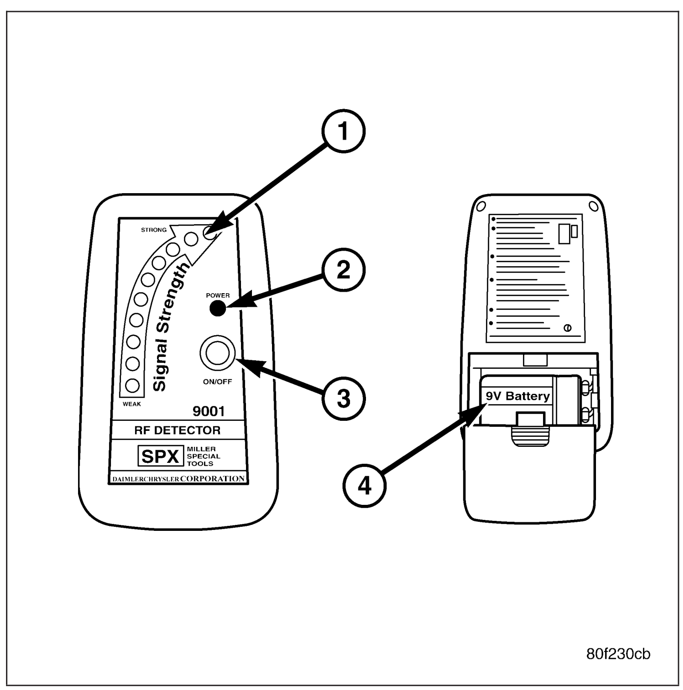
1. Position the Remote Compass Module (RCM) (5) on top of the instrument panel.
2. Install the screws (6) that secure the RCM to the instrument panel.
3. Connect the RCM electrical connector (1).
4. Install the instrument panel upper panel, (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - INSTALLATION).
5. Connect the battery negative cable.

UNIVERSAL TRANSMITTER

DESCRIPTION

Some vehicles are equipped with a Universal Transmitter transceiver (4). The universal transmitter transceiver (4) is located in the headliner (5) just to the rear of the courtesy/reading lamps (1). The only visible component of the universal transmitter are the three transmitter push buttons. The three universal transmitter push buttons are identified with raised buttons and contain a transmit indicator that lights during operation and programming functions.

Each of the three universal transmitter push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different radio frequency signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or just about any other device that can be equipped with a radio receiver in the 280 to 435 MegaHertz (MHz) frequency range for remote operation. The universal transmitter is capable of operating systems using either rolling code or non-rolling code technology. The system will not transmit operating signals if the Vehicle Theft Security System is armed.



The universal transmitter cannot be repaired, and if inoperative or damaged, the complete module assembly must be replaced.

OPERATION

The universal transmitter operates on a non-switched source of battery current so the unit will remain functional, regardless of the ignition switch position. For more information on the features, programming procedures and operation of the universal transmitter, see the owner's manual in the vehicle glove box.

DIAGNOSIS AND TESTING

UNIVERSAL TRANSMITTER

If the Universal Transmitter is inoperative, retrain the universal transmitter with a known good transmitter, insuring the transmitter battery is OK, (Refer to 8 - ELECTRICAL/MESSAGE CENTER/UNIVERSAL TRANSMITTER - STANDARD PROCEDURE) for the proper procedure. Test the universal transmitter operation again. If the unit is still inoperative, test the universal transmitter with Radio Frequency Detector special tool as described below:

1. Turn the Radio Frequency (RF) Detector ON (3). A "chirp" will sound and the green power Light Emitting Diode (LED) will light (2). If the green LED does not light, replace the battery (4).
2. Hold the RF detector within one inch of the TRAINED universal transmitter and press any of the transmitters buttons.
3. The red signal detection LEDs (1) will light and the tool will beep if a radio signal is detected. Repeat this test for all three transmitter buttons. If the tool does not detect a radio signal for any of the three buttons, replace the inoperative universal transmit-

ter assembly, (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).

STANDARD PROCEDURE

ERASING TRANSMITTER CODES

NOTE: Individual channels cannot be erased. Erasing the transmitter codes will erase ALL programmed codes.

To erase programming from the three buttons (individual buttons cannot be erased but can be ″reprogrammed″), follow the step noted:

- Press and hold the two outer HomeLink® buttons until the indicator light begins to flash-after 20 seconds. Release both buttons. Do not hold for longer that 30 seconds. HomeLink® is now in the train (or learning) mode and can be programmed at any time beginning with ″Programming″ (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/UNIVERSAL TRANSMITTER - STANDARD PROCEDURE).

PROGRAMMING TRANSMITTER CODES

Programming Common Transmitter Codes

WARNING: Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the vehicle's exhaust while training the transceiver. Exhaust gas can cause serious injury or death.

WARNING: Your motorized door or gate may open and close while you are training the Universal Transceiver if the vehicle is in range of the motorized device. Do not train the transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.

NOTE: When programming a garage door opener, it is advised to park outside the garage. It is also recommended that a new battery be placed in the hand-held transmitter of the device being programmed to HomeLink® for quicker training and accurate transmission of the radio-frequency signal.

1. Press and hold the two outer HomeLink® buttons, and release only when the indicator light begins to flash (after 20 seconds). **Do not** hold the buttons for longer than 30 seconds and **do not** repeat step one to program a second and/or third hand-held transmitter to the remaining two HomeLink® buttons.
2. Position the end of your hand-held transmitter 1-3 inches (3-8 cm) away from the HomeLink® buttons while keeping the indicator light in view.
3. Simultaneously press and hold both the HomeLink® button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.**

NOTE: Some gate operators and garage door openers may require you to replace this Programming Step 3 with procedures noted in the ″Gate Operator/Canadian Programming″ section.

4. The HomeLink® indicator light will flash slowly and then rapidly after HomeLink® successfully receives the frequency signal from the hand-held transmitter. Release both buttons after the indicator light changes from the slow to the rapid flash.
5. Press and hold the just trained HomeLink® button and observe the indicator light. If the indicator light **stays on constantly, programming is complete** and your device should activate when the HomeLink® button is pressed and released.

NOTE: To program the remaining two HomeLink® buttons, begin with ″Programming″ step two. Do not repeat step one.
If the indicator light blinks rapidly for two seconds and then turns to a constant light, continue with ″Programming″ steps 6-8 to complete the programming of a rolling code equipped device (most commonly a garage door opener).

6. At the garage door opener receiver (motor-head unit) in the garage, locate the ″learn″ or ″smart″ button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.

7. Firmly press and release the ″learn″ or ″smart″ button. (The name and color of the button may vary by manufacturer.)

NOTE: There are 30 seconds in which to initiate step eight.

8. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLink® button. Repeat the **″press/hold/release″** sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming. HomeLink® should now activate your rolling code equipped device.

NOTE: To program the remaining two HomeLink® buttons, begin with ″Programming″ step two. Do not repeat step one.

Canadian Programming/Gate Programming

Canadian radio-frequency laws require transmitter signals to ″time-out″ (or quit) after several seconds of transmission which may not be long enough for HomeLink® to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to ″time-out″ in the same manner.

If you live in Canada or you are having difficulties programming a gate operator by using the ″Programming″ procedures (regardless of where you live), **replace ″Programming HomeLink®″ step 3** with the following:

NOTE: When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the ″cycling″ process to prevent possible overheating.

3. Continue to press and hold the HomeLink® button while you **press and release every two seconds** (″cycle″) your hand-held transmitter until the frequency signal has successfully been accepted by HomeLink®. (The indicator light will flash slowly and then rapidly.) Proceed with ″Programming″ step four to complete.

REPROGRAMMING TRANSMITTER CODES

Reprogramming Basic Transmitter Codes

WARNING: Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the vehicle's exhaust while training the transceiver. Exhaust gas can cause serious injury or death.

WARNING: Your motorized door or gate may open and close while you are training the Universal Transceiver if the vehicle is in range of the motorized device. Do not train the transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.

To program a device to HomeLink® using a HomeLink® button previously trained, follow these steps:

1. Press and hold the desired HomeLink® button. **Do NOT** release the button.
2. The indicator light will begin to flash after 20 seconds. Without releasing the HomeLink® button, proceed to step 3.
3. Position the end of your hand-held transmitter 1-3 inches (3-8 cm) away from the HomeLink® buttons while keeping the indicator light in view.
4. Simultaneously press and hold both the HomeLink button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.**

NOTE: Some gate operators and garage door openers may require you to replace this Programming Step 3 with procedures noted in the ″Gate Operator/Canadian Programming″ section.

5. The HomeLink® indicator light will flash slowly and then rapidly after HomeLink® successfully receives the frequency signal from the hand-held transmitter. Release both buttons after the indicator light changes from the slow to the rapid flash.
6. Press and hold the just trained HomeLink® button and observe the indicator light. If the indicator light **stays on constantly, programming is complete** and your device should activate when the HomeLink® button is pressed and released.

NOTE: To program the remaining two HomeLink® buttons, begin with ″Programming″ step two. Do not repeat step one.
If the indicator light blinks rapidly for two seconds and then turns to a constant light, continue with ″Programming″ steps 6-8 to complete the programming of a rolling code equipped device (most commonly a garage door opener).

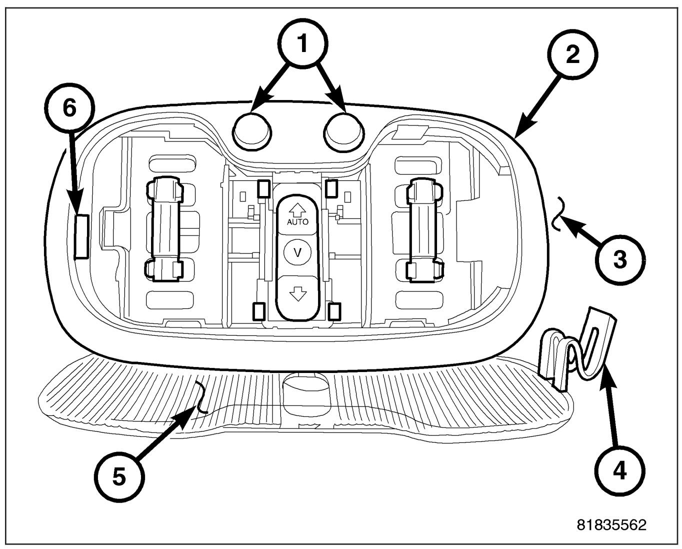
7. At the garage door opener receiver (motor-head unit) in the garage, locate the ″learn″ or ″smart″ button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
8. Firmly press and release the ″learn″ or ″smart″ button. (The name and color of the button may vary by manufacturer.)

NOTE: There are 30 seconds in which to initiate step eight.

9. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLink® button. Repeat the ″**press/hold/release**″ sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming. HomeLink® should now activate your rolling code equipped device.

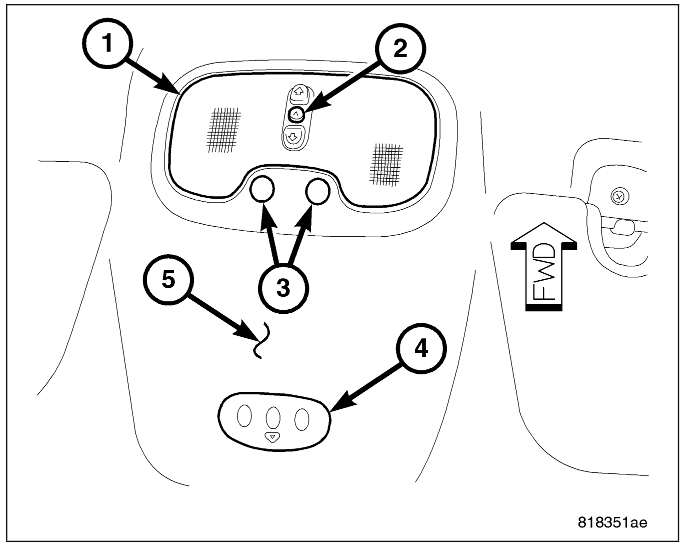
Canadian Programming/Gate Programming

Canadian radio-frequency laws require transmitter signals to ″time-out″ (or quit) after several seconds of transmission which may not be long enough for HomeLink® to pick up the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to ″time-out″ in the same manner.



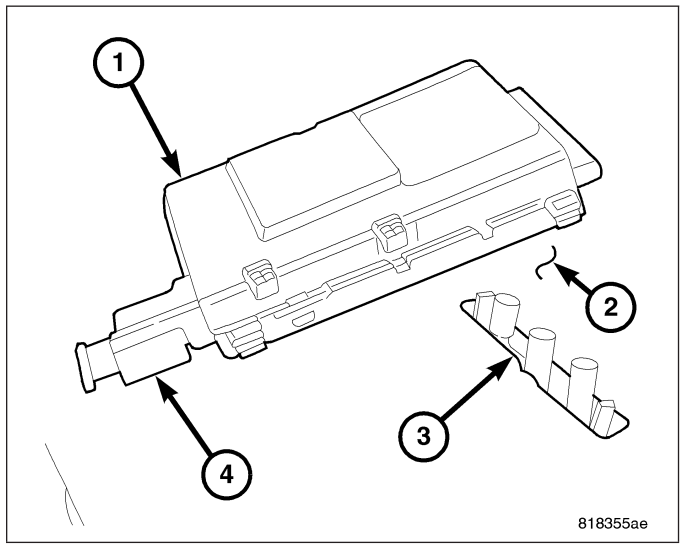
If you live in Canada or you are having difficulties programming a gate operator by using the ″Programming″ procedures (regardless of where you live), **replace ″Programming HomeLink®″ step 3** with the following:

NOTE: When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the ″cycling″ process to prevent possible overheating.



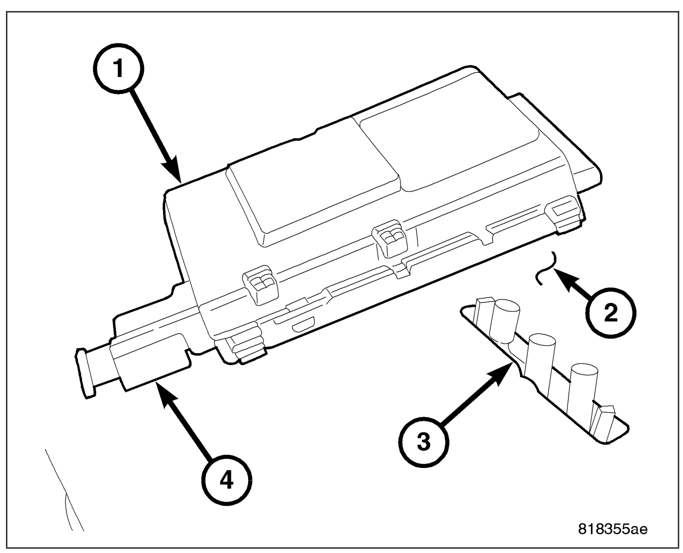
3. Continue to press and hold the HomeLink® button while you **press and release every two seconds** (″cycle″) your hand-held transmitter until the frequency signal has successfully been accepted by HomeLink®. (The indicator light will flash slowly and then rapidly.) Proceed with ″Programming″ step four to complete.

REMOVAL

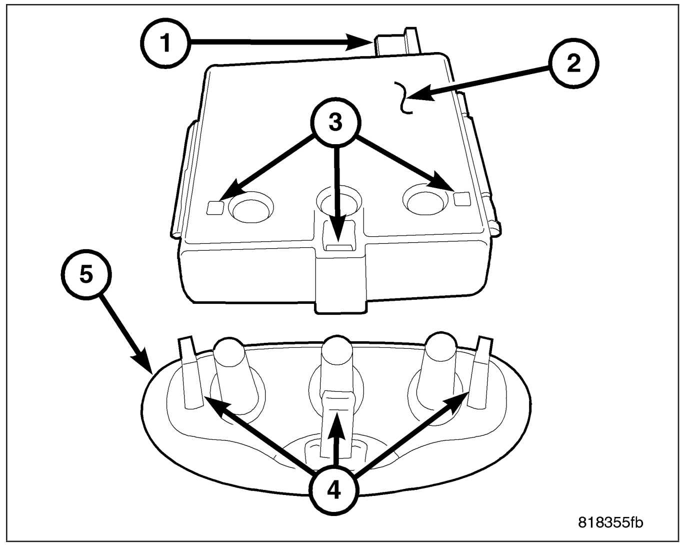


1. Disconnect and isolate the battery negative cable.
2. Remove the courtesy/reading lamp lens (5). Insert a suitable flat bladed tool into the slot (6) in the courtesy/reading lamp assembly (2). Pivot the lens down and to the left to release the holding tab (4). Remove the lamp assembly from the headliner (3).

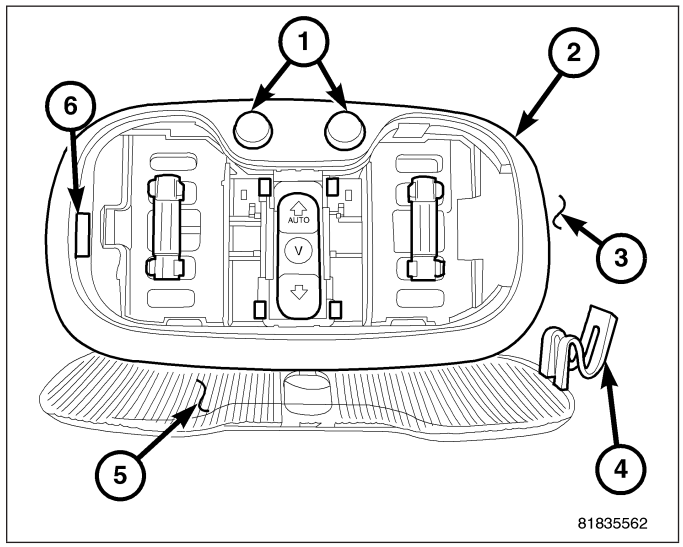
3. Using an appropriate flat bladed tool, remove the universal transmitter button trim bezel (4).



4. Working through the courtesy/reading lamp hole in the headliner, pull the universal transmitter module (1) forward and down through the headliner (2).
5. Disconnect the electrical connector.
6. Remove the universal transmitter module from the vehicle.



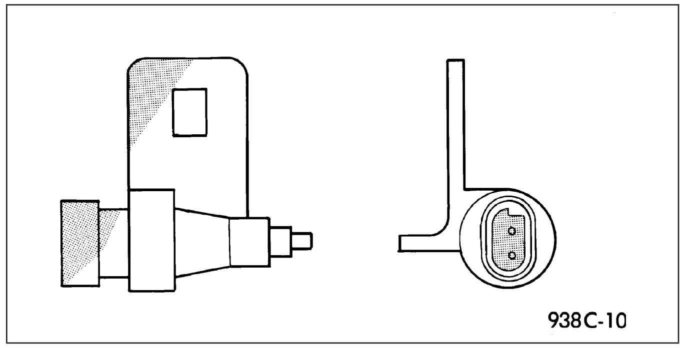
INSTALLATION



1. Position the universal transmitter module (1) into the vehicle.
2. Connect the electrical connector (4).
3. Working through the courtesy/reading lamp hole in the headliner (2), Insert the universal transmitter module up into place over the cut out for the button bezel (3).

4. Position the universal transmitter module (2) so that the mounting tabs (4) on the button bezel (5) are aligned with the module slots.
5. Holding the module in place push the universal transmitter button bezel through the headliner until the mounting tabs are securely engaged with the module.

6. Position the courtesy/reading lamp assembly (2) into the headliner (3).
7. Insert the mounting tab (4) on the lamp lens (5) into the right side of the lamp assembly and pivot the lens up until it snaps securely in place.
8. Connect the battery negative cable.



SENSOR-AMBIENT TEMPERATURE

DESCRIPTION

The ambient temperature sensor is a variable resistor type sensor. It is mounted to the lower front fascia behind the radiator grille and in front of the engine compartment.

The ambient temperature sensor cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced.

OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal. The resistance in the sensor changes as temperature changes, changing the temperature sensor signal circuit voltage to the Totally Integrated Power Module (TIPM). Based upon the resistance in the sensor, the instrument cluster or Cab Compartment Node (CCN) display senses a specific voltage on the Controller Area Network (CAN) data bus circuit, which corresponds to a specific temperature. The compass/temperature display unit then displays the proper ambient temperature.

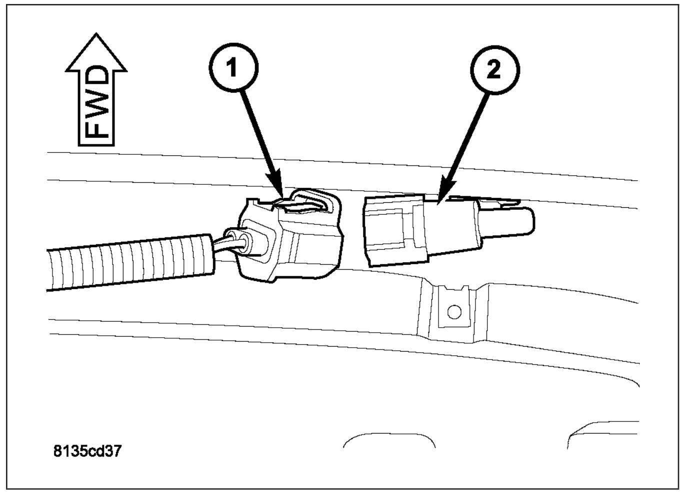
DIAGNOSIS AND TESTING

AMBIENT TEMPERATURE SENSOR

The thermometer function is supported by the ambient temperature sensor, the Totally Integrated Power Module (TIPM), the Controller Area Network (CAN) data bus circuit, and the instrument cluster or Cab Compartment Node (CCN) compass/temperature display unit.

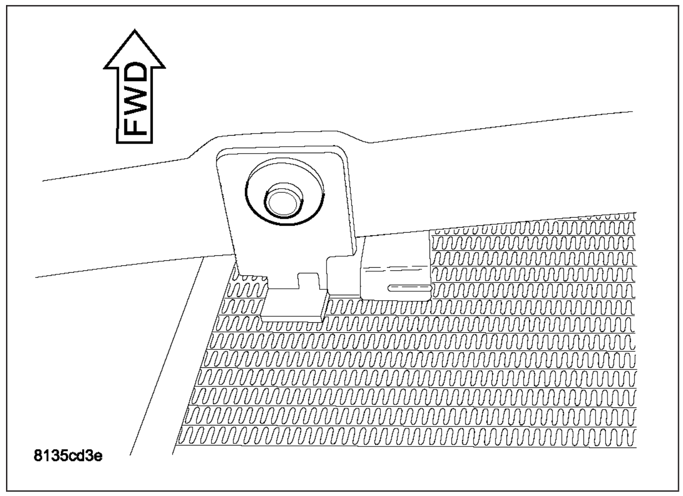
If the display shows “OC” (-49° F (-45° C)) or “SC” (140° F (60° C)), there is an OPEN or SHORT CIRCUIT that must be repaired.

The ambient temperature sensor circuit can also be diagnosed using the following Sensor Test, and Sensor Circuit Test. If the temperature sensor and circuit are confirmed to be OK, but the temperature display is inoperative or incorrect, replace the instrument cluster or CCN assembly.



SENSOR TESTING

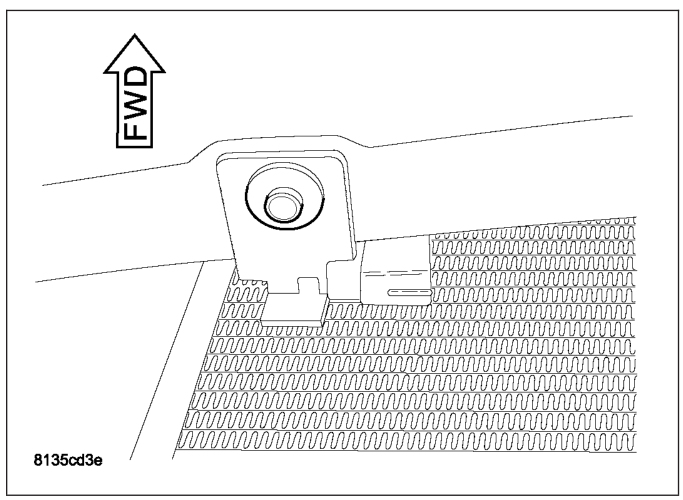
1. Turn the ignition switch to the OFF position. Disconnect and isolate the battery negative cable.
2. Disconnect the ambient temperature sensor wire harness connector.
3. Measure the resistance of the ambient temperature sensor. At room temperature (approx. 68°F (20° C)), the sensor resistance should be between 9-11 Kilohms (9000-11000 ohms). The sensor resistance should read between these two values. If OK, refer to the appropriate diagnostic information to continue diagnosis of the Totally Integrated Power Module (TIPM), the Controller Area Network (CAN) data bus circuit, and the instrument cluster or CCN. If not OK, replace the inoperative ambient temperature sensor.



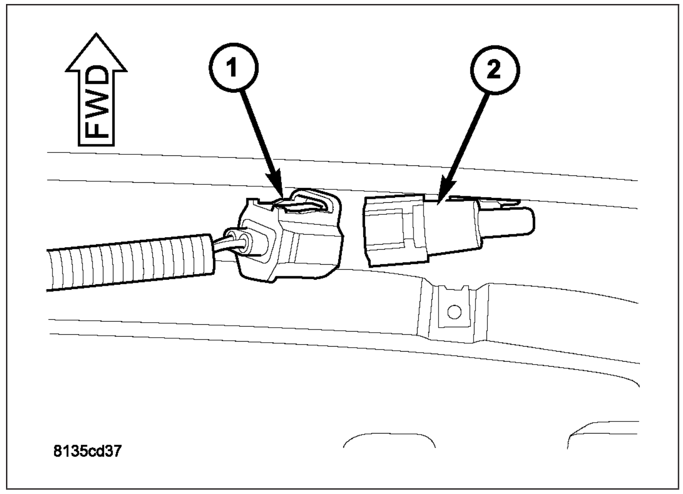
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the belly pan, (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL).

3. Disconnect the wire harness connector (1) from the ambient temperature sensor (2).



4. Remove the fastener that secures the ambient temperature sensor bracket to the front fascia.
5. Remove the ambient temperature sensor from the vehicle.



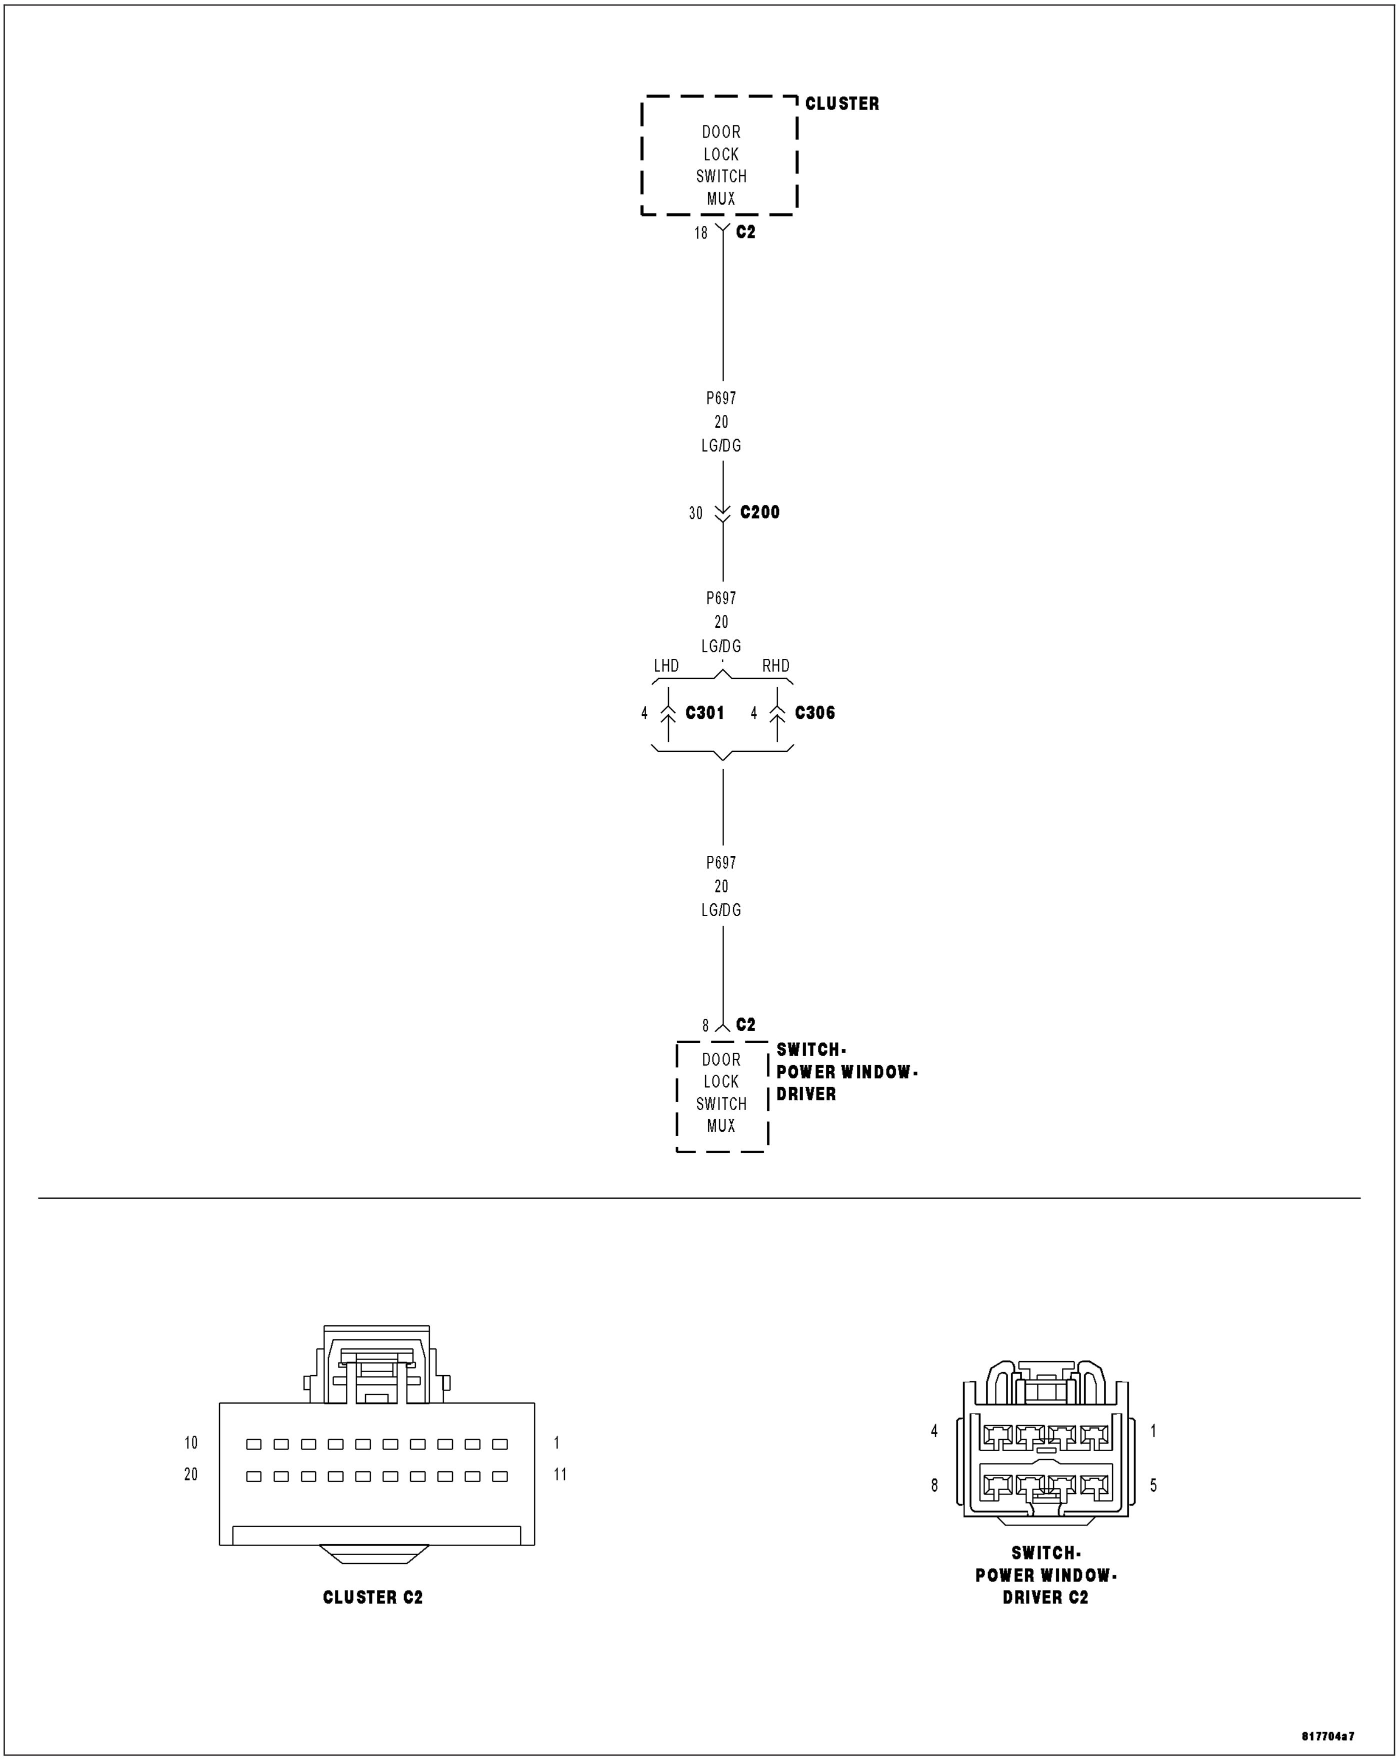
INSTALLATION

1. Position the ambient temperature sensor in the vehicle.
2. Install the fastener that secures the ambient temperature sensor to the front fascia.

3. Connect the wire harness connector (1) to the ambient temperature sensor (2).
4. Install the belly pan, (Refer to 23 - BODY/EXTERIOR/BELLY PAN - INSTALLATION).
5. Connect the battery negative cable.

POWER SYSTEMS

TABLE OF CONTENTS



POWER LOCKS - ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

POWER LOCKS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1800 DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Driver Door Lock Switch Mux circuit is below 1.5 volts or over 4.3 volts for 10 seconds, this code will set.

Possible Causes
(P697) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO GROUND
(P697) DRIVER DOOR LOCK SWITCH MUX CIRCUIT OPEN
(P697) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO BATTERY
DOOR LOCK SWITCH
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC’s

Operate the Driver Door Lock Switch in all positions several times.

Cycle the ignition from on to off.

Turn the ignition on.

With the scan tool, read DTC’s.

Does the scan tool display DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT PERFORMANCE?

Yes >> Go To 2

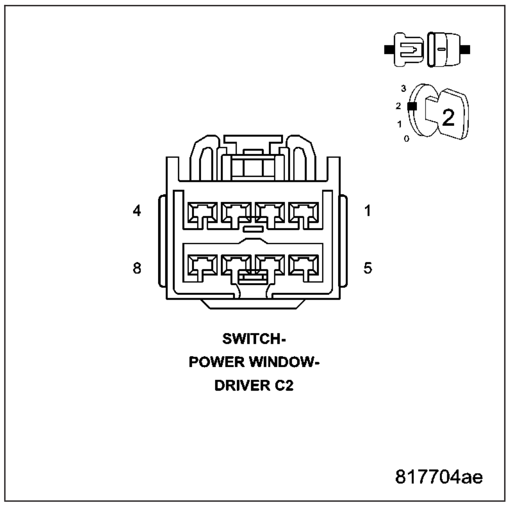
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. DOOR LOCK SWITCH SHORTED

With the scan tool, erase DTC’s.

Disconnect the Driver Window/Door Lock Switch connector.

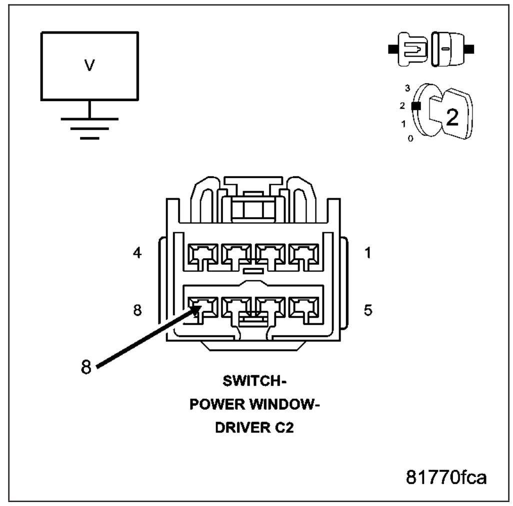


With the scan tool, read DTC’s.

Does the scan tool display DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT PERFORMANCE?

No >> Replace the Driver Window/Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



Yes >> Go To 3

3. (P697) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO BATTERY

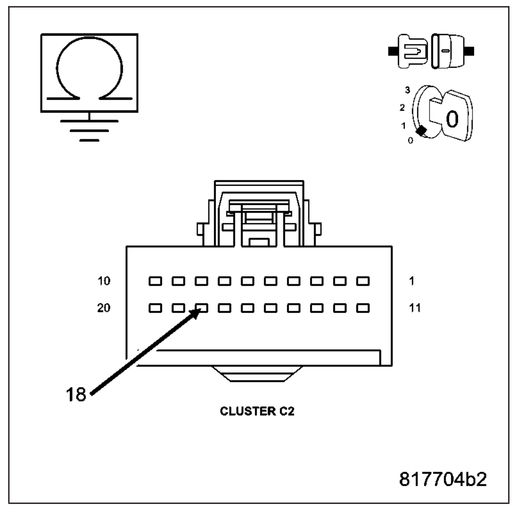
Ensure the ignition is on.

Measure the voltage between the (P697) Driver Door Lock Switch Mux circuit and ground.

Is the voltage above 5.2 volts?

Yes >> Repair the (P697) Left Door Lock Switch Mux circuit for a short to battery.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



No >> Go To 4

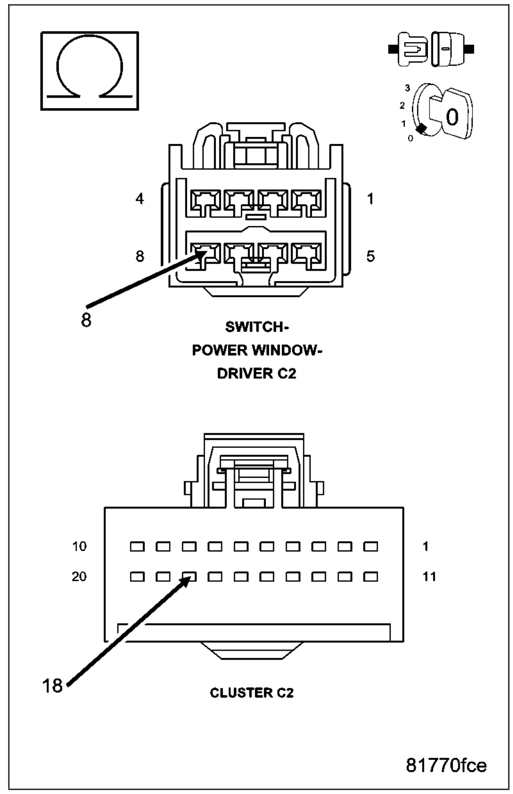
4. (P697) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Cluster C2 connector.

Measure the resistance between ground and the (P697) Driver Door Lock Switch Mux circuit.

Is the resistance below 1000.0 ohms?



Yes >> Repair the (P697) Driver Door Lock Switch Mux circuit for a short to ground.

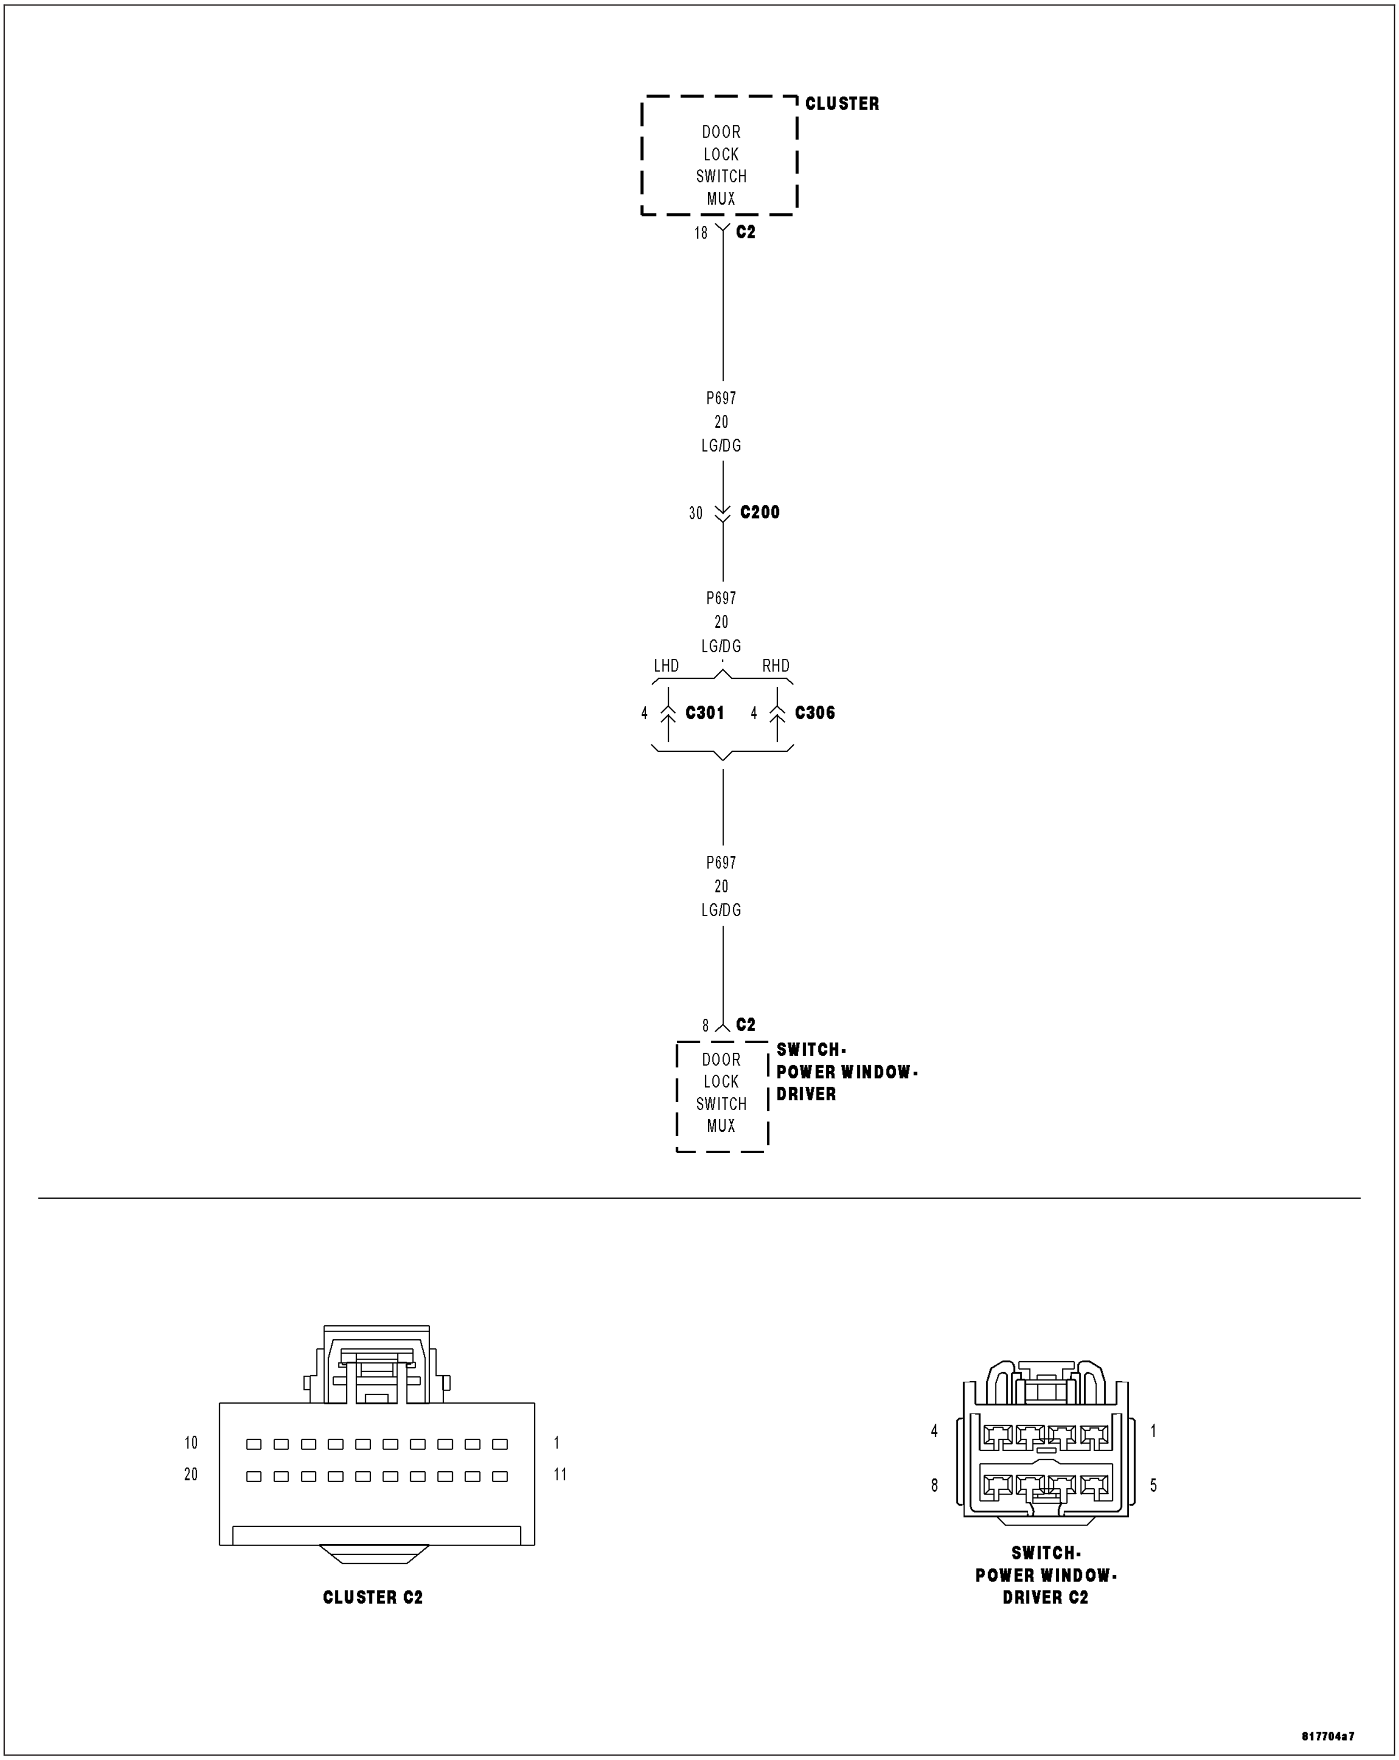
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. (P697) DRIVER DOOR LOCK SWITCH MUX CIRCUIT OPEN

Measure the resistance of the (P697) Driver Door Lock Switch Mux circuit between the Cluster C2 connector and the Driver Window/Door Lock Switch connector.

Is the resistance below 5.0 ohms?



No >> Repair the (P697) Driver Door Lock Switch Mux circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

Yes >> Replace the Instrument Cluster in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1801 DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW – CLUSTER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Driver Door Lock Switch Mux circuit is below 0.15 volts for over 10 seconds.

Possible Causes
(P697) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO GROUND
DOOR LOCK SWITCH SHORT TO GROUND
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's

Operate the Driver Door Lock Switch in all positions several times.

Cycle the ignition from on to off.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display B1801–DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW?

Yes >> Go To 2

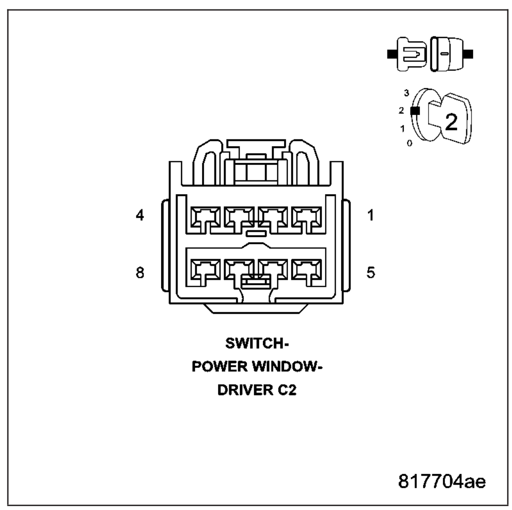
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. DOOR LOCK SWITCH SHORTED

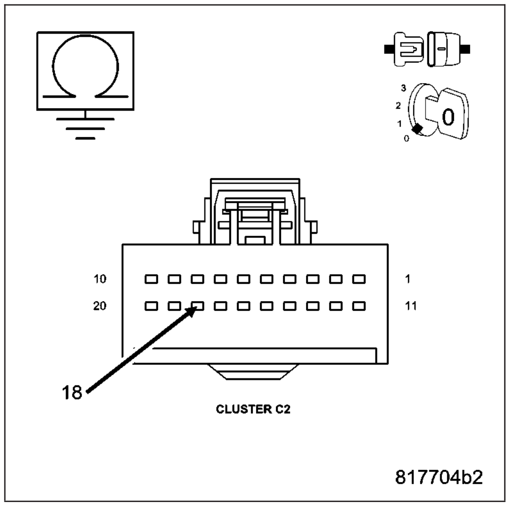
With the scan tool, erase DTC's.

Disconnect the Driver Window/Door Lock Switch connector.



With the scan tool, read DTC's.

Does the scan tool display B1801–DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW?



No >> Replace the Driver Window/Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

Yes >> Go To 3

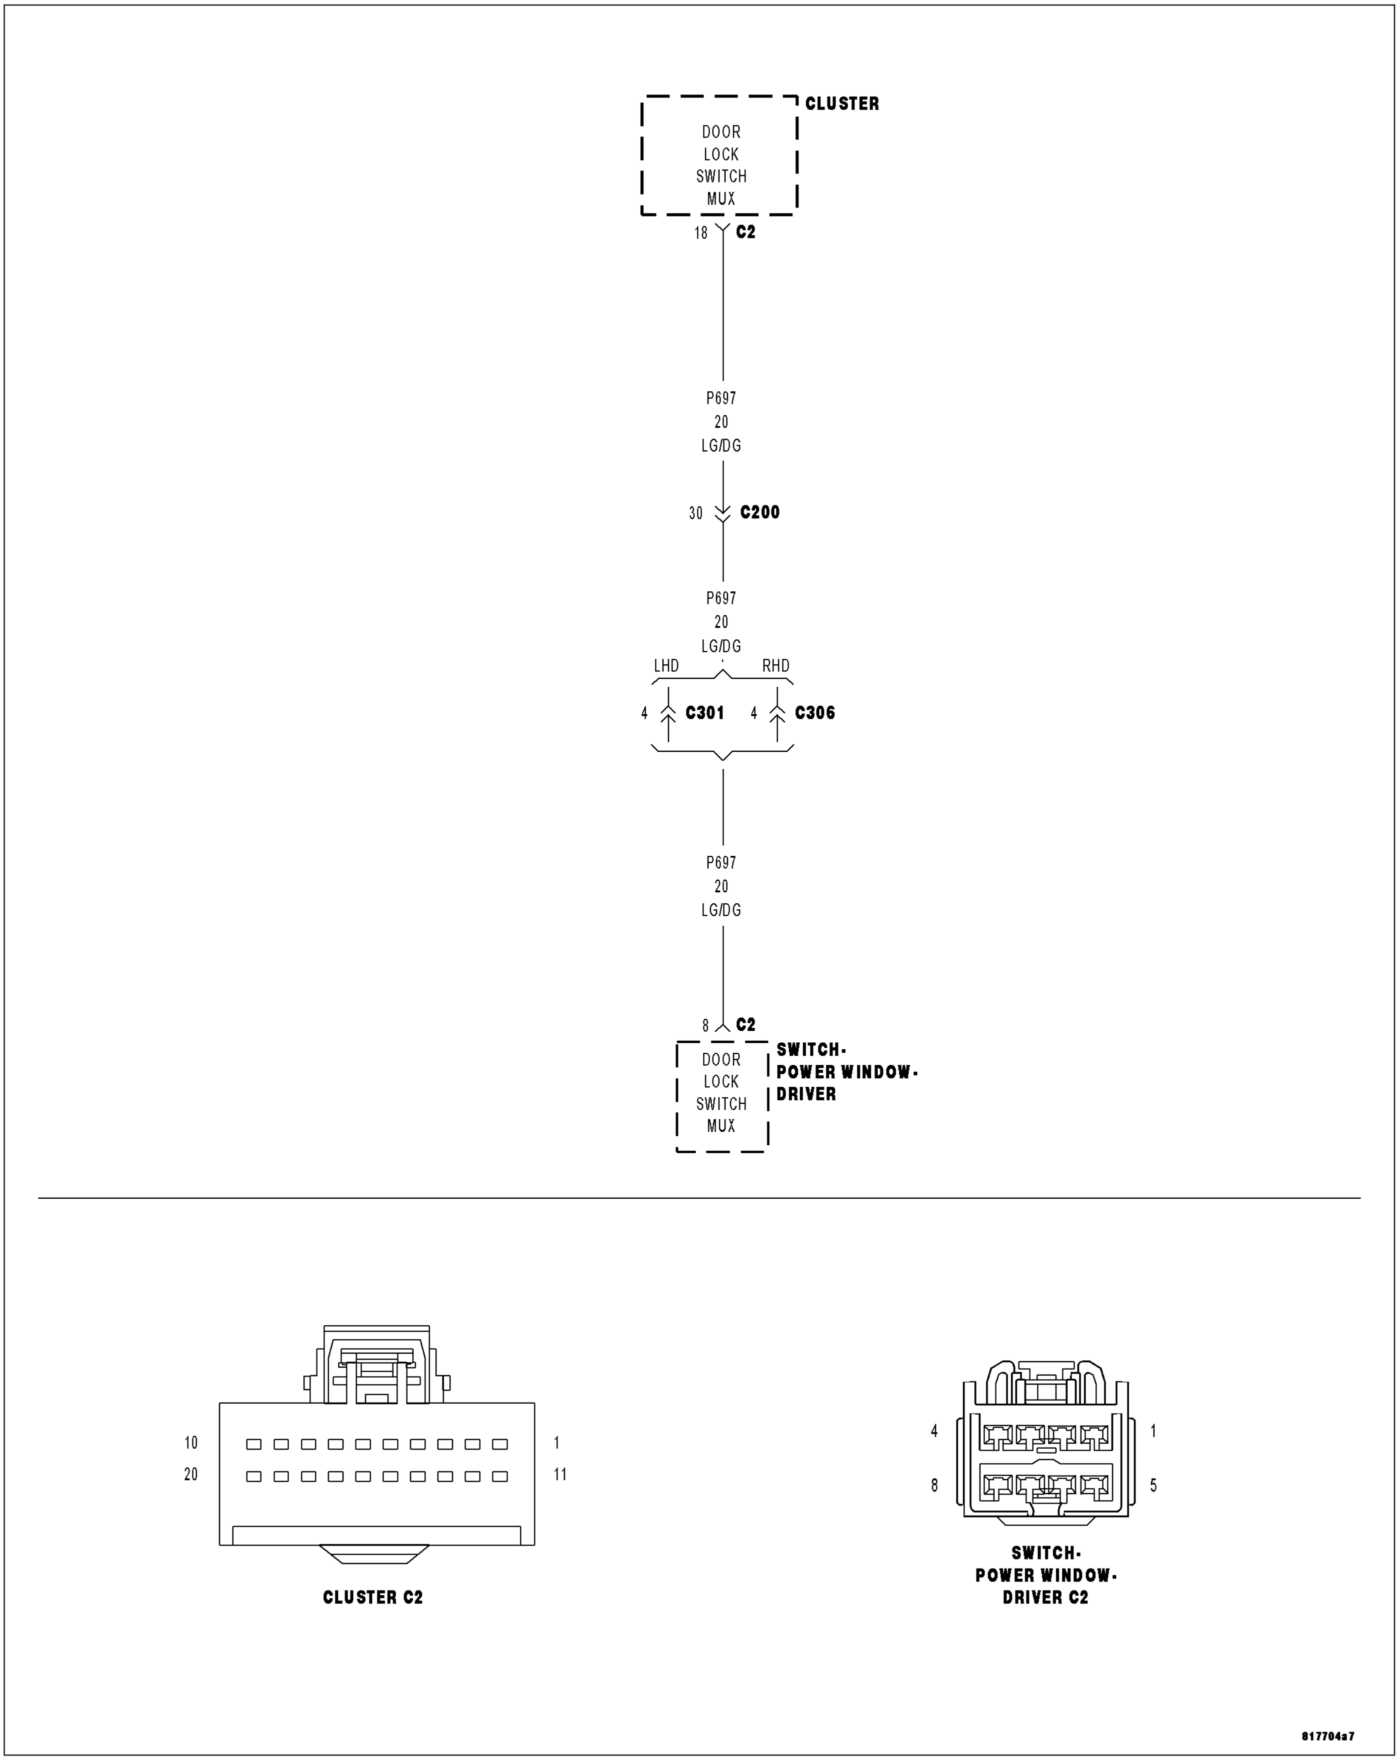
3. (P697) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Cluster C2 connector.

Measure the resistance between ground and the (P697) Driver Door Lock Switch Mux circuit.

Is the resistance below 10,000.0 ohms?



Yes >> Repair the (P697) Driver Door Lock Switch Mux circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1934–DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK – CLUSTER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Driver Door Lock Switch Mux circuit is between 0.8 and 3.5 volts for over 10 seconds.

Possible Causes
(P697) LEFT DOOR LOCK SWITCH MUX CIRCUIT PARTIAL SHORT TO GROUND
DOOR LOCK SWITCH SHORT TO GROUND
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's

Operate the Driver Door Lock Switch in all positions several times.

Cycle the ignition from on to off.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display B1934–DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK?

Yes >> Go To 2

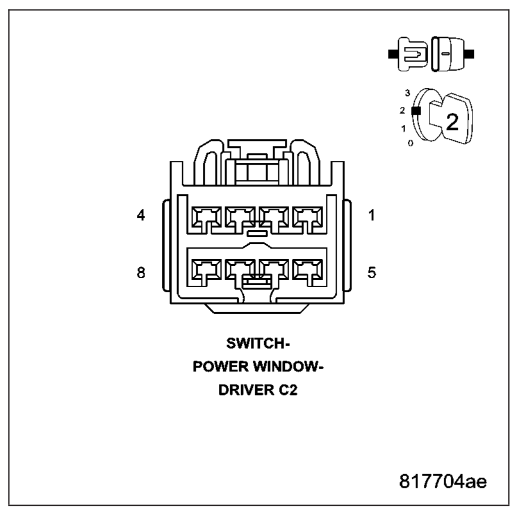
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. DOOR LOCK SWITCH SHORTED

With the scan tool, erase DTC's.

Disconnect the Driver Window/Door Lock Switch connector.



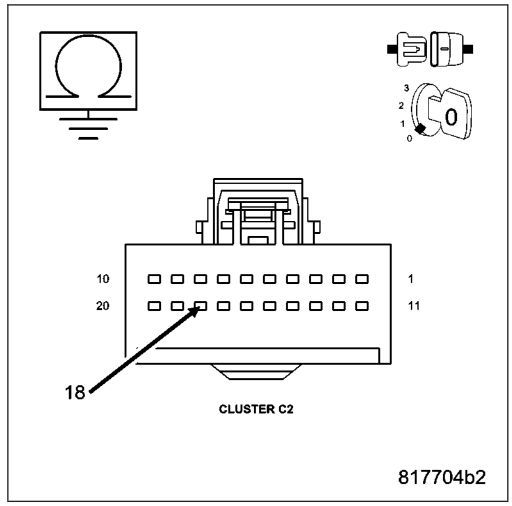
With the scan tool, read DTC's.

Does the scan tool display B1934–DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK?

No >> Replace the Driver Window/Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

Yes >> Go To 3



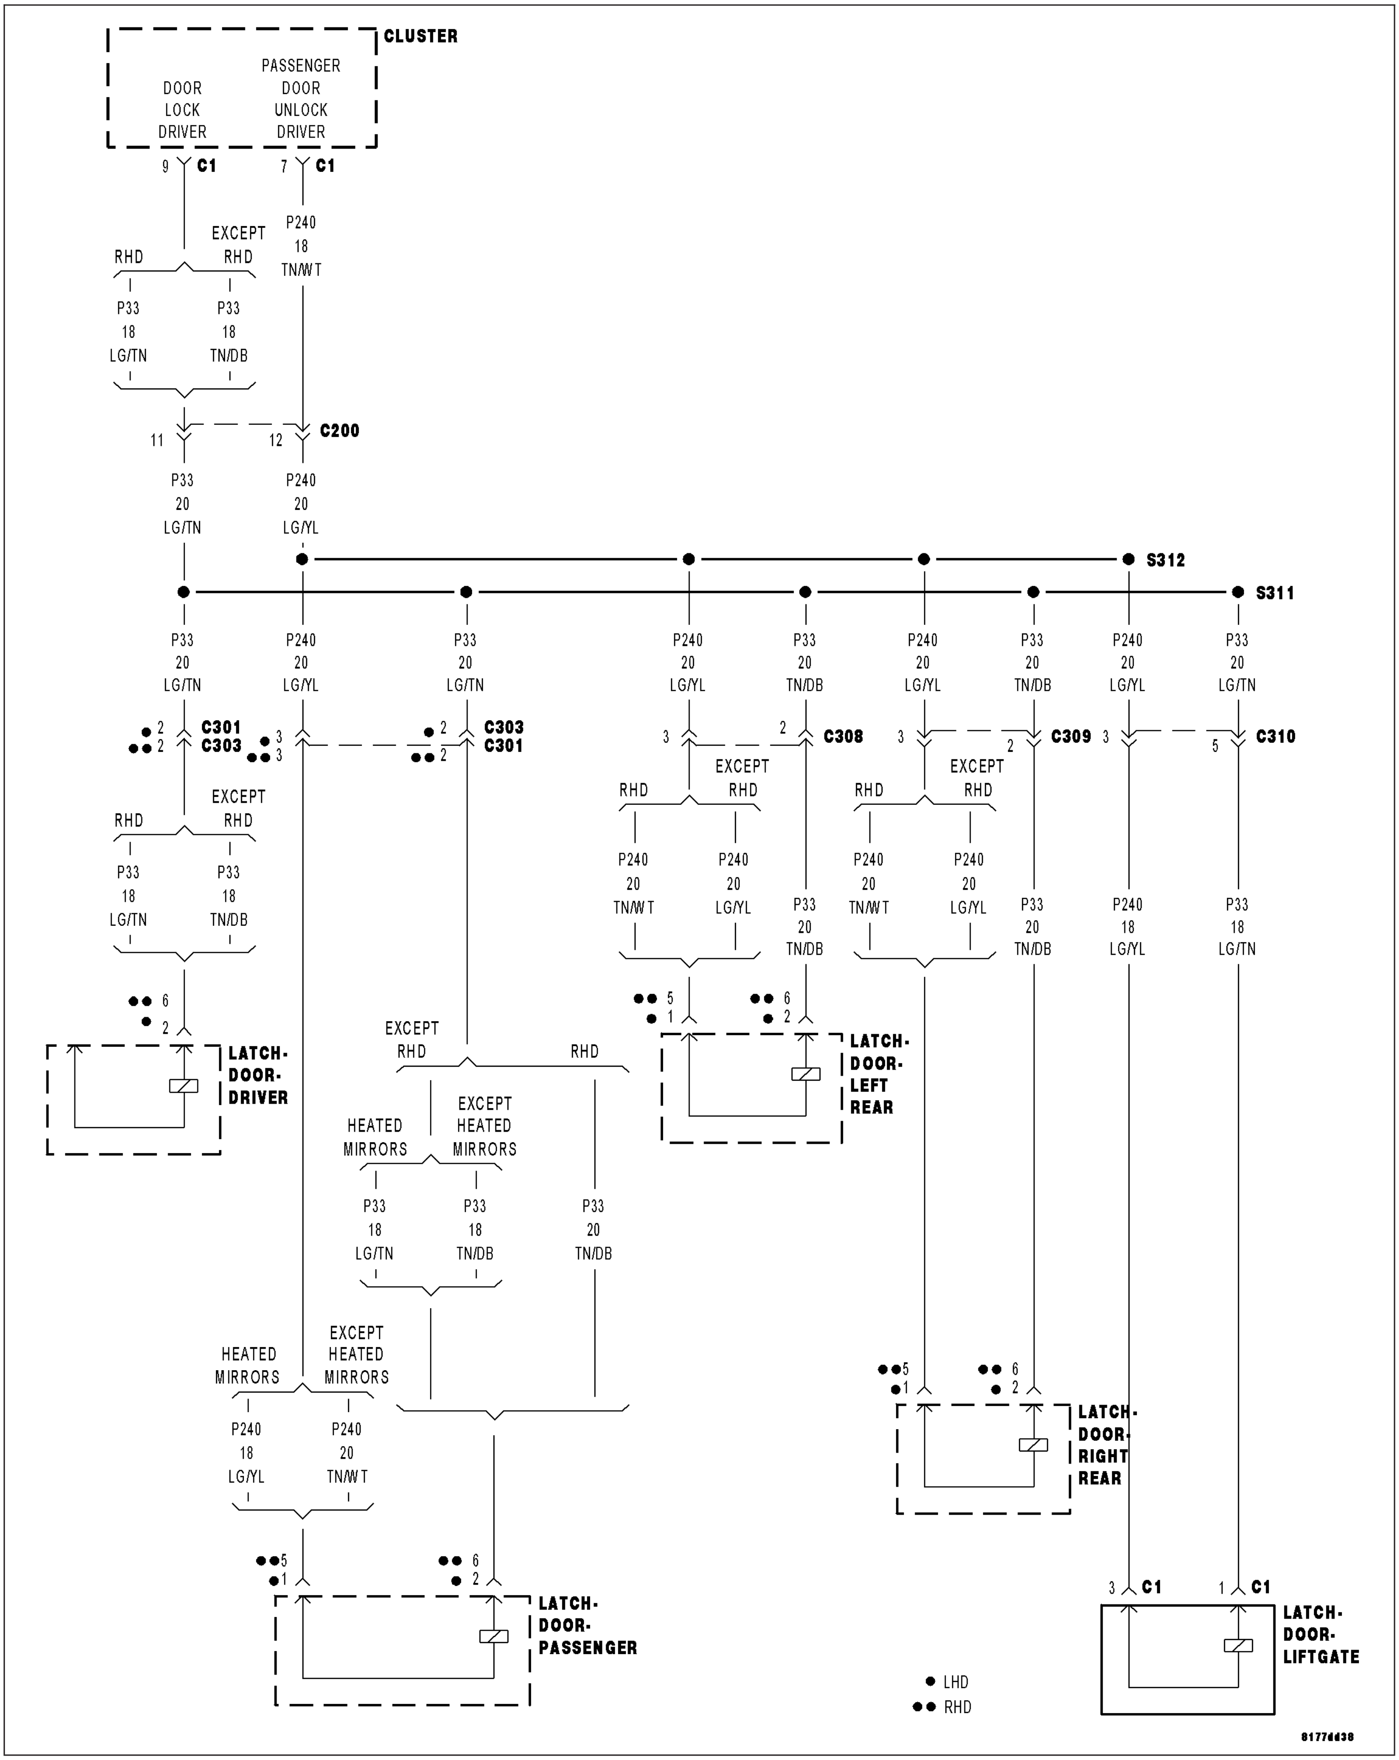
3. (P697) LEFT DOOR LOCK SWITCH MUX CIRCUIT PARTIAL SHORT TO GROUND

Turn the ignition off.

Disconnect the Cluster C2 connector.

Measure the resistance between ground and the (P697) Driver Door Lock Switch Mux circuit.

Is the resistance below 1,000.0 ohms?



Yes >> Repair the (P697) Left Door Lock Switch Mux circuit for a short to ground.

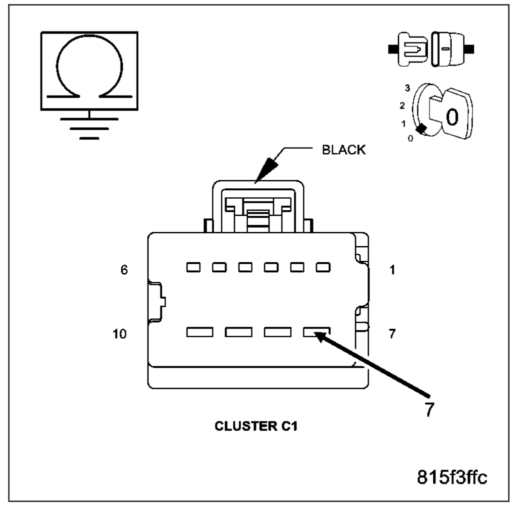
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

*ALL PASSENGER DOORS UNLOCK CONTROL CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.



Possible Causes
(P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT SHORT TO GROUND
(P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT SHORT TO VOLTAGE
(P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT OPEN
(P33) DOOR LOCK DRIVER CIRCUIT SHORT TO THE (P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT
INSTRUMENT CLUSTER

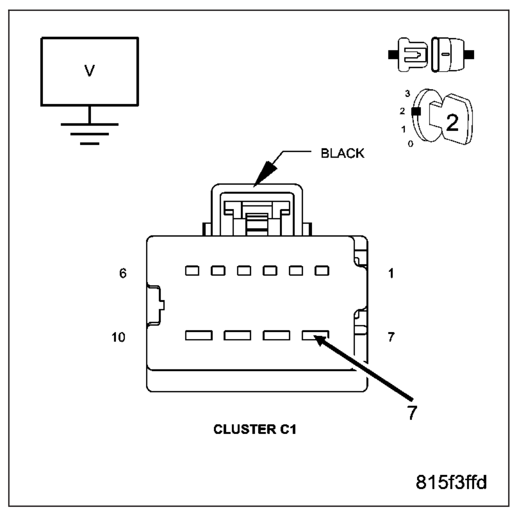
1. (P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Instrument Cluster C1 connector.

Measure the resistance between ground and the (P240) Passenger Doors Unlock Driver circuit in the Cluster C1 connector.

Is the resistance below 1,000.0 ohms?



Yes >> Repair the (P240) Passenger Doors Unlock Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE) (Refer to 8 - ELECTRICAL/ ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

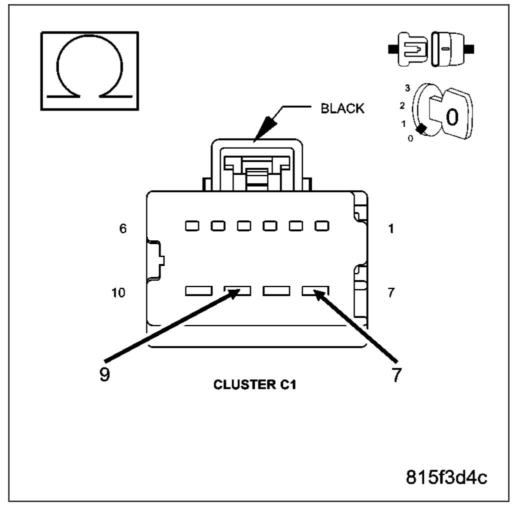
No >> Go To 2

2. (P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT SHORTED TO BATTERY

Turn the ignition on.

Measure the voltage between ground and the (P240) Passenger Doors Unlock Driver circuit in the Cluster C1 connector.

Is there any voltage present?



Yes >> Repair the (P240) Passenger Doors Unlock Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

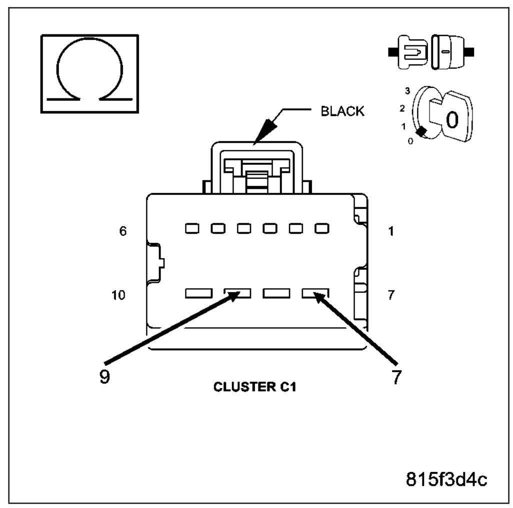
No >> Go To 3

3. (P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT OPEN

Turn the ignition off.

Measure the resistance between the (P33) Door Lock Driver circuit and the (P240) Passenger Doors Unlock Driver circuit in the Cluster C1 connector.

Is the resistance above 4.5 ohms?



Yes >> Repair the (P33) Door Lock Driver or the (P240) Passenger Doors Unlock Driver circuit for an open.

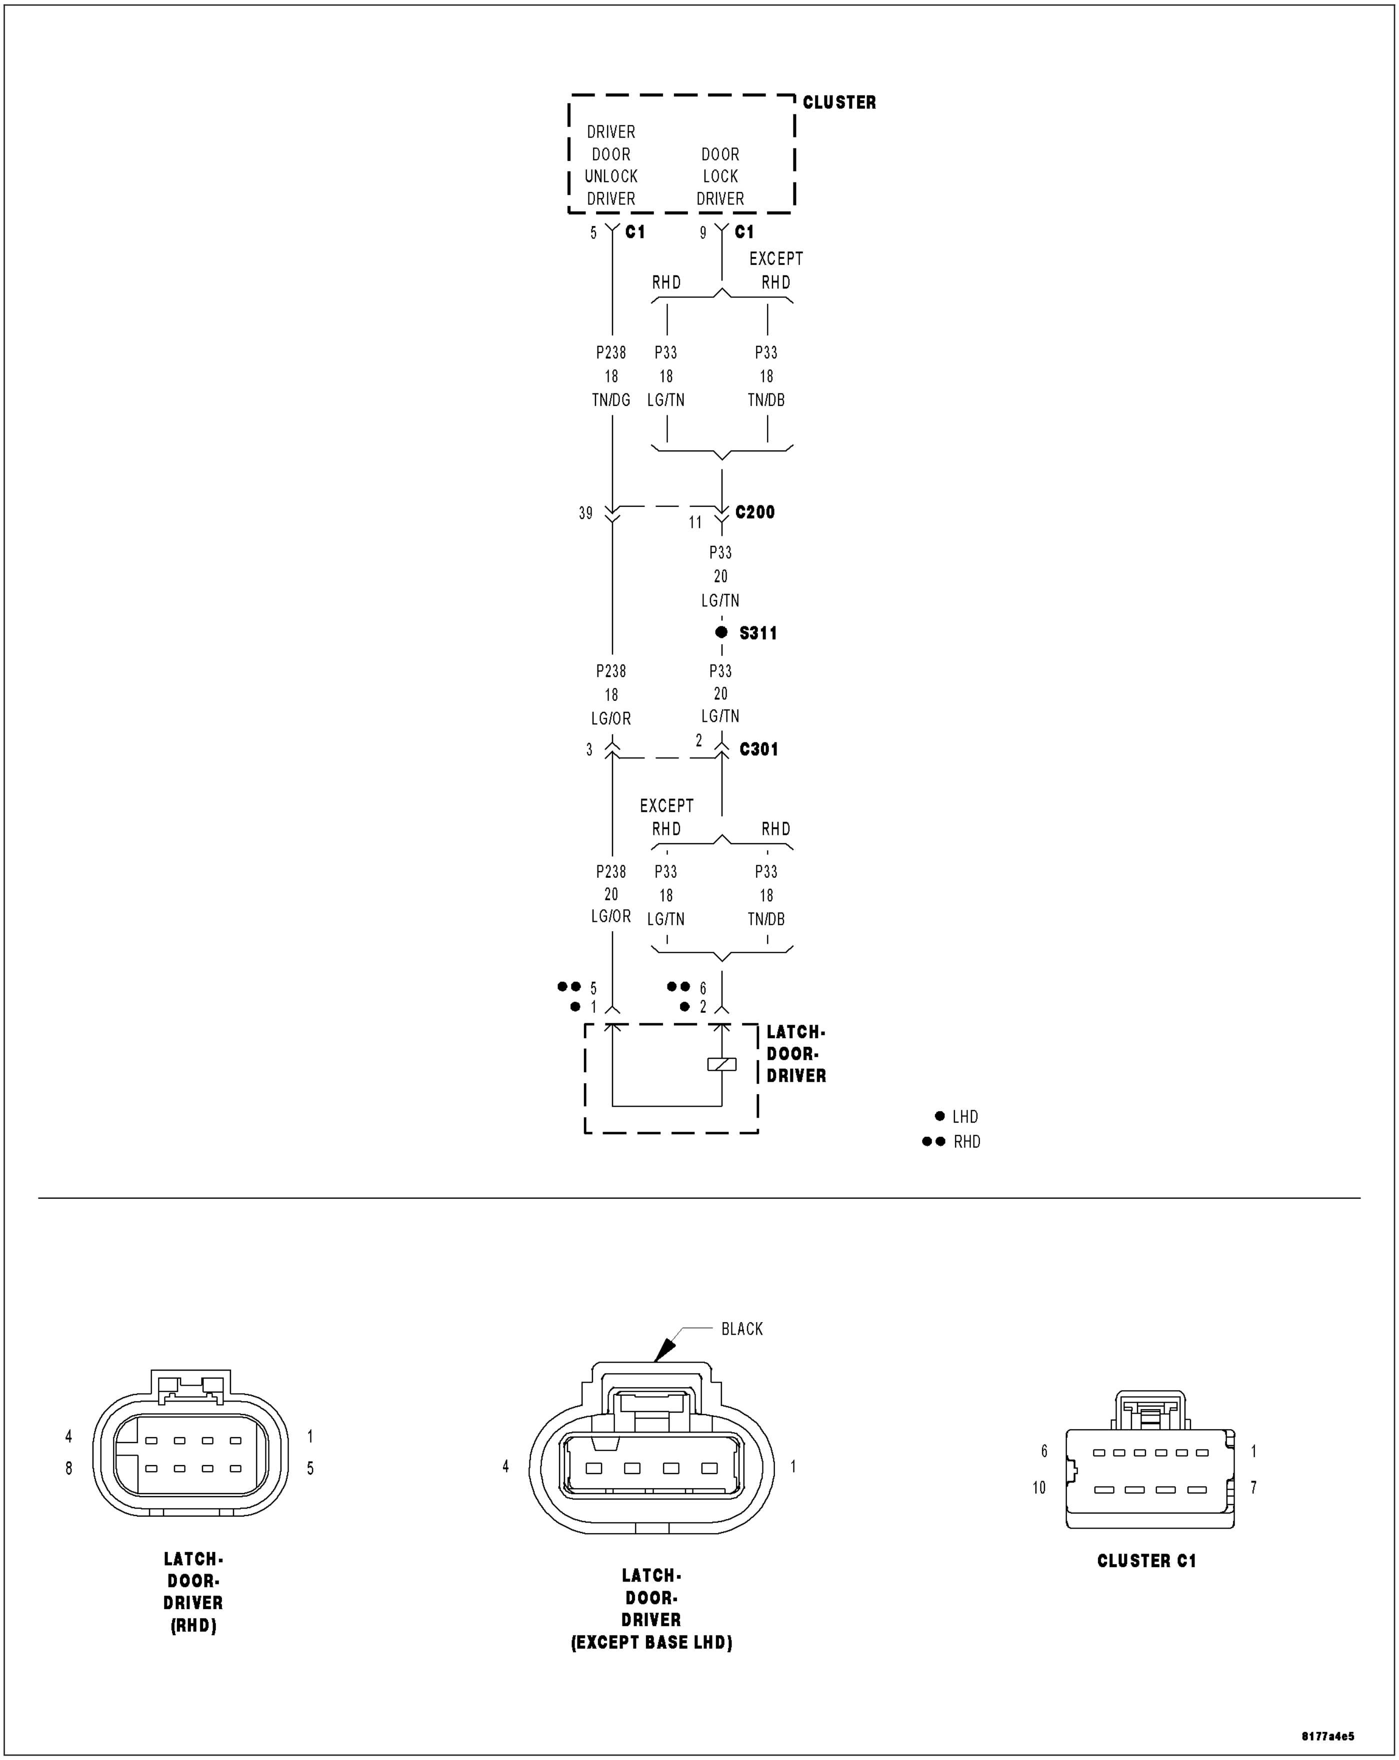
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (P33) DOOR LOCK DRIVER SHORTED TO THE (P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT

Measure the resistance between the (P33) Door Lock Driver circuit and the (P240) Passenger Doors Unlock Driver circuit in the Cluster C1 connector.

Is the resistance below 2.0 ohms?



Yes >> Repair the (P33) Door Lock Driver for a short to the (P240) Passenger Doors Unlock Driver circuit.

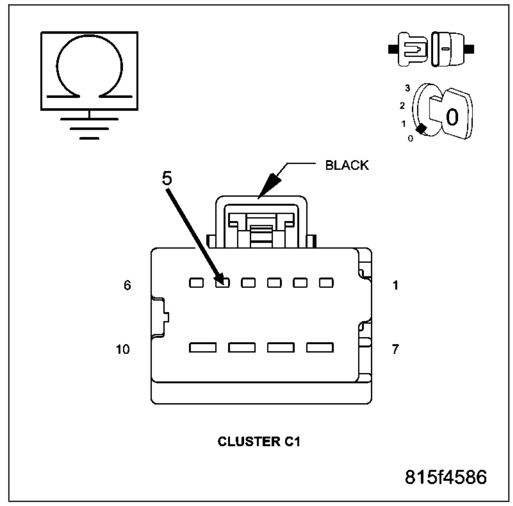
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

*DRIVER DOOR UNLOCK CONTROL CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.



Possible Causes
(P238) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORT TO GROUND
(P238) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORT TO VOLTAGE
(P238) DRIVER DOOR UNLOCK DRIVER CIRCUIT OPEN
(P33) DOOR LOCK DRIVER CIRCUIT SHORT TO THE (P238) DRIVER DOOR UNLOCK DRIVER CIRCUIT
INSTRUMENT CLUSTER

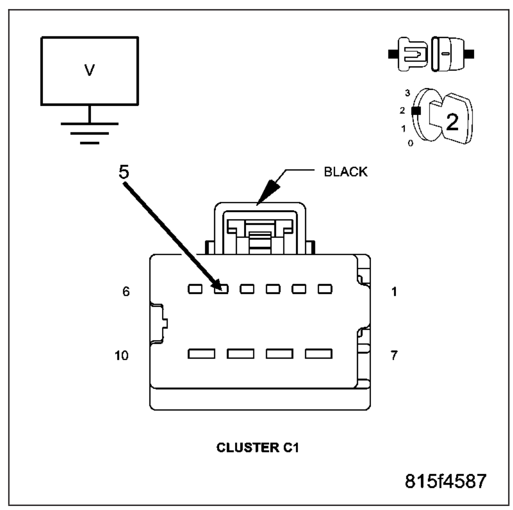
1. (P238) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Instrument Cluster C1 connector.

Measure the resistance between ground and the (P238) Driver Door Unlock Driver circuit in the Cluster C1 connector.

Is the resistance below 1,000.0 ohms?



Yes >> Repair the (P238) Driver Door Unlock Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

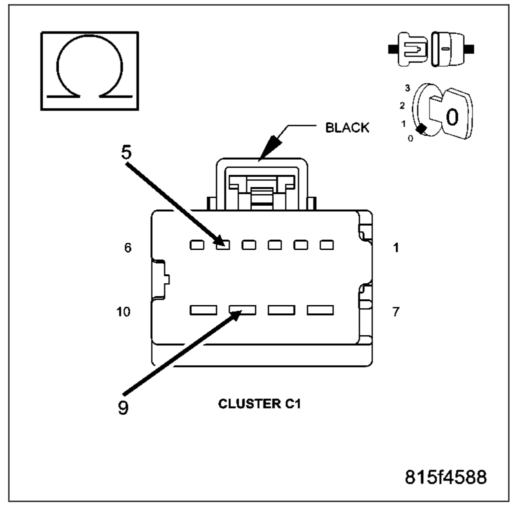
No >> Go To 2

2. (P238) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORTED TO BATTERY

Turn the ignition on.

Measure the voltage between ground and the (P238) Driver Door Unlock Driver circuit in the Cluster C1 connector.

Is there any voltage present?



Yes >> Repair the (P238) Driver Door Unlock Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

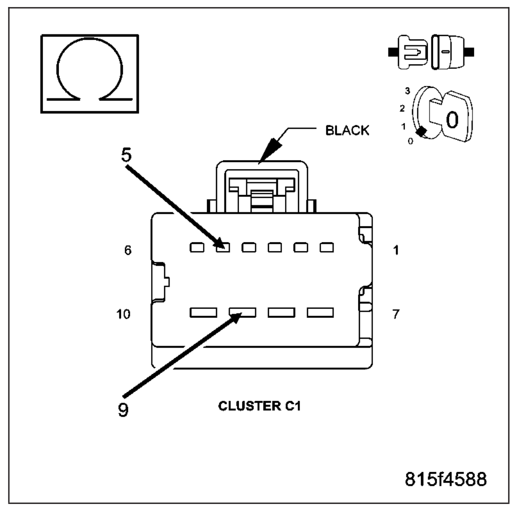
No >> Go To 3

3. (P238) DRIVER DOOR UNLOCK DRIVER CIRCUIT OPEN

Turn the ignition off.

Measure the resistance between the (P33) Door Lock Driver circuit and the (P238) Driver Door Unlock Driver circuit in the Cluster C1 connector.

Is the resistance above 4.5 ohms?



Yes >> Check and repair (if necessary) the (P33) Door Lock Driver or the (P238) Driver Door Unlock Driver circuit for an open. If the wiring is okay, replace the driver door latch.

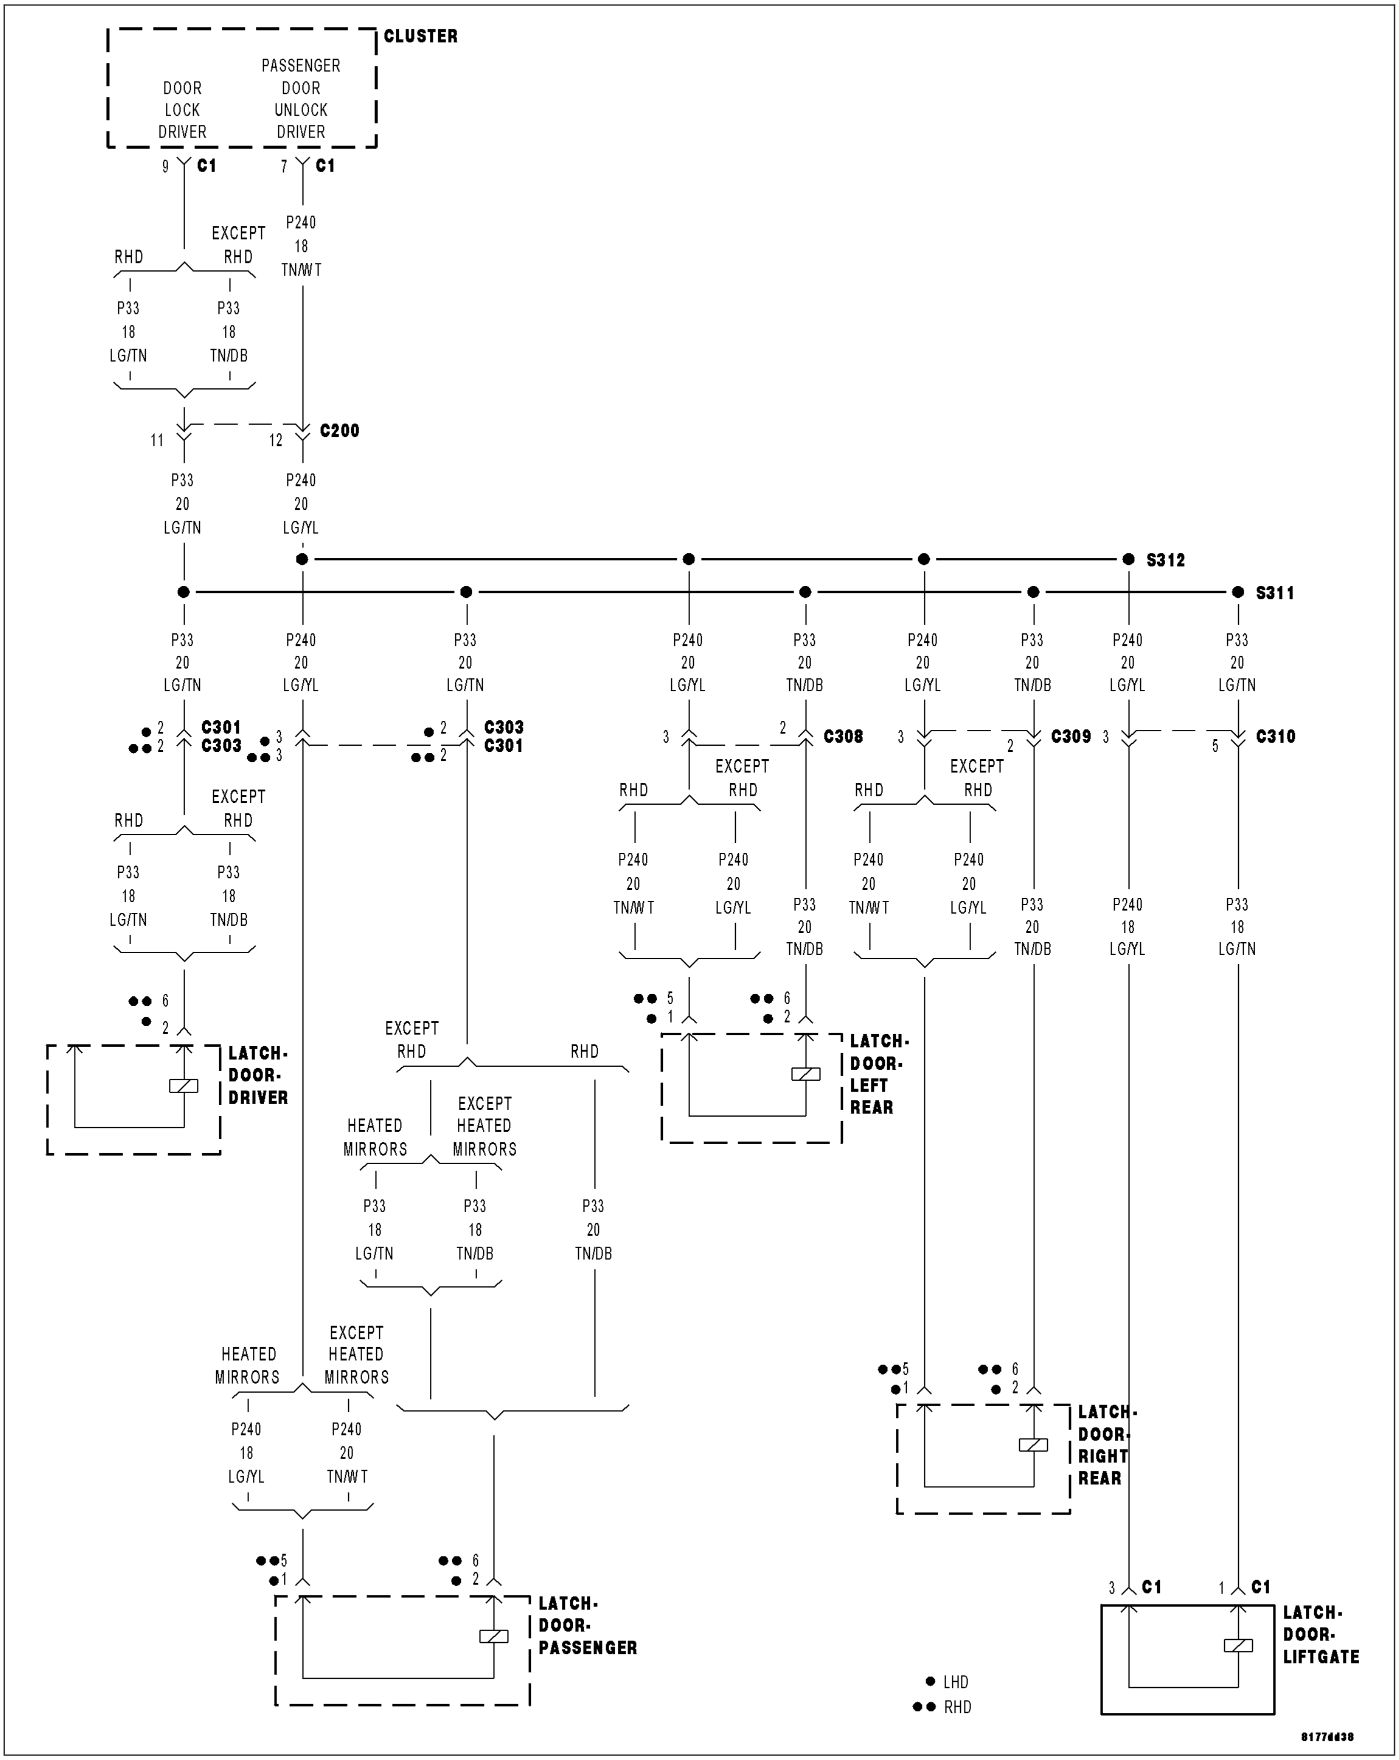
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (P33) DOOR LOCK DRIVER SHORTED TO THE (P238) DRIVER DOOR UNLOCK DRIVER CIRCUIT

Measure the resistance between the (P33) Door Lock Driver circuit and the (P238) Driver Door Unlock Driver circuit in the Cluster C1 connector.

Is the resistance below 2.0 ohms?



Yes >> Repair the (P33) Door Lock Driver for a short to the (P240) Passenger Doors Unlock Driver circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

*DOOR LOCK CONTROL CIRCUIT PERFORMANCE – CLUSTER

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(P33) DOOR LOCK DRIVER CIRCUIT SHORT TO GROUND
(P33) DOOR LOCK DRIVER CIRCUIT SHORT TO VOLTAGE
(P33) DOOR LOCK DRIVER CIRCUIT OPEN
(P33) DOOR LOCK DRIVER CIRCUIT SHORT TO THE (P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's

Operate the door locks several times.

Cycle the ignition from on to off.

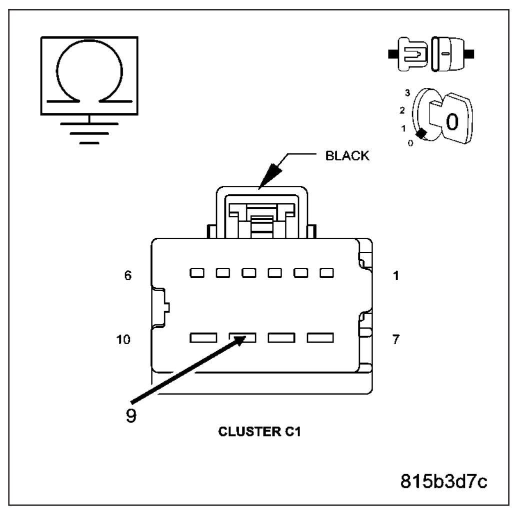
Turn the ignition on.

With the scan tool, read DTC's.

Are there any Door Lock related DTC's?

No >> Go To 2

Yes >> Refer to the symptom list for problems relating to Power Door Locks



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. (P33) DOOR LOCK DRIVER CIRCUIT SHORT TO GROUND

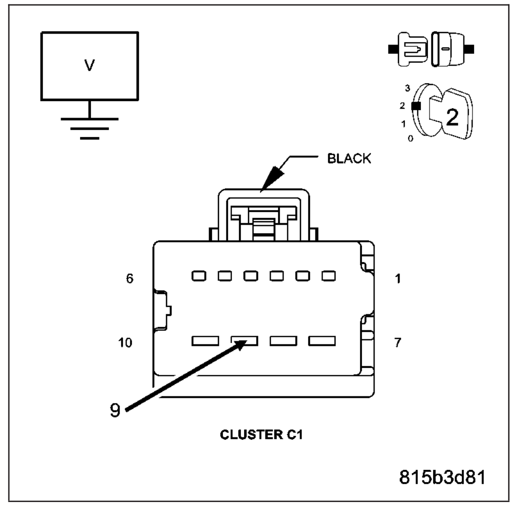
Turn the ignition off.

Disconnect the Instrument Cluster C1 connector.

Measure the resistance between ground and the (P33) Door Lock Driver circuit in the Cluster C1 connector.

Is the resistance below 1,000.0 ohms?

Yes >> Repair the (P33) Door Lock Driver circuit for a short to ground.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

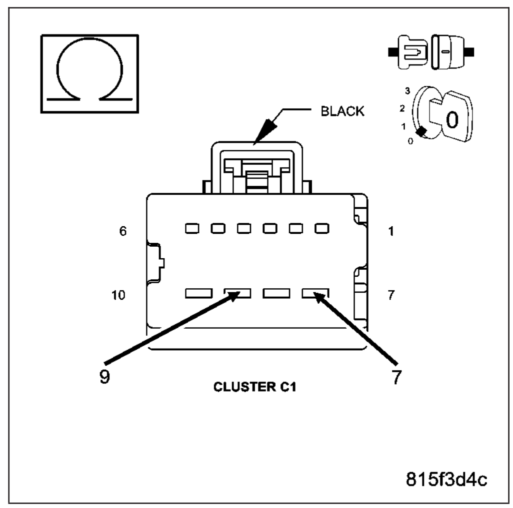
No >> Go To 3

3. (P33) DOOR LOCK DRIVER CIRCUIT SHORTED TO BATTERY

Turn the ignition on.

Measure the voltage between ground and the (P33) Door Lock Driver circuit in the Cluster C1 connector.

Is there any voltage present?



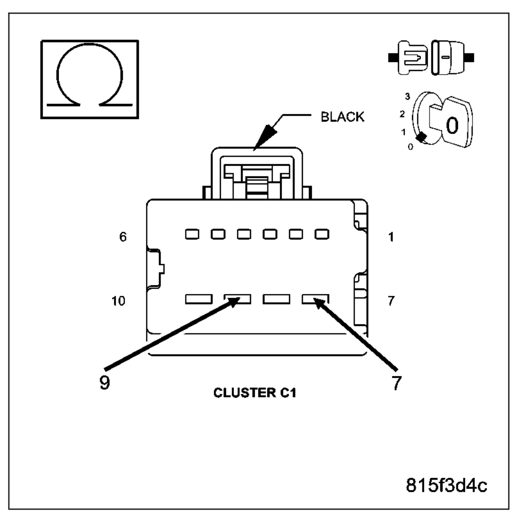
Yes >> Repair the (P33) Door Lock Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

4. (P33) DOOR LOCK DRIVER SHORTED TO THE (P240) PASSENGER DOORS UNLOCK DRIVER CIRCUIT

Turn the ignition off.

Measure the resistance between the (P33) Door Lock Driver circuit and the (P240) Passenger Doors Unlock Driver circuit in the Cluster C1 connector.



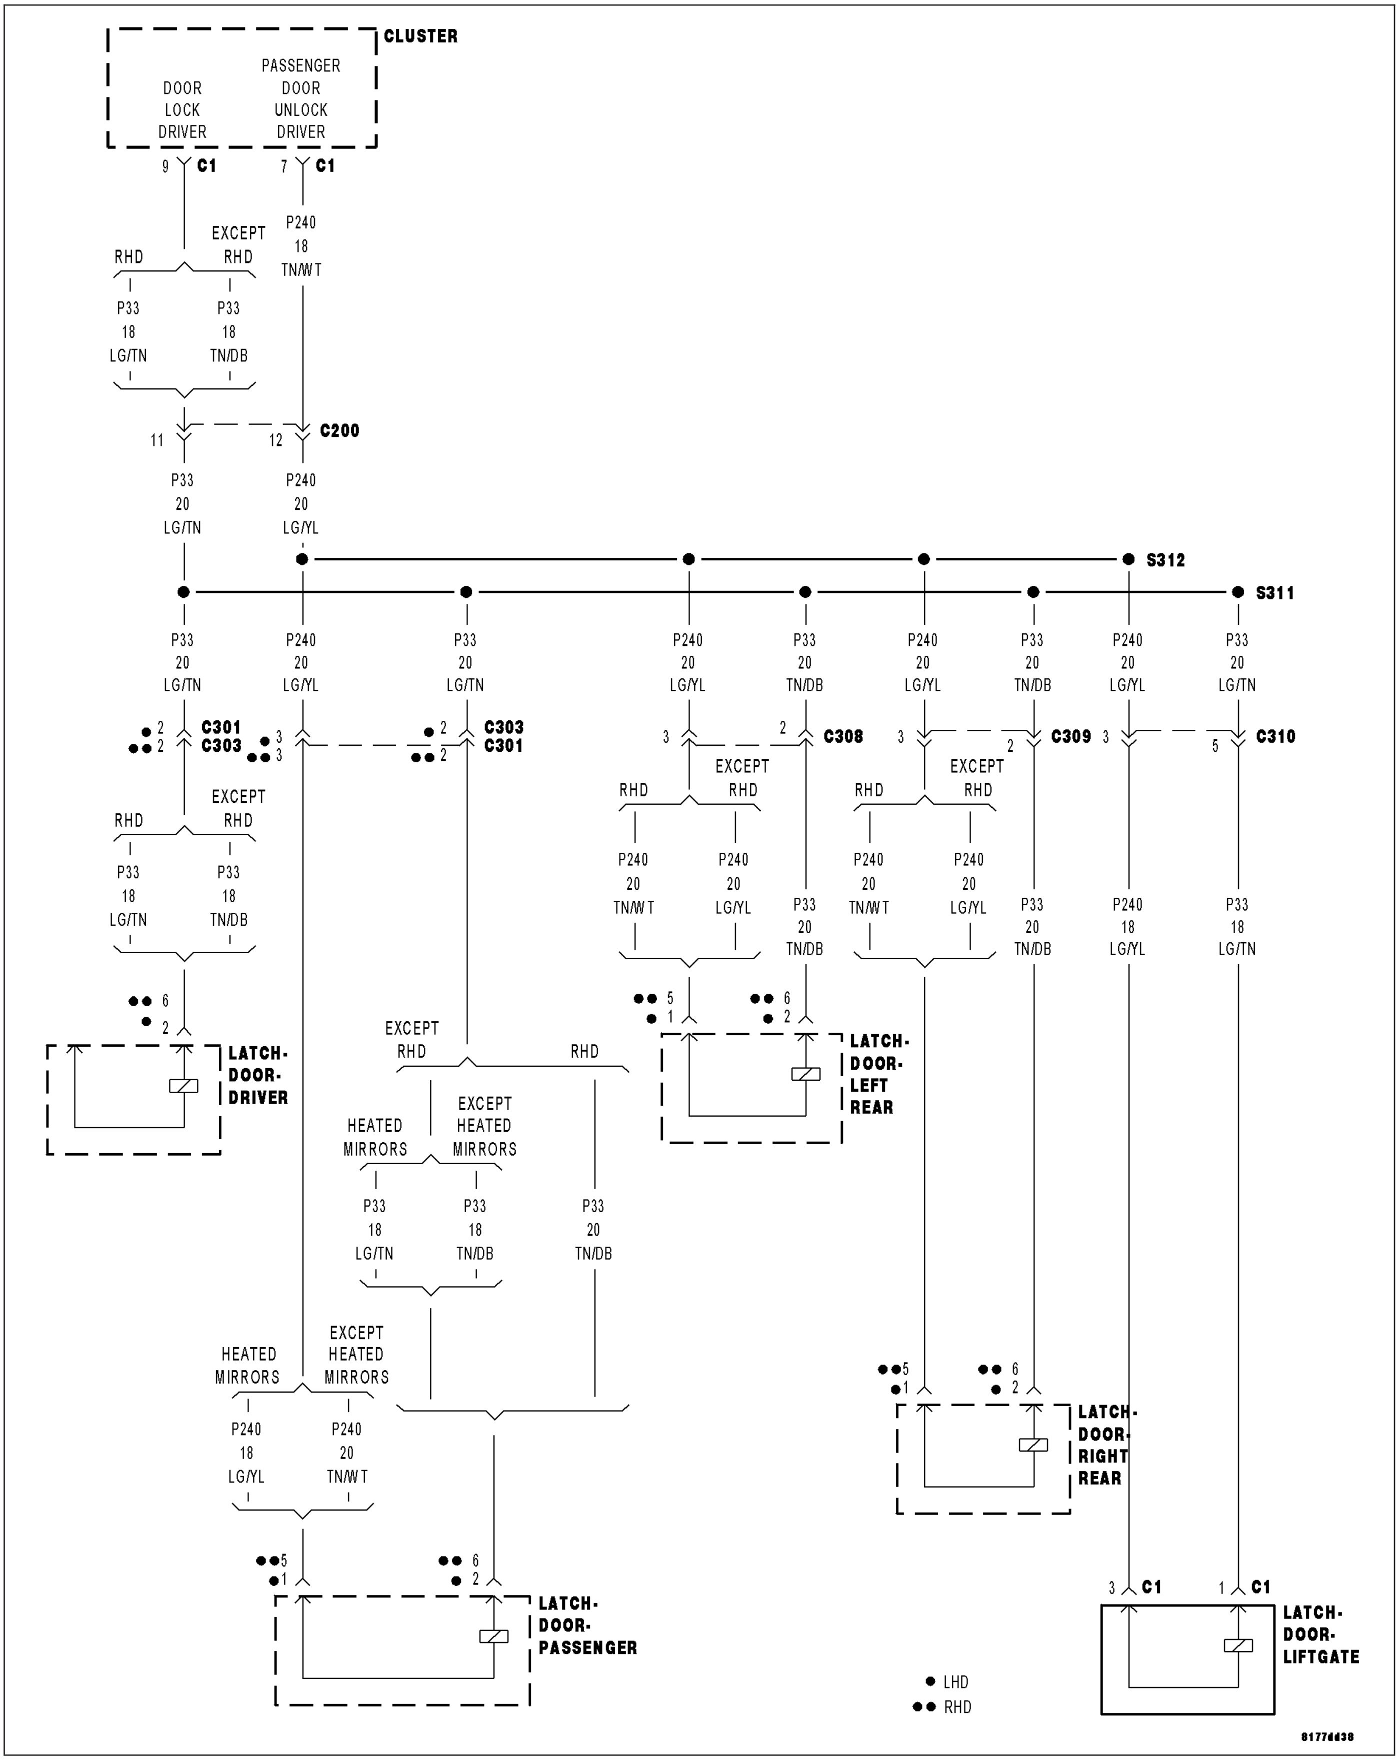
Is the resistance below 1.0 ohm?

Yes >> Repair the (P33) Door Lock Driver for a short to the (P240) Passenger Doors Unlock Driver circuit.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. (P33) DOOR LOCK DRIVER CIRCUIT OPEN

Measure the resistance between the (P33) Door Lock Driver circuit and the (P240) Passenger Doors Unlock Driver circuit in the Cluster C1 connector.



Is the resistance above 4.0 ohms?

Yes >> Repair the (P33) Door Lock Driver or the (P240) Passenger Doors Unlock Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Instrument Cluster in accordance with service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

*ONE PASSENGER DOOR FAILS TO LOCK AND UNLOCK

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(P33) DOOR LOCK DRIVER WIRE OPEN
(P240) PASSENGER DOOR UNLOCK DRIVER WIRE OPEN
DOOR LATCH OR LIFTGATE MOTOR

Theory of Operation

This test does not cover a secondary latch problem on a right hand drive vehicle.

Diagnostic Test

1. TEST FOR DIAGNOSTIC TROUBLE CODES

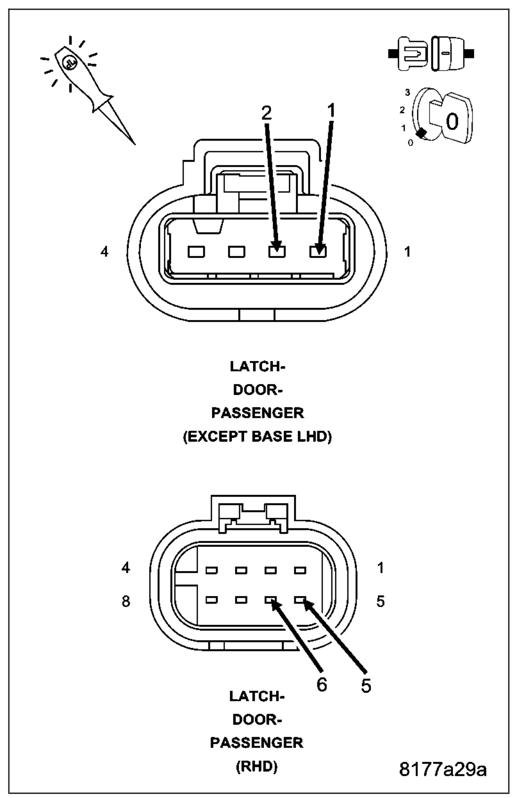
Turn the ignition on.
With the scan tool, record and erase DTC's
Operate the Driver Door Lock Switch in all positions several times.
Cycle the ignition from on to off and wait for five seconds.
Turn the ignition on.
With the scan tool, read the active DTC's.

Does the scan tool display any Power Door Lock related DTC's?

No >> Go To 2

Yes >> Refer to the Table of Contents in this section to diagnose and repair the DTC's.

2. CHECK DOOR LOCK MOTOR CIRCUIT



Turn the ignition off.

Disconnect the inoperative Door Latch (Motor) connector.

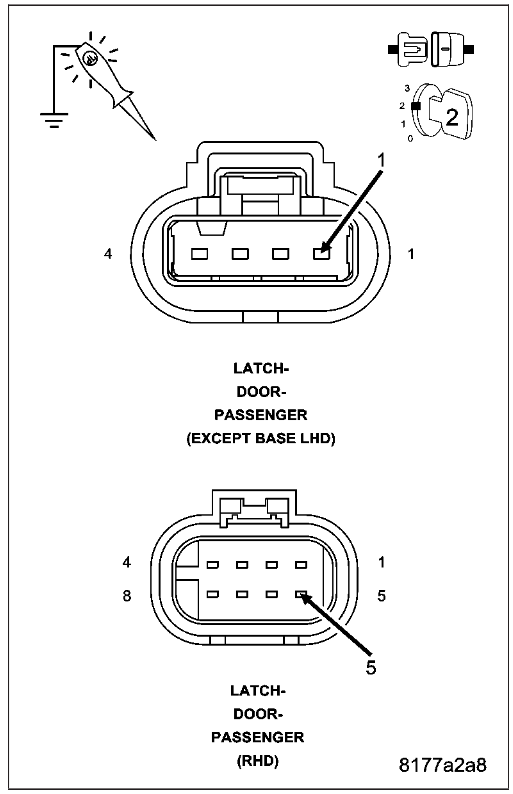
Connect a 12 volt test light between the (P33) Door Lock Driver and the (P240) Passenger Door Unlock Driver circuits in the latch connector.

NOTE: Graphic shows the Passenger Front Latch – all others similar.
Remove the key from the ignition switch.

Operate the door locks several times in the lock and unlock positions from the door lock switch and observe the test light.

Does the test light illuminate brightly when the locks are actuated in both directions?

Yes >> Replace the Door latch Assembly (or motor).
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)



No >> Go To 3

3. (P240) PASSENGER DOOR UNLOCK DRIVER WIRE OPEN

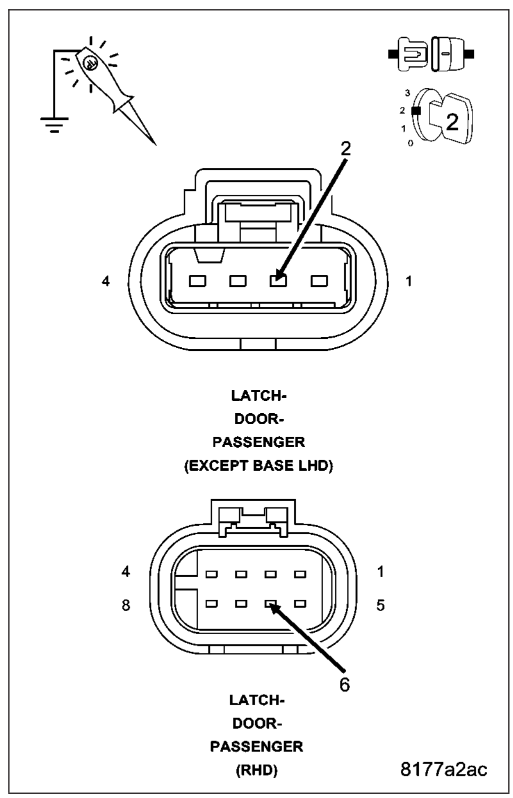
Turn the ignition on.

Using a 12-volt test light connected to ground, check the (P240) Passenger Door Unlock Driver circuit.

With the scan tool, actuate the Passenger Door Unlock Relay.

Does the test light illuminate brightly when the relay is actuated?

Yes >> Go To 4



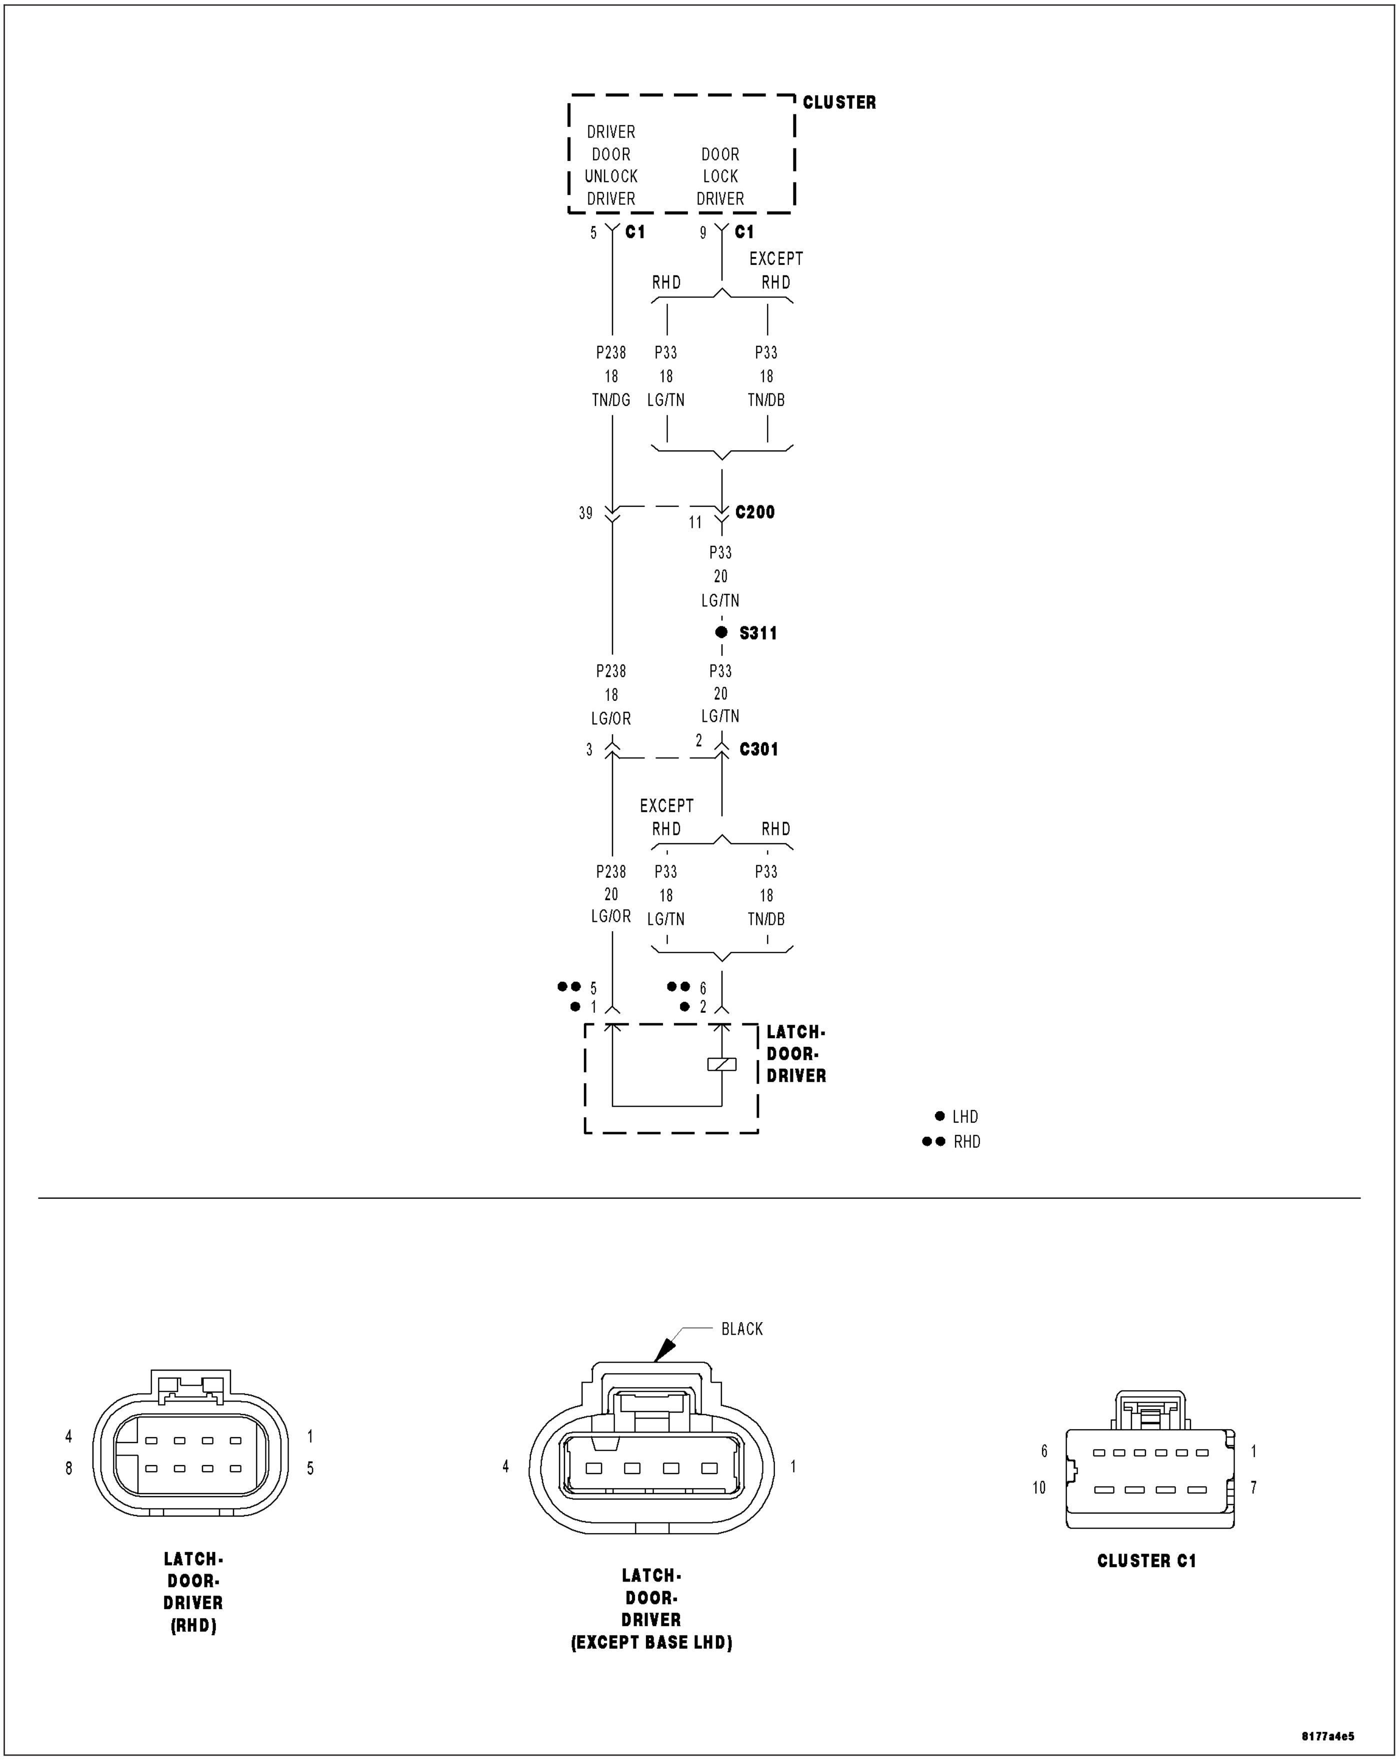
No >> Repair the (P240) Passenger Door Unlock Driver wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

4. (P33) DOOR LOCK DRIVER WIRE OPEN

Using a 12-volt test light connected to ground, check the (P33) Door Lock Driver circuit.

With the scan tool, actuate the Door Lock Relay.



Does the test light illuminate brightly when the relay is actuated?

Yes >> Test Complete.

No >> Repair the (P33) Door Lock Driver wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

*DRIVER DOOR FAILS TO LOCK AND UNLOCK

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
DTC's PRESENT
(P238) DRIVER DOOR UNLOCK DRIVER WIRE OPEN
(P33) DOOR LOCK DRIVER WIRE OPEN
INSTRUMENT CLUSTER
DRIVER DOOR LATCH

Theory of Operation

This test does not cover a secondary latch problem on a right hand drive vehicle.

Diagnostic Test

1. TEST FOR DIAGNOSTIC TROUBLE CODES

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Driver Door Lock Switch in all positions several times.

Cycle the ignition from on to off and wait for five seconds.

Turn the ignition on.

With the scan tool, read the active DTC's.

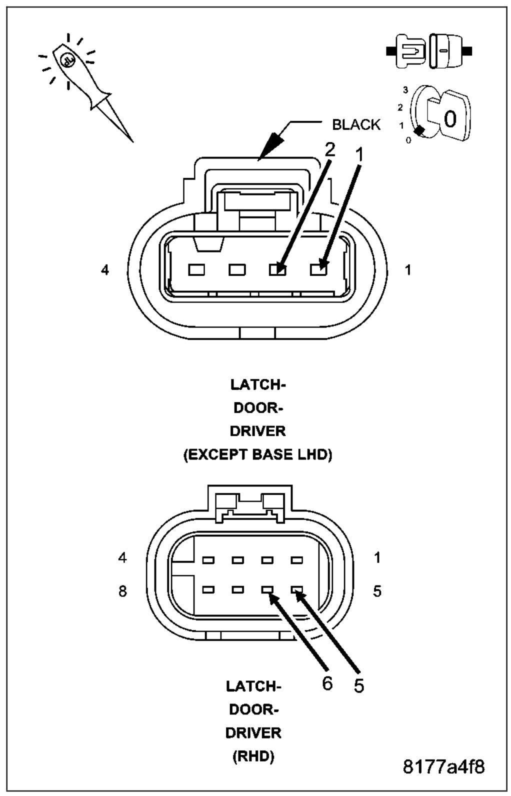
Does the scan tool display any Power Door Lock related DTC's?

No >> Go To 2

Yes >> Refer to the Table of Contents in this section to diagnose and repair the DTC's.

2. CHECK DOOR LOCK MOTOR CIRCUIT

Turn the ignition off.



Disconnect the Driver Door Latch connector.

Connect a 12 volt test light between the (P33) Door Lock Driver and the (P238) Driver Door Unlock Driver circuits in the latch connector.

Remove the key from the ignition switch.

Close the driver door or trip the latch to the door closed position

Operate the door locks several times in the lock and unlock positions from the door lock switch and observe the test light.

Does the test light illuminate brightly when the locks are actuated in both directions?

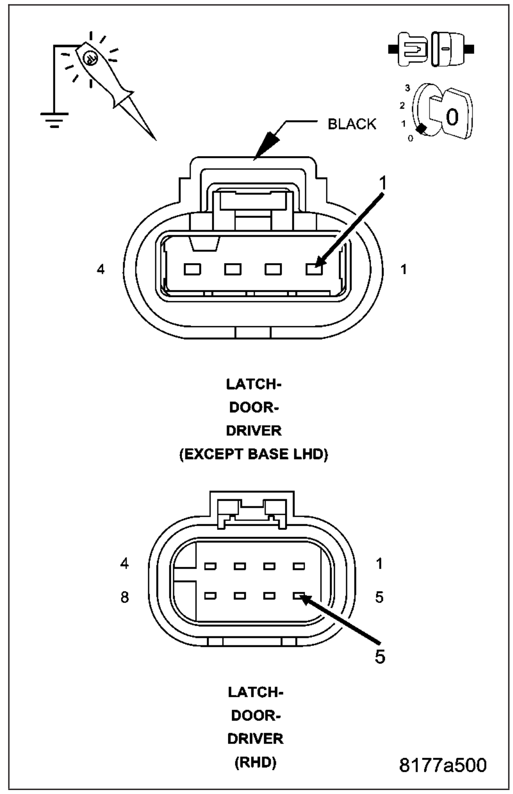
Yes >> Replace the Driver Door Latch Assembly.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

No >> Go To 3

3. (P238) DRIVER DOOR UNLOCK DRIVER CIRCUIT OPEN

Using a 12-volt test light connected to ground, check the (P238) Driver Door Unlock Driver circuit.



Close the driver door or trip the latch to the door closed position

With the scan tool, actuate the Driver Door Unlock Relay.

Does the test light illuminate brightly when the driver door unlock is actuated?

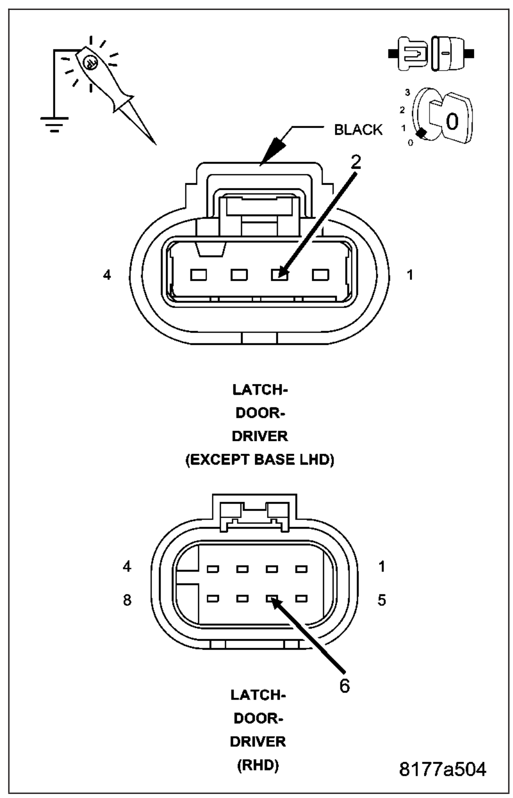
Yes >> Go To 4

No >> Go To 5

4. (P33) DOOR LOCK DRIVER WIRE OPEN

Using a 12-volt test light connected to ground, check the (P33) Door Lock Driver circuit.

Close the driver door or trip the latch to the door closed position



With the scan tool, actuate the Door Lock Relay.

Does the test light illuminate brightly when the door lock is actuated?

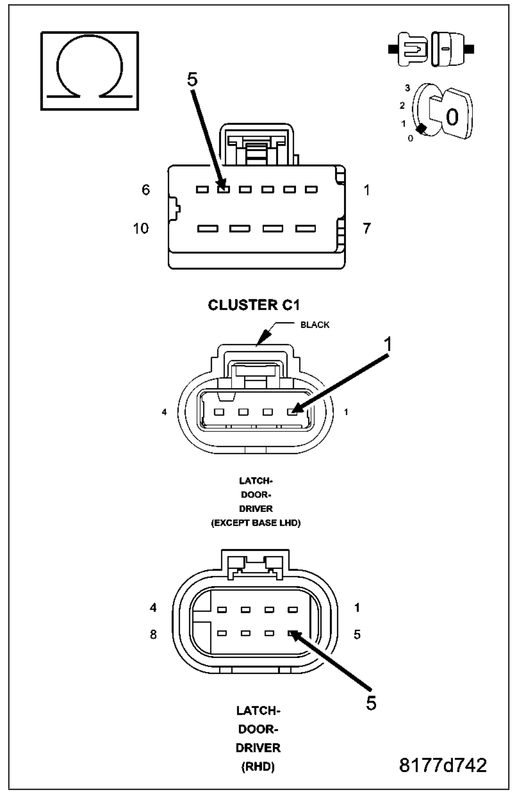
Yes >> Test Complete.

No >> Repair the (P33) Door Lock Driver wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

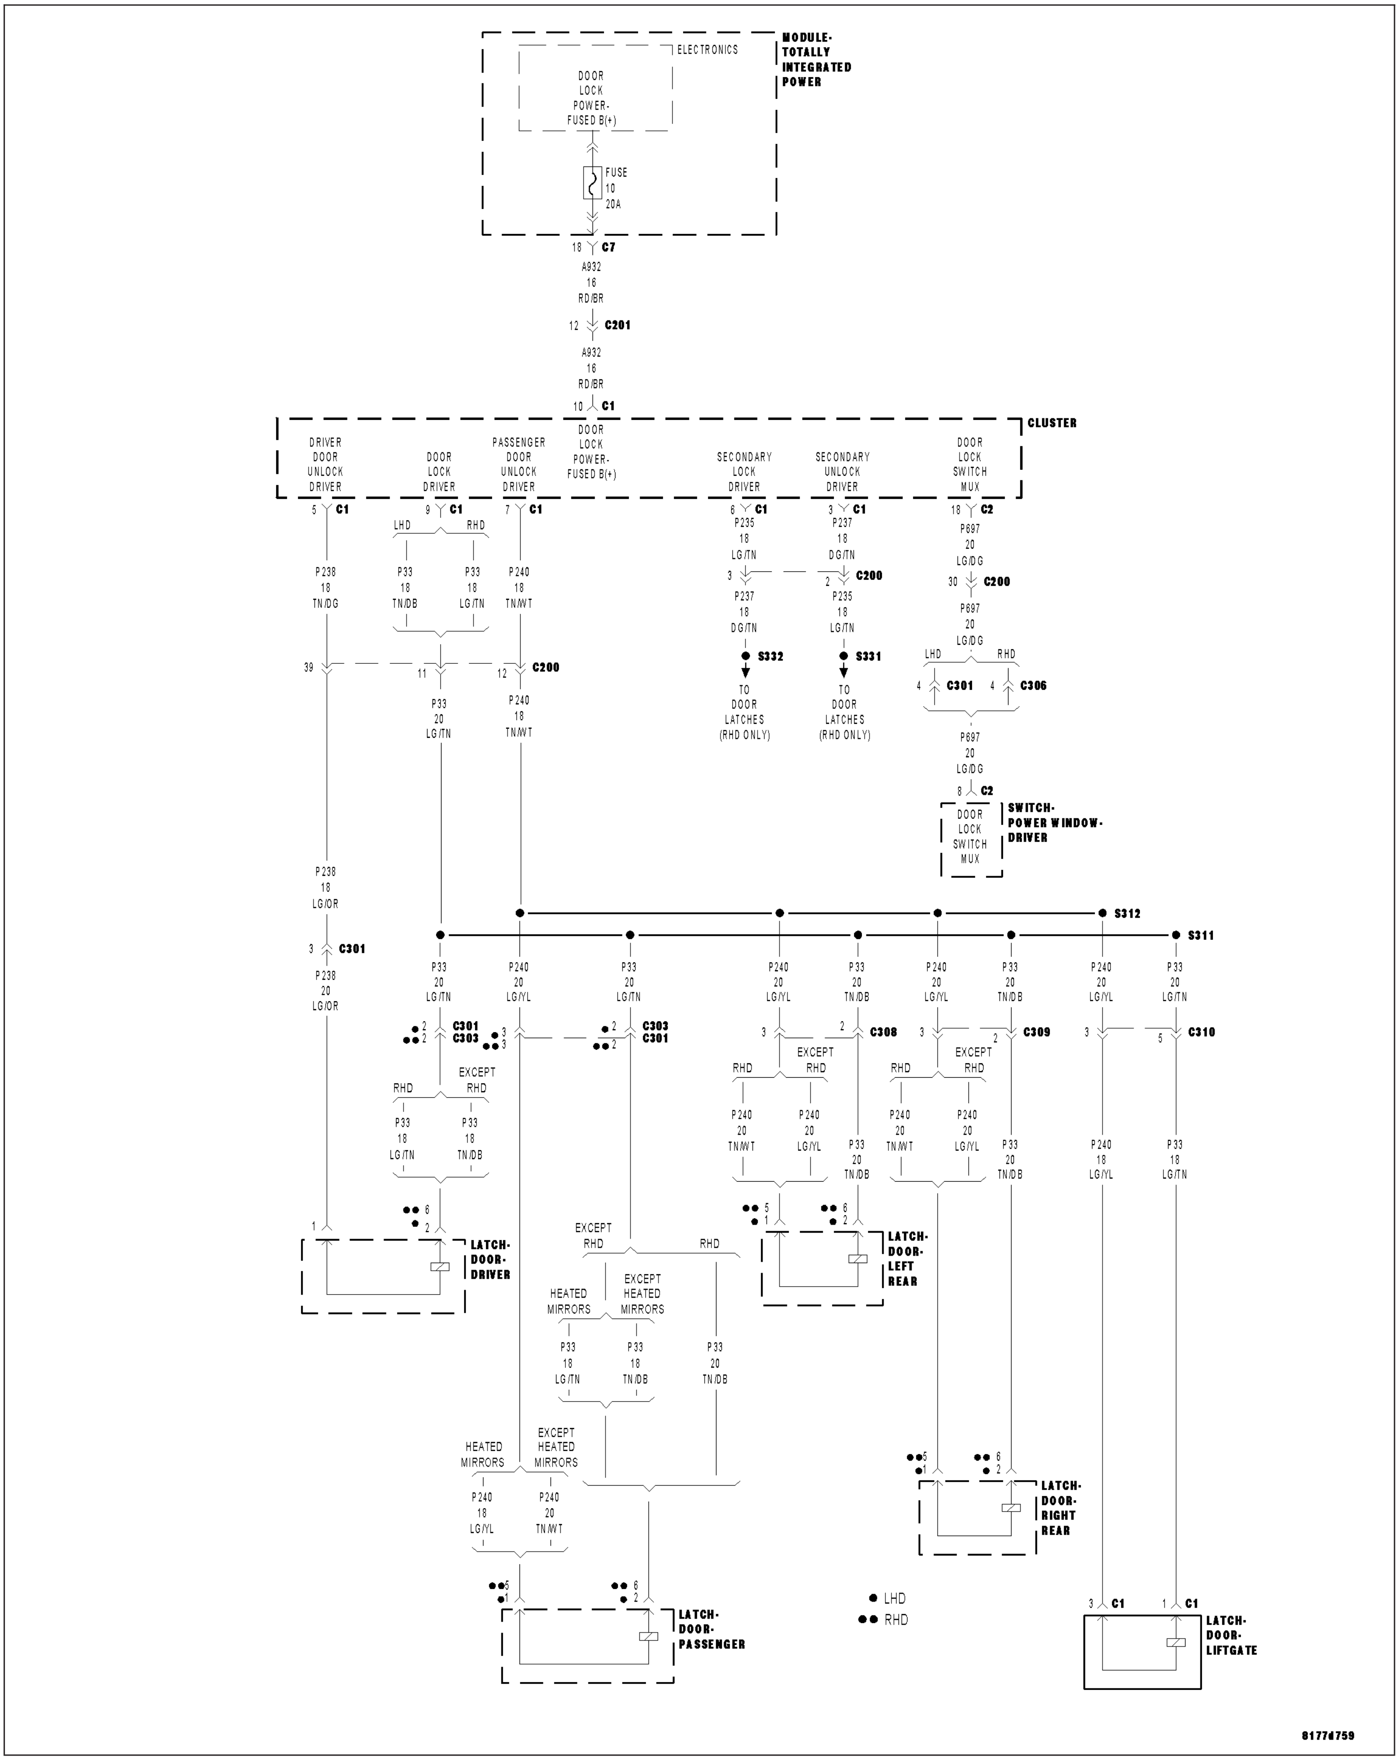
5. (P238) DRIVER DOOR UNLOCK DRIVER WIRE OPEN

Disconnect the Cluster C1 connector.



Measure the resistance of the (P238) Driver Door Unlock Driver wire between the Cluster C1 connector and the Driver Door Latch connector.

Is the resistance below 2.0 ohms?



Yes >> Replace the Instrument Cluster in accordance with service information.Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

No >> Repair the (P238) Driver Door Unlock Driver wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

*ALL DOORS FAIL TO LOCK AND UNLOCK

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
DTC's PRESENT
TIPM FUSE NUMBER 10 OPEN
(P33) DOOR LOCK DRIVER WIRE OPEN
(A932) FUSED B+ CIRCUIT OPEN
INSTRUMENT CLUSTER

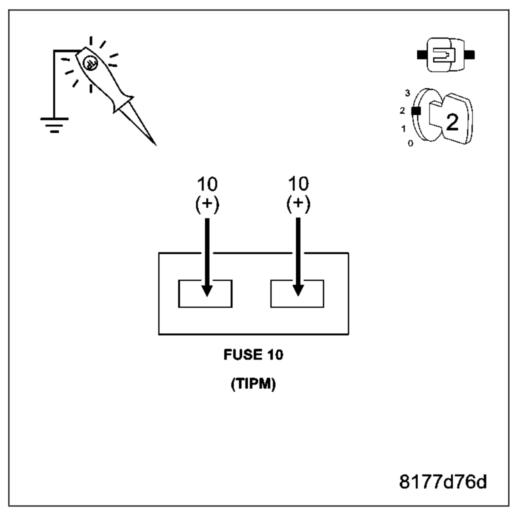
Theory of Operation

This test does not cover a secondary latch problem on a right hand drive vehicle.

Diagnostic Test

1. TEST FOR DIAGNOSTIC TROUBLE CODES

Turn the ignition on.
With the scan tool, record and erase DTC's
Operate the Driver Door Lock Switch in all positions several times.
Cycle the ignition from on to off and wait for five seconds.
Turn the ignition on.
With the scan tool, read the active DTC's.



Does the scan tool display any Power Door Lock related DTC's?

No >> Go To 2

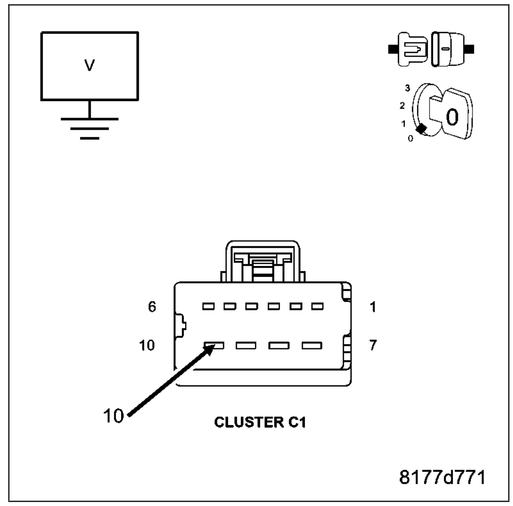
Yes >> Refer to the Table of Contents in this section to diagnose and repair the DTC's.

2. TIPM FUSE NUMBER 10 OPEN

Using a test light connected to ground, check both sides of the TIPM fuse number 10.

Does the test light illuminate brightly on both sides of the fuse?

No >> Repair the open circuit as necessary. If the fuse is blown, replace it and try the locks. If it blows again, use the schematics and locate and repair the short circuit.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

Yes >> Go To 3

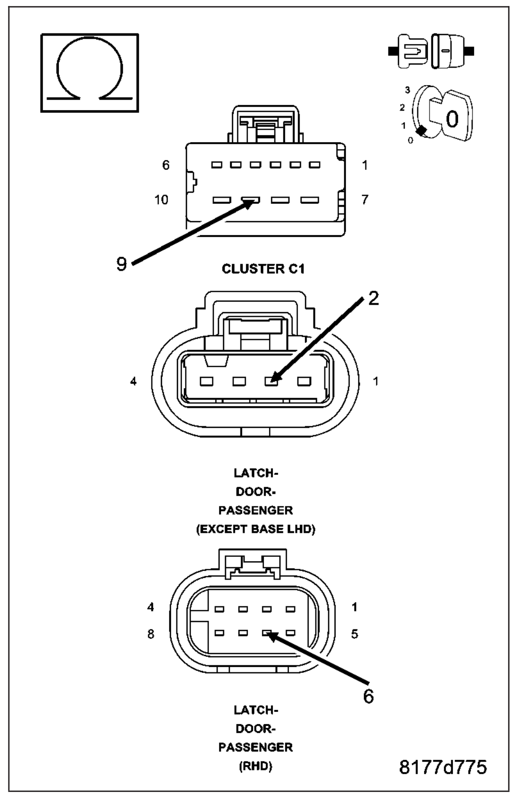
3. (A 932) FUSED B+ CIRCUIT OPEN

Disconnect the Instrument Cluster C1 connector.

Measure the voltage of the (A932) Fused B+ circuit in the Cluster C1 connector.

Is the voltage above 11.0 volts?

Yes >> Go To 4



No >> Repair the (A932) Fused B+ circuit for an open.

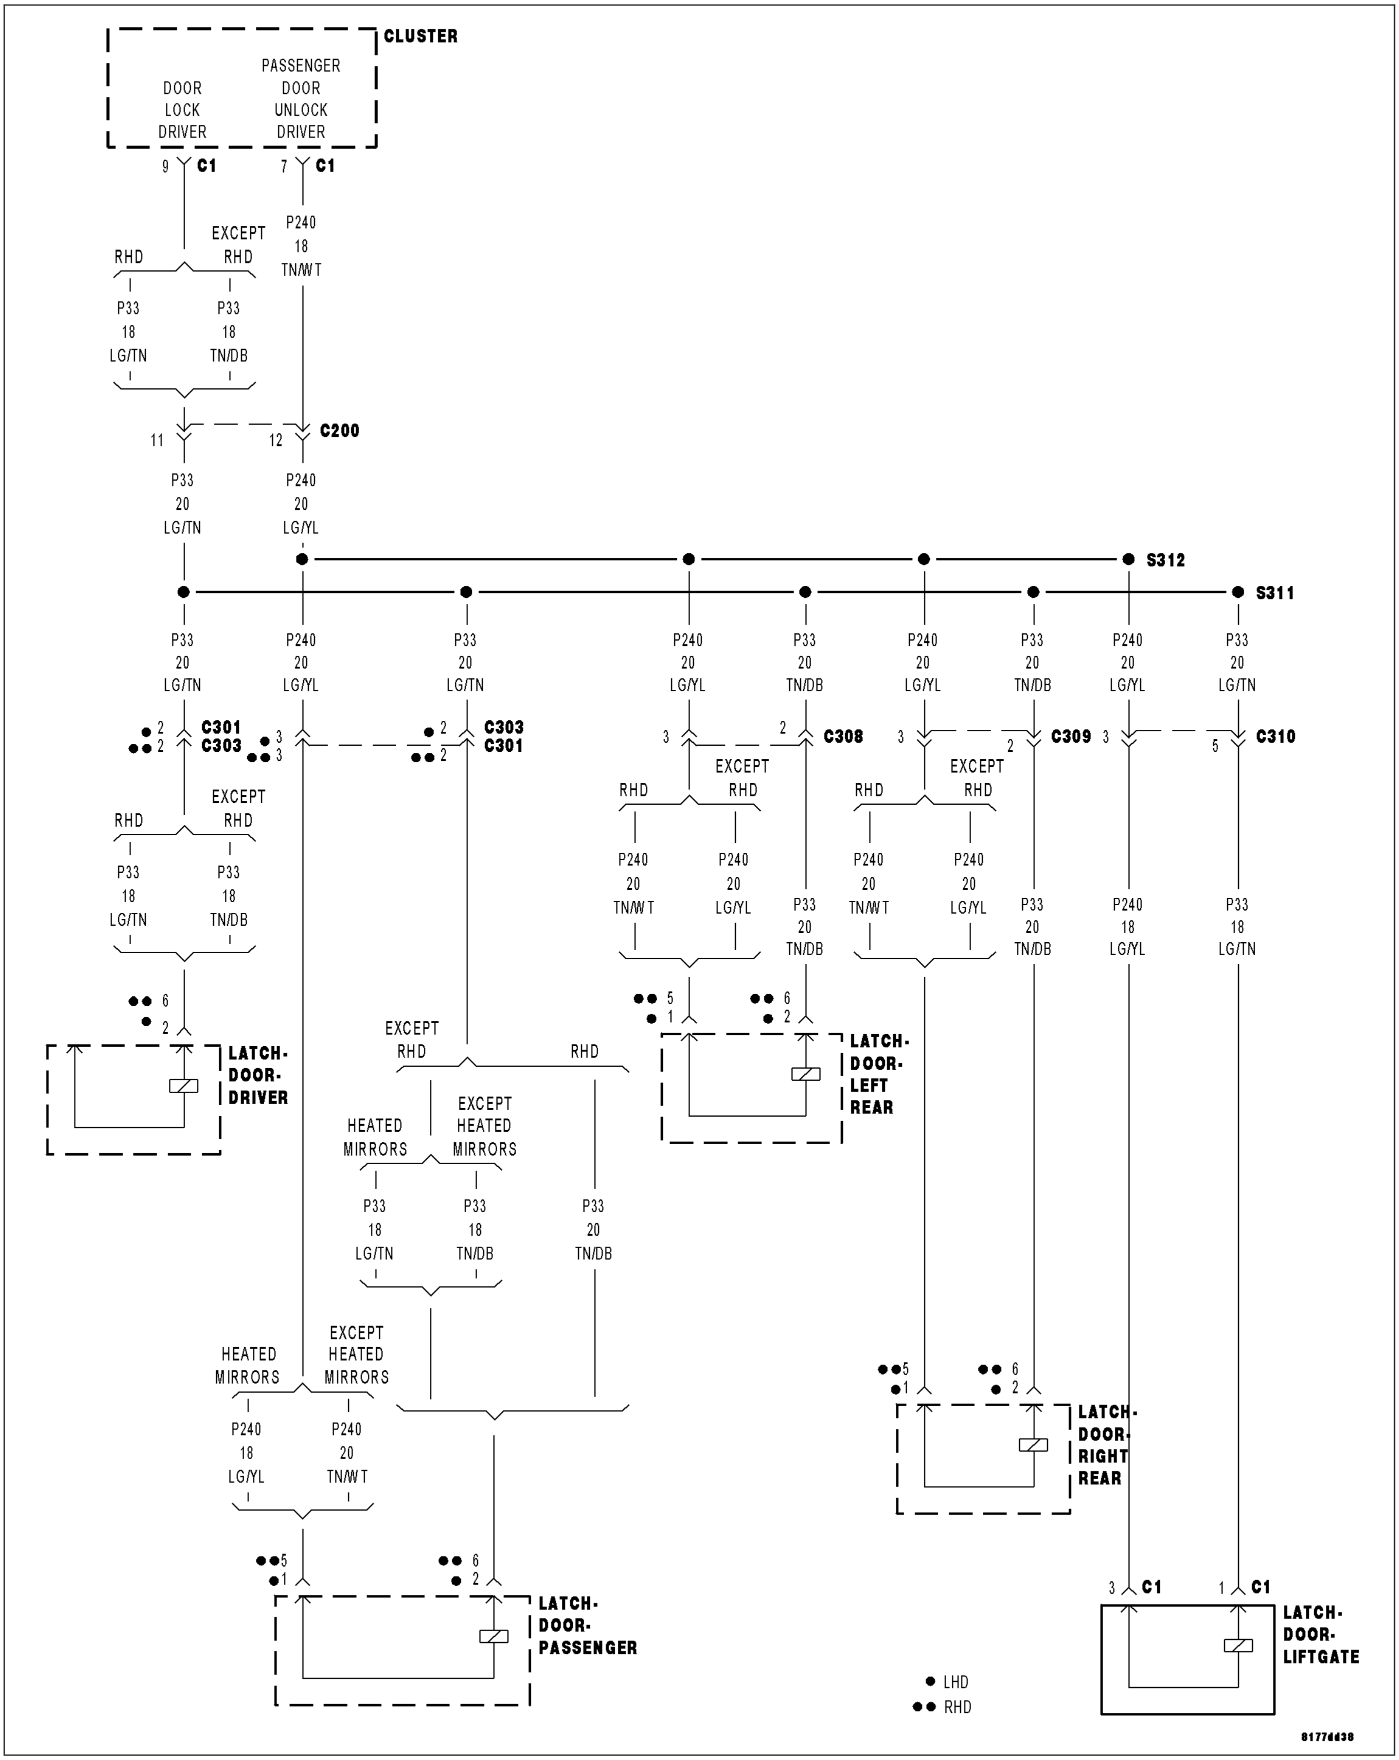
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

4. (P33) DOOR LOCK DRIVER WIRE OPEN

Disconnect any Door Latch Connector.

Measure the resistance of the (P33) Door Lock Driver wire between the Cluster C1 connector and the door latch connector.

Is the resistance below 5.0 ohms?



Yes >> Replace the Instrument Cluster in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

No >> Repair the (P33) Door Lock Driver wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

*ALL PASSENGER DOORS FAIL TO LOCK AND UNLOCK

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
DTC's PRESENT
(P240) PASSENGER DOORS UNLOCK DRIVER WIRE OPEN
INSTRUMENT CLUSTER

Theory of Operation

This test does not cover a secondary latch problem on a right hand drive vehicle.

Diagnostic Test

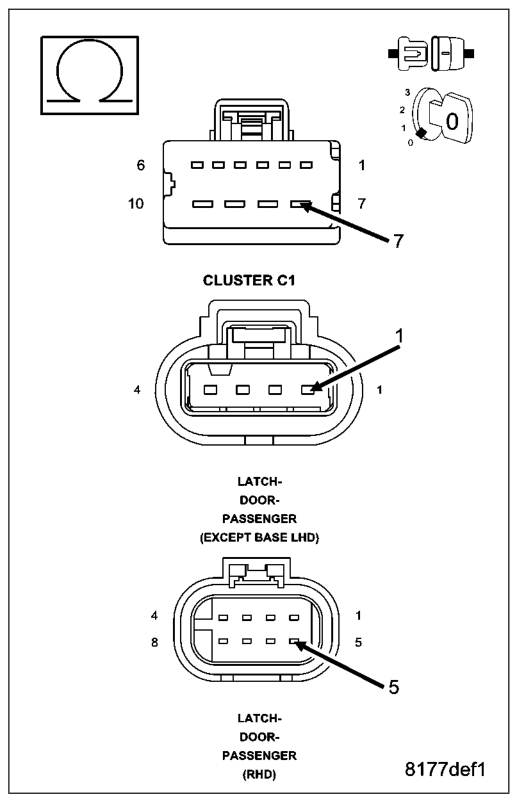
1. TEST FOR DIAGNOSTIC TROUBLE CODES

Turn the ignition on.
With the scan tool, record and erase DTC's
Operate the Driver Door Lock Switch in all positions several times.
Cycle the ignition from on to off and wait for five seconds.
Turn the ignition on.
With the scan tool, read the active DTC's.

Does the scan tool display any Power Door Lock related DTC's?

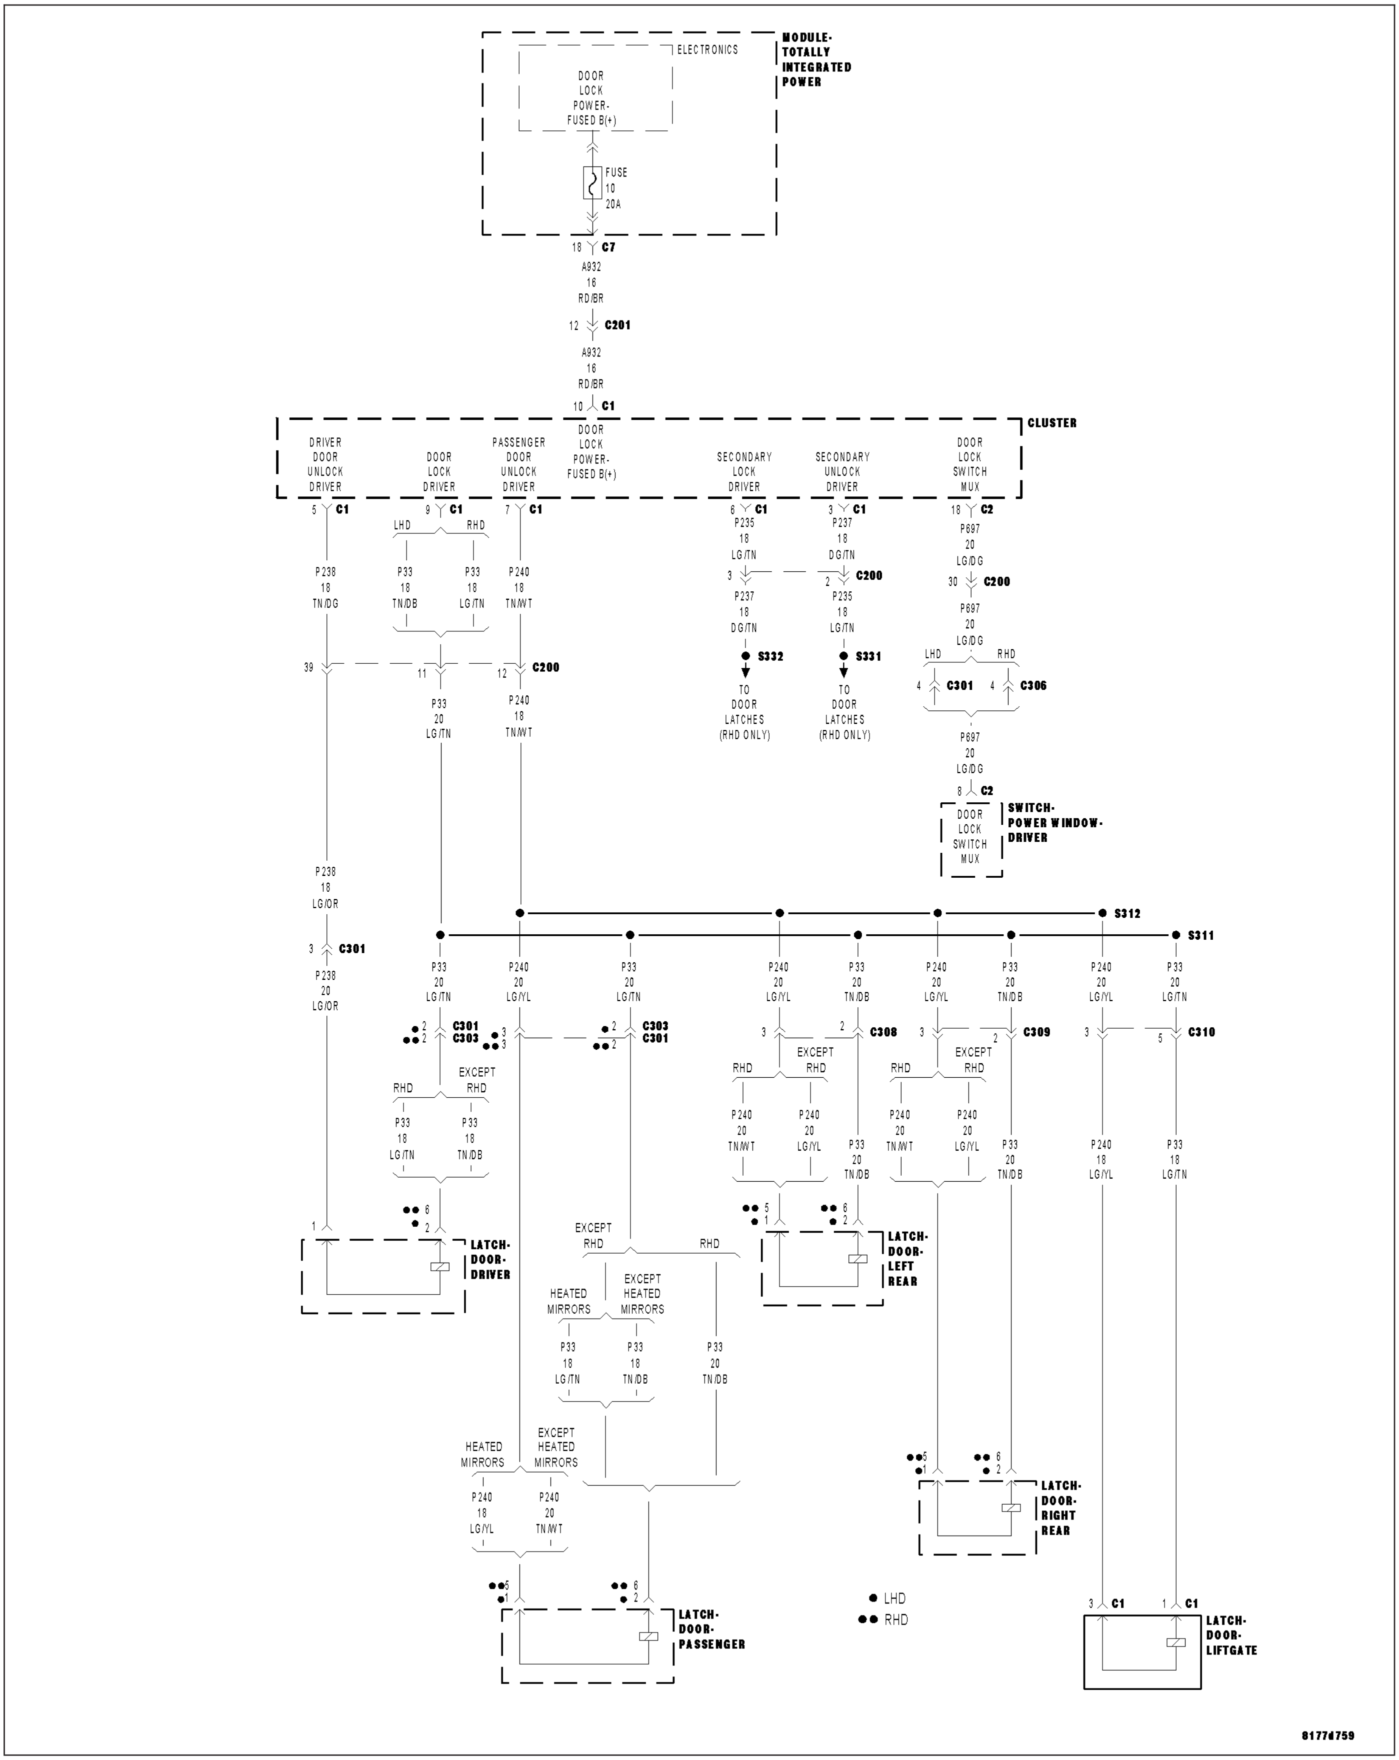
No >> Go To 2

Yes >> Refer to the Table of Contents in this section to diagnose and repair the DTC's.



2. (P240) PASSENGER DOORS UNLOCK DRIVER WIRE OPEN

Turn the ignition off.
Disconnect any Door Latch Connector.
Measure the resistance of the (P240) Passenger Doors Unlock Driver wire between the Cluster C1 connector and the door latch connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Instrument Cluster in accordance with service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

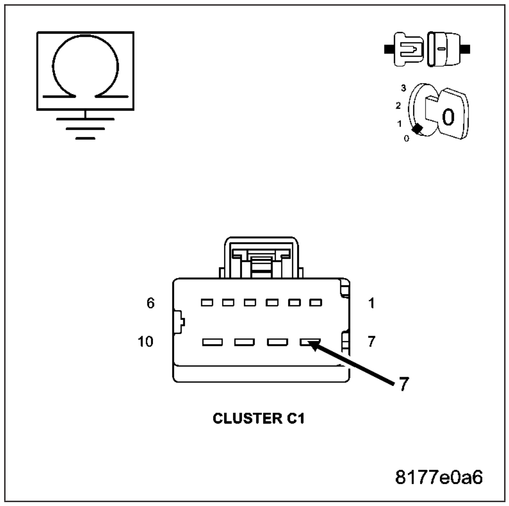
No >> Repair the (P240) Passenger Doors Unlock Driver wire for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

*ALL PASSENGER DOORS FAIL TO UNLOCK

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(P240) PASSENGER DOORS UNLOCK DRIVER WIRE SHORT TO GROUND
INSTRUMENT CLUSTER

Theory of Operation



This test does not cover a secondary latch problem on a right hand drive vehicle.

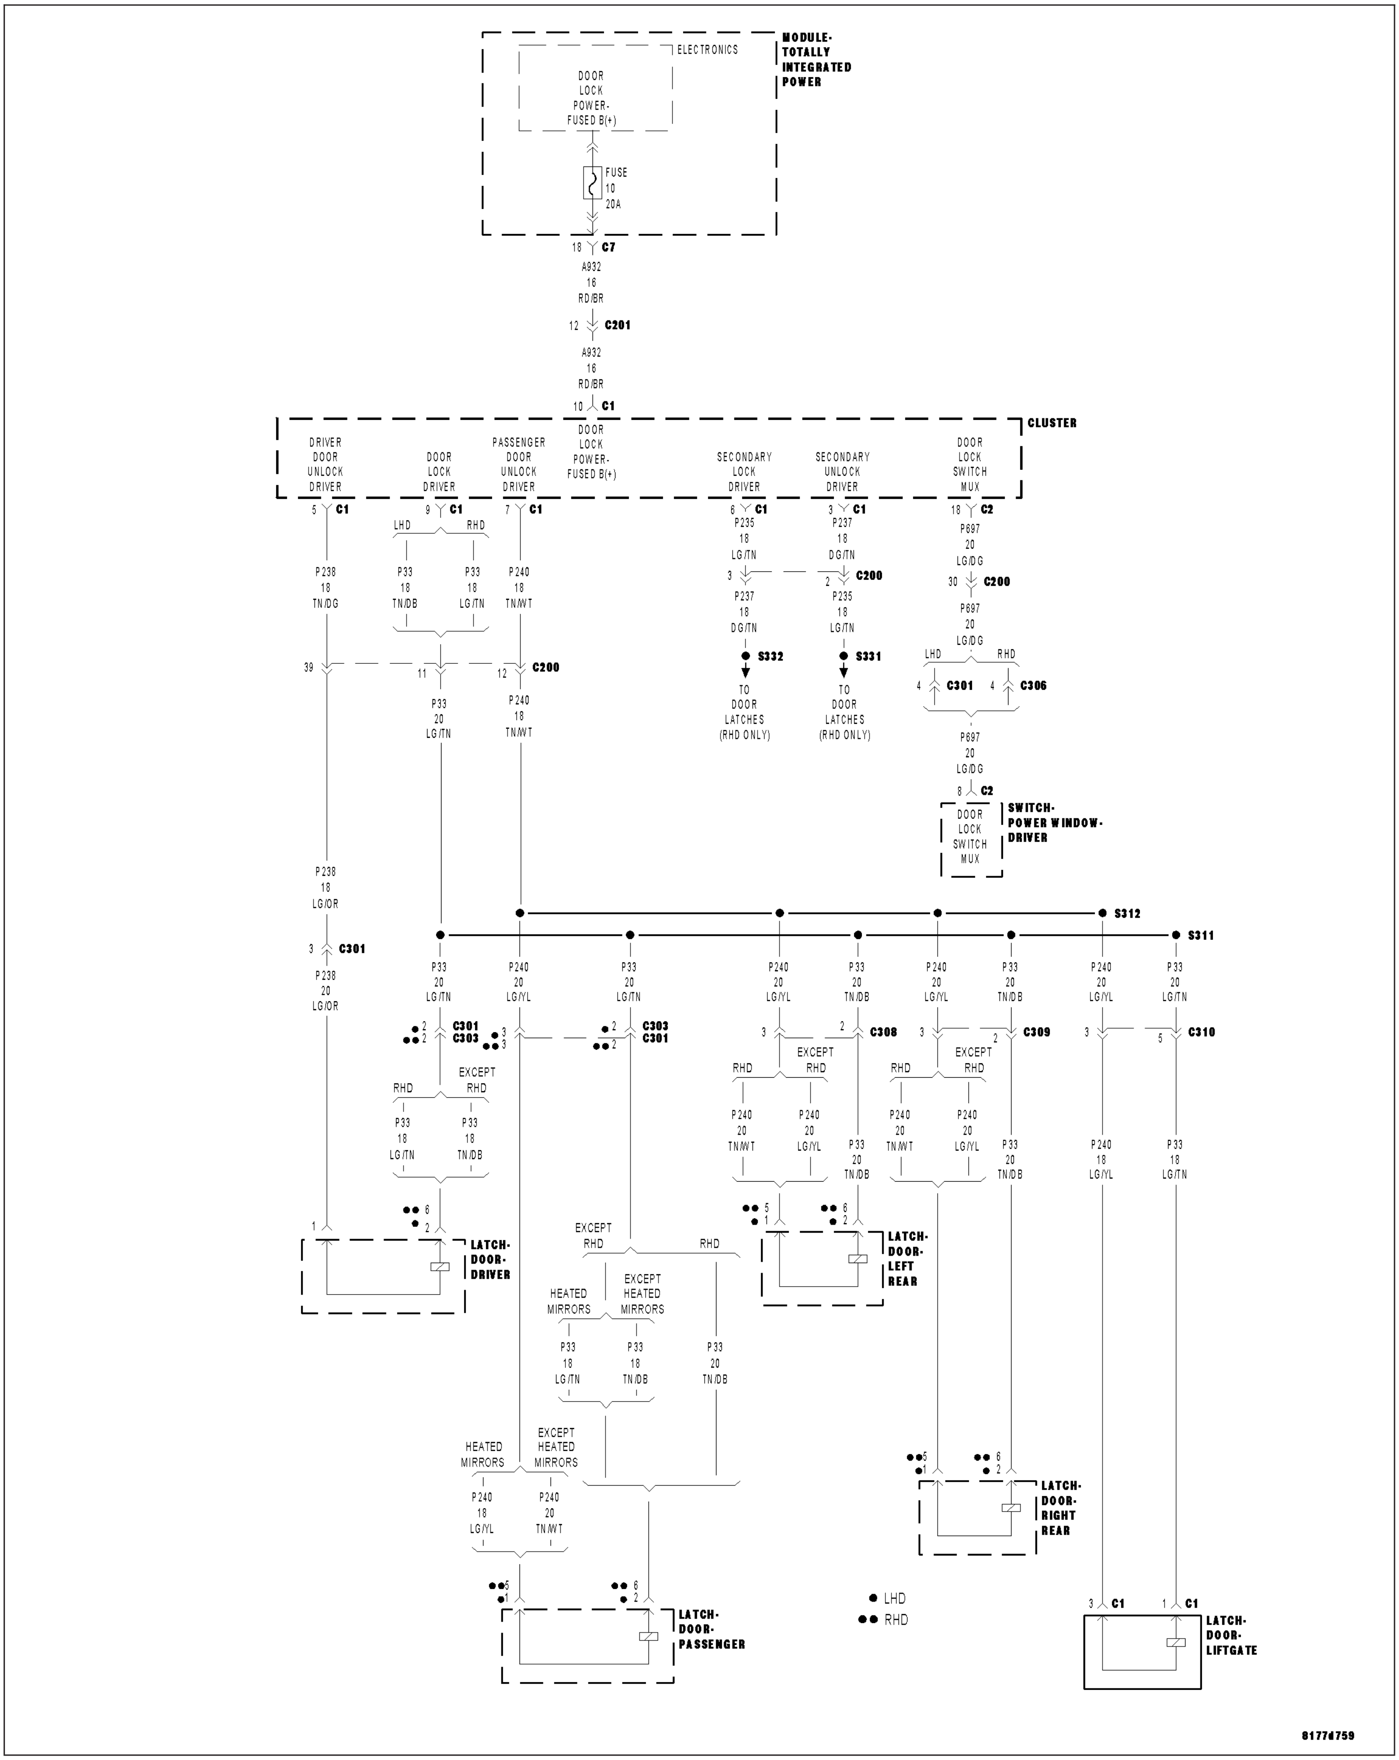
1. (P240) PASSENGER DOORS UNLOCK DRIVER WIRE SHORT TO GROUND

Turn the ignition off.

Disconnect the Instrument Cluster C1 connector.

Measure the resistance between ground and the (P240) Passenger Doors Unlock Driver circuit.

Is the resistance below 1,000.0 ohms?



No >> Replace the Instrument Cluster in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

Yes >> Repair the (P240) Passenger Doors Unlock Driver wire for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

*ALL DOORS FAIL TO LOCK

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(P33) DOOR LOCK DRIVER WIRE SHORT TO GROUND
INSTRUMENT CLUSTER

Theory of Operation

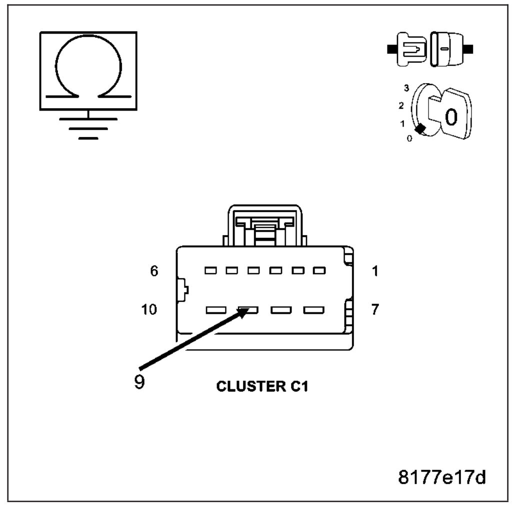
This test does not cover a secondary latch problem on a right hand drive vehicle.

1. (P33) DOOR LOCK DRIVER WIRE SHORT TO GROUND

Turn the ignition off.

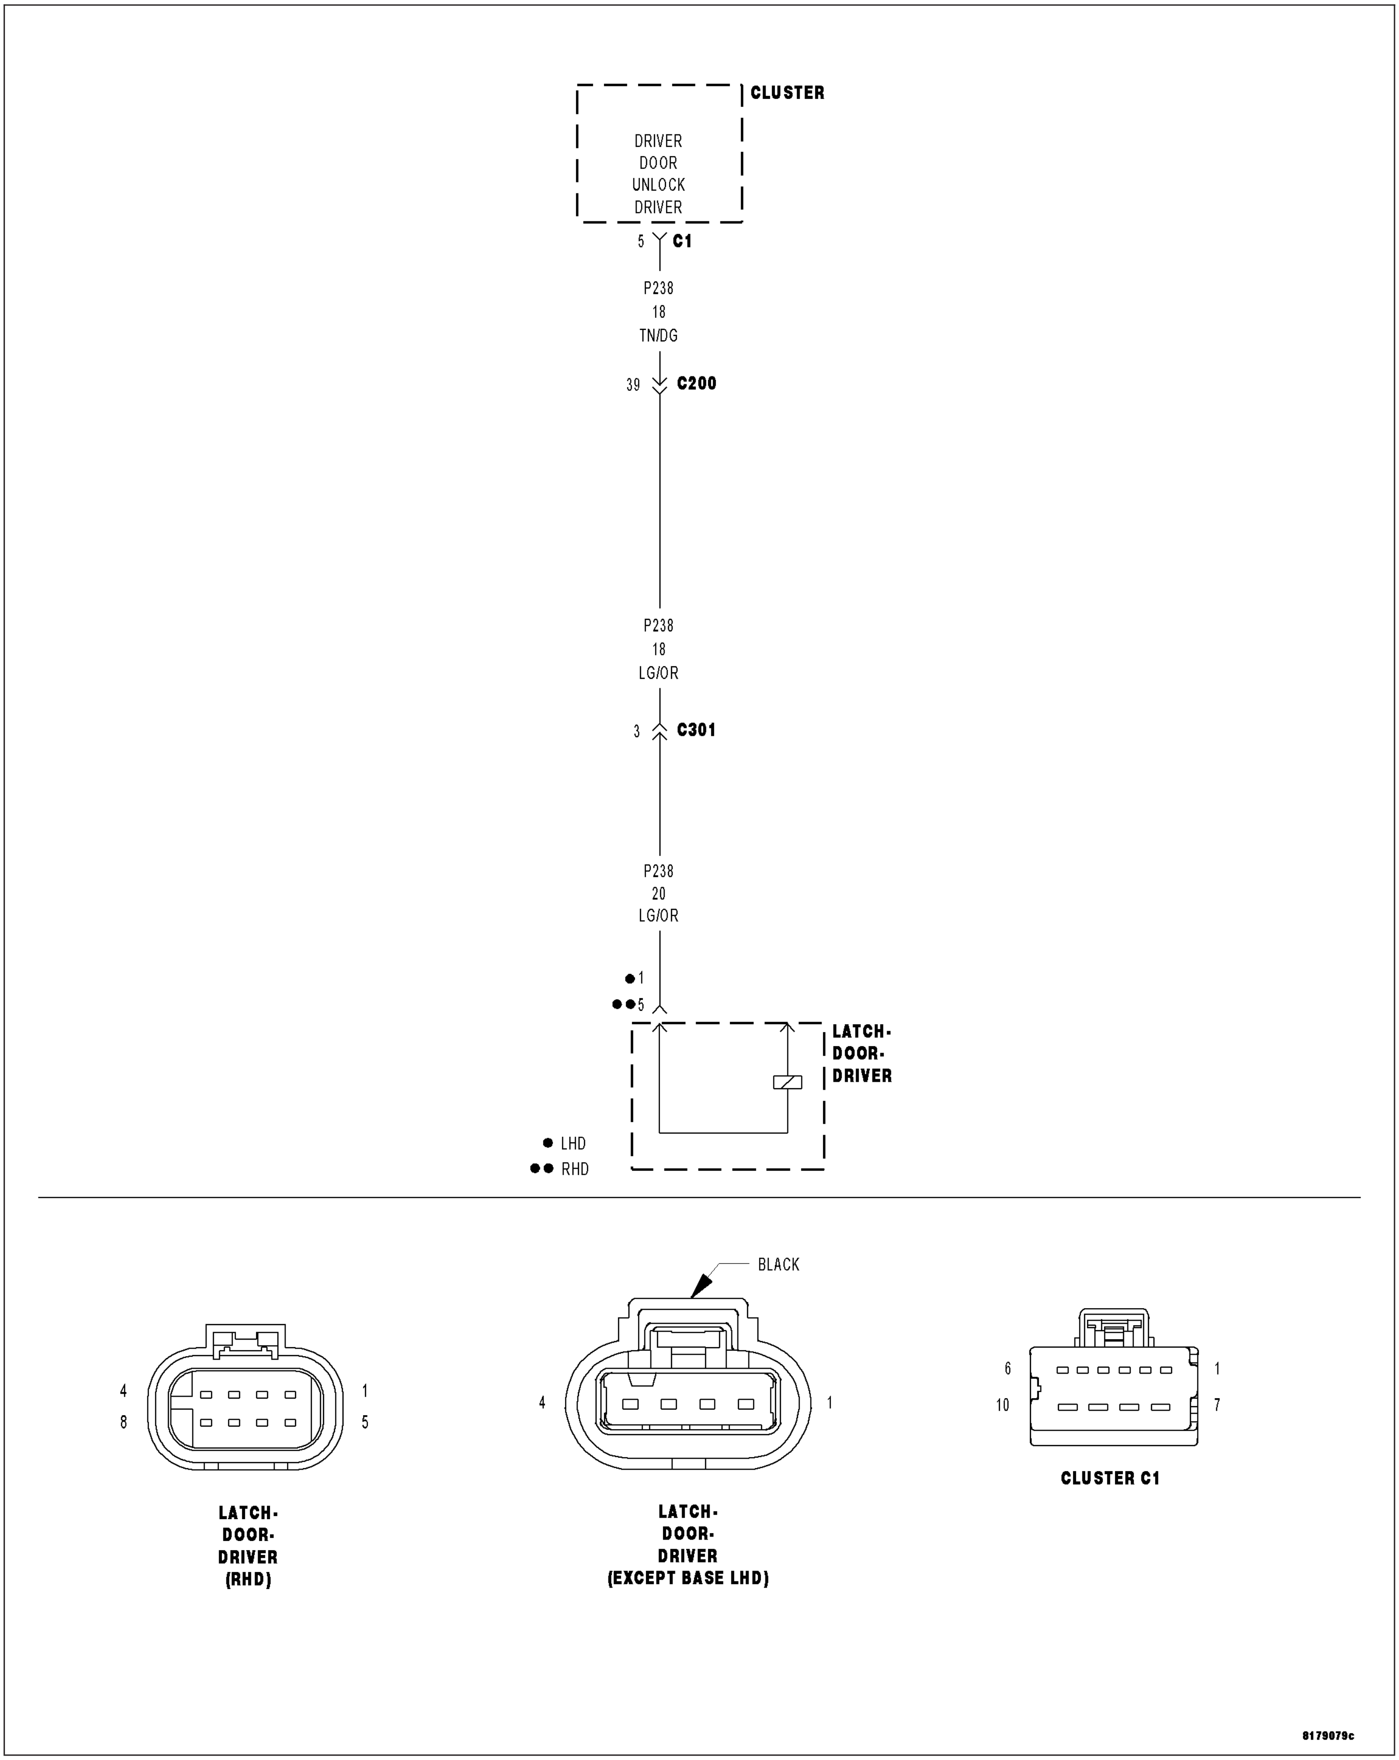
Disconnect the Instrument Cluster C1 connector.

Measure the resistance between ground and the (P33) Door Lock Driver circuit.



Is the resistance below 5.0 ohms?

No >> Replace the Instrument Cluster in accordance with service information.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

Yes >> Repair the (P33) Door Lock Driver wire for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

*DRIVER DOOR FAILS TO UNLOCK

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(P238) DRIVER DOOR UNLOCK DRIVER WIRE SHORT TO GROUND
INSTRUMENT CLUSTER

Theory of Operation

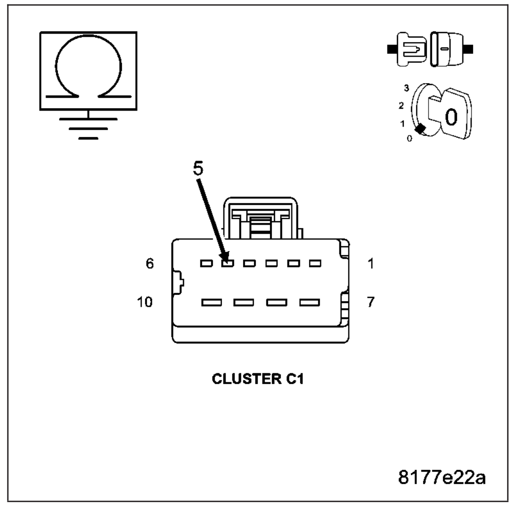
This test does not cover a secondary latch problem on a right hand drive vehicle.

1. (P238) DRIVER DOOR UNLOCK DRIVER WIRE SHORT TO GROUND

Turn the ignition off.

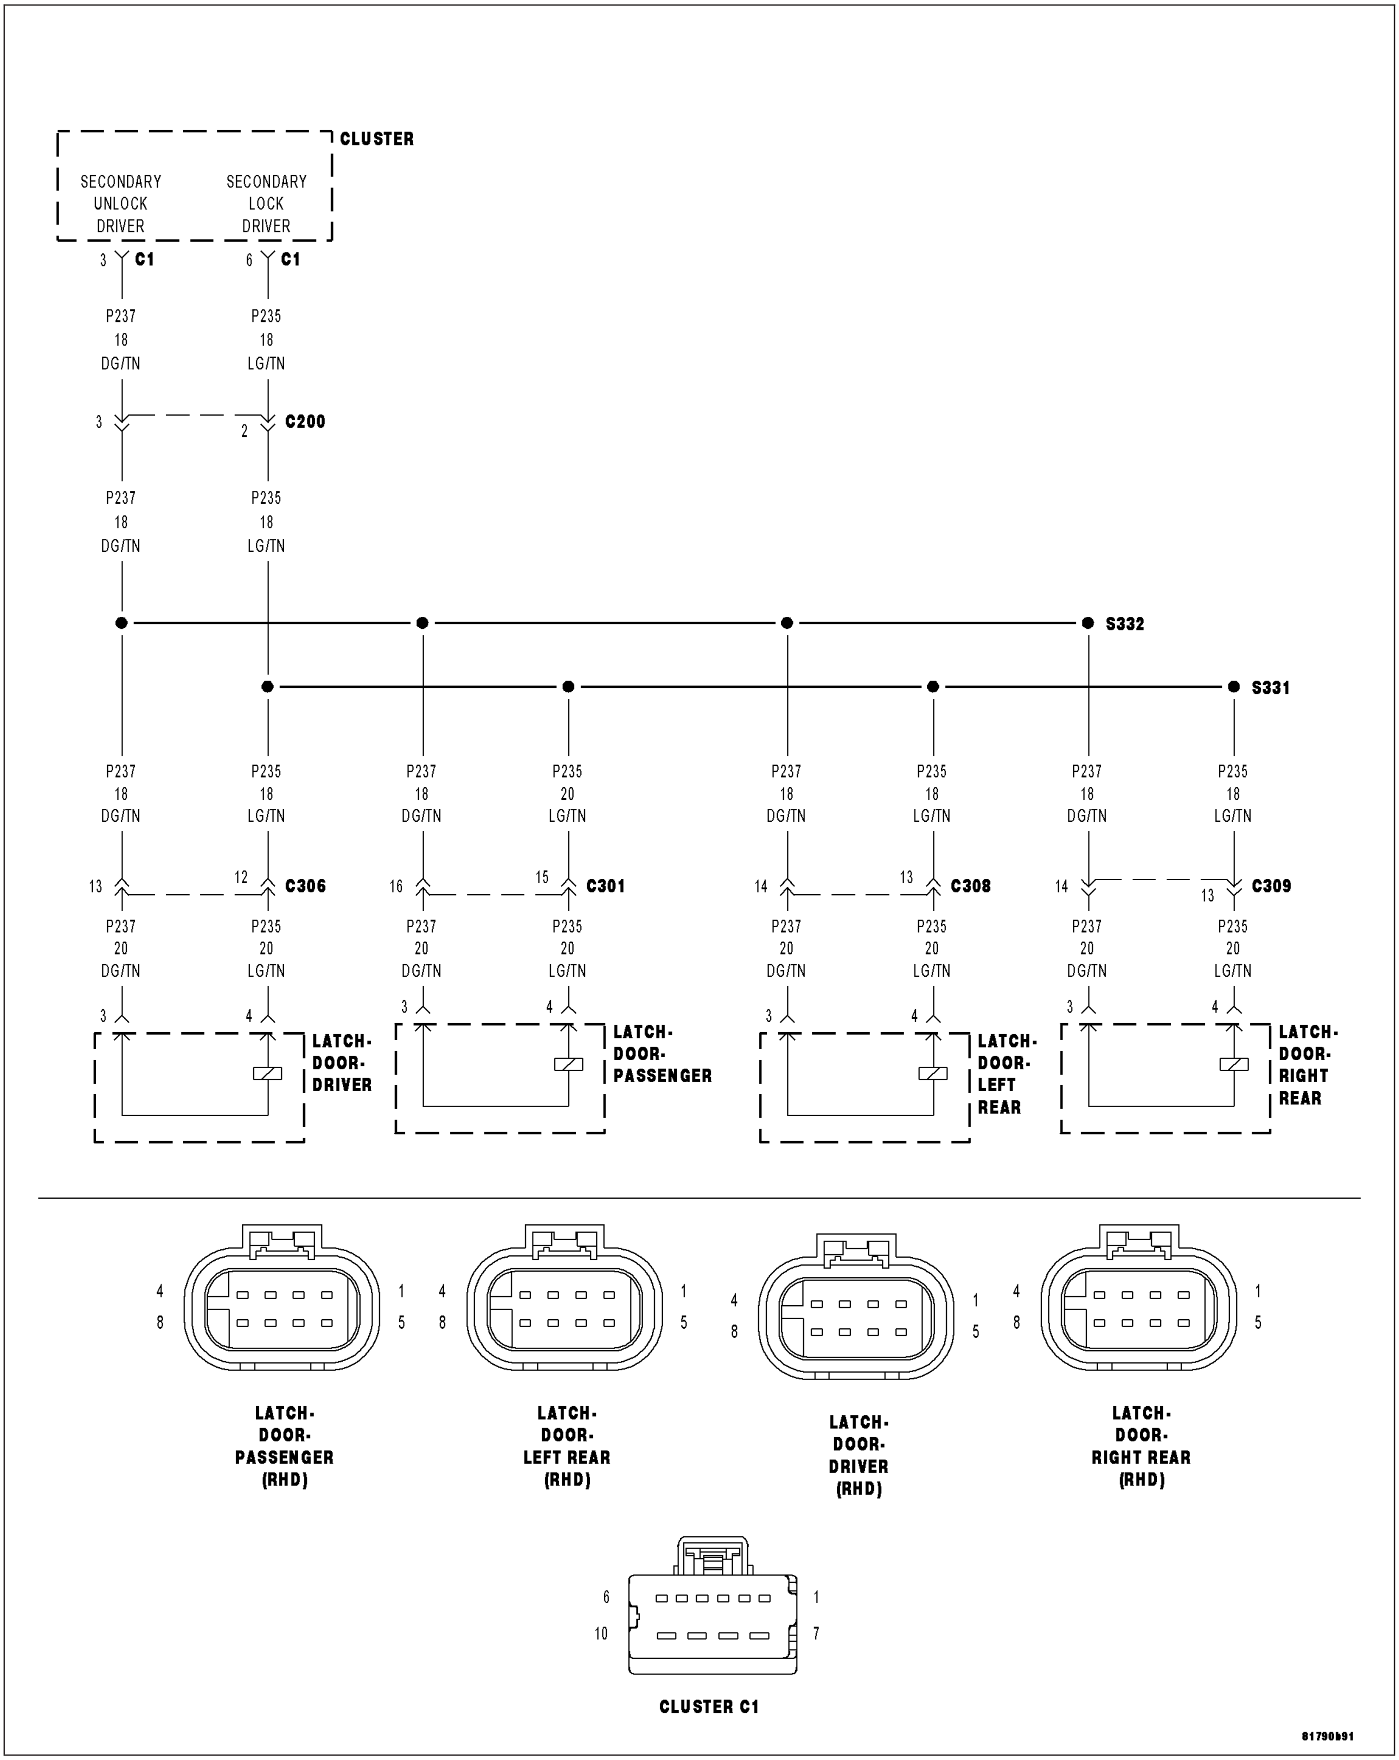
Disconnect the Instrument Cluster C1 connector.

Measure the resistance between ground and the (P238) Driver Door Unlock Driver circuit.



Is the resistance below 1,000.0 ohms?

Yes >> Repair the (P238) Driver Door Unlock Driver wire for a short to ground.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

No >> Replace the Instrument Cluster in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

*ONE SECONDARY DOOR LOCK INOPERATIVE – RHD ONLY

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(P237) SECONDARY UNLOCK DRIVER WIRE OPEN
(P235) SECONDARY LOCK DRIVER WIRE OPEN
DOOR LATCH OR LIFTGATE MOTOR

Theory of Operation

The secondary lock is a dead bolt that prevents the door from being opened when the vehicle has been armed. It can only be locked when the key is out of the ignition, all doors are closed, the front door ajar switch transition has been completed and the RKE fob is pressed in the armed position. The secondary lock will operate approximately 18 seconds after the door latches are locked. The secondary locks are unlocked by a RKE fob unlock command after approximately 375 ms later than the door latches. They will also unlock when a valid SKIM key is turned to the ON position or the vehicle is driven and reaches Auto Door Lock (rolling) status. This system is only used on Right Hand Drive vehicles.

Diagnostic Test

1. TEST FOR DIAGNOSTIC TROUBLE CODES

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Driver Door Lock Switch in all positions several times.

Cycle the ignition from on to off and wait for five seconds.

Turn the ignition on.

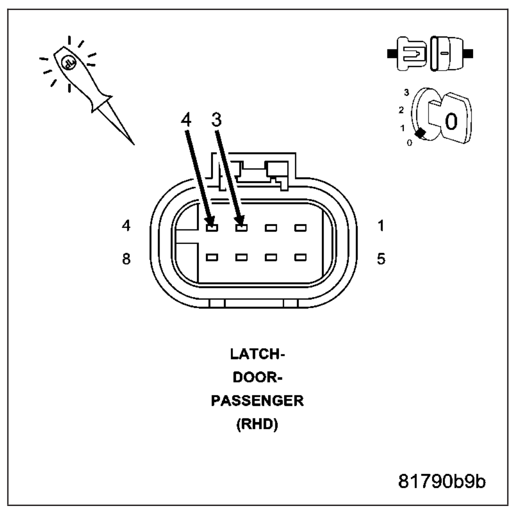
With the scan tool, read the active DTC's.

Does the scan tool display any Power Door Lock related DTC's?

No >> Go To 2

Yes >> Refer to the Table of Contents in this section to diagnose and repair the DTC's.

2. DOOR LOCK MOTOR CIRCUIT



Lower the driver window.

Turn the ignition off.

Disconnect the inoperative Door Latch (Motor) connector.

Connect a 12 volt test light between the (P235) Secondary Lock Driver and the (P237) Secondary Unlock Driver circuits in the latch connector.

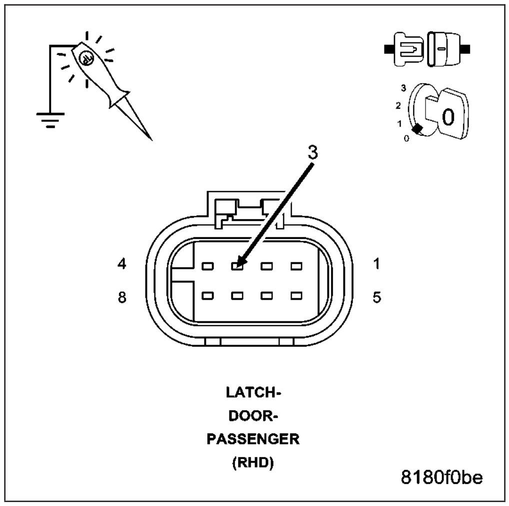
NOTE: Graphic shows the Passenger Front Latch – all others similar.

Remove the key from the ignition switch.

Using the RKE fob, operate the door lock. Wait 30 seconds and then operate the door unlock. Repeat this several times while observing the test light.

Does the test light illuminate brightly when the locks are actuated in both directions?

Yes >> Replace the Door latch Assembly (or motor).



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

No >> Go To 3

3. (P237) SECONDARY UNLOCK DRIVER WIRE OPEN

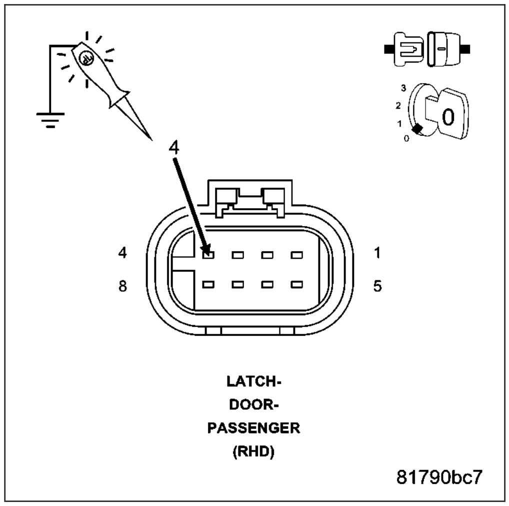
Using a 12-volt test light connected to ground, check the (P237) Secondary Unlock Driver circuit.

Using the RKE fob, operate the door lock. Wait 30 seconds and then operate the door unlock. Wait 30 seconds and repeat this several times, waiting 30 seconds between fob presses, while observing the test light.

Does the test light illuminate brightly when the unlock cycle is actuated?

Yes >> Go To 4

No >> Repair the (P237) Secondary Unlock Driver wire for an open.



Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

4. (P235) SECONDARY LOCK DRIVER WIRE OPEN

Using a 12-volt test light connected to ground, check the (P235) Secondary Lock Driver circuit.

Close all doors.

Using the RKE fob, operate the door lock. Wait 30 seconds and then operate the door unlock. Wait 30 seconds and repeat this several times, waiting 30 seconds between fob presses, while observing the test light.

Does the test light illuminate brightly when the lock cycle is actuated?

Yes >> Test Complete.

No >> Repair the (P235) Secondary Lock Driver wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING)

POWER LOCKS

TABLE OF CONTENTS

POWER LOCKS

DESCRIPTION

POWER LOCKS

The power lock system allows all of the doors and the liftgate to be locked or unlocked electrically by operating a switch on either front door trim panel. The power lock system receives non-switched battery current through a fuse in the Fuse Block, so that the power locks remain operational, regardless of the ignition switch position.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences.

The power lock system for this vehicle can also be operated remotely using the available Remote Keyless Entry (RKE) system Radio Frequency (RF) transmitters, if equipped.

Certain functions and features of the power lock system rely upon resources shared with other electronic modules in the vehicle over the Programmable Communications Interface (PCI) data bus network. For proper diagnosis of these electronic modules or of the PCI data bus network, the use of a scan tool and the appropriate diagnostic information are required.

CHILD PROTECTION LOCKS

To provide a safer environment for children riding in the rear seat, the rear doors have the “child protection” door lock system.

The child protection locks are on the rear doors only. The lock, when engaged, will disable the inside door handle from opening the door. The lock is part of the latch/lock assembly.

DOOR LOCK INHIBIT

With the key in the ignition switch and the driver door open, the Remote Keyless Entry (RKE) module will ignore the command to lock the power door locks using the interior door lock switches. Once the key is removed, or the drivers door is closed, the RKE module will allow the power locks to lock using the door lock switch.

REMOTE KEYLESS ENTRY

The remote keyless entry system allows locking and unlocking of the vehicle door(s) liftgate, panic alarm and arming or disarming of the vehicle theft security system (if equipped), using the hand held (RF) transmitter.

The RKE module is also referred to as the Alarm Remote Keyless Entry Module (ARKEM). It also contains the functionality for the Vehicle Theft Security System (VTSS).

The module may receive signals from up to four transmitters. Each transmitter has its own code, and the code is programmed and stored into the module memory. If a transmitter is replaced or additional transmitters are added, the codes for all units have to be reprogrammed into the RKE module or ARKEM memory. If a module is replaced, the transmitter codes must be stored in the new memory (by performing the steps for programming transmitters). The RKE or ARKEM is capable of retaining all transmitter codes when power is removed from the module.

SECONDARY LOCKS — RHD ONLY

The secondary lock is a dead bolt that prevents the door from being opened when the vehicle is armed. It can only be actuated when the key is out of the ignition, all doors are closed and the lock function on the RKE fob is pressed. The secondary lock will arm approximately 16 seconds after the door latches are locked. The secondary locks are unlocked by a RKE fob unlock command approximately 375 milliseconds after the door latches are unlocked. They will also unlock when a valid SKIM key is turned to the ON position. The secondary locks will also be unlocked when the vehicle is driven and reaches the Auto Door Lock (rolling) status for safety reasons. This system is only used on Right Hand Drive vehicles.

OPERATION

POWER LOCKS

All doors can be locked or unlocked mechanically and independently with their respective locking knobs. The front doors can also be unlocked by actuation of the inside remote door handle.

CENTRAL LOCKING/UNLOCKING (IF EQUIPPED)

The door locks can be locked or unlocked electrically via the exterior door key cylinders to provide the central locking/unlocking feature. The central locking/unlocking feature incorporates a customer programmable ″Double activation unlock″ feature which operates in the following manner: When enabled, the first turn of the key cylinder to the UNLOCK position (toward the front of the vehicle) will mechanically unlock the door whose key cylinder is being turned. A second turn of the key cylinder to the UNLOCK position (within five seconds of the first turn) will cause all vehicle doors and liftgate to unlock electrically. When this feature is disabled, all vehicle doors and liftgate will be unlocked electrically upon the first turn of a key cylinder to the UNLOCK position. The vehicle is locked electrically by turning the key cylinder to the LOCK position once, regardless of the state of the double activation unlock feature.

REMOTE KEYLESS ENTRY

The transmitter has three buttons for operation: LOCK, UNLOCK and PANIC.

- Pressing the UNLOCK button will unlock the driver's door, flash the park lamps twice and enable illuminated entry. Pressing and releasing the button once will unlock the drivers door. Pressing and releasing the button two times within a five second interval will unlock all doors.
